High-performance people. That's what you get with every disk system you purchase from System Industries. From responsive delivery to complete software support, our people know how to meet your specific requirements.

You can also add low price— the lowest in the industry for OEM-quantity purchases. Because we buy more disk drives than any other independent, we can afford to pass the savings on to our customers.

We believe the best business relationship is a mutually profitable one. That's why we're ready to help our customers become self-sufficient in handling their future disk storage needs. And that's why our customer base continues to grow rapidly.

We'd like to tell you more about our high-performance people and products by sending you "The Bit" — our quarterly newsletter. To receive your free copies, simply drop us a short note with your business card. Or phone your request to the System Industries sales/service office nearest you.

We make good disk drives work better, and we think you should know why.

...you get the support of high-performance people.

System Industries
an equal opportunity employer

Users Urged to Take Mini Selection Seriously

(Continued from Page S/2)

marize the technical content of the proposal in a standard manner that facilitates direct comparisons among vendors.

Specific Factors

The critical factor for judging a business minicomputer's useful speed is the speed at which the input and output devices operate. Extending the system is another major consideration in the evaluation process. Thus, one should consider a machine which accurately approximates current requirements, but which can easily be expanded to meet future demands.

A critically important area of evaluation is software. Vendor's claims and promises concerning the availability and capability of software should be carefully checked, particularly for software that has been announced but not yet released. Vendors frequently fail to live up to their marketing publicity or timetables for delivery.

The availability of reliable and qualified equipment maintenance is also critical in the business minicomputer environment.

Other factors include:

- Availability and cost of support for conversion assistance and training of company management.
- The location and availability of backup equipment, machine time provided for program testing prior to installation of your computer system and the extent of software documentation (particularly operator instructions).
- The trade-offs involved in the lease/rental/purchase contract offerings.

Other costs must also be considered. For example, one or more new employees might be needed to run the system and supplies, office space and overhead costs must also be included.

Added to these recurring annual costs should be the one-time costs of any initial conversion, any vendor support separately charged for and any delivery costs, taxes, etc. In some cases, these one-time costs can exceed 50% of the first year's cost of running the business minicomputer system:

The act of finally selecting the vendor and equipment configuration actually consists in most cases of a careful review and synthesis of the results of each major phase in the evaluation procedure. In most cases, a clear pattern of superiority will emerge.

Conversion, Installation Team

Once the equipment selection is made, the time has come to begin planning and scheduling the conversion of the current systems. The underlying requirement is to affix clear responsibilities, authorities and controls.

An excellent approach toward doing this is to form a conversion and installation team composed of some or all of the following people: company management, designated operator, DP manager, supervisory personnel from departments to be affected by the computer, computer vendor's representative and/or independent consultant.

Before any computer system is installed, familiarize all concerned parties — usually the entire company — with the features and capabilities of the new equipment.

As part of the computer installation, there will be a need for file conversion that will usually be performed by manually keying information from clerical records directly onto magnetic ledger cards, tape cassettes, punched cards or other storage media.

The importance of carefully performing file conversions cannot be overstated. If the file conversions are performed completely and accurately prior to installation of the computer system, the probability of a relatively trouble-free cutover to the new system will be greatly increased.

The Cutover

Now that the computer equipment and related hardware have been delivered and installed, it is time to begin the crucial work of cutting over. This cutover period may be not only the most critical, but also the most error-prone, frustrating and costly. For it is during the cutover that all hidden problems are forced out into the open.

Perhaps the most important guidelines in the cutover operation is this: cut over only one system function at a time. The smaller the function, the better.

A cutover technique commonly used when installing a business computer system is that of parallel operations. An alternative to parallel processing is to pick a cut-off data for each application and "go live" on the new system after that date. The programs in question must be thoroughly tested with simulated information and the only thing in question is the validity of the converted files.

Microdata
17481 Red Hill Avenue
P.O. Box 19501, Irvine, CA 92713

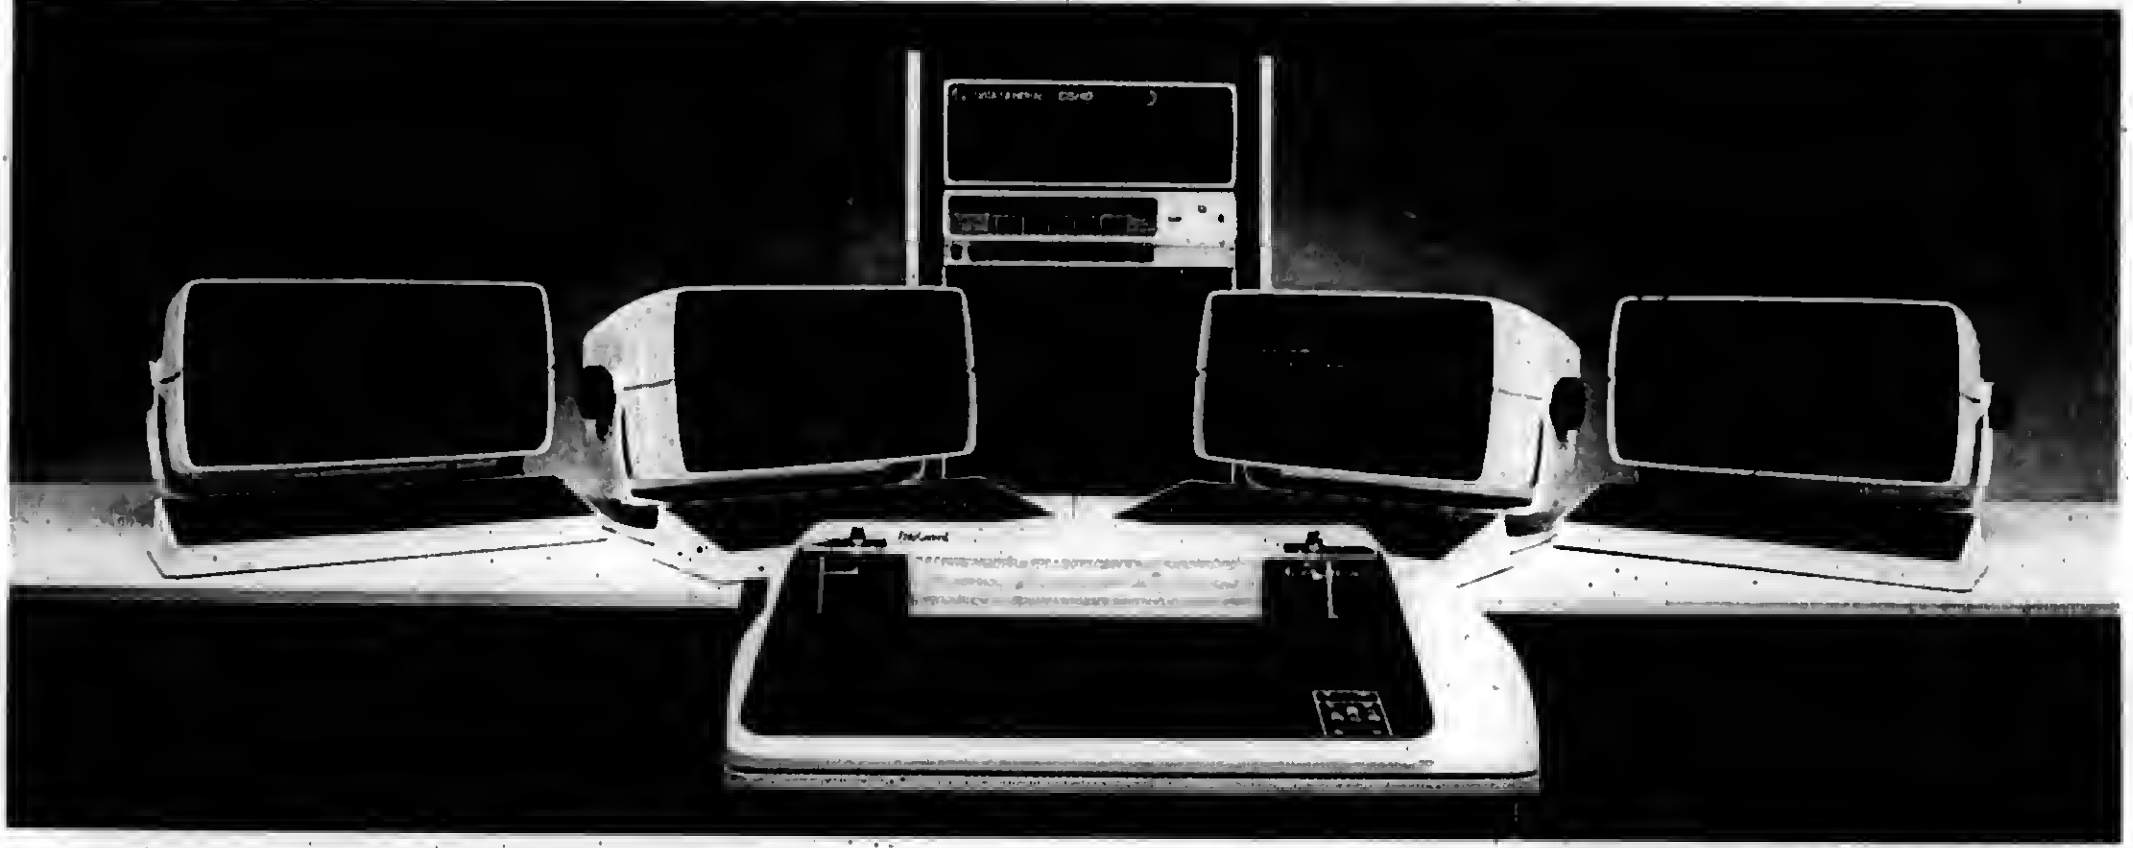
This new lower-cost member of the Reality® family of computer systems permits up to three independent users direct access to the system through the same kind of English you're reading right now.

The system gives you most of the advantages of our larger Reality systems at considerably less expense. You can use it for on-line order processing, inventory control, general ledger, accounts receivable and payable, management reporting and a whole list of other business applications.

There isn't another business-oriented computer system in the world that does so much for so little. And there isn't another one at any price that understands English.™ Now you can get your hands on Reality for a lot less. For a free hands-on demonstration, send in the coupon today.

Microdata
The people who bring you Reality.®

At last. The small business systems nobody's waiting for.



Data General's new Commercial Systems CS/40 models. They don't keep you waiting because they work the way business works. Interactively.

Multiterminals, no waiting. CS/40 puts data processing power right where your people need it, when they need it. In a distributed network or as a stand-alone system handling multiterminal applications or multiple single terminal applications or both. So some users could be updating inventory, while others enter orders, check payables, and process the payroll. All at the same time. And managers can still access the system any time.

It speaks your language. Interactive ANSI '74 COBOL, the standard business computer language and the language of large computers. With its COBOL, CS/40 has interactive debugging and workstation management, which makes it easier to use from the start.

Small doesn't mean limited. Three compatible models assure that as your company grows, CS/40 can grow along with you. And CS/40 can communicate with other popular commercial systems including our own. With features like up to 40 million bytes of online disc storage. And enough memory for large applications. Plus utility software you wouldn't expect on a small system. And a smart spooler that frees up terminals so your system can do more work.

And everything else you'd expect from Data General. Like innovation, because we put a larger share of our revenues into R & D than any other major computer manufacturer. Like reliability, because we make virtually everything we sell. Add attractive quantity discounts, solid systems engineering, field service and our superior price/performance and you'll understand why there are already over 39,000 systems installed worldwide.

Why wait any longer?

Mail to: Data General, Westboro, MA 01581

☐ Send me your Commercial Systems CS/40 series brochure.
☐ Send me your brochure and have your sales representative call.
☐ Quick, I'm getting ready to purchase. Call me pronto.

Mini Helps Auto Parts Firm Hike Sales 400%

PLYMOUTH, Mich. — A small business system has enabled National Set Screw Corp. (NSS) here to increase its sales almost 400% in four years without adding administrative help, according to Peter Ewing, president.

Programmed by the president himself, the system performs accounting, inventory, management, order entry and job cost estimation functions. Employees in various locations can simultaneously access programs and data stored in a central system through remote workstations.

In a key application the system also figures how much money it costs per day to use a particular machine for a particular job to allow the company to find out what jobs are profitable.

In 1973 the firm, which supplies parts for the auto and construction industries, reported sales of $1.5 million. Sales rose from that figure to an excess of $6 million in the most recent fiscal year.

"We achieved this increase in our sales without adding any more administrative staff," Ewing noted. "The Datapoint 2200 system we installed in 1974, plus the additions we have made to the unit in the meantime, have enabled us to raise the productivity of existing personnel to handle the increased workload," he said.

"Our out-of-pocket savings have been tremendous," he added. "Additional people would have cost us substantially more than the Datapoint investment but would not have produced the same results. As we see it, the equipment is not just a money saver, it's a moneymaker."

Comprehensive Study

NSS began its internal computing operation with a single Datapoint 2200 system in September 1974. Before settling on the Datapoint 2200 processor, Ewing made a comprehensive study of all the small business computers available at that time.

Ewing looked at small business systems and bare-bones minis alike, including systems from Digital Equipment Corp., Burroughs Corp., Basic Four Corp., Varian Data Systems and IBM. Systems from both Microdata and Datapoint came closest to fulfilling the need; the Datapoint was chosen on price and software considerations. As Ewing pointed out, "IBM has nothing comparable to it for under $300,000."

He said no other maker offered the comprehensive operating system and sophisticated programming languages available on the 2200 "I was especially impressed by the Databus language, with which I have written almost all of the programs involved here."

Key Benefit

Another key benefit of the system, from Ewing's point of view, is economy of operation. "I absolutely did not want to add a DP manager to our staff. With the aid of the 2200, a couple of sharp secretaries and I have been able to handle the entire operation," he said.

The original 2200 installation has now been upgraded to allow several users to access the processor at one time. The Datashare system incorporates not only the 2200, but two cartridge disk drives for data and program storage, a printer and five Datapoint 3600 CRT workstations. The workstations are located in various offices at NSS.

Ewing plans to increase the capability of the system again by putting in a large Datapoint 5500 processor to allow more terminals to be attached and to gain quicker response time, he said. The firm also purchased a Tektronix, Inc. 4501 graphics terminal to help its engineers, emphasizing its commitment to user-oriented DP.

Order Starts Ball Rolling

The basis for NSS' in-house activity is the purchase order, which usually arrives in the mail. The company currently receives approximately 1,000 purchases a month, all of which are entered into the system through a single unit in the company's administrative offices.

"My secretary can handle the purchase orders in a few hours each morning," Ewing stated. "Under our previous system, this amounted to a

'Powerhouse' in Small Package

Micros Helping OCR, Minis Perform Together

By Dennis Sullivan
Special to CW

In the past, the high cost of optical character recognition (OCR) has alienated that input method from the world of the minicomputer.

However, with the advent of the microprocessor, OCR has significantly dropped in price, just as the minicomputer cut costs through the use of semiconductor memory and LSI circuitry.

The end result is OCR and minis are combining their capabilities to achieve a powerhouse of performance in a small package. This provides the end user with what he is always looking for — more performance at less cost.

As the cost of hardware decreases and becomes affordable to more people, the volume of data to be processed becomes more abundant. As this data volume increases, more emphasis is being placed on distributed DP.

The large centralized computers are being replaced by the minicomputer at various DP sites. As the minicomputer begins to perform this role, OCR is waiting to demonstrate what it can do.

A minicomputer can be purchased for about $20,000, the same price range as the newer low-cost OCR systems.

The largest potential market for the minicomputer is conventional business DP. Ironically, OCR's biggest potential market is also business DP in the areas of remittance. processing or turnaround documents used in utilities, municipalities, insurance companies and publishing concerns. Other applications include banking applications such as credit card applications, reject reentry, check processing, loan payment processing and proxy scanning.

Once the minicomputer has been purchased, a significant number of CRT terminals can be added depending on the number and complexity of other functions the minicomputer will be performing. But rather than add those additional data entry terminals at a cost of about $1,000 per terminal and an overhead of 20 operators per month — which costs an additional $16,000 per month (based on $5 per hour) — and achieving a 10,000 to 11,000 keystroke rate per hour, per operator, an OCR installation costing $20,000 can reduce the labor costs while increasing the data capture rate.

'Data entry costs must come down, and they can with a mini and OCR combination.'

The user can achieve a 100,000 keystroke production level per operator and perform the work of several operators at a single workstation.

OCR Neglected

At most user sites the cost of data entry is still eating up the majority of DP costs. This is mainly because most DP managers have either neglected to give OCR an honest evaluation or have been given the wrong information on how OCR can fit into their present method of data entry. Data entry costs must come down, and they can with a mini and OCR combination.

Even if the entire document cannot be recognized by OCR (document with a preprinted account number and a location where someone will handprint the amount), OCR is still feasible by just entering the account number automatically and allowing an operator to manually enter the amount.

This method can be referred to as the "read and key" method, and aside from just reducing the manual key entry requirements, it provides a better method of handling documents. By eliminating the necessity of the operator physically handling each individual document, users can gain greater efficiency.

Sullivan is communications director at Key Tronic Corp., Spokane, Wash.

Count on GA for big COBOL performance in multi-terminal applications.

And count on the lowest cost per terminal. Available now, General Automation's new 440 Data Series, starting below $45,000, recognized for the best price/performance package in the computer field: "...It always works...far superior to any other full systems less than $80,000. Any comparable system will cost over $175,000.*"

1. **The most powerful ANSI COBOL**—years ahead of any other tested. Compiles 3-to-10 times faster than a 370/145.
2. **Store 160 megabytes; 1 second response.** Support 16 terminals with less than 1 sec response; 128 KB main memory. Store up to 160 megabytes on disk, with the 720ns GA 440 minicomputer.
3. **Concurrent batch and online processing.** With shared database protection: maximum multi-terminal access with minimum user-contention, all operating in our field-proven File Management System.
4. **GA 440: fully field-proven and GA-serviced,** in more than 500 installations around the world to date.
5. **Exhaustive system-testing:** over 400 different combinations rigorously tested for response time.

Count on GA for all your distributed processing systems — from a basic 2-terminal system to a 10,000-terminal network; from factory and business data collection to corporate networking systems — through our advanced line of high-technology mini and microcomputers. You'll be joining the world's largest corporations who now count on GA for the most productive system solutions: in financial, industrial and telecommunications applications.

32-Bit Systems May Dominate Future Mart

(Continued from Page S/2)

with getting a job done.

In similar fashion, most users never confront the PDP-11's 16-bit word, nor that of Data General's Nova or Eclipse. These systems have built up so much software support for the 16-bit word, it is of no concern except for special applications.

On the other hand, companies such as Interdata and Systems Engineering Laboratories, which have largely made their mark with 32-bit word minicomputers, have an easier time developing the system software. The 32-bit word should ultimately lead to more elegant software. Also, the longer word length with its large address space makes it possible to run large application programs without segmenting.

Because software development is easier on a longer word length machine, and software is the limiting factor now (and in the foreseeable future) for minicompter use, it seems unlikely that a new minicomputer company would develop a mini with less than a 32-bit word. This assumes all other things being equal which they never are..

Semiconductor Look-Alikes

The semiconductor manufacturers, like the minicomputer pioneers, are hardware buffs. Safaris into the wilds of software development are scary, thus they ogle any system with piles of already developed software. They also require high volume to turn a profit. So minicomputers with a large installed base and hefty software support are prime candidates for a semiconductor manufacturer's look-alike model.

This appears to point to the conclusion that the safest course for a minicomputer manufacturer is to develop little software and to maintain a small user base. That is obviously uncapitalistic and the road to failure.

What it does indicate, however, is that viable minicomputer systems cannot be produced with cookie cutters. If they are, the semiconductor houses will build a look-alike that will outsell the original because it will be cheaper. The software and hardware must be optimized for specific applications so that high-volume, general-purpose, less expensive look-alikes can't be developed to do the job.

The 32-bit word minicomputer has the inherent capacity to be applicable for a wide range of jobs because of high precision, rich instruction set, large address space and big memory. But which jobs should its hardware and software modules be optimized for? That is the manufacturer's challenge.

It seems unlikely that the 32-bit minicomputers can offer a challenge in the older 16-bit minicomputer markets: real-time industrial control, test and measurement, small time-sharing and desk calculator applications and data communications (line handling). The 16-bit word minicomputer hardware and software have been optimized for these markets. In some cases, where a 16-bit minicomputer is overqualified for the job (has more hardware and software than the job requires), the challenge will come from the microcomputer.

It is in the expanded minicomputer markets that require new software, more powerful hardware or a reorientation of the hardware/software system where the 32-bit word minicomputers shine. These are applications for larger scientific processing systems, data communications processors (front-ends, remote concentrators) and network processors in distributed processing systems.

Of course, the big market for expansion eyed by all minicomputer manufacturers is the commercial market. It is the commercial market that requires a major hardware/software reorientation.. Because of this, the commercial market is risky even though it is the most potentially lucrative market available.

The new software will be easier to program on a 32-bit mini. The systems can be expanded into very powerful configurations. The software/hardware reorientation for the commercial market, however, is probably little easier for 32-bit minicomputers than for 16-bit minicomputers.

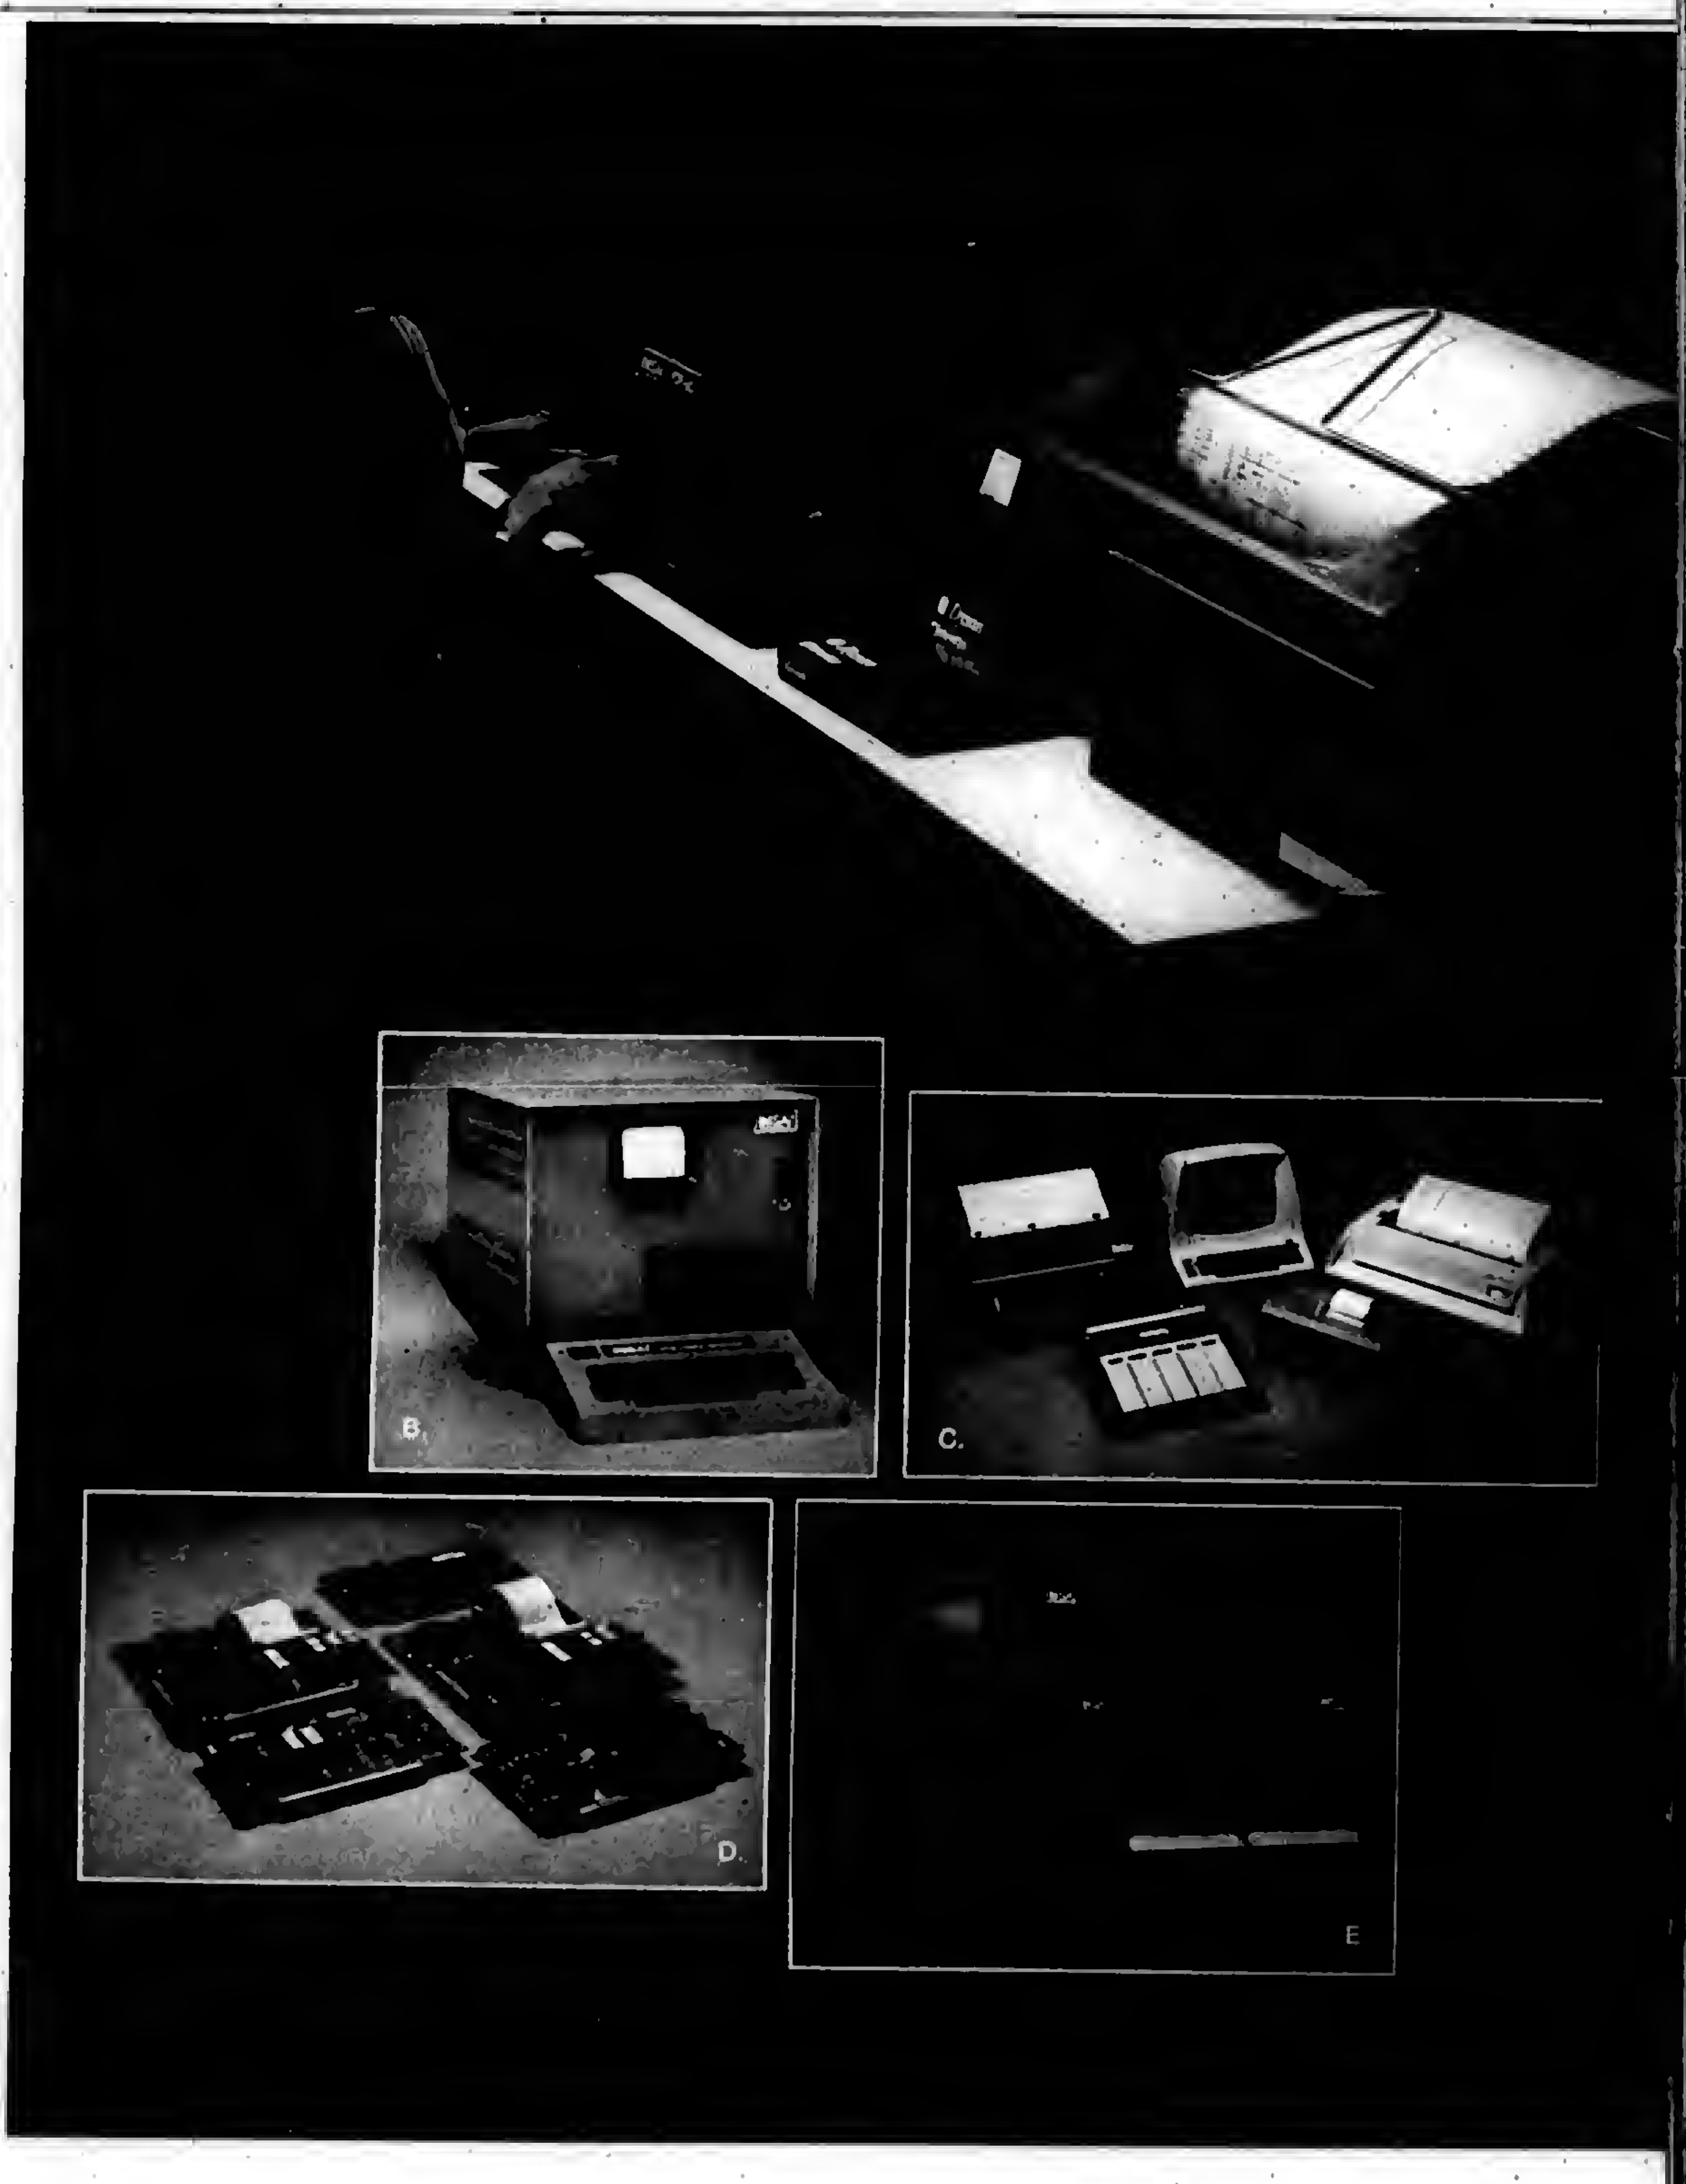
Think Commercial

The reason is the hardware/software orientation results from the thinking of the people who plan, design, build, sell and service minicomputer systems. All these people must be reeducated to think commercial. Until that is done, precious little reorientation that is relevant to the commercial market will happen. The developer is not commercially oriented because the traditional minicomputer markets are very different from the commercial market.

Up to now, the minicomputer manufacturers have primarily responded, in interrupt mode, to the OEM market. Initially they responded to the product OEM who developed an end-user product: buying CPUs and memory from one manufacturer, peripherals from other manufacturers and tying them together with special interfaces and software. The minicomputer manufacturer was primarily concerned with making modular, high performing, low-cost CPUs and memories.

Gradually, a system OEM emerged. He wanted modular, high performing systems that included peripherals, data communications, interfaces and software. Thus, minicomputer manufacturers began to spend more and

(Continued on Page S/22)



Sophisticated Capabilities

Large Mini Realistic Alternative to Mainframe

By Neal J. Rapp
Special to CW

Nearly everyone knows that minicomputers are getting smaller and cheaper. But not too many people realize they are also getting larger and cheaper. I'm referring to the growing use of the large-scale minicomputer that is, systems that provide large-scale mainframe functions in a minicomputer package.

Large-scale minicomputers are more like mainframes than minis. They are used to solve very sophisticated problems by system designers who use techniques and functions that until recently were available only on very large systems. That means the market for large-scale minicomputer systems is not a traditional minicomputer market. And that, in turn, implies that a large-scale minicomputer is much different than a traditional minicomputer.

In fact, the only reason they are called minicomputers at all is because their central processors are derived from the 16-bit architecture that has become synonomous with minicomputers.

People who use large-scale minicomputers view them as extremely cost-effective solutions to on-line, interactive problems. Their most exciting characteristic is that they combine large system software with the interactive capabilities of the traditional minicomputer, at costs far below mainframe costs.

Therefore, to get a fair indication of what large-scale minicomputers can do, and for whom they do it, they should be compared with mainframes and the mainframe environment, rather than with traditional minicomputers.

Just how do they compare to mainframes? The simplest answer is that they compare differently in different areas.

For example, there is little difference in the area of system capability. Because it has comprehensive, sophisticated software, a large-scale minicomputer system can do most things a large mainframe can do. A good large-scale minicomputer system and a mainframe have these things in common:

- A sophisticated data base management system.
- Large virtual memory addressing capabilities.
- A large main memory capacity.
- A wide array of languages and software utilities that can be mixed without restriction.
- The ability to run very large programs.
- The ability to handle a large number of users.

When it comes to performance, the differences between large-scale minicomputers and mainframes become a matter of interpretation.

If performance is measured in interactive, on-line terms – response time, for example – the large-scale minicomputer and mainframe are very close, with the advantage usually going to the minicomputer. But when performance is measured in batch-oriented terms, the mainframe, which was designed for batch work, ordinarily comes out on top.

There is a significant physical difference between large-scale minicomputers and mainframes. Obviously, the minicomputer-based system is considerably smaller. While size alone may not be an important criterion, the mainframe's size often means a user must provide expensive environmental controls that are not always necessary with a large-scale minicomputer.

Finally, there's the difference in cost. Because their orientation has primarily been toward interactive, on-line work, large-scale minicomputers offer significantly more interactive work per dollar compared with mainframes. On a system level, it's safe to say that a large-scale minicomputer system costs about one-tenth to one-half the price of a mainframe with comparable capabilities.

Since system designers have the same tools available on mainframes and large-scale minicomputers – comprehensive software capabilities, large virtual memory address space and large amounts of storage – it follows that mainframes and large-scale minicomputers can be used for similar applications.

Specifically then, who uses large-scale minicomputers and how are they used?

One class of user is the one with a number of remote sites, each using most of the data it generates. The large-scale minicomputer's data base management capability supports local operations, and its efficient data communication capability allows data to be transmitted to a host system.

For example, a West Coast aerospace/electronics company uses a large-scale mini system in the headquarter's financial department. The system lets the vice-president of finance gather data from a division's operating groups and use the data to prepare monthly financial reports. Specific information can be transmitted to a corporate host system, an IBM 370/158, to update its files.

Another class of user is the one who

(Continued on Page S/16)

Microcomputers: Just Ask IMSAI.

If you wonder who leads the way in technology, look into IMSAI's list of industry firsts—IMSAI 8048, first complete control computer on a board; IMSAI 65K RAM Board, first to offer four times the memory capacity previously available on one board; IMSAI printers, first with high-speed direct memory access.

If you wonder why IMSAI products have gained the reputation for the standard of excellence in microcomputer systems, check with any one of the more than 10,000 IMSAI owners.

If you wonder who offers the broadest line of hardware, software, and peripherals, visit any one of the more than 275 IMSAI dealers around the world.

If you wonder how microcomputing can fit your specific needs, ask IMSAI. Because when it comes to microcomputers, we have the answers.

An IMSAI Product to Answer Every Microcomputing Need:

Let's start with our product line. In all, IMSAI offers more than 120 high quality, completely integrated systems, components, peripherals and software. Here's just a sampling:

Single Board Central Processors:
- MPU-A (8080 based)—Industry standard.
- MPU-B (8085 based)—50% faster 8080.
- 8048—Programmable control computer.

Interfaces:
- Video I/O—24x80 CRT. Edit & data entry.
- Serial I/O—2 port I/O, all std. protocols.
- Parallel I/O—4 & 6 port TTL level I/O.
- Multiple I/O—2 cassette, 2 parallel, 1 serial & 1 control I/O.
- DMA—For floppies & line printers.

Peripherals:
- Printers—44/80/132 col. 30 cps-300 lpm.
- Video displays—Large assortment.
- Tape Drive—9 track, 800 bpi; 25 ips.
- Floppy Disks—Single/double density.

Memory Expansion Boards:
- 4K RAM—Programmable memory protect.
- 16/32/65K RAM-16K paging option for virtual memory addressing.
- Intelligent Memory Mngr.—Handles up to 1 megabyte.

Self-Contained Systems:
- VDP-80—Computer/terminal/mass storage unit. Assembled & tested.
- PCS-80—Integrated component system.

Software:
- DOS—Enhanced CP/M.
- BASIC—Interactive or compiler with scientific and/or commercial features.
- FORTRAN IV—Level 2 ANSI compiler.
- Self-contained Systems:
  - SCS 1 & 2/TCOS—Assembler/line editor/debugger.
  - 4 & 8K BASIC—Optional cassette support.

Compare IMSAI. You'll realize that ours is the most complete product line available. Whatever your needs, you can get them from one source. IMSAI.

A wide selection of components is only the beginning. IMSAI offers much more. Just ask.

Answers For Businessmen:

Announcing IMSAI's VDP-80. This totally self-contained unit includes a megabyte of disk memory via floppy disk, 32K computer memory (expandable to 256K), 12" CRT and 62 pad main keyboard with 10 pad numeric keyboard. Several printer options available.

If you want speed and accuracy in high volume work such as word processing, or business data collection and analysis, the VDP-80 is your cost effective answer.

Answers For The Personal User & Educators:

Introducing IMSAI's new PCS-80 System, the fully integrated microcomputer component system, configurable to your exact needs. The basic system consists of our Intelligent Keyboard and the PCS-80 which houses an 8085 based CPU, 16K of RAM, intelligent ROM monitor, serial I/O port, 24x80 CRT, with an extra 7 slots in the chassis for expansion.

System component options include single or dual mini and standard floppy disks. The choice is yours, configure the system as you like.

IMSAI has answers for the educator, too. Take the basic PCS-80, add 8K of PROM, 4K of RAM and our self-contained 8K BASIC software, and you have a complete operating system your entire department can use to teach anything from elementary programming to advanced computer science.

Require a bit less sophistication? Use our Intelligent Breadboard system for learning, designing and building microcomputer assemblies.

Rather do it from scratch? Start with our single board MPU-B central processor, the heart of the PCS-80 System. It has a 1K ROM monitor, 256 bytes of RAM and serial and parallel I/O.

Since the MPU-B is 8085 based, you can run all programs previously developed for the 8080, 50% faster. Without requiring faster memory.

Answers For Industry:

IMSAI products provide the expandability and flexibility manufacturers demand for microcomputing applications.

We offer rack mountable components for the standard 19" RETMA racks, powerful MPU boards, I/O and memory boards for easy system expansion and configuration, and a broad line of peripherals and subsystems fully integrated and ready to go to work.

IMSAI has what you need to make tomorrow's design today's reality.

Answers For Current IMSAI Users:

There are over 10,000 of you. And, we haven't forgotten. You might say that we thought of you before you even thought of us.

That's why every new product is designed to accommodate expansion, rather than outdate equipment.

For example, our new PCS-80 retro-fit kit comes complete with MPU-B, replacement front panel photomask and additional hardware bracketing. So you can enjoy a single cabinet PCS-80 computer, with your choice of integrated component configurations.

The Answer For Everyone:

Dial (415) 483-2093, Ext. ACT. That's IMSAI's action hotline. Designed to answer the thousands of questions we didn't have a chance to answer in the space of this ad.

Call us. We'll assist you in putting together a system, direct you to your nearest IMSAI dealer, and send you our new catalog with all the details.

In short, if you have any questions at all regarding microcomputers, put us to the test.

Just ask IMSAI.

IMSAI®

Auto Parts Company's Mini Helps Boost Sales

(Continued from Page S/10)

full-time job for at least one clerk and other less qualified help."

Ewing's secretary uses a 3600 workstation to enter purchase order information into a computerized filing system. The video screen displays a menu, or an entry format for the data, which helps secure error-free data input. Should errors be made during the data input process, the unit is programmed to signal the operator and initiate reentry of the data.

Inventory Check

Finished goods inventories are checked by the mini and a stock-pull issued. If the item is not in stock, the order is entered into the NSS production schedule and a request for raw material is inserted.

NSS executives receive a daily printout of jobs in progress and their current status. Managers need a daily printout of this file so that they can determine the status of any particular job and, at the same time, get an accurate overview of company progress in sales and deliveries.

The order entry log, also prepared at periodic intervals, provides company executives with current information on orders in process. This enables them to handle production scheduling more efficiently and to maintain and replenish necessary stocks of raw materials and other parts.

Order File

The file of order entries also provides information for sales and analyses, including the movement of particular products, the performance of sales representatives and territorial and industry performance. When goods are shipped; the same file is used as the basis for preparation of the appropriate invoices.

The order entry information provides a basis for the production scheduling process, which is under the direction of Paul Ewing, Peter's brother and partner in this family-owned business. "To increase our productivity, we must accurately assess — on the basis of manpower requirements, machine availability and, especially, stocks of raw materials and other commodities — what the manufacturing situation will be two, three or four months from now," he explained.

"If you guess wrong here, other variables such as raw stock prices, which can fluctuate rapidly, will eat you right up."

NSS has completely converted its stock inventory to the Datapoint system and is currently converting its work-in-progress to the computerized approach. "The company Ewing pointed out, "will reap major benefits from having all its materials inventory maintained and updated by the system. We will be better able to adjust our production scheduling and sales forecasting to the buying process. We will then have the stock when we need it and won't be so vulnerable to price fluctuations and materials shortages. This will also help us to make sure that we do not have capital tied up in dormant inventory."

Self-Taught Programs

Peter Ewing learned the Databus language in a few hour's time through study of the manual provided by Datapoint. "I did take some computer programming in courses," he acknowledged, "but that was some time ago."

Ewing noted that while the Datashare system has helped the company in many ways, it has been especially helpful in the area of job follow-ups. "We used to keep a card file on each job we had going, and as the number of jobs we handled increased, it got to be a three-ring circus trying to keep tabs on everything," he said.

"When customers called and asked about the status of their orders or why an order hadn't been delivered on time, I used to spend half my day tracking down the jobs and finding out what the trouble was. Quite often my efforts were hampered by misfiled or lost job cards; that can't happen now. With the minicomputer, all that information is stored on a consolidated file which can be accessed immediately. It has enabled me to make much more productive use of my time," he indicated.

NOW YOU CAN
RENT
DEC DATASYSTEM
350's & 500's

We are pleased to announce a rental alternative for DEC Datasystem users! We are MLPI — Manufacturers' Lease Plans Inc. — a Phoenix-based company engaged in the ownership of computers and related equipment.

Since 1963, MLPI has purchased for investment over $50 million of equipment and has become a major supplier of rental programs for both manufacturers and direct users.

In the past, with DEC equipment, you had to choose between purchase or full-payout lease. Now you can have the total flexibility of renting!

MLPI'S RENTAL PLAN PROVIDES
- 1, 2, or 3-year rental plans.
- Accumulation of purchase option credits.
- Application software packages.

We have many application software packages specifically designed for DEC Datasystems. These, combined with MLPI rental financing, team up to provide you with an outstanding solution to your total data processing needs.

Other financing alternatives are also available.

So call us about our new DEC Rental Plan!

cros Helping OCR, Minis Perform Together

ennis Sullivan
ecial to CW

st, the high cost of
racter recognition
alienated that in-
from the world of
nputer.

with the advent of
ocessor, OCR has
v dropped in price,
minicomputer cut
ugh the use of semiconductor memory and LSI circuitry.

The end result is OCR and minis are combining their capabilities to achieve a powerhouse of performance in a small package. This provides the end user with what he is always looking for — more performance at less cost.

As the cost of hardware decreases and becomes affordable to more people, the volume of data to be processed becomes more abundant. As this data volume increases, more emphasis is being placed on distributed DP.

The large centralized computers are being replaced by the minicomputer at various DP sites. As the minicomputer begins to perform this role, OCR is waiting to demonstrate what it can do.

A minicomputer can be purchased for about $20,000, the same price range as the newer low-cost OCR systems.

The largest potential market for the minicomputer is conventional business DP. Ironically, OCR's biggest potential market is also business DP in the areas of remittance processing or turnaround documents used in utilities, municipalities, insurance companies and publishing concerns. Other applications include banking applications such as credit card applications, reject reentry, check processing, loan payment processing and proxy scanning.

Once the minicomputer has been purchased, a significant number of CRT terminals can be added depending on the number and complexity of other functions the minicomputer will be performing. But rather than add those additional data entry terminals at a cost of about $1,000 per terminal and an overhead of 20 operators per month — which costs an additional $16,000 per month (based on $5 per hour) — and achieving a 10,000 to 11,000 keystroke rate per hour, per operator, an OCR installation costing $20,000 can reduce the labor costs while increasing the data capture rate.

The user can achieve a 100,000 keystroke production level per operator and perform the work of several operators at a single workstation.

> *'Data entry costs must come down, and they can with a mini and OCR combination.'*

OCR Neglected

At most user sites the cost of data entry is still eating up the majority of DP costs. This is mainly because most DP managers have either neglected to give OCR an honest evaluation or have been given the wrong information on how OCR can fit into their present method of data entry. Data entry costs must come down, and they can with a mini and OCR combination.

Even if the entire document cannot be recognized by OCR (document with a preprinted account number and a location where someone will handprint the amount), OCR is still feasible by just entering the account number automatically and allowing an operator to manually enter the amount.

This method can be referred to as the "read and key" method, and aside from just reducing the manual key entry requirements, it provides a better method of handling documents. By eliminating the necessity of the operator physically handling each individual document, users can gain greater efficiency.

Sullivan is communications director at Key Tronic Corp., Spokane, Wash.

Count on GA for big COBOL performance in multi-terminal applications.

And count on the lowest cost per terminal. Available now, General Automation's new 440 Data Series, starting below $45,000, recognized for the best price/performance package in the computer field: "...It always works...far superior to any other full systems less than $80,000. Any comparable system will cost over $175,000."*

1. **The most powerful ANSI COBOL**— years ahead of any other tested. Compiles 3-to-10 times faster than a 370/145.
2. **Store 160 megabytes; 1 second response.** Support 16 terminals with less than 1 sec response; 128 KB main memory. Store up to 160 megabytes on disk, with the 720ns GA 440 minicomputer.
3. **Concurrent batch and on-line processing.** With shared data-base protection: maximum multi-terminal access with minimum user-contention, all operating in our field-proven File Management System.
4. **GA 440: fully field-proven and GA-serviced,** in more than 500 installations around the world to date.
5. **Exhaustive system-testing:** over 400 different combinations rigorously tested for response time.

Count on GA for all your distributed processing systems — from a basic 2-terminal system to a 10,000-terminal network; from factory and business data collection to corporate networking systems — through our advanced line of high-technology mini and microcomputers. You'll be joining the world's largest corporations who now count on GA for the most productive system solutions: in financial, industrial and telecommunications applications.

32-Bit Systems May Dominate Future Mart

(Continued from Page S/2)

with getting a job done.

In similar fashion, most users never confront the PDP-11's 16-bit word, nor that of Data General's Nova or Eclipse. These systems have built up so much software support for the 16-bit word, it is of no concern except for special applications.

On the other hand, companies such as Interdata and Systems Engineering Laboratories, which have largely made their mark with 32-bit word minicomputers, have an easier time developing the system software. The 32-bit word should ultimately lead to more elegant software. Also, the longer word length with its large address space makes it possible to run large application programs without segmenting.

Because software development is easier on a longer word length machine, and software is the limiting factor now (and in the foreseeable future) for minicompter use, it seems unlikely that a new minicomputer company would develop a mini with less than a 32-bit word. This assumes all other things being equal which they never are.

Semiconductor Look-Alikes

The semiconductor manufacturers, like the minicomputer pioneers, are hardware buffs. Safaris into the wilds of software development are scary, thus they ogle any system with piles of already developed software. They also require high volume to turn a profit. So minicomputers with a large installed base and hefty software support are prime candidates for a semiconductor manufacturer's look-alike model.

This appears to point to the conclusion that the safest course for a minicomputer manufacturer is to develop little software and to maintain a small user base. That is obviously uncapitalistic and the road to failure.

What it does indicate, however, is that viable minicomputer systems cannot be produced with cookie cutters. If they are, the semiconductor houses will build a look-alike that will outsell the original because it will be cheaper. The software and hardware must be optimized for specific applications so that high-volume, general-purpose, less expensive look-alikes can't be developed to do the job.

The 32-bit word minicomputer has the inherent capacity to be applicable for a wide range of jobs because of high precision, rich instruction set, large address space and big memory. But which jobs should its hardware and software modules be optimized for? That is the manufacturer's challenge.

It seems unlikely that the 32-bit minicomputers can offer a challenge in the older 16-bit minicomputer markets: real-time industrial control, test and measurement, small time-sharing and desk calculator applications and data communications (line handling). The 16-bit word minicomputer hardware and software have been optimized for these markets. In some cases, where a 16-bit minicomputer is overqualified for the job (has more hardware and software than the job requires), the challenge will come from the microcomputer.

It is in the expanded minicomputer markets that require new software, more powerful hardware or a reorientation of the hardware/software system where the 32-bit word minicomputers shine. These are applications for larger scientific processing systems, data communications processors (front-ends, remote concentrators) and network processors in distributed processing systems.

Of course, the big market for expansion eyed by all minicomputer manufacturers is the commercial market. It is the commercial market that requires a major hardware/software reorientation. Because of this, the commercial market is risky even though it is the most potentially lucrative market available.

The new software will be easier to program on a 32-bit mini. The systems can be expanded into very powerful configurations. The software/hardware reorientation for the commercial market, however, is probably little easier for 32-bit minicomputers than for 16-bit minicomputers.

Think Commercial

The reason is the hardware/software orientation results from the thinking of the people who plan, design, build, sell and service minicomputer systems. All these people must be reeducated to think commercial. Until that is done, precious little reorientation that is relevant to the commercial market will happen. The developer is not commercially oriented because the traditional minicomputer markets are very different from the commercial market.

Up to now, the minicomputer manufacturers have primarily responded, in interrupt mode, to the OEM market. Initially they responded to the product OEM who developed an end-user product: buying CPUs and memory from one manufacturer, peripherals from other manufacturers and tying them together with special interfaces and software. The minicomputer manufacturer was primarily concerned with making modular, high performing, low-cost CPUs and memories.

Gradually, a system OEM emerged. He wanted modular, high performing systems that included peripherals, data communications, interfaces and software. Thus, minicomputer manufacturers began to spend more and

Sophisticated Capabilities

Large Mini Realistic Alternative to Mainframe

By Neal J. Rapp
Special to CW

Nearly everyone knows that minicomputers are getting smaller and cheaper. But not too many people realize they are also getting larger and cheaper. I'm referring to the growing use of the large-scale minicomputer that is, systems that provide large-scale mainframe functions in a minicomputer package.

Large-scale minicomputers are more like mainframes than minis. They are used to solve very sophisticated problems by system designers who use techniques and functions that until recently were available only on very large systems. That means the market for large-scale minicomputer systems is not a traditional minicomputer market. And that, in turn, implies that a large-scale minicomputer is much different than a traditional minicomputer.

In fact, the only reason they are called minicomputers at all is because their central processors are derived from the 16-bit architecture that has become synonomous with minicomputers.

People who use large-scale minicomputers view them as extremely cost-effective solutions to on-line, interactive problems. Their most exciting characteristic is that they combine large system software with the interactive capabilities of the traditional minicomputer, at costs far below mainframe costs.

Therefore, to get a fair indication of what large-scale minicomputers can do, and for whom they do it, they should be compared with mainframes and the mainframe environment, rather than with traditional minicomputers.

Just how do they compare to mainframes? The simplest answer is that they compare differently in different areas.

For example, there is little difference in the area of system capability. Because it has comprehensive, sophisticated software, a large-scale minicomputer system can do most things a large mainframe can do. A good large-scale minicomputer system and a mainframe have these things in common:

- A sophisticated data base management system.
- Large virtual memory addressing capabilities.
- A large main memory capacity.
- A wide array of languages and software utilities that can be mixed without restriction.
- The ability to run very large programs.
- The ability to handle a large number of users.

When it comes to performance, the differences between large-scale minicomputers and mainframes become a matter of interpretation.

If performance is measured in interactive, on-line terms — response time, for example — the large-scale minicomputer and mainframe are very close, with the advantage usually going to the minicomputer. But when performance is measured in batch-oriented terms, the mainframe, which was designed for batch work, ordinarily comes out on top.

There is a significant physical difference between large-scale minicomputers and mainframes. Obviously, the minicomputer-based system is considerably smaller. While size alone may not be an important criterion, the mainframe's size often means a user must provide expensive environmental controls that are not always necessary with a large-scale minicomputer.

Finally, there's the difference in cost. Because their orientation has primarily been toward interactive, on-line work, large-scale minicomputers offer significantly more interactive work per dollar compared with mainframes. On a system level, it's safe to say that a large-scale minicomputer system costs about one-tenth to one-half the price of a mainframe with comparable capabilities.

Since system designers have the same tools available on mainframes and large-scale minicomputers — comprehensive software capabilities, large virtual memory address space and large amounts of storage — it follows that mainframes and large-scale minicomputers can be used for similar applications.

Specifically then, who uses large-scale minicomputers and how are they used?

One class of user is the one with a number of remote sites, each using most of the data it generates. The large-scale minicomputer's data base management capability supports local operations, and its efficient data communication capability allows data to be transmitted to a host system.

For example, a West Coast aerospace/electronics company uses a large-scale mini system in the headquarter's financial department. The system lets the vice-president of finance gather data from a division's operating groups and use the data to prepare monthly financial reports. Specific information can be transmitted to a corporate host system, an IBM 370/158, to update its files.

Another class of user is the one who

Microcomputers: Just Ask IMSAI.

If you wonder who leads the way in technology, look into IMSAI's list of industry firsts—IMSAI 8048, first complete control computer on a board; IMSAI 65K RAM Board, first to offer four times the memory capacity previously available on one board; IMSAI printers, first with high-speed direct memory access.

If you wonder why IMSAI products have gained the reputation for the standard of excellence in microcomputer systems, check with any one of the more than 10,000 IMSAI owners.

If you wonder who offers the broadest line of hardware, software, and peripherals, visit any one of the more than 275 IMSAI dealers around the world.

If you wonder how microcomputing can fit your specific needs, ask IMSAI. Because when it comes to microcomputers, we have the answers.

An IMSAI Product to Answer Every Microcomputing Need:

Let's start with our product line. In all, IMSAI offers more than 120 high quality, completely integrated systems, components, peripherals and software. Here's just a sampling:

Single Board Central Processors:
- MPU-A (8080 based)—Industry standard.
- MPU-B (8085 based)—50% faster 8080.
- 8048—Programmable control computer.

Interfaces:
- Video I/O—24x80 CRT. Edit & data entry.
- Serial I/O—2 port I/O, all std. protocols.
- Parallel I/O—4 & 6 port TTL level I/O.
- Multiple I/O—2 cassette, 2 parallel, 1 serial & 1 control I/O.
- DMA—For floppies & line printers.

Peripherals:
- Printers—44/80/132 col. 30 cps-300 lpm.
- Video displays—Large assortment.
- Tape Drive—9 track. 800 bpi. 25 ips.
- Floppy Disks—Single/double density.

Memory Expansion Boards:
- 4K RAM—Programmable memory protect.
- 16/32/65K RAM-16K paging option for virtual memory addressing.
- Intelligent Memory Mngr.—Handles up to 1 megabyte.

Self-Contained Systems:
- VDP-80—Computer/terminal/mass storage unit. Assembled & tested.
- PCS-80—Integrated component system.

Software:
- DOS—Enhanced CP/M.
- BASIC—Interactive or compiler with scientific and/or commercial features.
- FORTRAN IV—Level 2 ANSI compiler.
- Self-contained Systems:
  - SCS 1 & 2/TCOS—Assembler/line editor/debugger.
  - 4 & 8K BASIC—Optional cassette support.

Compare IMSAI. You'll realize that ours is the most complete product line available. Whatever your needs, you can get them from one source. IMSAI.

A wide selection of components is only the beginning. IMSAI offers much more. Just ask.

Answers For Businessmen:

Announcing IMSAI's VDP-80. This totally self-contained unit includes a megabyte of disk memory via floppy disk, 32K computer memory (expandable to 256K), 12" CRT and 62 pad main keyboard with 10 pad numeric keyboard. Several printer options available.

If you want speed and accuracy in high volume work such as word processing, or business data collection and analysis, the VDP-80 is your cost effective answer.

Answers For The Personal User & Educators:

Introducing IMSAI's new PCS-80 System, the fully integrated microcomputer component system, configurable to your exact needs. The basic system consists of our Intelligent Keyboard and the PCS-80 which houses an 8085 based CPU, 16K of RAM, intelligent ROM monitor, serial I/O port, 24x80 CRT, with an extra 7 slots in the chassis for expansion.

System component options include single or dual mini and standard floppy disks. The choice is yours, configure the system as you like.

IMSAI has answers for the educator, too. Take the basic PCS-80, add 8K of PROM, 4K of RAM and our self-contained 8K BASIC software, and you have a complete operating system your entire department can use to teach anything from elementary programming to advanced computer science.

Require a bit less sophistication? Use our Intelligent Breadboard system for learning, designing and building microcomputer assemblies.

Rather do it from scratch? Start with our single board MPU-B central processor, the heart of the PCS-80 System. It has a 1K ROM monitor, 256 bytes of RAM and serial and parallel I/O.

Since the MPU-B is 8085 based, you can run all programs previously developed for the 8080, 50% faster. Without requiring faster memory.

Answers For Industry:

IMSAI products provide the expandability and flexibility manufacturers demand for microcomputing applications.

We offer rack mountable components for the standard 19" RETMA racks, powerful MPU boards, I/O and memory boards for easy system expansion and configuration, and a broad line of peripherals and subsystems fully integrated and ready to go to work.

IMSAI has what you need to make tomorrow's design today's reality.

Answers For Current IMSAI Users:

There are over 10,000 of you. And, we haven't forgotten. You might say that we thought of you before you even thought of us.

That's why every new product is designed to accommodate expansion, rather than outdate equipment.

For example, our new PCS-80 retrofit kit comes complete with MPU-B, replacement front panel photomask and additional hardware bracketing. So you can enjoy a single cabinet PCS-80 computer, with your choice of integrated component configurations.

The Answer For Everyone:

Dial (415) 483-2093, Ext. ACT: That's IMSAI's action hotline: Designed to answer the thousands of questions we didn't have a chance to answer in the space of this ad.

Call us. We'll assist you in putting together a system, direct you to your nearest IMSAI dealer, and send you our new catalog with all the details.

In short, if you have any questions at all regarding microcomputers, put us to the test.

Just ask IMSAI.

IMSAI®

Auto Parts Company's Mini Helps Boost Sales

(Continued from Page S/10)

full-time job for at least one clerk and other less qualified help."

Ewing's secretary uses a 3600 workstation to enter purchase order information into a computerized filing system. The video screen displays a menu, or an entry format for the data, which helps secure error-free data input. Should errors be made during the data input process, the unit is programmed to signal the operator and initiate reentry of the data.

Inventory Check

Finished goods inventories are checked by the mini and a stock-pull issued. If the item is not in stock, the order is entered into the NSS production schedule and a request for raw material is inserted.

NSS executives receive a daily printout of jobs in progress and their current status. Managers need a daily printout of this file so that they can determine the status of any particular job and, at the same time, get an accurate overview of company progress in sales and deliveries.

The order entry log, also prepared at periodic intervals, provides company executives with current information on orders in process. This enables them to handle production scheduling more efficiently and to maintain and replenish necessary stocks of raw materials and other parts.

Order File

The file of order entries also provides information for sales and analyses, including the movement of particular products, the performance of sales representatives and territorial and industry performance. When goods are shipped; the same file is used as the basis for preparation of the appropriate invoices.

The order entry information provides a basis for the production scheduling process, which is under the direction of Paul Ewing, Peter's brother and partner in this family-owned business. "To increase our productivity, we must accurately assess — on the basis of manpower requirements, machine availability and, especially, stocks of raw materials and other commodities — what the manufacturing situation will be two, three or four months from now," he explained.

"If you guess wrong here, other variables such as raw stock prices, which can fluctuate rapidly, will eat you right up."

NSS has completely converted its stock inventory to the Datapoint system and is currently converting its work-in-progress to the computerized approach. "The company," Ewing pointed out, "will reap major benefits from having all its materials inventory maintained and updated by the system. We will be better able to adjust our production scheduling and sales forecasting to the buying process. We will then have the stock when we need it and won't be so vulnerable to price fluctuations and materials shortages. This will also help us to make sure that we do not have capital tied up in dormant inventory."

Self-Taught Programs

Peter Ewing learned the Databus language in a few hour's time through study of the manual provided by Datapoint. "I did take some computer programming in courses," he acknowledged, "but that was some time ago."

Ewing noted that while the Datashare system has helped the company in many ways, it has been especially helpful in the area of job follow-ups. "We used to keep a card file on each job we had going, and as the number of jobs we handled increased, it got to be a three-ring circus trying to keep tabs on everything," he said.

"When customers called and asked about the status of their orders or why an order hadn't been delivered on time, I used to spend half my day tracking down the jobs and finding out what the trouble was. Quite often my efforts were hampered by misfiled or lost job cards; that can't happen now. With the minicomputer, all that information is stored on a consolidated file which can be accessed immediately. It has enabled me to make much more productive use of my time," he indicated.

Tracks Order Progress

Photo Studio's Mini Puts Production In Focus

CHATTANOOGA, Tenn. — To say that Olan Mills School Portrait Division is using a minicomputer to solve a production problem doesn't really focus in on the extent of that problem.

Each year the firm photographs and processes portraits for over 1 million elementary, high school and college students from several hundred schools located in thirteen Southeastern states.

Making sure that Joan Doe's picture gets to Joan Doe can be a monumental task, according to Olan Mills II, chairman of the board.

The minicomputer is part of a larger system designed by Technical Analysis Corp. (TAC) of Atlanta. The entire system is a combination of a Data General Corp. Eclipse minicomputer and several Micronova systems. The Micronovas are replacing Monroe calculators previously used in the production process, according to Fred Friday, production control manager.

When an order is received its requirements are input to the system via one of six interactive display terminals. The system then monitors the movement of the order through the complete photographic and packaging process.

The minicomputer tracks the location of each order in process, schedules work loads and alerts staff members to potential production problems before they become serious.

Should delays occur, it informs staff personnel so that the delayed order can be located and placed in a top priority production flow, Mills said.

In addition to order tracking, production scheduling and accounting, the system is used for software development and to load compiled programs into microcomputers that control the color printing machines used for printing the photographs.

Long-term color information is stored and analyzed periodically to fine tune the total system. Technicians also monitor the photographic processes on a daily basis, making any necessary changes to insure color quality, he added.

The configuration consists of the CPU, a 92M-byte disk system, dual 9-track magnetic tape transports, six interactive CRTs, two hand-held OCR readers, two medium-speed printers and a line printer. The system runs under Business Basic software, supplied by TAC.

Ended Manual Functions

Prior to purchasing the large-scale mini, the firm used a Data General Nova 2 to develop software and load compiled programs into the microcomputers. Accounting functions at that time were performed manually and no computerized tracking system existed. The Nova 2 is now located at another facility where it is used for photographic and electronic research, Mills said.

When switching from the Nova 2 to the Eclipse the company did not consider any other manufacturer's system, Friday said, because the Nova 2 was running the TAC Basic and "it would have been a massive effort to change over." Besides, the company was satisfied with the system, he indicated.

"The main considerations for purchasing the Eclipse," Mills said "were speed, expandability and, of course, cost benefits. We needed a machine powerful enough to handle the eight ports that we required at that time and would be expandable to accommodate future growth."

He said the company included the 3330-type 92M-byte disk subsytsem to allow the high-speed system to be easily expanded with up to three additional 92M-byte disk drives. The cost benefits resulted from decreased production costs. "The improvement in service further justified our computer investments," he added.

"The Business Basic language that we have been using since we installed the Data General system offers many features that we find particularly useful. One of the most significant is the multiterminal/multiprogramming capability inherent to most Basic systems," he noted.

"To us, however, the most attractive feature of the language is the indexed sequential access method. It allows rapid inquiry from a reasonably large, randomly organized data base. Furthermore, its file positioning feature permits any byte within a file to be accessed without the need to define a specified record length. This allows variable-length records to be located within a single file, Mills stated.

According to Friday, "many of the RDOS utility features incorporated within Business Basic are also useful to us, since they allow system maintenance concurrent with operation under Basic. One of the most significant utilities is a comprehensive file maintenance system which allows inspection and/or updating of many of the RDOS-type files within our system."

VINCENT, Iowa — Trying to communicate ideas and solutions through systems people and programmers to a computer was a difficult but necessary task until my firm, New Cooperative, Inc. here, got its portable small business system.

When IBM came out with the 5100 portable system about a year and a half ago, I was convinced this was my opportunity to learn the Basic language and write programs to get the results I wanted.

New Cooperative is a farm cooperative located in a small town here. The business is larger than an average sized company and sales this year will be about $36 million.

Cooperatives face a unique accounting problem. All transactions of the member/owners have to be maintained so that dividends can be distributed based on their patronage.

After receiving the 5100 it took seven months to write and debug the necessary programs. Presently we are running 65 programs on the system, 17 of which pertain to the patronage and members' equity problem. We can write payroll checks to 50 employees in one hour and mail 1,300 monthly statements to patrons on the second work day of the month.

Customer statements are itemized in the language familiar to the customer so, for example, corn sales to the company is Corn Purchases to the customer.

The system also provides management with departmental preliminary profit and loss and balance sheets on the second work day of a month. The general ledger trial balance is also run on the first work day of each month.

Sales analysis and budget creation are two more key applications for the unit. In the budget applications the company uses the portable system in the conference room to directly input the departmental budgets and then print out results. Revisions made to the budgets during the year are easily incorporated.

Accounts receivable aging can be listed any time during the month. In addition, the system computes and writes checks to the member/owners showing a detailed history of their equity holdings in the cooperative. It also provides listings of warehouse receipts held by the customer either in alphabetical order or by number. Checks can be sorted on the system and listed in numerical order for easier bank reconciliation.

All of these applications plus the convenience of a computer that is simple enough for me and my three employees to operate has made me realize there are advantages to in-house computing. I learned how to program from the manuals that came with the computer.

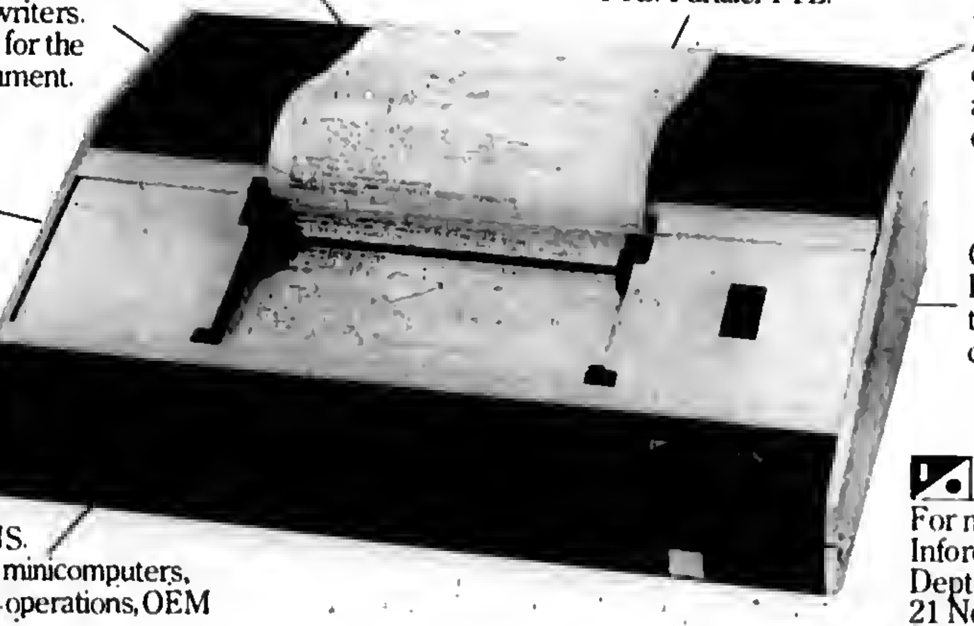
The cost of the system was also very attractive. The basic system cost about $25,000. The software was written in-house. The maintenance agreement is $110/mo. Paper cost is about $25/mo. Total monthly cost, not including investment credit, using straight line five-year depreciation is $555.

The cost of the previous system, which was a CRT connected to a service center 500 miles away, was between $1,100- and $1,300/mo.

This is a savings of $650/mo, with no increase in personnel. The best thing is now we have a "feel" for the accounting we do because we do it all in-house.

Burke is an accountant with New Cooperative.

The Inforex 180 Magnetic Line Printer.
Only the paper is ordinary.
Our patented dry-ink transfer gives you a high quality printout on an ordinary, inexpensive 8½" roll of paper. But everything else about the 180 is definitely *not* ordinary.



SMALL.
Desk top size, weighs just 33 pounds.

QUIET.
At least 10db below electric typewriters. Ideally suited for the office environment.

INTERFACE.
Serial RS-232 or TTL. Parallel TTL.

CHARACTER SET.
Full 96 characters ASCII, upper and lower case. Expanded character sets available as options.

FAST.
180 lines per minute. A 1920 character screen in 8 seconds.

GRAPHICS OPTION.
Permits intermix of text with bar charts, curves, etc.

APPLICATIONS.
CRT hard copy, minicomputers, remote printing operations, OEM or end-user.

Foreign Office Arrives at Mini, T/S Balance

(Continued from Page S/3)

Mark III services.

In our plants we installed Datapoint 2200 minicomputers with 5M-byte disk and 300 line/min printers to do order entry, invoicing, stock status and in-plant reporting. All applications were designed to be usable in all countries and screen formats can be compiled in different languages for different countries. The minis periodically transmit sales, production and other data to the Mark III service.

At our accounting/administrative offices the minis and the time-sharing service more equally share the functions as they interact to provide a total system. The minis are used by accountants to enter monthly accounting data. All editing is done interactively, contra accounts are automatically generated where possible, updates are made to exchange rates (all transaction data is entered in local currency) and maintenance to master files is performed.

When a transmission to Mark III is requested by the accountant (a logical function request, all control characters are supplied) all files are prefixed with the JCL or control data necessary to trigger the correct programs in delayed batch on Mark III. If any file maintenance was performed on the mini, this is now performed on the corresponding files at the time-sharing service.

All data or requests for processing sent from the minis in accounting offices are prefixed by Fips codes (nation identifiers) under program control. Therefore, all transactions are identified by country. This allows each accounting office to add or delete combinations of master data (account records, account/responsibility relationships, distribution algorithms without affecting other accounting offices in other countries.

Requests for reports such as a preliminary trial balance are also prefixed under program control. This allows the Cobol programs on Mark III to process only the data for that requestor, using only the proper portion of the master files and selecting those report headings corresponding to the requestor's language.

This gives all users the feeling that the system is fully under their control. Each user works under his own schedule without waiting until all users are ready to perform a given step, although they all share common time-sharing programs and files.

This combination of resources on our accounting system allows us to provide interactive processing to our accounting staff with minis, while having the resource of a large processor available when needed, particularly the first several work days of each month.

The monthly management reports are available to all users in Europe, and each user receives his selection of reports in the local language upon request. An added advantage of using the time-sharing service as the central processor is that it allows corporate headquarters in the U.S. access to data for consolidation and access to reports generated.

We also have the potential to add other overseas subsidiaries such as Mexico, South America and the Far East to our accounting systems as they all share the same chart of accounts, and the minicomputer programs can add their language screens to the library to facilitate processing in the local language.

Harper is manager, corporate planning at Johns-Manville Corp., Denver, Colo.

Minis Tackling Mainframe Jobs

(Continued from Page S/13)

adds a new interactive application to a batch-oriented mainframe system. In many cases, the cost of upgrading the system and converting the software is greater than the cost of the large-scale minicomputer system.

A federal government agency wanted to experiment with providing on-line terminal support for 50 to 75 users. To do this, it installed a supermini as a front-end processor to its existing mainframe systems. The mini system handles communications and shares the large number-crunching load with the mainframe systems.

A third type is the cost-controlled user, who has a job that calls for mainframe capability, but who does not want to commit capital to a very expensive computer.

An example is a New York City institutional investment management firm that replaced a small, outdated system with a large minicomputer. It now runs over 200 programs for securities research and analysis.

No list of large-scale minicomputer users can span the entire range of computer users. That's because large-scale mini systems are not the answer to every problem. Mainframes will, for example, probably be the best solution for the jobs they were designed for: the high-volume batch application.

But the user who must run programs that are typically 3 million bytes long, maintain data bases that run 1 billion or 2 billion bytes or support multiple simultaneous interactive users in several languages should certainly look at the large-scale

Rapp is program manager for interactive data processing at Prime Computer, Inc., Framingham, Mass.

THE WORLD'S A SOMEWHAT LESS

In the spring of 1962, Dataproducts began building printers.

And a reputation.

Today, we design and build printers (in the United States and Europe) for OEM's and their end-users the world over.

We are dedicated to producing the finest printers money can buy.

We will never copy.

We will never offer you a printer whose only virtue is low price.

We will never compromise with quality.

And neither should you.

Everything from 80 CPS to 2000 LPM

We have a printer for every purpose.

We make fast printers and slow ones; big printers and little ones.

We make printers for high-volume EDP, for small business systems, for message terminals, and machine readable applications.

We make impact and nonimpact printers;

T-80 THERMAL PRINTER—80 CPS

B-180 BAND PRINTER—180 LPM

M-200 MATRIX PRINTER—200 LPM

2290 LINE PRINTER—900 LPM

2470 LINE PRINTER—1250-2000 LPM

2550 CHARABAND PRINTER—1500-2000 LPM

Produces Accurate Forecasts

Inventory System a Lifesaver for Marine Firm

RICHMOND, Va. — Tired of "borrowing" time on an IBM 3/10 from a friend on nights and weekends, Jeremy Crews, president of Marine Development Corp. here, decided to go inhouse with a GRI-99 minicomputer.

"I got started on the IBM 3/10 about four years ago," Crews explained, "when we got into a real bind. Our annual sales were $2 million and we found ourselves with $1 million in parts inventory," he said.

"We couldn't get our billings out fast enough and we couldn't ship because we couldn't get parts," the manufacturer of boat air conditioning systems noted.

"Purchasing couldn't get parts because we hadn't paid our supplier's bills; accounting couldn't pay the bills because we had borrowed to the extent of our credit line to pay for our $1 million worth of parts on hand."

Crews began to design a manual parts forecast system. After it took three people four hours to develop a usage forecast for the first of 3,500 detail parts for the company's 600 products, he decided to seek an automated solution to the inventory trouble.

To try to bring the situation under control, Crews "borrowed" time on an IBM 3/10 from a friend and learned how to program the system himself. His friend didn't want just anybody from the company using the system, he explained, so he did all the work.

The effort was successful, he reported. For the first time the company knew the number of products each detail part was used to build, the number of parts on hand and how many parts should be purchased on what date to meet the production schedule.

The effort was successful. For the first time, the company knew the number of products each detail part was used to build, the number of parts on hand and how many parts should be purchased to meet the production schedule.

Tiring Schedule

"I got tired of nights and weekends" and decided to look for an in-house system, Crews said. The company examined several systems including the 3/10, which it dismissed as too expensive; the IBM 32, Burroughs B700, systems from NCR; Basic Four; and Logical Machines Corp.'s Adam system. He chose the GRI-99 because it came closest to having the flexibility and capability of the IBM 3/10 at "the right kind of price."

Another reason the company switched to the GRI machine is that it is cardless and "we didn't want to fool with cards anymore." Input on the GRI system is via CRT terminals, he noted.

The firm purchased the GRI-99 about a year ago from Automated Data Systems, the local GRI distributor, which also provides service for the system. Crews described the service as good.

System Configuration

The configuration includes a 24-byte CPU, disk drive, two CRT terminals and a 100 line/min printer. To expand the current system, the firm has ordered a third CRT terminal, a second printer and an additional 8K bytes of main memory.

Conversion to the system was straightforward; card files were transferred to disk storage. Because the local GRI distributor owns a duplicate model of the computer, the company was able to begin conversion even before its system 99 was delivered.

The firm's system now handles payroll, shipping orders, invoices, accounts payable, accounts receivable, vendor files, dealer files, cross-reference information, back orders and an overseas subsidiary's records, in addition to materials control.

"Our sales are twice what they were four years ago, but our inventory is down from $1 million to $400,000. Now we only stock the parts we need and we ship finished products on time," Crews said.

"I really appreciate the flexibility of this machine. We can set up files and reports just about any way we want. We can change programs and recompile right on the machine in just a few minutes. We can even set up a series of reports to run on an or/if basis so that the computer can decide which program should be run next without anyone being there to tell it. There are all kinds of things we can do," he said.

"I'm really convinced it's the best machine I could get for the money," Crews stated.

Extensive Analysis Leads Firm to Mini Choice

(Continued from Page S/3)

last year," Bevis said, and dealt with the financial aspects, business aspects and two categories of technical requirements — those dealing with remote to host communications and those dealing with local processing.

At this stage, the company wanted a system that could do data entry in the foreground mode using from two to six terminals. "For local pocessing we wanted to have a high-level language facility and be able to run multiple applications. The on-line interactive access to the host today would consist of a dial-up 2,400 bit/sec bisynchronous IBM protocol. Tomorrow, we envision a multidropped lease line network using system network architecture (SNA)/synchronous data link control with detail," he noted.

To avoid repetitive questions after the RFP was issued, the firm set up a vendors' conference about two weeks later. At that time they requested the vendors follow the format specifically, both in exact section-heading and item number, so the firm could review the answers more easily, Bevis said.

The firm looked at the vendor's maintenance capabilities, vendor's stability, installed equipment base, flexibility and future direction. For hardware it. examined the general-purpose mini capabilities, multitasking, ease of program development, CPU architecture and the screen management and file structure used. "The technical requirement was primarily a statement on SNA development, Bevis said.

All the requirements were defined by quartile and the highest score any vendor could get was 40.

"We narrowed our group of 11 respondents down to six finalists (IBM, Four-Phase, Digital Equipment Corp., Microdata Corp., Datapoint, CA). From a paper standpoint, looking at the proposals and looking at all those points and adding them up . . . probably CA was near the bottom of the six finalists at that point in time," he noted.

Because the company wanted to "separate fact from fiction in their proposals," the firm decided to go through a benchmark evaluation.

"We would ask them to come in and install a system at Fireman's Fund for two or three weeks." This gave the company an opportunity to really ascertain the hardware performance, software capabilities, throughput and vendor responsiveness, he said.

"We had some really interesting results from the benchmarks," Bevis noted. "It really promoted a high intensity of competition. We had people knocking on our doors all over the place and calling everybody wondering what was going on. Some vendors were anxious to get their systems in benchmark and others were not too happy about that at all, because the equipment they proposed was not ready for us to benchmark.

Difficulties arose in comparing identical systems because some manufacturers did not have the highest end of the disk range, he stated. Another problem was the way some of the screens were used. Some of the systems had the screen formats within the system while in others the formats stored within the screen itself.

While the systems were installed the company ran several benchmarks. One to determine data entry performance measured the number of 50-character data records entered by six terminals in one minute.

Another benchmark measured file look-up. The insurance company generated a dummy file, measuring the number of screen images read from the largest file by six terminals in one minute. The CA system excelled in this one, Bevis said.

In still another benchmark the firm ran data entry, a disk file look-up printer spooler and measured the throughput of each of them running concurrently. The CA system also performed better than the others on this one, he said.

Because the company was concerned that no sooner would the systems be installed in the branches than the remote site would develop requirements heretofore unknown, it did an analysis of the cost of going from a small configuration to a larger configuration for each vendor.

"Finally we came up with an overall grid divided into four major categories: technical, financial, business and communications," he noted.

The selection was made on equipment the vendors had now, not any under development because, Bevis noted, the firm had been promised developments several times that never came to be.

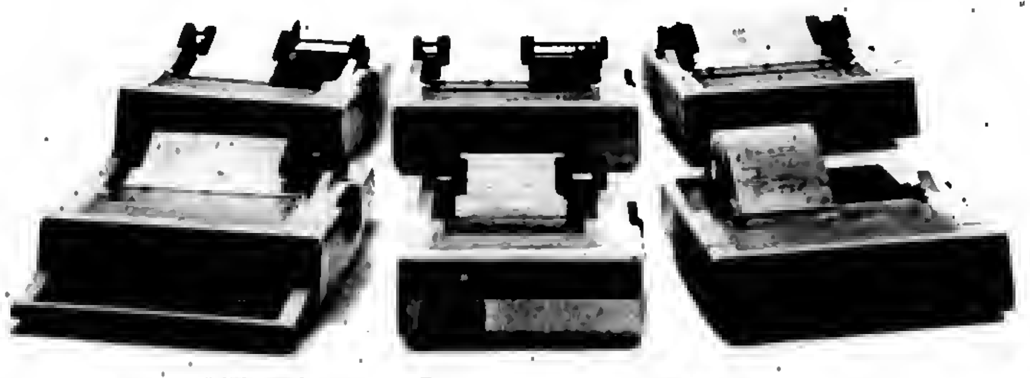
The firm finally selected CA but was very concerned about the maintenance area, which was third-party maintenence. "The company was told it would have to come up with some rather creative and innovative solutions to compensate for what we thought then was a deficiency," he said.

CA agreed to put in four regional centers to sevice the 29 branches in addition to third-party Sorbus maintenance which is used in four cities.

The vendor also agreed to put in a network control center that has a Wats line for on-line diagnostics to the various branch offices staffed by CA personnel.

Company stability was also a factor. "We spent a lot of time with their people looking at their financial position and our financial people were very impressed," Bevis noted.

You won't find a better family of printers for the price.
It's that simple.



The New Centronics 700 Series.
Now, the features that make our model 700 the best, lowest-priced serial printer are available in a *family of seven* models: uncomplicated modular construction; the reliability of fewer moving parts; high parts commonality; and low price. All of which means a lower cost of ownership.
The new 700 family covers a full range of serial printer requirements: 80- and 132-column format; 60 to 180 cps speed range; bi-directional and logic-seeking operations; and 110-300 baud KSR and RO teleprinters.
Like all Centronics printers, the 700 family is better because we back them with a wide choice of customizing options and accessories. More than 100 sales and service locations worldwide. Centronics' financial stability, and dependability proven by more than 80,000 printers installed.
Simplicity of design, full range capabilities, and better back-up make our 700 series printers simply better.

Guess who's helping OEMs and system builders get out in front of their competition?

Honeywell's Level 6 Minicomputer is helping OEMs and systems builders stay ahead of the pack.

With its fully open-ended architecture and unique Megabus that lets you mix processors, memories, communications, and peripherals to meet just about any systems requirement.

With versatility that offers tabletop, rack-mounted, and office versions.

With software that includes GCOS 6/MDT, a Multi-Dimensional Tasking disk-based operating system that provides multi-tasking for independent on-line processing concurrent with batch or program development. It features an indexed-sequential file access method and supports multiple real-time or data communications applications in multiple streams.

With program preparation aids that include a powerful Text Editor; FORTRAN, COBOL and RPG compilers; and a wide range of utilities and debugging aids.

With our attractive OEM pricing, contracts and policies.

And with a worldwide mainframe supplier on your team, when you need maintenance or support, you don't have to hunt for it.

Take advantage of the most profitable distributor plan available for the small business computer market. You'll find Randal offers the highest gross margins — from system number one on. And no quotas, billbacks or other hassles. You won't find us competing with you — we only market through distributors, so your success is ours.

Never before have your potential customers been able to buy as much reliable office computer power for such an incredibly low (Randal systems start at $12,750) price. Every system is available for 60 days — or less — delivery and priced lower than any comparable competitive models. Plus, you can stop worrying about training — ours is continuous, or service — ours is nationwide.

Randal Data Systems has the broadest family of software compatible small business computers and an extensive application software library. Just as important, our Business Basic makes it extremely easy to program.

Maybe that's why we have the fastest growing independent distributor network in the nation.

Call us today or send coupon for details.

What Basic 4, DEC, Microdata, Data General, etc. should know about distributors.

Randal wrote the book.

Firm Selects Mini System For Control, Expandability

SAN JOSE, Calif. — The "typical situation in which the user doesn't know anything about computers" and trusts his applications to an outside service has been replaced at Employee Benefits Insurance Co. here with an in-house minicomputer that is firmly under the control of the user, according to Dana Brown, the firm's administrator of information services.

The company switched from the service to in-house programming after the programmers who were working on applications for EBI left the service company, Brown explained. What resulted was an in-house system destined to give the company more control over its applications.

Choosing the correct in-house system was an extensive affair, Brown said. The company looked at the IBM System 3, Hewlett-Packard 3000 Series II Digital Equipment Corp. PDP-11/70 under RSTS, the Prime Computer, Inc. 400, Data General Corp. Eclipse and Microdata Corp. Reality.

"We looked very hard at the Digital Equipment system" because Brown came from a DEC environment, but the software couldn't be justified. The Data General Eclipse was just beginning a data base management capability and the Prime system was "too young," he said. "We needed a system to run and be supported," he added.

The HP system was chosen on its data base management capability and Query software and also because "we needed a fast-moving computer system that could grow with us. We can build a distributed system with additional processors at branch offices later on. We can easily double our processing capability with a second processor," he added.

"The small system, like EBI, is young and not steeped in tradition. Many of the older insurance companies have large mainframes and it's extremely difficult for them to change directions in data processing," Brown commented.

"The distributed processing approach means flexibilty and it's affordable to us while leaving room for growth. It will be much smoother to go from a one processor system to a multiple processor system than it would be to go from a mini to a large mainframe. In the future, we can download operating programs from a central control CPU through the network to the other processors on the system. Programming would be made at the central system," he said.

Marketing Tool

Using the on-line system, members of the staff can retrieve claim details or summary information necessary to analyze accident or injury data. According to Brown, the on-line information system is an extremely useful marketing tool and a means of retaining a personalized and responsive claim service.

A claimant's question can be answered in seconds, such as whether a claim has been paid and when, and where the check was mailed. EBI managers can review the loss data and project trends and profitability.

By using HP Image/3000 and Query software packages, data storage, retrieval and manipulation can be performed without having to develop special programs, Brown noted. Listings of information that managers may be interested in studying are presented on the computer terminals — for example, all labor class categories for which the loss ratio (loss divided by premium) is greater than a given fraction.

The HP data base management software will respond to the Query language commands that employ such words as "find," "sort," and "report," by displaying all the desired categories. The user may then explore the least or most profitable portion of the business further by sorting in various ways and asking for more details.

"Being on-line is the key to service,"

The pioneer of small business computers now makes small business computers.

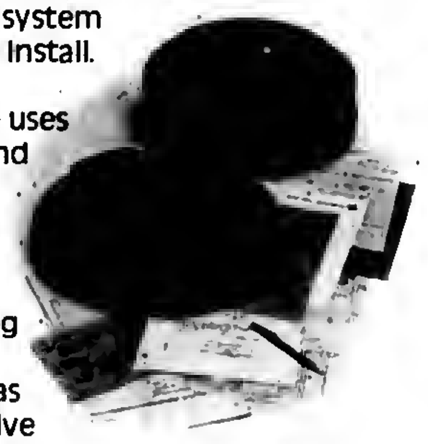
Actually, Basic/Four Corporation has been making its own central processing units since August, 1976. We now make our own terminals, too.

We wanted tighter rein on manufacturing and testing, choice of the latest components, total control of quality, production and delivery. So we could offer even more reliable, better products.

Now we do.

The Basic/Four® CPU's new semiconductor memory means 40% faster cycle time, down from 1 microsecond to 600 nanoseconds. New models make expansion even easier, accommodating one to 16 terminals. There are other improvements, too, with more to come.

And the Basic/Four systems we make have been running, bug-free. Just like before – only better. The best small business computers available.



All-around simplicity

We also made sure our system would be the easiest to install. And operate.

The software uses BUSINESS BASIC. And we have applications modules that are preplanned and packaged, including such eminently usable programs as CBS (Comprehensive Business System) and EASY, an exception analysis system. Plus a multitude of specialty packages. For hospitals, insurance, travel agencies, bond brokers, banking, the apparel industry, trucking, publishing – literally dozens, and more on the way.

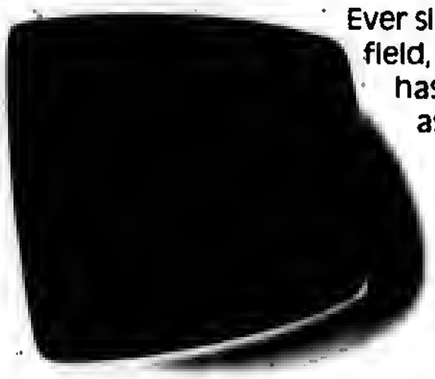
Full time commitment

Our specialty is small business computers; it engages our full attention, dedication and effort. And, of course, as the pioneer, we've been at it longer. Long enough to have established through SORBUS INC., our sister MAI company, a national network of support and service, 24-hours a day, if needed.

All this leadtime and concentration keeps us ahead.

And now we make our own. So we *know* we're offering the best.

If you'd like to know more, call or write:
Basic/Four Corporation,
18552 MacArthur Blvd.,
Irvine, CA 92714



Look to the pioneer

Ever since we pioneered the field, our operating system has been acknowledged as the best of any small business computer. It had to be – because our systems were always interactive, even when others were batch.

Nowadays, everyone in the field is talking "transaction processing" – following our lead, some six years later!

32-Bit Minis on the Rise

(Continued from Page S/12)

more development energy and dollars on peripherals, software and interfaces.

The minicomputer manufacturer was inspired to respond to the system OEM because the product OEM market represented a decreasing source of unit volume profits as the price of CPUs and memories fell each year. Thus, manufacturers had to increase unit volume sales to maintain flat net profits. Peripherals and software were good sources for additional revenue. The systems OEM continued to supply applications software, special I/O devices and the human interface.

Most minicomputer manufacturers have dealt little with the commercial end-user market. Here, the computer system need not be particularly price/-performance competitive, but it must be designed for a nontechnical end user.

The system must be reliable enough to run around the clock, seven days a week and foolproof, with a simple human interface. Backup and recovery procedures must ensure that service is uninterrupted.

Seeking to repeat past successes, all minicomputer manufacturers are looking for commercial system OEMs to lead them into new markets. But there are not enough of them to go around, so the mini manufacturers are looking for marketing gurus to develop selected, delimited commercial markets.

Continued growth demands entry into the endless market of commercial applications. This marketing challenge has little to do with 16-bit vs. 32-bit word lengths.

The CPU hardware costs are a minimal factor in the commercial development. But the cost to develop the hardware/software interface to nontechnical users for a myriad of specific applications will be high.

Minicomputer manufacturers understand hardware. The 32-bit word presents fewer limitations than the 16-bit word. One can count on the minicomputer manufacturers to make the 32-bit word minicomputer dominate the minicomputer market.

Bartik is manager of marketing support at Systems Engineering Laboratories, Fort Lauderdale, Fla.

Mini Expedites Lab Procedures

(Continued from Page S/7)

a terminal to display the completed test information and verify it with the original work sheet.

During the day, two interim ward summary reports are printed containing all completed test results as of printing time. These are used by the team leader nurses. The final document for the laboratory is a printout of each patient's test data.

Once a day these printouts are delivered to the medical floors for inclusion in the patient records. Nurses no longer have to "chart" these results as the printout is sized to fit in the patient's chart. Lab reports for all patients are "charted" by one clerical individual on the midnight shift.

Meanwhile the laboratory system moves pertinent patient charge data in blocks of 23 records to the business computer for billing purposes and laboratory financial reports.

The microbiology section also shares the Medlab system, entering its test results on mark sense cards. This information is processed into the patients' records along with the other clinical laboratory data. It also provides the section with cumulative records and reports on the occurrence of bacterial infections.

Installation of the Medlab system was part of Mercy's ongoing building-block approach to the development of a completely computerized, integrated hospital information system. The hospital has a total of 500 beds, admits more than 18,000 patients annually and has a yearly outpatient load of 33,000.

Now there's an alternative to the high cost of mainframe disc storage. DIVA's Computroller V.

If you've decided to buy your minicomputer system from DEC, DG or Interdata, you already know the facts about their disc storage systems. They're well designed. They're also expensive.

Now, you can get the same high performance, reliability and software transparency of the mainframe product at a price that makes sense. With Diva's Computroller V line of disc systems.

The Computroller V matches the mainframer's system feature-for-feature, but costs up to 50 per cent less to purchase, install and maintain. With no shortcuts in design or service support.

The reason? Unlike the mainframer, we specialize in the development of disc storage systems to help you cope with the continuous expansion in information processing. The Computroller V has an amazing capacity range of 25-300 megabytes per spindle. Plus compatibility with the mainframe system and total software transparency.

No other disc storage system can interface, adapt and self-test like the Computroller V. Make your own comparison and see how the Computroller stacks up against other mainframe products.

	DIVA Computroller V	Mainframer
Complete Software Transparency	YES	YES
ECC Error Correction	YES	YES
Complete Customer Services	YES	YES
Resident Self-Checking Diagnostics	YES	YES
Microprocessor Technology	YES	YES
Dual Processor Support	YES	YES
Interface to Most 3330 Technology Drives.	YES	NO

From now on, this may be the only system your company will need for mass storage. For more information, fill in the coupon or call Toll-Free at 800-631-2141.

System Offers Small Firm Control, Expandability

(Continued from Page S/21)

Brown said. "It ensures that our data is accurate and current. Data input to the system is validated by the computer and becomes part of the data base. The system tells us immediately if coverage has expired, even if by only a few hours, for example," Brown explained.

One particular report that has proved valuable to EBI and its insured companies is called the "Loss Analysis Report." Here, a statistical analysis of problem areas is performed, pinpointing the characteristics of accidents at a company. For example, the report covers the time of day when the accidents are occuring, the months or days that are most common, the age of the employees involved, the type of injuries and the typical claim value.

Using this data and analysis, EBI can help its customers improve safety and reduce accidents thereby reducing the costs of workers compensation insurance and the amount of claimant litigation.

Staff More Efficient

While the workload at EBI has doubled in the past six months since the installation of the HP3000, not a single data entry person has been added. According to Brown, the main reason for the improved efficiency of the present staff is the on-line nature of the computer system.

One key application of the system is the printing of claimant checks. To do this, the HP 2645 display station presents a form called a "Claim Payment Entry Form" and the user then enters certain data onto the appropriate fields. The system does the rest.

By entering the claim number; for example, the system produces other data, such as name and address of the claimant, next check number, the company code number, etc. When the amount and payment period are entered, the check is ready to be written on the company check stock, which is placed in the printer. Some five forms are generated on the CRTs, including claim data entry forms for medical and indemnity claims.

The HP 3000 costs about $300,000 or about $8,000/mo. with maintenance. That's a small fraction of the cost of a large system besides the fact that it would not have been possible to have a large system installed, the software developed and functioning in two months. This could not have been done without the Image/Query pair," Brown noted.

The initial programming was accomplished by EBI programmer Barry Gleaton and two part-time programmers working with Cobol and Fortran.

Display stations are located in EBI offices in San Jose, Portland and Santa Monica, as well as in the homes of five of the staff members of the DP department. "Using dial-up lines, any of us can work on the system over the weekend or at night at our convenience. It permits us to deal with an emergency that might arise with a customer at the last minute," he explained.

"We selected the 2645 models [display stations] primarily because we expect to go into synchronous polled communications eventually and these terminals are capable of that using HP-DS/3000 software. The tape cartridge facility on the 2645s (also CRTs) is used for off-line data collection and entry later," Brown said.

EBI now has three offices equipped with data entry terminals and expects to have 12 offices on-line by the end of the year.

The hardware for the system includes the CPU with 512K bytes of memory, a 600 line/min printer, four moving-head disk subsystems with capacity for 50M bytes each, 25 CRT terminals, three 180 char./sec printers; a hard-copy facsimile machine that can copy a CRT screen and a Codex concentrator used for multiplex communications to Portland at 9,600 bit/sec.

We've
come of age.

A small business computer can be your passport to the productive world of Tymshare computer services

With the advance of technology, the computer revolution has finally reached the smaller independent business and the field offices of larger corporations. In these locations small business systems and intelligent terminals are being installed in great numbers at present, but many users are not yet fully aware of the total potential for productivity they represent.

One important aspect of that potential relates to the integration of the local processing and communications capabilities of these systems with Tymshare's extensive computer service network. Backed up by Tymshare support, these small systems, highly efficient for certain tasks and relatively low cost, can free many companies from the traditional shackles of the standard mainframe. In fact, in many cases the combination can do away with the need altogether for the expensive and increasingly hard to justify in-house mainframe unit.

A new approach to networking

The on site small business system can handle a portion of your overall processing needs. But for those chores which exceed the capacity of a small computer, Tymshare service is utilized, with the small computer doubling in service as a local 'work station' terminal. Where there are multi-offices with small computers, the Tymshare service maintains and keeps current the master files to which the small systems may make access at any time. Since Tymshare communications capability is multi-disciplinary, virtually any small computer system can be integrated painlessly into the system. There are virtually no restrictions on communication codes, formats, etc.

To the user, advantages include:

- the ability for the first time for the small to medium sized independent user to employ a major computer resource effectively in his business but without incurring a substantial capital cost in hardware and software.
- access to the extremely powerful complex of Tymshare computers at a fraction of the cost represented by the large stand-alone mainframe, offering practical new and unlimited ways of utilizing computers in on-going operations and in performing necessary management analysis.
- the flexibility and versatility of accessing a powerful outside computer/communications capability that extends internationally as well as nationally.

It's your opportunity

Think about it. Your small computer system can be an opening to a big, big world of computing indeed. Tymshare is a leading international supplier of advanced computer services with offices in major cities in the U.S. and abroad, and with a proven record in assisting thousands of companies become more profitable and efficient through advanced computer techniques. Let us explain more to you about how it all works. Simply write to Tymshare, Inc., attention: Corporate Information, 20705 Valley Green Drive, Cupertino, California 95014, and we'll make sure you get the appropriate information.

Designer's Challenge

Low-Cost Peripherals Needed to Fill Micro Gap

By Joel A. Kramer
Special to CW

The much heralded microprocessor revolution, which is supposed to bring digital intelligence to the very fingertips of commerce and industry, has produced "smart" games, washing machines, electric ovens, sewing machines, etc., but has done precious little to bring clerical automation to your friendly neighborhood drug store. In fact, very few ma-and-pa type businesses could justify today's cost of DP systems. This fact seems strange with microprocessors going for around $30 a clip.

Peripherals Bottleneck

The problem lies in the cost of peripherals, rather than the computing hardware itself. By and large, "smart" appliances don't require input terminals, output printers or data storage devices, whereas small business systems do.

The semiconductor industry's phenomenal ability to squeeze more and more circuits onto a tiny sliver of chemically processed silicon has produced a 1,000-fold decrease in the price of computing circuitry over the past decade.

Unfortunately, production costs for keyboards, CRTs, servomotors, print mechanisms and other peripheral "ingredients" are far less amenable to comparable price reductions.

The remarkable fact is that peripheral equipment manufacturers have been able to turn from equipment for multimillion dollar centralized DP systems to peripherals for the past decade's minicomputer explosion. Prior to the minicomputer's development, peripherals alone were priced at several times the cost of a typical mini: a $2 million computer could easily support a $35,000 line printer.

Consequently, until Centronics Data Corp. brought out its high-speed serial printer, minicomputer users requiring appreciable hard copy were obliged to purchase a $10,000-upwards line printer. That, along with other large-computer peripherals, left minicomputer users in the position of using a steam hammer to crack a nut.

Gradually, peripherals manufacturers rose to the minicomputer challenge, creating an entirely new generation of input/output/storage, devices whose price and performance were geared to the mini's orders-of-magnitude lower cost and throughput levels.

In some instances, the mini's reduced DP horsepower permitted fresh peripherals approaches; in others, the growing pattern of distributed DP paved the way for new peripherals concepts.

Now the microprocessor brings a fresh round of challenges to the peripherals industry. Doubtless, it will spawn a new wave of entrepreneurial firms which, along with present-day contenders, will develop low-cost peripherals for microprocessor-based systems.

It's like a rerun of the earlier minicomputer revolution . . . except that today's minicomputer peripherals are the "biggies" that have proven uneconomical for ma-and-pa business automation.

Uniqueness of Market

The market size for computer systems is a direction function of hardware cost and can be portrayed as a pyramid as shown in Figure 1. The number of applications for computer systems increases as the number of users increase. At the apex of the pyramid we find the monstrous computer systems manufactured by IBM, Amdahl and the like that sell for millions of dollars and for which a limited user market exists.

Next we have the medium-scale computer systems, the requirements for which the IBM 360 series did such a remarkable job of fulfilling.

The third slice of the pyramid represents the minicomputer systems characterized by the Digital Equipment Corp. PDP-8 in the 1960s and the PDP-11 in the 1970s. To date, the installed mainframe base is in excess of 50,000 minicomputers of these types.

Widespread utilization of these machines was made possible by cost reductions in mainframes and the associated peripehrals. In many instances, these systems were utilized in an environment containing sophisticated technical personnel who could understand the complexities of the hardware and rationalize "downtime." A telephone call would dispatch a serviceman, usually within hours, to restore the system to normal operation.

Now, an entirely new breed of systems depicted by the base of the pyramid will be dispersed to the general public, which lacks the sophistication of the minicomputer user. As a

Comparison of Various Magnetic Recording Subsystems

The need for data storage on microcomputers has typically been filled by devices that employ magnetic media. A quick review of these methods is given below.

IBM-Compatible Reel-to-Reel Tape Drives: This method of data storage was the first implementation of removable magnetic media data storage. It ultimately became the backbone of the large centralized DP installations.

For tape velocities exceeding about 45 in./sec, designers developed vacuum column buffering methods. Recently, our firm developed the Model TDX 75 in./sec tape drive that uses a new mechanical rather than vacuum column buffering technique, called the Floating Shuttle, which we think overcomes the problems of operation at high altitude and restart after power blackout.

Philips Cassettes

Philips cassettes were the only game in town when minicomputer users first sought an economical alternative to the large and costly reel-to-reel tape storage systems. Consequently, despite the cassette's slow data transfer rate, poor data integrity and lack of mechanical reliability, it has gained fairly widespread usage among the less demanding applications.

Even with the low cost, however, the Philips cassette, in its modified digital incarnation, will probably prove to be a transitional device. It has provided a storage medium reserved for remote data logging, memory for automated typewriters, low-cost replacement for punched paper tape and so forth.

Floppy Disks: Approximately five years ago, the peripherals industry took a device developed by IBM as part of a programmable controller, known as a floppy disk, and converted it to a minicomputer peripheral. Needless to say, it was an instant success. For less than $3,000 one could implement a dual floppy disk system on a minicomputer. The floppy disk provides a capacity of 250,000 bytes of data with an average access time of 200 msec.

3M Standard Data Cartridge: About the same time that peripheral manufacturers were beginning to design their floppy disk units, the 3M Co. introduced its DC300A data cartridge. Unfortunately, when the media was first introduced there were no drives available.

It was approximately one year before the first drives were shipped, and surprisingly enough, Mohawk Data Sciences delivered before 3M. These units were followed by drives from other vendors.

Since that time, there has been a substantial movement toward industry utilization of the cartridge. Most notable of these is IBM with its Model 5100 desk-top computer, Tektronix with its graphic display terminals and Qantex with its U.S. Navy standard cartridge peripheral.

Microperipheral Storage Devices: There are basically two specific media types that are expected to capture the microsystems market, namely, the new miniature 3M DC100A data cartridge and the miniature floppy disk.

The miniature data cartridge was developed jointly by 3M, under its patents, and Hewlett Packard.

The first mini floppy was introduced by Shugart. Other drive manufacturers have also introduced miniature floppies.

A comparison of various storage media is shown in the figure. This comparison assumes a subsystem with the necessary formatter controller and power supply.

For the microsystem, power requirements will be handled by a total system power supply while the formatter/controller functions will be accomplished by use of LSI circuits.

Tape vs. Disk: The decision between media types requires the designer to perform a detailed analysis of the system requirements.

If rapid random access or fast data transfer is paramount, then the disk is the obvious choice. If data capacity, media durability and convenience, ease of long-term data storage and lower system cost are key requirements, then tape is the best choice.

Other crucial operating parameters might be the length of time it takes to validate a data block just recorded (read-after-write).

The minidrive with a dual-gap head can provide verification 5 msec after the last bit of data has been recorded. For many applications where throughput is important, such as data transmission over phone lines and real-time data logging, this is a critical parameter.

Beware of Analyses

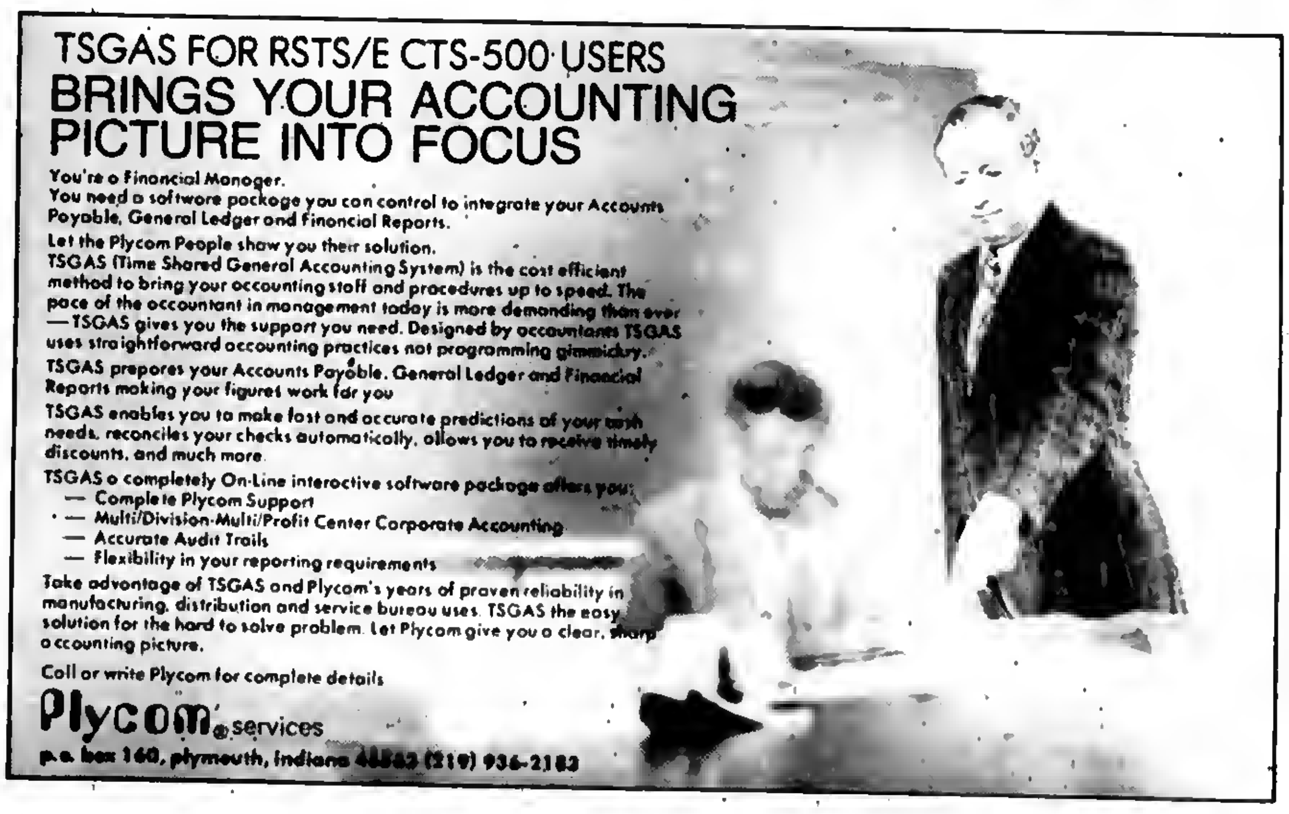
(Continued from Page S/4)

and systems courses available have encouraged businessmen to familiarize themselves with computer system considerations. They develop a vocabulary and confuse that with knowledge.

Proverbially, a little knowledge is a dangerous thing. It would be foolish to tell a businessman to endeavor to keep himself totally ignorant of minicomputer considerations. On the other hand, unless he is willing to devote several years of fulltime effort to becoming an expert, he should endeavor to seek such an expert in making technical evaluations.

The difference between meaning and data is more than one of semantics. Frequently, it is one of dollars and cents and of success or failure.

David is president of Minicomputer Industry National Interchange, an association for minicomputer users and others interested in minicomputer technologies. He is also an independent consultant based in Englewood, N.J.



TSGAS FOR RSTS/E CTS-500 USERS
BRINGS YOUR ACCOUNTING
PICTURE INTO FOCUS

You're a Financial Manager.
You need a software package you can control to integrate your Accounts Payable, General Ledger and Financial Reports.
Let the Plycom People show you their solution.
TSGAS (Time Shared General Accounting System) is the cost efficient method to bring your accounting staff and procedures up to speed. The pace of the accountant in management today is more demanding than ever — TSGAS gives you the support you need. Designed by accountants TSGAS uses straightforward accounting practices not programming gimmickry.
TSGAS prepares your Accounts Payable, General Ledger and Financial Reports making your figures work for you
TSGAS enables you to make fast and accurate predictions of your cash needs, reconciles your checks automatically, allows you to receive timely discounts, and much more.
TSGAS a completely On-Line interactive software package offers you:
— Complete Plycom Support
— Multi/Division-Multi/Profit Center Corporate Accounting
— Accurate Audit Trails
— Flexibility in your reporting requirements
Take advantage of TSGAS and Plycom's years of proven reliability in manufacturing, distribution and service bureau uses. TSGAS the easy solution for the hard to solve problem. Let Plycom give you a clear, sharp accounting picture.

Small System Unbundling Eroding User Rights

By Lawrence Feidelman
Special to CW

Small computer system architecture is evolving toward implementing more processor functions in software while reducing the proportion of hardware.

In particular, the system software associated with the newer small business computers includes multiterminal, multiprogramming operating systems, microprogrammed logic, utilities, assemblers, compilers for basic programming languages such as RPG-II, Cobol, Basic, as well as businessman English language. In addition, most manufacturers are supplying application software with turnkey systems.

While this situation is definitely beneficial to the small businessman from a technical viewpoint, there is one hitch in this otherwise rosy picture.

The trend is toward unbundling or separately pricing system software. The term unbundling came into being in the early seventies when various outside pressures (if you can believe it) caused IBM to separately price its equipment and software components.

However, the separate software pricing affected only the compiler, utilities and application software. The unbundling of the application software was the most logical step for vendors to take since application packages must be modified on a customer basis.

As the demands of application program packages for the small business system user began to increase, licensing of software became important.

While no standard software license exists, all of the licensing agreements are designed to restrict the use of the application software package to a particular user on a particular system and to prevent that user from copying the package or reselling it to another user. The basic purpose is to prevent the user from distributing easily made program copies and thereby severely damaging the software developer financially. The DP industry needed to develop licensing due to the inability of the legal system to effectively deal with this software copyright problem.

While licensing has provided an answer to a definite need to protect illegal copying of software, it also has placed some heavy restrictions on the unknowledgeable user.

While the user is paying a sizable amount of money for application programs (which eventually may cost more than the computer system), these programs, unlike the computer, never belong to the user.

The reasoning behind this practice became more a matter of marketing concern than concern over copyright protection. Thus while the user can resell his CPU, magnetic tape drive or printer, reselling even the restrictive single program is not permitted. Most users take this situation in stride and go along with the software licensing agreement.

Recently this separate pricing and licensing of software went one step further — to the operating system itself. The announcements of the Burroughs Corp. B80; IBM System 34 and NCR I-8250 all stated that the operating system is separately priced and licensed. By licensing the operating system, the manufacturer can affect the resalability of the purchased system.

While passing on the operating software to a new user may be just a formality, it appears that the manufacturer still has the final word. While manufacturers claim that software companies can develop operating systems for their computers, it is certainly more difficult and expensive. Therefore, the purchasing user has only rights to the computer hardware that cannot operate without the software.

Following this trend in computer-development to its conclusion, users will discover that most of their systems will be operating under licensed system software and the user will have rights to very little, while paying for everything.

This trend demonstrates an evolving erosion into the computer buyer's rights with nary a wimper from anyone. The small business computer user may be too unknowledgeable or inexperienced to understand this situation. User groups also appear to be very apathetic. As with the previous form of licensing, user inaction will be taken as concurrence by the manufacturers and new forms of computer licensing may be introduced.

It is about time the small business computer users stood up for their rights and got some protection.

Feidelman is president of Management Information Corp., Cherry Hill, N.J.

Peripheral Cost Causes Problem

(Continued from Page S/24)

result, the demands for system reliability are significantly increased.

This end user will not tolerate hardware that requires excessive maintenance or frequent, expensive service calls. The user demands the reliability that his typewriter or calculator achieves. Such a combination of low cost and extremely high reliabiltiy at first seems mutually incompatible.

Therein lies the peripheral builders' major design challenge. Not only must the hardware be offered at low cost, but the system or peripheral must be designed for high "user operational" reliability.

Kramer is president of Qantex, North Atlantic Industries, Inc., Plainview, N.Y.

Invoicing Punctual Now

Turnkey System Turns Around Account Woes

Special to CW

GARDEN CITY, N.Y. — A turnkey small business system at ABC Hanger and Supply, Inc. here has helped this firm gain control over its accounts receivable and inventory, according to Howard Schulman, vice-president.

The firm, which furnishes ready-to-wear retailers with supplies ranging from hangers to wrapping aids, ships and receives its orders through the mail.

Until April 1976, the $2.5 million company struggled through invoicing with one Friden and one Hermes billing machine. At that time the firm was invoicing customers two and a half weeks after the merchandise was shipped. The merchandise went out on time, but not the invoice, Schulman noted.

Seeking a better alternative, Schulman opted for an IBM System 32, expecting that order entry, accounts receivable and invoicing could be speeded and customer service improved. He hoped to automate inventory as well.

Schulman accepted the System 32 with a 3741 data input station and the accompanying MNAS program. The company was never able to get past order entry and invoicing in nine months with the customized package purchased from IBM.

Schulman hired two extra people who spent every morning assigning account numbers. They punched numbers in, but if nonvalid numbers were entered, they did not find out and merchandise was shipped to the wrong customer. As a result, extra people had to be hired to edit the already entered orders, he added.

Enough Is Enough

By September 1976, Schulman had had enough and looked for a better way. He saw just about every minicomputer manufacturer's system including Basic Four Corp., Nixdorf, Digital Equipment Corp. and Burroughs total responsibility "turnkey" system was the objective, Schulman said.

In November 1976, ABC was contacted by Turnkey Sales & Leasing, Inc., a New York City-based distributor of minicomputer systems. Schulman visited two user installations, saw a demonstration and made the decision to switch. The turnkey house evaluated the company's needs and recommended the Microdata Corp. Reality system.

"Even though their price was $10,000 higher than the other systems we felt it was worth it," Schulman reported.

"Interactivity, immediate real-time response, ability to do whatever we wanted, whenever we wanted it done, was important in the selection," he noted. "Turnkey's approach of providing a system on a customer requirement basis, the use of English and the versatility in extracting information from the system were the things that impressed me," Schulman stated. "Turnkey didn't try to put me into the computer business," he added.

Schulman ordered the Microdata Reality system from Turnkey on Nov. 15, 1976. The system was delivered on schedule, Feb. 9, 1977. In six days, the entire system was operational. After one week, the system processed 1,400 orders and billed 1,000 customers in 10 days.

Sales analysis enables ABC to prepare its catalogs based on which items are selling. Invoices are in the mail the day after shipment so the customer can verify the items and quantities, he ordered and know when and how his order was shipped. Cash flow has improved and credit checks are accurate, Schulman said.

The system also segregates custom items from drop-ship items and warehoused items and will create purchase orders to suppliers of the "specials." Stock items are put on a picking list.

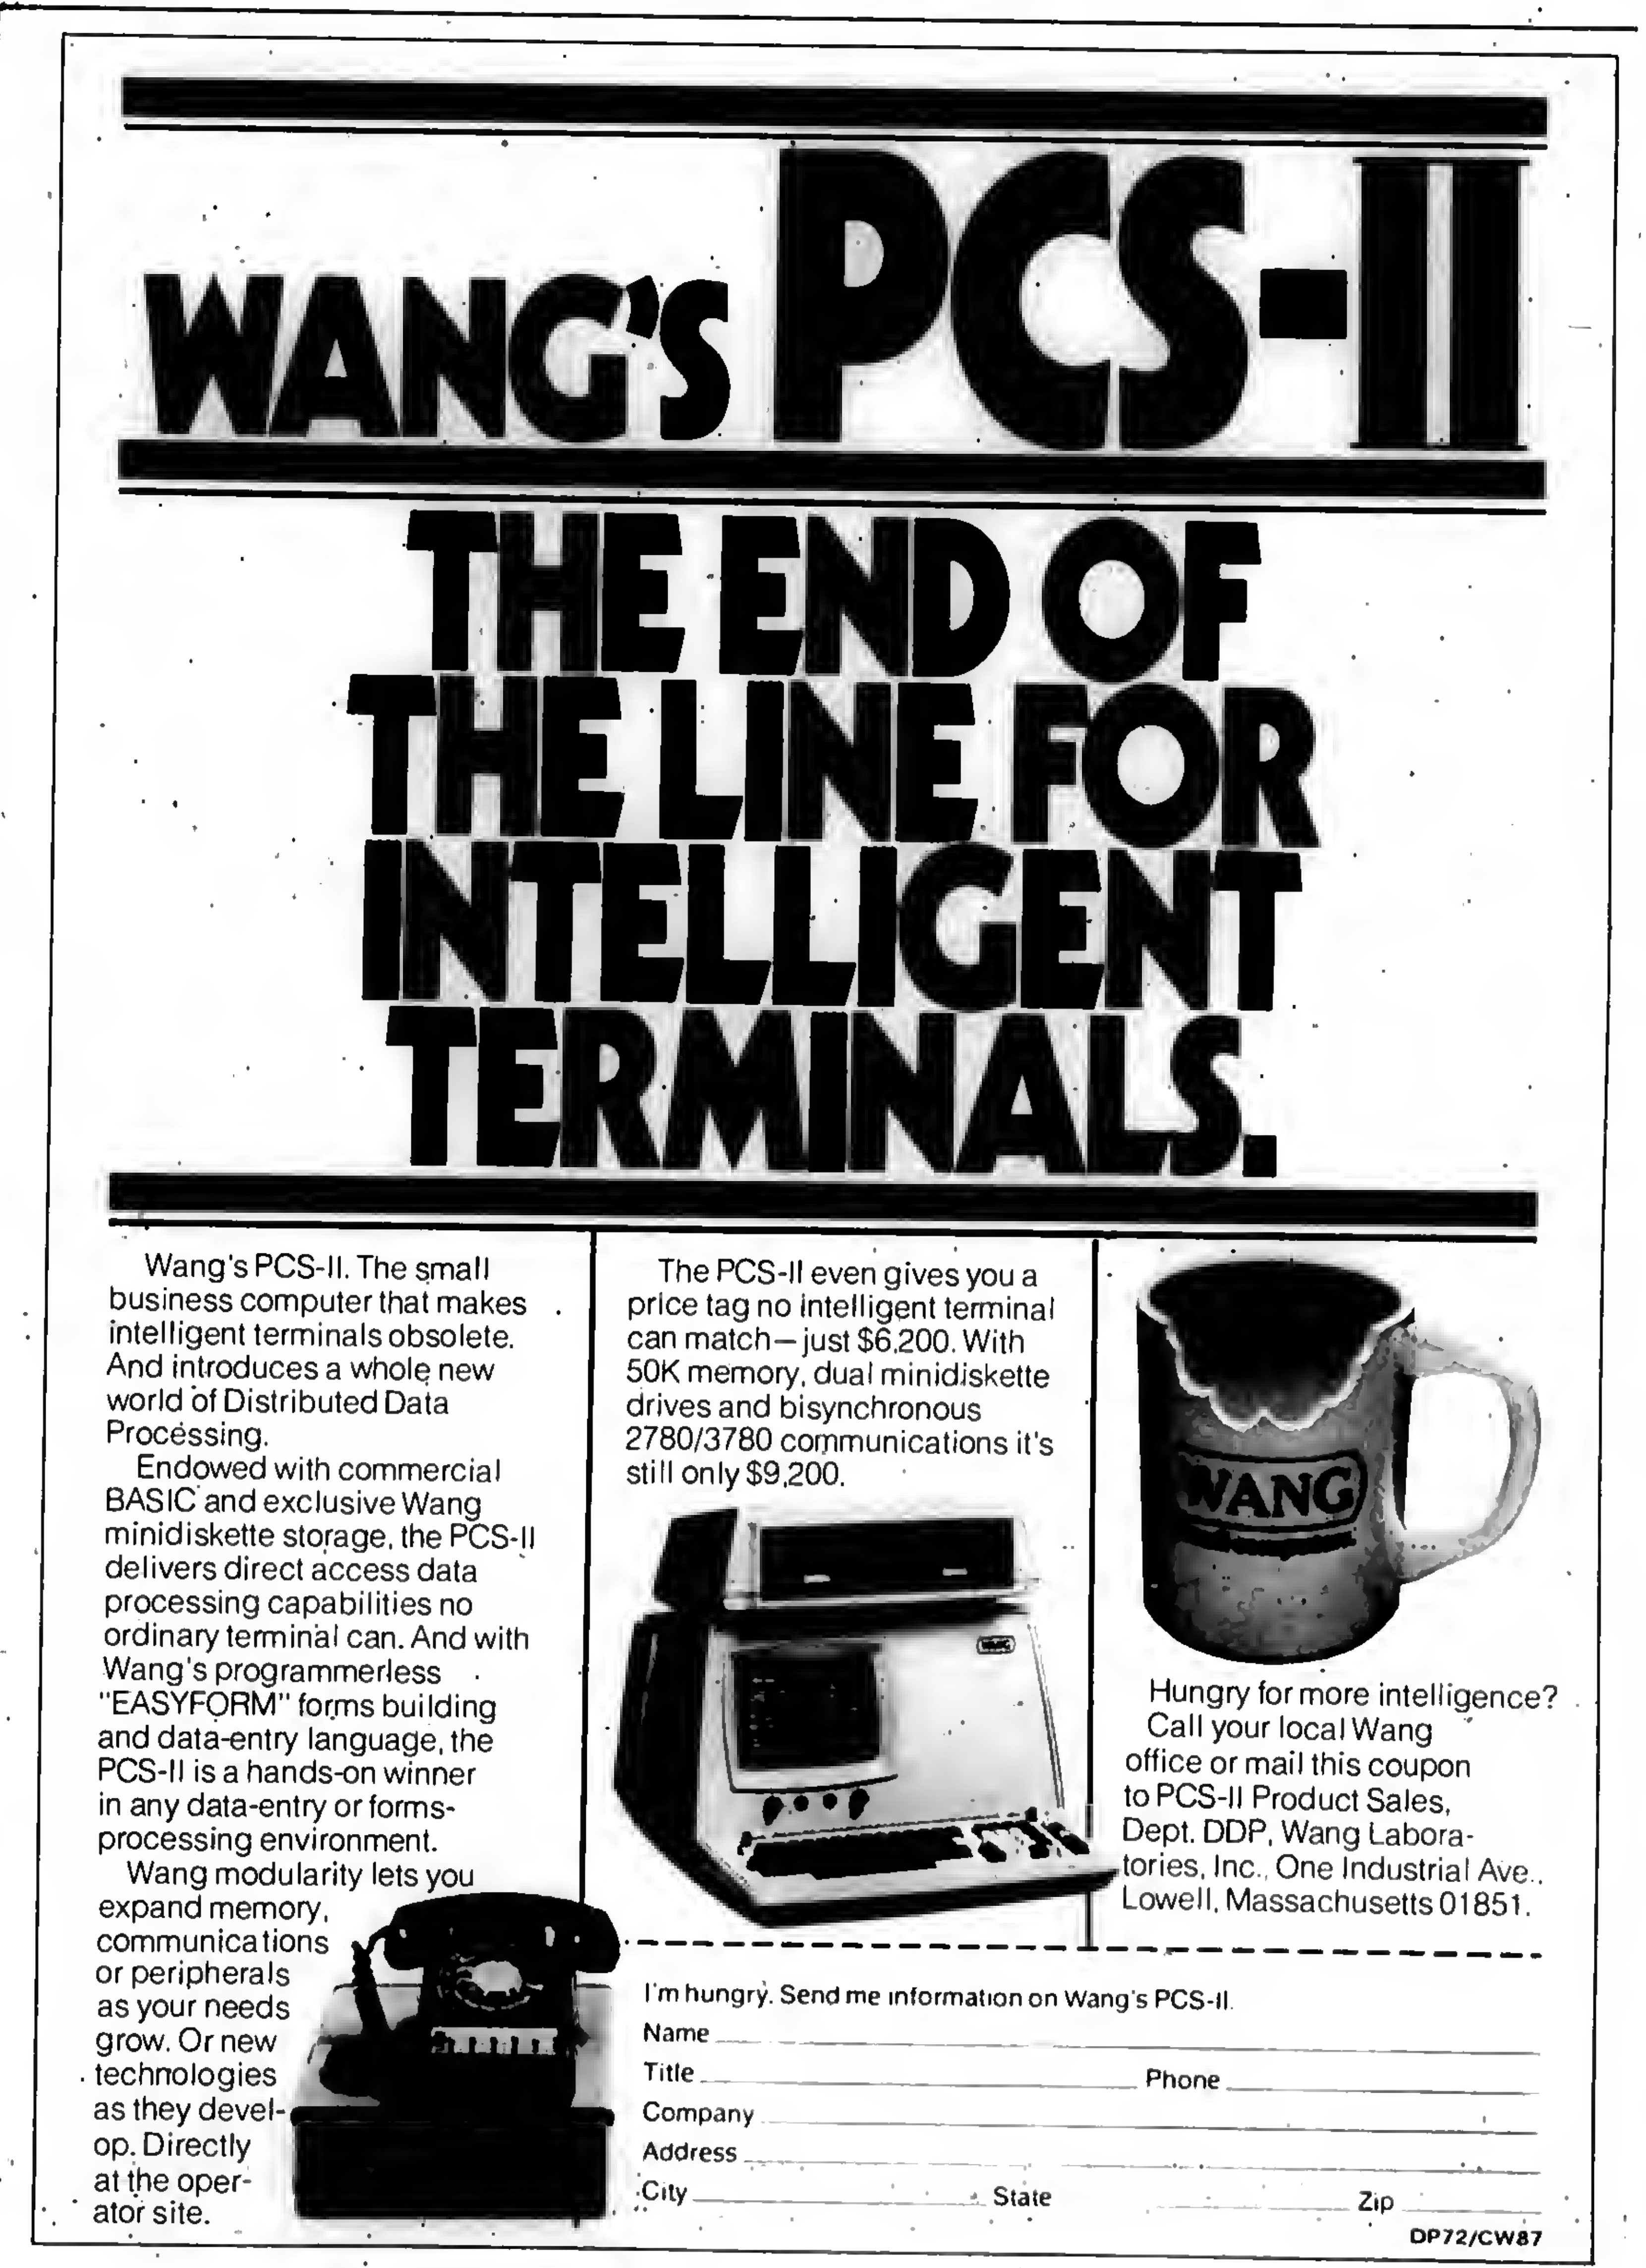
Also, with certain items which are not warehoused on a regular basis, but brought in for shipment, the system recognizes these items, prints them on a picking order and creates a purchase order for vendors with instructions to ship them into ABC's warehouse.

The system also accommodates quantity price differentials and is able to price out any item. The system maintains price breaks as they relate to quantity and posts the right price.

Prepaid Accounting

Another important facet is the handling of multi-item, prepaid orders. The amount of the payment is carried in an order file. Cash is applied to the first shipment.

For example, if a prepaid order for $100 is received and the first shipment is invoiced for $50, the system issues an itemized paid invoice which totals $50 and details $50 credit remaining on the account. If the second shipment is for another $50, the system again issues an itemized paid invoice and states "zero balance." If the second shipment exceeds the outstanding balance (e.g., a $70 shipment), the system issues a paid invoice of $50 with a "balance due" of $20. Account statements are issued at the end of each month.



WANG'S PCS-II

THE END OF THE LINE FOR INTELLIGENT TERMINALS.

Wang's PCS-II. The small business computer that makes intelligent terminals obsolete. And introduces a whole new world of Distributed Data Processing.

Endowed with commercial BASIC and exclusive Wang minidiskette storage, the PCS-II delivers direct access data processing capabilities no ordinary terminal can. And with Wang's programmerless "EASYFORM" forms building and data-entry language, the PCS-II is a hands-on winner in any data-entry or forms-processing environment.

Wang modularity lets you expand memory, communications or peripherals as your needs grow. Or new technologies as they develop. Directly at the operator site.

The PCS-II even gives you a price tag no intelligent terminal can match—just $6,200. With 50K memory, dual minidiskette drives and bisynchronous 2780/3780 communications it's still only $9,200.

Hungry for more intelligence? Call your local Wang office or mail this coupon to PCS-II Product Sales, Dept. DDP, Wang Laboratories, Inc., One Industrial Ave., Lowell, Massachusetts 01851.

I'm hungry. Send me information on Wang's PCS-II.

current users of PAN*DA

WHO'S MINDING THE STORAGE?

Chances are nobody is, full time.

Pansophic knows that DASD space is too expensive to not manage. That's why we developed PAN*DA, the software system designed to do automatic DASD management for IBM 360/370 OS installations. Day or night, without sick days and regardless of shift, PAN*DA monitors your DASD population. Reports by user, by track, by volume or multiple volumes give accurate, easy-to-read status reports of stored data. Each report pinpoints potential problem areas, obsolete data sets or wasted space in nine different ways. Automatic data set scratch, PDS compression, and Format 5 label error repair insure high disk usage without waste.

PAN*DA is the only disk management utility with so many automatic functions. And the only one that identifies VSAM data areas.

Who's minding the storage? Let PAN*DA do it for you.

Pansophic is the leading system software company dedicated to solving your software problems. Call or write today for further information on our complete line of proven software products.

8080 Code Handbook Catalogues Functions

VAN NUYS, Calif. — The *Programmer's 8080 Reference Data Handbook* by West Pulse Engineering here features cross listings for rapid assembly and debug of machine code mnemonics, according to a spokesman.

The handbook has listed the 8080 instructions by functional groups: data movement, arithmetic, logical, control and branching. A complete listing of the 8080 instructions by hexadecimal and octal order as well as an alphabetical listing are provided. The instructions are also classified according to format.

The book provides notes about the unassigned Op-code, full 128-character Ansi Ascii code table with hexadecimal and octal cross conversion, octal and decimal conversion, hexadecimal and decimal conversion and powers of 2, 8 and 16.

The handbook costs $7.95 with quantity discounts available, the spokesman said from 14632 Erwin, Van Nuys, Calif. 91411.

Micro 'Recipe' Book Bows

SAN FRANCISCO — The *Microcomputer Recipe Book* from the Computer Center, Inc. contains information from soup-to-nuts on putting together a microcomputer operating system for personal, business or scientific use.

Under "Ingredients" there are a variety of system components such as microcomputers, semiconductor and floppy-disk memories, CRT displays and hard-copy printers. Suggested "Menus" for complete systems range from the "Big Mac," a simple 8080-based computer hooked into the family TV set, to the "Beef Wellington," which includes microcomputer, dual floppy-disk memory, printer and video monitor.

In addition to the menu of computer systems, the recipe book includes a listing of technical books related to hardware design, software development and "How to Do It" books.

The book is free from the Computer Center, Inc., 321 Pacific Ave., San Francisco, Calif. 94111.

Design Manual Covers MCS-48

SANTA CLARA, Calif. — Intel Corp. has announced the *MCS-48 Microcomputer User's Manual*, a 304-page design handbook.

The manual covers design of systems based on the MCS-48 family of single-chip microcomputers, which includes the 8048 microcomputer with read-only memory (ROM) program storage, the 8748 with erasable programmable read-only memory (Eprom) program storage, the 8035 microcomputer and the 8243 I/O expander.

Sections cover microcomputer operation, the use of compatible 8080 and 8085 system peripherals, standard memory components for expansion and both hardware and software applications examples. Data sheets and instruction set are also included.

Copies may be obtained for $5 from the Literature Department, Intel Corp., 3065 Bowers Ave., Santa Clara, Calif. 95051.

Mits/Altair to Sell Icom Line

WOODLAND HILLS, Calif. — The Icom brand of microcomputer peripheral products will be sold in all Mits/Altair retail computer stores, according to a spokesman for Pertec Computer Corp. Pertec manufactures Icom products.

Wintek Hands-On Course To Use Take-Home Micro

LAFAYETTE, Ind. — Wintek Corp. is offering a microprocessor workshop course in which each attendee receives a microcomputer to use at the course and then take home.

The three-day course has both lectures and lab experiments. Topics include computer basics, microprocessor units, memory, I/O, microcomputers, addressing modes, programming, programming aids, processor evaluations and selection, economics, applications and interfacing techniques.

Lab experiments include Fantom-II familiarization, stack pushing and pulling, delay loops, interrupt handler, editor, sort, random number generator and Morse code decoder.

11 Cities

The course will be offered in 11 cities through the end of the year. In six cities, the course will be expanded to include a two-day hands-on interfacing workshop. It consists of analog-to-digital and digital-to-analog conversion, signal conditioning, keyboard scanning/decoding, LED display driving, motor position and velocity control.

The three-day course schedule is:

Sept. 14-16	Dallas, Texas
Oct. 11-13	Melbourne, Fla.
Oct. 18-20	Denver, Colo.
Oct. 26-28	Palo Alto, Calif.
Dec. 6-9	Detroit, Mich.

The five-day course schedule is:

Sept. 19-23	Houston, Texas
Sept. 26-30	Washington, D.C.
Oct. 31-Nov. 4	San Diego, Calif.
Nov. 14-18	Indianapolis, Ind.
Nov. 28-Dec. 2	Boston, Mass.
Dec. 12-16	Chicago, Ill.

A special three-day course will be held Jan. 3-5 at the University of Puerto Rico at Mayaguez.

The three-day workshop costs $499 and the five-day workshop costs $699. The two-day course alone costs $299 and the special January course costs $599. Prices include tuition, course book, all course materials, graduation certificate and take-home microcomputer. A 20% discount is available with five or more enrollments from the same firm. For information, contact Wintek at 902 N. 9th St., Lafayette, Ind. 47904.

8800b Gets Data Base System

BLACKSBURG, Va. — The Personal Data Management System (PDMS), a data base system for personal microcomputers, has been developed by Physical Biological Sciences (PBS) Ltd. here.

The first PDMS system is for the Altair 8800b with one or two floppy disks at a minimum of 32K bytes of core memory. Additional versions for cassette systems are under development, according to a spokesman.

The interactive PDMS system allows the 8800b user to set up a new file by issuing a RUN command. Once the file is set, the user may ADD, LIST or DELETE records in sequence or selectively. A RESTORE command actuates previously deleted records. A CHANGE command allows changes to be made in existing records of a file, and a SEARCH command searches a field for a string as well as an integer value of fields, the spokesman explained.

A 40-page user's manual, when provided with the system disk, contains the source listing of the program. The PDMS costs $795 from the firm at P.O. Box 47, Blacksburg, Va. 24060. The manual without source code can be purchased for $20.

Two Boards Expand Z80 Series

CUPERTINO, Calif. — Zilog, Inc. has expanded its family of Z80-based microcomputer boards (MCB) by adding a video display board, an I/O board and a serial I/O board.

The Z80-VDB video display board interfaces Zilog's standard Z80 microcomputer board directly to the transistor-to-transistor logic (TTL) horizontal, vertical and video drives of a standard TV monitor. Containing 256 bytes of dynamic random-access memory (RAM) for line buffering to the MCB, the board accommodates 64 uppercase Ascii characters and display size of 24 lines, 80 char./line. Price of the Z80-VDB is $475.

The Z80-IOB board provides users with programmable control of up to 64 I/O lines. The board, containing four Z80-PIO parallel interface controllers, sells for $350.

The Z80-SIB serial I/O board provides eight serial (four full-duplex) channels, each capable of synchronous or asynchronous data transmission including Bisync protocol. Featuring two on-board Z80-CTC programmable timers, the Z80-SIB is priced at $375 from Zilog at 10460 Bubb Road, Cupertino, Calif. 95014.

Microcyber 1000 Based on 6502

HUNTSVILLE, Ala. — Cybersystems, Inc. has introduced the Microcyber 1000 microcomputer system. The Micocyber 1000 is based on the 6502 chip and comes assembled and ready to plug in, according to a spokesman.

The unit includes 1K of random-access memory (RAM) and 2K of read-only memory (ROM). The ROM contains the operating system for the cold-start bootstrap, teletypewriter handles, keyboard and display handlers and audio cassette handlers, he said.

The Microcyber 1000 comes with a full hexadecimal keyboard and 7-digit light-emitting diode (LED) display for address and data. A single-board expansion capability is contained within the basic chassis and the expansion can be either memory or I/O board. A 72-pin I/O and memory expansion bus connector is included with the system to permit further expansion, the spokesman added.

The Microcyber 1000 sells for $525 and comes with a 90-day warranty. Additional static RAM is available in 4K increments for $189 and in 8K increments for $299 from the firm at 4306 Governors Drive W., Huntsville, Ala. 35805.

MICROCOMPUTER ADS

Where to find bargains, buyers, programs, peripherals or personals.

CRT Terminal Excellent Condition Teleray Model 3311 Only $695. Kenneth E. Hughes Co., 2175 Lemoine Ave., Ft. Lee, N.J. 07024 (or) 201-944-1600.

8080 Software Send $1.00 for catalog Machine Language subroutines. BASIC Applications-Games, Software Supply, Box 5038, Bossier City, La 71111.

Multi-Uer, Multi-Processing Microcomputer system for businesses. Can grow from Floppies to hard disks. Starting at $8,000. Applications include A/R, A/P, G/L, P/R, O/E., Inv. Send replies to Box 1126.

Cross assemblers available for most popular microprocessors on PDP 11/45 in Boston's oldest time sharing company. Costs as low as $2/hr plus 80¢/sec during corss-assembly — Call Mark/OPS (617) 266-1930.

Logical Design Associates, Software Development: LDA will DESIGN and CODE complete, custom application software packages to fulfill your business needs; follow through with IMPLEMENTATION, TRAINING, and software SUPPORT to assure application success. We utilize a wide range of microprocessors. Contact LDA: (415) 332-4816, 3000 Bridgeway, Suite 103, Sausalito, CA 94965.

Micro Club Listing

Microcomputing clubs are drawing more and more interest all across the country. It is sometimes difficult, however, to find one that serves your area of the country.

As a service to hobbyist readers, *Computerworld* would like to periodically list the micro clubs in different parts of the country.

If you are a member of a microcomputer club and would like it to be listed, contact Frank Vaughan at *Computerworld*, 797 Washington St., Newton, Mass. 02160.

Please provide the full name, address and telephone number of the club.

Micro Stores 17K Bytes

NATICK, Mass. — A Z80-based single-board microcomputer with a capacity for 17K bytes of on-board memory is available from Control Logic, Inc. here.

The CCS-1143 contains the Z80 microprocessor unit (MPU), 1K byte of random-access memory (RAM) and sockets for up to 16K bytes of erasable, programmable read-only memory (Eprom). It also has a serial interface for either current-loop or RS-232 serial devices, a 2MHz system clock and MPU support hardware and logic for I/O to users' devices, a spokesman said.

The unit is suitable for applications requiring large program or fixed data memories such as control or switching uses, the spokesman said.

The memory-mapped and bussed I/O structure of the CCS-1143 permits the user to employ the memory reference instructions of the Z80 MPU, according to the spokesman.

Additional features include automatic power-on restart, jumper-selectable serial I/O data rates, interrupt capability and direct memory access.

The CCS-1143 costs $500 from the firm at 9 Tech Circle, Natick, Mass. 01760.

Package Handles 3D Perspective

CULVER CITY, Calif. — Sublogic Co. here has introduced a micrographics package that allows a user to view two-dimensional perspective projections of three-dimensional scenes from any locations in space, a spokesman claimed.

Two versions of the graphics package are being offered.

Adaptation instructions, program listings, applications, interface and testing information are supplied with each package. The Basic version will retail for $22 and the 6800 Assembly Language package will cost slightly more from the firm at P.O. Box 3442, Culver City, Calif. 90230.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:
Box XXXX

Withington Testimony

IBM Could Force Others Out: Trial

By Molly Upton
CW Staff

NEW YORK — IBM has the financial resources to put a variety of firms out of business, computer industry expert Frederic G. Withington testified at the U.S. vs. IBM trial here recently.

If IBM were to make products designed specifically for users of Burroughs, Honeywell, or Univac systems and price them low enough, it could force these firms out of business and survive, the Arthur D. Little, Inc. researcher said.

And, IBM could similarly force out of business plug-compatible suppliers in the areas of add-on memories, tape and disk drives and CPUs and still be alive, he added.

Much of Withington's testimony on redirect examination has been devoted to his predictions. Judge David N. Edelstein queried him extensively on the significance of such items as new memory technologies and IBM's use of microcode.

Since Amdahl Corp's 470V/6 lacks a control store, there is no way it can provide the equivalent to IBM's MVS extension Withington noted. IBM's MVS extension incorporates some systems programs in microcode in the control store for reportedly greater throughput, he said.

Withington expects IBM to increase the number of key systems programs in microcode, thus rendering hard-wired machines incompatible.

Edelstein asked Withington whether he considers the use of microcode a "technological miracle" that could hinder entrance into the computer industry.

Withington said no, not in itself. However, in the future, it is conceivable that microprogramming could seem close to a technological miracle, he said.

Edelstein used the term "technological miracle" to refer to a technique that incorporates price/performance, compatibility and functionality or ease of use, Withington explained later.

The judge also asked Withington whether the mirocode expected to be released with the IBM 3033 could be copied. The witness estimated five or 10 people could "replicate a functional alternative" in six months to a year if they had the code with which to work.

Other mainframers have more ways of being competitive with IBM than the plug-compatible mainframers, which must either duplicate IBM's CPUs or make their products look like duplicates he said. The other mainframers can select a variety of methods through which to offer equivalent or better price/-performance.

Withington suggested that perhaps other mainframers might make more suitable markets for plug-compatible mainframers than IBM, since several plug-compatible mainframers are already concentrating on IBM.

The general-purpose systems of Honeywell, Univac and Burroughs are lower in price than IBM's and their installed bases are smaller. As a result, they probably have less leeway in cutting prices — and in innovating new products — than IBM does, he indicated.

Disk drives of an improved sort will remain the dominant memory technology through at least 1985, Withington said.

Adaptation Cost

The cost to one company to adapt or develop systems to use these different technologies, which organize the storage of data in smaller blocks will be $10 million to $50 million, Withington estimated. Two-thirds to three-quarters of this expense will be in software, he added.

Lead government attorney Raymond M. Carlson produced two IBM documents that substantiated Withington's earlier testimony that it would have cost about $300 million for a firm to

Continued on Page 43)

Telecommunications Seen Ripe For More Mini Firm Participation

By Toni Wiseman
CW Staff

CHICAGO — The telecommunications industry is ripe for increasing participation by minicomputer companies, Harry Newton, an independent telecommunications consultant, told top industry executives here.

Minicomputer companies have the technology and the problem solution and industry segmentation marketing skills to make a significant impact on this industry," Newton said at the Computer & Communications Industry Association's (CCIA) annual membership meeting.

Yet, despite the available enthusiasm, marketing and technical skills, only two companies to date have ventured actively into the voice area as end-user suppliers. These two are Rolm Corp., which markets a computerized PABX, and Datapoint Corp., which has developed InfoSwitch, a mini-based least-cost telephone routing system, he said.

Newton compared DP with communications, pointing out that the telecommunications market is 50% larger than that of DP.

Telephone industry revenues, for instance, were $41.19 billion in 1977. This includes $16.6 billion in local exchange revenues, $1.5 billion from interstate toll and Wats, $1.2 billion from interstate private lines, $8.3 billion from intrastate toll and $3.7 billion from PABXs and key sets.

DP industry revenues, on the other hand, amounted to only $27.9 billion in 1977, he noted. Mainframes accounted for $7.2 billion; peripherals for $10.8 billion, software and services $5.1 billion, supplies $2.4 billion and minicomputers $2.4 billion.

R&D Orientation

Another reason minicomputers have a definite opportunity in the voice telecommunications industry is the intense R&D orientation of the DP industry as compared with telecommunications firms, Newton said.

In 1975, AT&T spent $619.4 million or 2.1% of sales on R&D, General Telephone and Electronics spent $93.7 million or 1.6% of sales, ITT spent $219 million or 1.9% and RCA $113.6 million or 2.4%.

In the same year, Data General Corp. spent $11.6 million or 10.8% of sales on R&D, Digital Equipment Corp. $48.5 million or 9.1%, IBM $946 million or 6.6% and Hewlett-Packard $89.6 million or 9.1%, he stated.

But, the profitability of the communications industry is very, very high and thus very enticing, he pointed out. IBM realized a 14.7% profit in 1976 while AT&T accumulated an 11.6% profit on sales that year. This compares with an average 5% profit for the Fortune 500 companies, Newton said.

Newton further compared the two giants, IBM and AT&T, in terms of revenues, expenditures and depreciation issues.

For the year ended December 1976, AT&T had revenues of $32.8 billion, or 2.01 times IBM's $16.3 billion. AT&T's earnings were $3.8 billion or 1.58 times IBM's $2.4 billion, he noted.

On the other hand, AT&T's long-term debt is $32.5 billion, 118 times IBM's 275 million, which is in itself negligible since IBM had $6 billion in cash assets at the end of the year.

AT&T's total plant and equipment amount to $91.3 billion but will take 20.3 years to depreciate at the 1976 rate, Newton said, adding IBM's $16.1 billion plant and equipment will take only 9.4 years to depreciate at the 1976 rate.

Buyer Conservatism

But the major concern with marketing to the end-user in the telecommunications industry has been the erstwhile conservatism of the average communications buyer, Newton told the CCIA members.

However, this is changing; interconnect's present popularity is growing for several reasons:

- The manufacturers are offering equipment with popular features not available from the telephone companies.
- The manufacturers are standing behind their distributors, backing up installations with manufacturer guarantees.

(Continued on Page 42)

CI Notes

Itel, Siemens Agree To Joint Project

SAN FRANCISCO — Itel Corp. has entered into an agreement with Siemens A.G. (Germany) for the joint development of IBM-compatible nonimpact laser printer subsystems.

Itel intends to add products developed under this agreement to its existing computer and peripheral line.

The initial Itel printing subsystem will utilize the ND-2 laser printer, a product designed and manufactured by Siemens A.G., and will be plug-to-plug compatible with the IBM 3800.

Dataforce Takes Control Of Randal Maintenance

TORRANCE, Calif. — The Dataforce Service Co. has taken control of a nationwide network of 115 organizations providing maintenance for Randal Data Systems small business computers.

While it intends to continue providing service to Randal Data, Dataforce will also seek maintenance contracts for other types of minicomputer systems, according to Dataforce president, Jack Tateel.

A central diagnostic center has been established at Dataforce's headquarters, 2807-F Oregon Court, Torrance, Calif.

The company is wholly owned by Randal Data Systems, Inc., but will operate independently.

Supershorts

Centronics Data Computer Corp. has filed a claim against Mannesmann and SCI with the U.S. International Trade Commission demanding an import embargo on the printers.

Data Magnetics Corp. has formed a Tape Products Division to handle the manufacture and marketing of a new line of digital tape heads.

168

System available immediately for 24 month lease

Army Cancels CDC System As Interim DOD Standard

By Edith Holmes
CW Staff

WASHINGTON, D.C. – The Army Electronics Command recently canceled its sole source designation of Control Data Corp.'s 480 system architecture as the interim standard for all U.S. military operations.

In the wake of industry criticism, the Army plans to go out for competitive bids to select the interim tactical computer architecture that will serve as a basis for the Military Computer Family (MCF) to be used by all branches of the Department of Defense (DOD), a spokesman for the command said.

Digital Equipment Corp.'s PDP-11 has already been selected by the command as the ultimate standard MCF architecture [CW, Aug. 8], the spokesman added. But since few militarized PDP-11 CPUs are currently in the field, the Army is trying to find an interim architecture to save existing tactical computer systems.

The computer industry was informed in July that the Army, in cooperation with the Navy, had chosen the CDC 480. Army officials said the 480 was selected as the interim machine architecture because it is compatible with CDC's AN/AYK-14 standard Navy airborne computer and Litton Industries' AN/GYK-12 emulator.

Industry representatives objected strenuously to the DOD move toward CDC during a July industry advisory group meeting. Competitors argued CDC would gain a lead position in the eventual supply of hardware modules to the military if the features of its equipment were made standard without "a thorough objective and written analysis."

Mini Users Gain Special Support

ANDOVER, Mass. – Software International Corp. has formed a new group devoted exclusively to software package support of small systems and minicomputer users.

"Users of small computers, just like those who employ large-scale machines, are faced with making their machines produce application results. Since the cost of in-house or contract programming can be prohibitive, small systems users should be able to take advantage of field-tested and proven software application packages," according to Chester J. Domoracki, small systems group vice-president.

With more than 100 installations of Software International's small systems packages already at work on various sizes of IBM System 3 computers, the firm is now designing a broader product line offering. Software International's general ledger, accounts receivable and accounts payable are already on the market with on-line versions as well, Domoracki noted.

Basic financial reporting systems for the following popular small or minicomputer manufacturers are either available or being planned from Software International's new small systems group: Burroughs, Digital Equipment Corp., Data General, Hewlett-Packard and Interdata. The needs of IBM System 32 and System 34 will also be met soon," he said.

Milgo Name Change

MIAMI – Milgo Electronic Corp. has been renamed Racal-Milgo, Inc. as a result of its merger into the Racal Group.

Edward Bleckner Jr. will serve as president of Racal-Milgo, along with Raymond Colucci, vice-president/operations; Matthew A. Kenney, vice-president/sales and marketing; Paul E. Payne, vice-president/engineering; Charles Weston, vice-president/finance; and Sang Youn Whang, vice-president/research.

IN THE FAST CHANGING WORLD OF INFORMATION MANAGEMENT, WHERE CAN YOU FIND ALL THE LATEST PRODUCTS AND APPLICATIONS UNDER ONE ROOF?

INFO 77 is the Exposition and Conference that shows you how to shape information systems to management's needs.

It brings together thousands of the latest products and applications in one great "showcase," the New York Coliseum, so you can quickly and easily find the newest and best solution to your specific problem.

The Conference explores a new concept that combines data processing, office systems, records management and telecommunications into a single function that is becoming increasingly important in the corporate structure: information management. It keeps you abreast of advances in technology, new applications that help you deliver the right information to management at the right time.

SEE AND EXAMINE ALL THE LATEST TOOLS OF INFORMATION MANAGEMENT: Computers... Data Communications... Distributed Data Processing ...Dictating Systems...Duplication/Copying Systems ...Information Retrieval Systems...Microfilm Systems ...Software & Data Services...Word Processing Systems.

PLUS THOUSANDS OF APPLICATIONS FOR: Banking Systems...Office Systems...Financial Systems...Sales & Marketing...Insurance Systems... Hospital Systems...Small Business Systems...and more.

ATTEND THE CONFERENCE THAT HELPS EDP MANAGERS BECOME BETTER INFORMATION MANAGERS: More than 60 sessions in ten industrial and commercial areas. Nearly 200 experts share their experiences with you—case histories, state-of-the-art reviews on current practice. Cost effective applications for small business computers. Cost savings in office automation. And much more!

For information on the show and Conference call toll free, 800-221-0222 (in New York State only, call 212-786-7504) or write Clapp & Poliak, Inc., 245 Park Avenue, New York, N.Y. 10017

Ask Control Data.

Control Data introduces the OMEGA 480 System—**two compatible, price-conscious alternatives to IBM's 370-135/138 and 145/148.**

Our new OMEGA 480-I gives you half again as much throughput capacity as 370/138—yet costs about the same! And the OMEGA 480-II will exceed 370/148 performance while offering a purchase-price savings of $200,000!

What's more, OMEGA 480 is a space-saving one-half the size of the comparable 370! And, it's field-upgradable. That means you can get OMEGA 480-I now... upgrade it to 480-II capacity later!

Compatibility? OMEGA 480 supports without modification IBM Operating Systems, Program Products, and user programs.

Financing? Several options are available either through our competitively-priced Installment Sales Plan or a selection of 3- to 7-year leases.

But most important, you want service support. And you get it from Control Data! In our support organizations are more than 8,000 dedicated hardware and software specialists—including many with years of IBM system experience. Experience that comes from servicing more than 1,200 current IBM users, and maintaining such Control Data plug-compatible peripherals as Disk, Tape, Memory, Printer and Mass Storage Systems.

The OMEGA 480 Systems are available initially in: Boston, New York City, Philadelphia, Washington, Baltimore and Atlanta; Cleveland, Chicago, Detroit, Milwaukee, Minneapolis, Dallas and Houston; Denver, Portland, Los Angeles and San Francisco. For information phone your local Control Data Representative or write Thomas E. Phillips, Vice President, Peripheral Systems Marketing, Control Data Corp., P.O. Box 0, Minneapolis, MN 55440.

The better business decision

CORPORATION

Panel Sees Eventual Standards For Graphics

By Toni Wiseman
CW Staff

TORONTO — Members of an Ifip '77 panel on computer graphics agreed that there is an exciting future in store for that discipline, one which includes discernible trends, innovations and the certainty of standards.

K.Bo, who participated in the development of GPGS/Fortran in Norway, said he foresaw three trends, the most important of which is that computer graphics are penetrating into industry. Even smaller firms have begun to recognize what they can gain from using computer graphics, he said.

He noted, however, that to reach the goal of widespread use of graphics it will be necessary for the DP industry to support development, increase knowledge and provide standards.

Secondly, Bo noted that one reason computer graphics have encountered difficulty in widespread use is due to the isolation of the educational world, which is the prime user of the technology. "To get individuals to accept computer graphics, we have to offer them professional implementation, education and maintenance," he stated.

Finally, while technology has a good grip on the control and understanding of line graphics, it is a primitive usage, he said. Graphics today are using one dimension to stimulate two- and three-dimensional objects. In the future, he predicted, two-dimensional primitives, such as polygons, will be common.

"This field is now moving very fast. In order to keep up, I urge you to keep an eye on the raster scan approach and on holography," Bo said.

Changing Slowly

Tom Sancha, founder of Cambridge Interactive Systems, Ltd. in Great Britain, tried to tread the line between what will happen in the future and what should happen.

Sancha divided graphics into two "worlds": the old world of vector graphics and the new world of raster graphics. Vectors will diversify as more things become possible through the application of LSI technology, he predicted. There will be changes, but they will not be radical, he said.

In the raster area, the changes will come from the low end of the market. "Rasters will probably never compete with vector graphics, for instance in engineering, he noted, because the requisite resolution is not available. But the use of enhanced video display units will prove very cost-effective and cause the raster market to take off," he said.

He also predicted that as graphics terminals become more widely used within organizations by more users, the demand for hard copy will diminish — a prediction one attendee termed "naive."

Standards, he observed, are the only way to provide wide availability of applications. These standards, he added, will be adopted by government and large industry and will constrain the user, "but we'll have to live with them."

Jim Foley, graphics editor for the Communications of the ACM, agreed that standards are coming, setting a five- to 10-year time frame for their implementation.

Standards, he said, will result in relative program portability and eliminate the need for major program changes. They will also result in program affordability, a major and practical impact for the expansion of computer graphics.

There are currently five separate groups working on graphics standards projects, all working closely together and cooperating toward the same objective, he said. To date, however, only a single standard — one for line drawing systems developed by the ACM Siggraph group — has been proposed.

Small Systems Becoming Chief Market

Floppy Media Sales Seen Climbing 40%/Year

By Molly Upton
CW Staff

WELLESLEY, Mass. – Shipments of floppy disk drives should rise at an annual rate of 33% over the next five years, while diskettes will rise 40% per year over the same period, according to a study from Venture Development Corp. here.

In 1981 the drive market should reach 605,000 units per year and sales of diskettes 18.7 million per year, the study indicated.

The 1976 base of drive shipments was 145,000 units and the media sales were 3.45 million units, according to the report.

Over half of the drive shipments in 1981, or 392,000 units, will be of the IBM-type from OEMs, compared with 103,000 in 1976, Venture indicated.

The only segment of the drive market which will not expand is the non-IBM full size, which should dwindle to nearly zero in shipments by 1981, according to the firm.

The other segments, such as the IBM captive, OEM-IBM type and minifloppies will continue to grow, Venture continued.

Shipments of minifloppy drives will grow from 1,000 units in 1976 to 76,000 in 1981 and should find wide application to hobby computers and word processing systems, the report stated.

Although suitable for desktop computers, Venture sees the minifloppy being challenged by solid-state memories.

Double-density recording codes will be used on 75% of all drives shipped in 1981, the report said.

Dual-sided drives will constitute 40% of 1981 shipments and 35% of all diskette shipments in 1981 will be dual-sided, the firm added.

Minidiskettes should account for 10% of the total diskette market at that time.

IBM holds about one-third of the diskette market and Information Terminals Corp. leads the independents, Venture stated.

Soft sector drives will account for 65% of all drives shipped in 1981 compared with 45% in 1976, the report continued.

Small Systems Use Growing

The predominant market for floppy drives through 1977 will be the intelligent terminal, but in mid-1978 the small business system will become the major consumer, according to the study.

"The transition to small business systems will result from the upgrading of intelligent terminal capabilities to the point where they assume the status of small computers rather than from a collapse of the intelligent terminal market per se," Venture observed.

In a rough breakdown of markets, Venture shows data entry, microcomputers and word processing each consuming about 10,000 units during 1977.

Minis and larger computers together take about 20,000, while small business systems are charted at about 60,000 units in 1977. Intelligent terminals lead with around 90,000 units.

However, in 1981, small business systems will take about 190,000 drives, intelligent terminals 90,000, word processing and micros each about 70,000, followed by large computers and minis with 30,000 and data entry with scarcely more than its original 10,000.

The floppy disk drive study costs $950 from Venture Development at One Washington St., Wellesley, Mass. 02181.

Star performer in a supporting role.

TEXAS INSTRUMENTS.

Most people see us as a hardware company. And that's good. But look again.

We offer in our 990 software the same experience and versatility found in our 990 hardware. And that's got to tell you something about our software capabilities.

Software to fit your application.
The software we've designed for the 990 Computer Family serves a wide range of applications. You can get software for small standalone multitask applications requiring only a few hundred words of memory. Or software for medium-capacity floppy-based applications.
Or a choice of COBOL, FORTRAN IV, and *both* standard and Business BASIC for large, disc-based applications. You can even get a SORT/MERGE utility on all our higher level languages.

It grows with your needs.
All 990 family software is completely upward compatible from the smallest to the largest member of our 990 Computer Family — from the TMS 9900 Microprocessor and 990/4 Microcomputer to the 990/10 Minicomputer. So as your needs grow, your system can grow — without scrapping the valuable software you've already developed.

You can increase the effectiveness of your programmers, too. Now they can use the faster, more powerful software of our larger family members to develop software for smaller systems.

Depend on it.
You'll also like our after-the-sale support for 990 software. It includes field analyst support and our direct customer telephone support line.
You get it with all 990 operating systems, development utilities, assemblers and language packages. We even include a free software update subscription service for *one full year* with every 990 software license.

At TI we know you need more than our proven 990 hardware. You need our software, too.

To find out all the latest 990 software enhancements, mail this coupon, contact your nearest TI sales office, or call Computer Systems Marketing at (512) 258-7111.

Yes! Fill me in on all the latest talents of 990 Computer Family Software.

Telecommunications Market Seen Unique Area

CW at CCIA

CHICAGO — There are several factors that make telecommunications marketing unique, Harry Newton, an independent consultant, suggested to CCIA members here recently.

First, there are regulatory factors, such as the "alphabet soup" of government and semigovernment agencies and associations — Naruc, Usita, OTP, FCC, and state PUCs and PSCs.

In addition, there are the federal courts where everything of significance finally gets decided, Newton said, noting the decisions are made after much delay and usually in the regulatory agency's favor.

Dominance by one supplier is another important factor. AT&T has 930,000 employees and controls 85% of U.S. telephones. Long Lines controls 99% of all long-haul traffic and Western Electric had $7 billion in sales last year, Newton pointed out.

The product life cycle is also important.

Some end-users are writing off PABXs over five years (versus a tax rate of eight years) while earlier versions of Bell central office switches were written off over 40 years, Newton said. Bell equipment is still designed for life cycles and mean-time-between-failures longer than those of any other industry, he said.

This all means that market penetration can take much longer, requiring far greater start-up expenses.

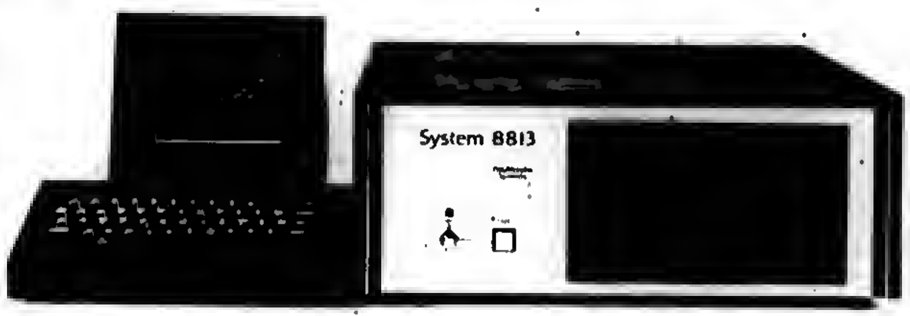
Also, regulation can affect product life cycles, either speeding them up or slowing them down, he said, citing the Federal Communications Commission change to a 40-channel system, which destroyed the 23-channel CB market value.

There are also minimal OEM sales in the telecommunications industry since vertical integration has been the industry practice and standard in order to assure adequate supply and quality products, he said.

Customer psychology is not to be ignored, Newton suggested. There is almost no risktaking in the telecommunications industry, since communications managers cannot "bury" their mistakes.

"Ignorance is bliss in a static monopoly situation, but it is the enemy in today's competitive world," he said, adding that education should be a major part of any marketing effort in this area.

The computer you can call your own.



The System 8813 from PolyMorphic Systems is a complete, powerful problem solver in a walnut cabinet. This microcomputer allows you to quickly formulate and solve sophisticated financial, scientific, and engineering models from the convenience of your office or den.

The English language commands of our disc BASIC programming language permits easy use of our video graphics and disc files. Complete systems are available as low as $3250. See it at your local PolyMorphic Systems dealer.

PolyMorphic Systems

460 Ward Drive, Santa Barbara, California 93111 (805) 967-0468

Field Ripe for Mini Makers

(Continued from Page 37)

- Virtually all the leading independent telephone companies have moved into the interconnect industry, effectively legitimizing it.
- Many independent and some Bell companies are offering the same interconnect equipment interconnect companies are, further legitimizing the industry.
- The newer equipment is small, modular and compact, allowing ease of delivery and installation.
- A secondary market in used interconnect equipment has developed, thus assuring users of a market for equipment they outgrow.
- Bell's most recent prices for PABX and key set systems have been higher than its early dimension and Comkey pricing, thus providing an effective competitive pricing umbrella.
- Users no longer have to be sold on interconnect. If they haven't had first-hand experience, then someone in the same town or the same industry certainly has.
- Consultants are more and more comfortable with recommending interconnect.

This year, Newton forecast, the voice interconnect industry will show sales of $640 million, which includes $400 million for PABX systems, most of which are mini- or micro-controlled, and $15 million to $20 million for mini- or micro-controlled telephone management.

According to surveys Newton has done of the International Communications Association members, the largest communications users in the U.S., 42% say their 1977 bills will be up 10% (an estimate Newton considers very conservative); 83% billback expenses and 25% have billback "bitches." Of those interviewed, 43% did not have major interconnect systems. However, of the 57% who do, 65% are happy with interconnect, 71% are happy with specialized common carriers and 83% are planning more circuits.

Newton predicted that the threat of SBS taking over complete networks of Fortune 500 companies must prompt a new service offering by the Bell System which would provide detailed real-time information on network management and usage for both optimization and billback.

"Such a network will mean the use of data links from voice tandeming switches into a centralized mammoth computer which could be accessed by corporate communication managers," he predicted.

To Avoid IBM Domain

Growth, Profit Goals Led Adds to OEM Market

By Toni Wiseman
CW Staff

HAUPPAUGE, N.Y. — When Applied Digital Data Systems, Inc. (Adds) went into business eight years ago, management set certain criteria for the company in terms of growth and profit.

To achieve these goals, it decided it had to start with a product that was not IBM-oriented and address a marketplace that was not IBM-dominated. It also decided to develop products with advanced features and become a leader in marketing them, while entering the market on a sales-only basis. This had to be the OEM marketplace, William J. Catacosinos, president and chairman of the board, told the New York Society of Security Analysts recently.

Taking these steps would allow Adds to build a strong company with a very strong capital base, he said. "We felt we had to have strong cash generation and we therefore established for ourselves certain profit goals. Our goal as we grow is to try to maintain profits between 30% and 40% before tax.

"We also believed we had to have an international presence and had to build our overseas business so that it represented 15% or 20% of our total revenues," Catacosinos said.

"We wanted a product that would not be susceptible to being folded into the IBM mainframes as the disk controllers were with the IBM 370 series of computers — a product that could take advantage of advances in solid-state technology and improve the performance-to-cost ratio over a period of time.

"And we wanted to be at the end of the telephone line where we could not be controlled or dominated by an IBM," he stated.

The end result of these deliberations has established Adds as one of the leading suppliers to the OEM Teletype-compatible marketplace.

Adds produces a wide range of products including the 520 and 580 series of desktop Consul terminals as well as the 920 and 980 Consul series.

The strategy would seem to have been successful. Adds revenues have grown from $1.7 million in 1972 to $23.4 million in 1976. Earnings have similarly grown from a loss of $52,303 in 1972 to earnings of $4.6 million in 1976.

Adds' customer base has also grown dramatically, from 212 in 1972 to over 1,000 last year, representing more than 32,000 installed units.

At the National Computer Conference last June, Adds introduced the first members of a new product line based on Intel's latest technology. The new devices, the Regent 100 and 200, will eventually replace the Consul 500 and 900 series, he said.

The Regent 300 is scheduled to be introduced this fall, the Regent 400 in early 1978 and the 500 and 600 shortly thereafter. "These will be user-programmable terminals.

Catacosinos does not subscribe to the theory that "it will be necessary to develop the tremendous processing capability at each of the sites as the proponents of distributed data processing would lead us to believe."

This view, he admitted, involves a risk for Adds. "But we believe it's a worthwhile risk because IBM will prevail in lowering data communications costs.

IBM Seen Potential Threat

(Continued from Page 37)

enter the general-purpose computer systems business with a line of products in 1972.

The Feb. 20, 1970 memos were circulated to B.O. Evans, who was president of IBM's Systems Development Division. J.G. Powers, director of financial analysis for the DP group was the author of the estimates that also went to R.A.Camuso, who became manager of financial analysis at the DP Division, and D.J. Perry, who became manager of financial analysis at the DP group.

Withington had estimated that the cost of entering the general-purpose system business with a line of products would be $300 million in 1972 and $400 million in 1977. The difference in price was split equally between inflation and the added cost of the broader product line that would be needed, he said.

IBM's estimates were $150 million to $500 million. Although the two estimates were on slightly different bases, several aspects were nearly identical.

They each assigned $50 million for plant and working capital.

Withington estimated $100 million for programming support and IBM allocated $90 million, but noted this could grow to $300 million.

But Don't Break the Bank

Argonaut's Taxbreak/Taxcost Software...for $1225.

Argonaut's software is superbly crafted. So you get programs that are easy to work with because they're so well-written.

Our Taxbreak module calculates pay check withholdings, and Taxcost figures employer liability. The complete package includes our special Taxtest program that allows testing of all calculation routines. So you get flexible software at a price that's easy to handle.

Quality software modules at a low cost...that's what we call efficiency. From ARGONAUT SYSTEMS.

Financial News

Analysts Bullish on DP Stocks Outlook for Year

By Molly Upton
CW Staff

NEW YORK — Computer industry stocks should continue to outperform the stock market for the rest of the year, according to investment analysts here.

They said the stocks have recently bounced back from a relatively low position after companies announced their recent quarter results.

The results show that margins weren't as adversely affected by IBM's recent pricing moves as people had anticipated, they indicated.

William Easterbrook of Kidder Peabody & Co., Inc. observed the stocks have recently had a "very nice move, and the move they will have in the next six months will be better than the market.

"The major reasons will be that earnings comparisons are going to be better in the second half than in the first, I think, and also there are increasing estimates of capital expenditures for this year and next year, which will favor the industry," he said.

In addition, the negativism among portfolio managers caused by IBM's pricing moves, which was reflected in the low stock prices, has been greatly dissipated, he stated.

"I think the second quarter results, the maintenance and in many cases the improvement in margins, have been major factors as has been the order gains that many of the companies have shown in the second quarter," Easterbrook said.

James Blair, first vice-president of White Weld & Co., observed computer stocks recently have been "super." He indicated the stocks were probably depressed before because people were concerned that profit margins would erode as a result of the price cutting, but they didn't.

Blair's prognostication is that margins look pretty good, and foreign currency trends ought to help the margins a lot, also. He is "pretty optimistic" about the stocks and predicts they will outperform the market.

Harry Edelson of Drexel Burnham Lambert, Inc. indicated nearly all Wall Street analysts were surprised by the second quarter results, which were higher than had been predicted.

Even with the price performance offerings of the IBM 3033, the industry had an excellent quarter, he observed.

"The computer group is showing a lot of vitality and stock market interest has definitely picked up as a group and done much better than the averages."

DEC Revenues Increase 44% Over '76 Level

MAYNARD, Mass. — Digital Equipment Corp.'s fiscal 1977 revenues leaped 44% over 1976 revenues while earnings soared 48%.

Revenues for the year ended July 2 rose to $1.05 billion compared with $736.3 million a year ago.

Earnings for the period climbed to $108.5 million or $2.78 a share compared with $73.4 million or $1.98 a share in the year-ago period.

Fourth-quarter revenues gained 42%, rising to $330.3 million compared with $231.9 million in the 1976 period.

Earnings for the quarter rose to $41 million or $1.05 a share compared to $26.8 million or 70 cents a share in the year-ago quarter.

DEC attributed much of the strength in year-end results to a steady buildup in demand throughout all worldwide markets plus a sustained high order rate which began in fiscal year 1976. To meet the strong customer demand, DEC hired more than 11,000 people during the year.

During the year, DEC acquired or expanded 12 manufacturing plants representing more than 2 million square feet of additional space.These investments; which placed a high level of expense and cost burden on operations, enabled the company to shorten delivery times to customers.

In addition, the company introduced several major products, including the PDP-11/60 mid-range computer, the microprocessor-based PDP-8 and a PDP-11-based distributed plant management system for industrial customers.

Nickels & Dimes

Medical Computer Systems has received a cash offer of $7 a share for each of its 2.7 million outstanding shares from Dun & Bradstreet. Current market price for the stock is $4.75. The firm's board of directors has not yet made a recommendation on the matter.

$ $ $

Trading in **Wyly Corp.'s** securities has been halted pending announcement of a new recapitalization plan due Aug. 20.

$ $ $

Network Data Processing has declared a 4-cent divident payable Sept. 1 to holders of record Aug. 15.

$ $ $

National CSS has declared a quarterly dividend of 10 cents a share payable Sept. 1 to holders of record Aug. 15.

How to stretch your DP dollars without getting bent out of shape.

Read our special report on *Stretching the DP Dollar* in the September 26th *Computerworld.*

Working within the tight budget constraints that exist in most DP departments can start with something simple — like a thorough management review of the reports you produce. A few might be outmoded or unnecessary, and these could be eliminated. Others could be produced less frequently; and the reports you rely upon most might be combined. All of which saves not only computer time, but end user, managerial time as well.

There are literally hundreds of other ways to save money and aggravation in your DP operation. And we'll have several experienced people on hand to tell us how they found ways to maximize efficiency in their installations in our September 26th special report. Edited by Frank Vaughan, *Stretching the DP Dollar* will be filled with informative stories like these:

- Making your computer a profit center through timesharing - an applications story.
- Trade-Offs of using a service bureau versus an in-house system — a tutorial.
- Lease or purchase? — Caveats and benefits.
- Designing a computer facility — how it's built is almost as important as what's in it.
- Saving money in a universlty DP environment — a case study.
- How a municipal government and a state agency cut costs by sharing a system — an applications story.
- Saving money on computer room forms — a survey of innovative methods.

If you're a DP Manager, financial specialist or executive with a flair for doing more with less expense, our September 26th special report will have valuable and interesting information for you. If you market a product or service that helps people save on data processing costs, you should advertise here. Ad closing date is September 9. Get the details from your *Computerworld* salesman. Or call Terry Williams at (617) 965-5800.

Contracts

Alanthus Data Communications Corp. has been awarded a three-year blanket purchase order contract to lease data communication terminals to Chrysler Corp.'s Service & Parts Division, Detroit, Mich.

Logicon, Inc. has received two contracts totaling $1 million from the Naval Sea Systems Command to expand its work in support of the Navy's Aegis ship combat direction system

Keane Associates, Inc. has received a five-year contract from Newton-Wellesley Hospital in Wellesley, Mass. to provide on-site DP management services.

Conrac Corp. has been awarded a contract by IBM's Federal Systems Division for the Strategic Air Command Communication Systems replaceable keyboard displays.

Collins Commercial Telecommunications Group of Rockwell International has received a five-year contract from Securities Industry Automation Corp. (Siac) for the upgrading and expansion of Siac's Rockwell-Collins front-end/message-switching system.

Distronics Corp. has received a contract from Huron Pipe & Supply Co. to automate business operations.

The Pertec Computer Corp. Service Division has received a two-year contract from Randal Data Systems, Inc. to provide field maintenance for Randal's business computer systems.

TRW, Inc. has received a contract from Pitney-Bowes to service customers of Pitney-Bowes' Spice retail terminal systems.

Recognition Equipment, Inc. has received a $1.7 million contract from the Federal Reserve System to build five high-speed Currency Verification, Counting and Sorting systems.

Executive Corner

- Mark McGrew has been promoted to president of Computer Power Systems Corp.
- George J. Vosatka has been named president of the Valcomp Division of Tymshare, Inc.
- Emmett W. Johnson was appointed vice-president, Navy Systems Division and John W. Vold was named vice-president of the International Systems Division within the Sperry Univac Defense Systems Division.
- Jerome J. Meyer has been named vice-president and general manager of Sperry Univac Minicomputer Operations and James B. Aldrich was named vice-president of airlines operations.
- Donald P. Moffet was named chief operating officer and executive vice-president of Sycor, Inc.
- M. Kenneth Oshman and E.E. van Bronkhorst have been elected to the Xebec Systems, Inc. board of directors.
- Dr. Peter McCuen has been named president and chief operating officer of Information Terminals Corp.
- Stephen E. Sargent has been appointed president of Continental Computer Leasing Corp. and Gordon D. Tracy has been appointed vice-president.
- Norbert Steinberger has been named acting president and chief excutive officer of Compuscan, Inc. after the resignation of Robert A. Leonard, who was chairman, president and a director.
- John E. Fox has become vice-president, marketing and Robert J. Perry has become vice-president, plans and controls at Satellite Business Systems.
- Charles D. Kempton has been appointed vice-president, western sales of Wang Laboratories, Inc.
- James V. Wilson has been elected assistant vice-president of C.T. Law Technology, Inc.
- Bobby R. Cabaniss has been appointed vice-president/product marketing for the Computer Products Division of Itel Corp.'s Data Products Group.
- Karl Brdlik has become vice-president and general manager of Comtech Small Business Systems Division.
- Waldo L. Landmeier has been promoted to the new position of vice-president of engineering for Talos Systems, Inc.
- Jack C. Davis has been appointed a corporate vice-president/group executive of Harris Corp.

SENIOR SYSTEMS PROGRAMMER

Responsibilities will include systems programming support of OS MVT. The successful applicant will have at least 2 to 3 years experience in systems programming (OS or VS) and be familiar with the respective SYSGEN process, and a bachelors degree or equivalent combination of education and experience. A proven ability to lead others as a project manager is also highly desirable. Starting salary will be in the $16,000-$20,000 range, depending on qualifications. A full fringe-benefit package also applies, including 4 weeks of vacation.

The J. Preston Levis Regional Computer Center (JPLRCC) provides computing services for a number of users in Northwest Ohio, including Bowling Green State University, the City of Toledo, the University of Toledo, and the Toledo/Lucas County Criminal Justice Regional Planning Unit with IBM and Univac systems. RPLRCC is located south of Toledo in surburban Perrysburg in an area with a full range of cultural and recreational opportunities. Applicants should submit a complete resume, salary history and a list of references no later than September 9, 1977 to: Personnel Officer, JPLRCC, 25875 Dixie Hwy., Perrysburg, Ohio 43551. (JPLRCC is an EO/AA Employer)

PROGRAMMERS -- ANALYSTS

DASD Corporation, a national consulting firm specializing in Software Product development and Contract Services, is planning to increase its staff considerably during 1977. Positions are now open in the following areas:

- Project Management
- Project Leaders
- Senior Analysts
- Programmer/Analysts
- Programmers
- DATA BASE CONSULTANTS

We are looking for people with experience in any of the following catagories:

COBOL
ALC/BAL
RPG II
PL1
FORTRAN

IMS
TOTAL
IDMS
CICS
CFMS
DBOMP

IBM (DOS, OS, VS)
BURROUGHS
HONEYWELL
CDC

This is an excellent opportunity for the right individuals.

Benefits include Blue Cross Blue Shield Medical Ins., Life Ins., Disability Ins., Retirement Plan and an excellent salary.

We have offices in Milwaukee, Chicago, Houston, Los Angeles and Philadelphia. Expansion plans for other cities are also underway. We will relocate you to accommodate your career as well as DASD's plans.

Please call or send your resume to our Corporate Offices at:

DASD CORPORATION
8705 North Port Washington Road, Suite 301
Milwaukee, Wisconsin 53217
(414) 351-2600

COMPUTER PROFESSIONALS

M.I.S. INTERNATIONAL, INC. — an internationally-known computer systems integration organization — requires specialized professionals for top assignments in Michigan and Indiana.

Knowledge of the following computers is desirable:

- IBM/IMS Expert
- COBOL Programmers for IBM 360/370, Burroughs 4700, Honeywell 6000, Interdata
- MARK IV, Varian, Microdata Programmers
- Mini/Micro Programmers for CAI/LSI-2, ModComp, PDP-11 with RSX, TI 990-4

Computer Professionals interested in furthering their career should consider M.I.S.'s top salary structure, stable employment environment, fully-paid fringe benefits, educational opportunities, and relocation allowances. You are invited to send your resume to Mrs. M. Roselisp

M.I.S. INTERNATIONAL, INC.

COMPUTER CENTER DIRECTOR

Clemson University is seeking a director for the Computer Center who is responsible for academic, administrative, and contract computing services. The director is responsible for the host computer facility (IBM 370/165-II under MVS) as well as local and remote terminal networks. The director will maintain computing facilities at a state-of-the-art level to support research and instructional needs as well as maintain maximum system availability for production support of statewide on-line systems. The director reviews and coordinates computer resource needs with two directors of application programming divisions which serve on-campus departments and off-campus agencies. He supervises managers of computer operations, software systems, hardware systems, and academic computing services. Minimum qualifications include five years experience in data processing management, design and operation of data base/data communication systems and management of teleprocessing networks. Masters degree in data processing related area required, Ph.D. preferred. Salary negotiable and commensurate with qualifications. Submit three letters of reference relevant to technical and management qualifications and complete resume to:

Search Committee, Computer Center Director, c/o Graduate School, E-106, Martin Hall, Clemson University,
Clemson, South Carolina 29631

Closing date for applications is October 31, 1977. Clemson University is an equal opportunity, affirmative action employer.

PROGRAMMER ANALYST

Corporate office of Rocky Mountain meat packer has a current opening for a programmer/analyst. We offer a challenging opportunity to an individual with a minimum of two years programming PDP 11/40 in BASIC + under RSTS/E. Degree in business or math preferred. Thorough knowledge of RSTS/E operating system, accounting systems and experience with a data base would be a plus. Send confidential resume to Personnel Dept., P.O. Box 16345, Denver, CO 80216

An Equal Opportunity Employer

BURROUGHS PROGRAMMER

The FIRST PEOPLE have an opening for an individual with 3-4 years experience in the data processing field with COBOL and Burroughs System exposure. Knowledge on IPS on medium systems is essential. Data Communications experience preferable.

We offer free checking, cafeteria facilities, excellent employee benefits and attractive salary.

SEND RESUME (with salary requirements) OR APPLY 9 AM TO 4 PM.

SYCOR

Sycor is holding a Distributed Data Processing Systems Career Conference in San Francisco!

WESCON SHOW INTERVIEWS!
TO ARRANGE A CONVENIENT APPOINTMENT
CALL TOLL FREE: 1-800-521-3176

SYCOR, Incorporated, a leader in the manufacture of distributed data processing systems, is currently seeking qualified:

SENIOR ELECTRONICS ENGINEER

BSEE with minimum 4 to 6 years' experience or equivalent in development of hardware systems using micro computers on discrete controllers. Experience in areas such as disc controllers or other mass storage system controllers is preferable.

SENIOR DESIGN ENGINEER - FIRMWARE

BSEE or BS in Computer Science with 2 to 3 years' experience in software development of real time mini-micro computer systems. Experience with I/Q drivers for devices such as cassettes, magnetic tapes, floppy disks or disks is preferable.

FIRMWARE ENGINEER - DIAGNOSTICS

Minimum 2 years' experience in hardware design, programming in assembly language of micro computers. Diagnostics programming a definite plus. BSEE or equivalent desired.

SENIOR ENGINEER - ANALOG

BSEE a must, MSEE desirable. Five years' experience in analog circuit design, preferably in magnetic recording and/or servo mechanisms.

SENIOR MECHANICAL ENGINEER

A BSME is required, MSME highly desirable, plus at least 7 years' experience in the design of products involving small, high reliability mechanisms, preferably in the printer field or related to computer peripherals. Your background should include leadership responsibility on development projects.

INDUSTRIAL ENGINEER

Minimum 2 years' experience with printed circuit board assembly methods a must, electro-mechanical assembly experience a definite plus; should be experienced in processing and standards. A degree in E.E. or equivalent experience is needed.

SYSTEMS PROGRAMMERS

Minimum two years' experience as a Systems Programmer in any of the following areas:

- ● Data Communications ● Compiler and Languages ● Access Methods
- ● Data Base Management Systems

Experience in mini/micro computers with Assembler language is desired. BS in Computer Science or equivalent is a must. MS is preferred.

SYSTEMS ENGINEER

Experience as a Programmer in COBOL or Assembler required. Micro/Mini and/or programmable (intelligent) terminal use or support experience desirable, plus exposure to data entry applications and marketing customer support. Communications with bi-sync and on-line background especially helpful. Bachelor's degree desired.

SALES REPRESENTATIVE

Minimum of 3 years' experience successfully selling terminals, peripherals, or small systems and general knowledge of DP applications, including communications is required. Candidates must have a proven track record of sales performance over quote. Responsibilities include sales of a complete line of computer products and support of existing customers.

If unable to see us during the WESCON show interviews, please send your resume in confidence to:

COMMITTED TO EXCELLENCE

DATA PROCESSING PROFESSIONALS

Federated Department Stores, a national leader in retailing, is currently in the midst of a major systems development program utilizing the most advanced systems techniques and software available in today's market. The end result will be one of the most highly sophisticated data processing shops in the nation. The program is in full swing and growing rapidly, with many ground floor opportunities still available in a variety of areas.

Programmer Analysts

Qualified individuals will have at least two years of COBOL programming experience (any type of hardware) along with system design ability. Any familiarity with IMS, TSO, or structured programming techniques would be a definite plus.

System Analysts

Qualified individuals will be "take charge" type of people with at least four years of systems design and programming experiance. Special consideration will be given to those applicants familiar with Retail applications as well as those familiar with general accounting systems.

Data Base Analysts

Qualified individuals will have at least three years of systems and programming experience with at least one year of experience designing, programming and implementing systems under IMS. COBOL expertise would be helpful as well as an understanding of IMS internals.

These positions offer excellent starting salaries, a liberal benefits package, and a challenging opportunity to play a key role in a multi-divisional systems development effort.

consider these unique software opportunities at EAI

EAI is a world leader in the design and manufacture of computation and simulation equipment. Our continued desire for increased capability and sophistication in all related areas has created these challenging software opportunities for,

SENIOR SYSTEMS ANALYSTS

INDUSTRIAL SYSTEMS – Will specify, design and implement industrial real time data acquisition/analysis systems software for Laboratory and Power Plant monitoring systems, and act as technical support to field personnel.

HYBRID SYSTEMS – To design hybrid software for 16- and 32-bit digital computers and power systems simulator software for hybrid-based systems.

SYSTEMS ANALYSTS

COMPILER DESIGN – Working with senior Compiler Designers, will design software tasks to be programmed, debugged and integrated into a hybrid compiler: will also be involved in system installation and education of customer personnel.

CUSTOMER SUPPORT – Will interface with customers in the analysis and resolution of system software problems, and coordinate quality assurance activities relating to system software and design support for internal and customer projects.

PROGRAMMER ANALYST

To develop and implement data reduction algorithms on a hybrid computer system, initially, will analyze, improve, document and direct production use of an existing program which collects and presents logged test data.

All the above positions require a B.S. in an Engineering discipline and/or Computer Science or Math; a knowledge of FORTRAN and/or ASSEMBLER languages; experience in related areas, and, most importantly, a high degree of professional commitment.

Compensation includes salary commensurate with experience, comprehensive benefits, and paid relocation to the Jersey Shore. For immediate consideration, forward your resume to Barbara Evenson, Corporate Staffing, or call her collect at (201) 229-1100.

San Diego opportunity in advanced-technology

EDP SYSTEMS DEVELOPMENT

Want to combine the ideal career opportunity with your favorite lifestyle? NCR Special Systems Division needs your help now in developing advanced, high-technology EDP systems for customers around the world. You'll be doing important work in our Sorrento Valley facility, just three miles from the ocean and only minutes from Torrey Pines, La Jolla and downtown San Diego. You can live in the setting of your choice—beach, valley, mountain, country, small-town or urban—and still be only a short drive from work. Spend your leisure hours golfing, swimming, hiking, getting advanced degrees from major universities, attending theatrical, music, art and sports events, or soaking up the year-round sun. Pick your climate, too—from mild coast to dry desert. San Diego is a place of extraordinary choices—and right now the choice is yours.

SENIOR SOFTWARE SPECIALISTS

For development of a very large distributive processing system, involving advanced, state-of-the-art technology. Activity will utilize the entire spectrum of EDP equipment, from minis to large mainframe, and a wide assortment of peripherals, terminals and associated devices. Minimum of 5 years' experience required in development of systems software, with heavy emphasis in telecommunications, networks and file processing, plus background in operating systems, expertise in assembly languages or COBOL, and preferably a related degree.

DISTRIBUTIVE PROCESSING SYSTEM DEVELOPMENT

Positions are available in the development of a very large distributive processing system, advancing the state-of-the-art technology utilizing the spectrum of EDP equipment—minis to large mainframe with assorted peripherals and terminal devices. Experience in telecommunications, networks, file processing or operating systems plus expertise in COBOL.

Our benefit package is what you would expect from a major blue chip corporation. What you might *not* expect is the relaxed and very creative environment of this small, highly specialized division. The facilities are modern, comfortable, designed to provide an atmosphere in which every employee can achieve an uncommon degree of personal and professional satisfaction. May I offer you the opportunity to judge for yourself? Please send your resume (with salary history) to me,

Thom Harris, Employment Specialist

Advanced Dispersed Processing Systems

Make Your Future with the Leader

Datapoint Corporation has openings at its home office in San Antonio for product marketing analyst professionals to work with our advanced dispersed processing systems. Duties will span a wide range of responsibilities including competitive product analysis and providing marketing inputs on the design of new Datapoint products and the improvement of existing products.

Applicants should have three to five years of commercial programming experience with a background in operating systems, minicomputer time sharing and/or communications. Prior associations with a computer manufacturer as well as in end user operations would be a plus. Candidates should have good analytical skills on hardware/software developments, and the ability to articulate findings orally and in writing.

These positions offer the opportunity to fill a key role with Datapoint Corporation, one of the fastest growing companies in the computer industry. Successful candidates will receive excellent salaries and benefits, opportunity for rapid advancement and the challenge of a fast moving work environment. And San Antonio offers outstanding scope for quality living in a Sun Belt setting.

Advanced Software Design

Talk With Us About The Career Challenges In Telecommunications

CALL TOLL FREE

(800) 323-1966

In Illinois (800) 942-0491

Today thru Friday, from 8 am to 5 pm cst

Telecommunications is one of the most rapidly growing segments of the software frontier. We have major projects underway now . . . forerunners of our long-term commitment to significantly advancing the state-of-the-art. We're working from definition and design through development and implementation in areas such as CAD, Data Base Systems, Simulation, Fault Recovery, Diagnostics and many areas of software design in an on-line, real-time environment.

SOFTWARE DESIGN

We're looking for an indepth background in the development of systems software and a minimum of 3 years' experience in structured design, testing and documentation of programs running on large data base, multi-file systems in real-time. Familiarity with HIPO design documentation, TSO usage and software simulation techniques as well as PL1, Fortran and assembler languages for the 8080 and PDP 11 programming is also important.

DATA BASE DESIGN

This position requires a minimum of 5 years' experience in the planning development, design and implementation of data base software, including data base management systems administration. Your primary responsibilities will be the development of data base system for a large on-going project including the implementation, support and administration of systems.

COMPUTER AIDED DESIGN

We are looking for an extensive background in the design of CAD/CAM systems and the development of interactive access by the users of CAD/CAM functions. Required is 5-10 years' experience in both hardware and software aspects; DA systems operations, and design, and systems engineering. Your initial responsibilities will include evaluation of existing systems, and working with a project team in the Architectural Planning of a major new system.

MINI-COMPUTER PROGRAMMERS

We have specific assignments available on project development teams responsible for the design implementation of various telecommunication processing systems utilizing mini-computers as the processing element. Responsibilities will include the development of software programs for real-time operating systems as well as unique hardware elements incorporated into the systems.

If you have in-depth expertise in one or more of these areas, a BS, MS or PhD in Electrical Engineering, Computer Science, Math or other appropriate engineering discipline and have an interest in moving forward with one of the challenging new frontiers in computer technology, talk with us.

If unable to call, please send your resume to:

WE'RE BRANCHING OUT

PICK YOUR CITY!

NCSS is expanding again, continuing its pattern of growth. As a result, we need more front-line professionals capable of matching the sophistication of a total information management market. If you're interested in. . .

***Enjoying excellent career growth. *Achieving above average earnings.**
***Receiving recognition for your accomplishments . . .**

. . . Then you owe it to yourself to explore a career with NATIONAL CSS, INC., one of the nation's leading computer services firms, offering timesharing, RJE, remote batch & professional programming services via our international communications network.

We provide state-of-the-art, solution oriented applications programs and languages in data base management, econometric modeling, financial analysis & statistics, business control and planning, engineering, general accounting and many other areas.

MARKETING REPRESENTATIVES

This is your chance to take advantage of your experience selling timesharing and computer services by representing a dynamic company. A company that is already an industry leader. Your background should include a proven track record synonymous with an aggressive over-achiever. Degree required, MBA preferred.

TECHNICAL REPRESENTATIVES

Here, at NCSS, you'll work with proven professionals capable of recognizing the true merit of your capabilities. You should possess knowledge of 2 programming languages; experience with large IBM equipment, timesharing, and customer support and/or training; applications background in econometrics modeling, data base management systems, electrical engineering or finance. Degree required.

Our position within the industry permits us to offer an excellent salary with incentive bonus, high visibility, promotion from within and a complete comprehensive fringe benefits program. For prompt consideration, please forward your resume in confidence to:

"MSA's personnel management and reporting system is my first draft choice."

"I learned that it keeps records on more people than live in Atlanta, San Diego, Boston, and Los Angeles combined!" Francis Tarkenton, MSA

MSA's Personnel Management and Reporting System enjoys widespread popularity in virtually every kind of business all over the country. The System helps management comply with Federal governmental EEO, ERISA and OSHA requirements. And is designed in such a way as to be easily interfaced with the MSA Payroll Accounting System. Highlights include: comprehensive personal data, skills inventory, salary and performance review as well as termination and leave of absence reporting.

There's a computer on board this spacecraft — and it's doing just what it wants to do.

System On Board Voyager Takes Its Cue From '2001'

By Ann Dooley
CW Staff

PASADENA, Calif. — Much like HAL — the computer in the film "2001, A Space Odyssey" — the National Aeronautics and Space Administration's (Nasa) computer on board the Voyager II unmanned spacecraft decided it knew better than its human operators.

Last week the computer took over control of the ship headed for Jupiter and beyond and refused orders from scientists at ground control. It did not respond to human command because it was "trying to protect itself" from a "rough ride," a spokesman explained.

The problem occurred when the Voyager II did not follow directions from the command center and failed to order a maneuver to check the position of a science boom on board the craft, the spokesman said. Instead, the computer cancelled the maneuver and returned the craft to its previous status.

The command was to have removed the dust cover from instruments at the end of the boom and at the same time to have spun the craft on its axis, the spokesman said.

The computer's failure to maneuver caused all activity to terminate while it waited for further information from the ground.

It took scientists back on Earth

Calcomp Asks Directed Verdict Be Thrown Out

By Molly Upton
CW Staff

SAN FRANCISCO — California Computer Products, Inc. has filed an appeal asking the Ninth Circuit Court of Appeals here to reverse the directed verdict in its antitrust case against IBM and grant a new trial.

The Justice Department filed an amicus curiae, or "friend of the court," brief asking that at the very least Judge Ray McNichols, who directed that verdict, be ordered to indicate his reasons for doing so.

Regardless of whether he issues an opinion, however, McNichols' judg-

Nations to Debate Conflicts In Transborder Data Flow

By Edith Holmes
CW Staff

WASHINGTON, D.C. — Are European governments using the privacy issue to drive U.S. companies out of the international data base and telecommunications markets?

This issue and a host of others concerned with transborder data flow will be the subject of an international meeting in Vienna, Austria, from Sept. 20-23 sponsored by the Organization for Economic Cooperation and Development (OECD).

As many as six European nations have passed or are considering laws ostensibly to protect the confidentiality of data about their citizens which companies operating within their borders are sending to other nations to process.

These nations fear that growth of information technology outside their borders poses a threat to their national sovereignty. A country whose data files are located in other nations is more vulnerable in times of peace as well as war, according to G. Russell Pipe, a consultant to OECD's Computer and Privacy Studies unit.

Like Canada, European nations also fear technology within their own borders will be retarded if they routinely send data abroad for more sophisticated processing, Pipe said. (See related story on Page 9).

With the marriage of computer and communications technology, the U.S. has become the acknowledged leader and is rapidly becoming the "backbone of all industrial activity in the Western world," Pipe said.

Document Reveals Bell Plans Packet Network

By Ronald A. Frank
CW Staff

NEW YORK — AT&T's upcoming answer to public packet networks will be a nationwide network handling "various protocols."

Slated to be called the Bell Data Network (BDN), the offering will include communications processing services and network management capabilities, according to preliminary specifications obtained from an industry source.

Announcement of a network that would allow the Bell System to compete with the public packet networks emerging around the world has been expected for some time. The AT&T network would compete with the packet network operated by Telenet Communications Corp. in this country.

Communications services to be provided by the BDN include "communications processing functions" such as data entry, inquiry/response, remote job entry and message distribution, according to the AT&T specifications. These functions can be customized by BDN customers using a high-level programming language called Feature Definition Language (FDL), according to the AT&T document, dated November 1976 and called a "Service Offering Statement."

Processing in Nodes

Implementation of the processing functions will be "provided for" in storage areas of the BDN nodes. Each node will include general-purpose storage for data accumulation and a "communications processor" to execute a user's FDL instruction set, according to the Bell document.

The BDN will include as an integral part of its structure "many of the communications-oriented functions now being performed by the customer's on-premise hardware and software."

The AT&T specifications for the BDN do not use the term "packet switching," but they do state that the unit of volume selected for transmission is the "kilopacket," which was described as 1,000 packets each containing 100 characters. The Service Offering Statement did not list proposed rates for BDN services.

The BDN will connect terminals to terminals; terminals to hosts; or hosts to hosts on a 24-hour, seven day per week basis. Two service grades will be provided for data transmission — standard grade and priority grade.

Each grade of service has several "delivery options." Once a user selects the grade of service desired, billing is computed on the basis of transmission volume "without regard to the amount of time for transmission or to the distance traversed," according to the BDN document.

Within the priority service designa-

Firm Charged With Using Program to Inflate Stock

By E. Drake Lundell Jr.
CW Staff

WASHINGTON, D.C.— Fisco, Inc., a Philadelphia-based auto insurance company, used a computer program to inflate its profits apparently to increase the value of its stock, according to a complaint filed here recently by the Securities and Exchange Commission (SEC).

In one day alone, the program — called "clean" — canceled out almost $1 million in claims against the company, thereby allowing it to report higher earnings, the complaint charged.

Named along with the company in the charges was the firm's former vice-president for DP, Richard C. Mitchell, and five other former officials of the company.

Fisco, which has been "essentially bankrupt" since the fraud was discovered when its books for 1973 were audited, and the six officers agreed to permanent injunctions enjoining them from violations of the antifraud and reporting provisions of the security laws on the same day the complaint was filed.

The "clean" program was essentially very simple, according to SEC investigators.

In the normal course of events, an insurance company sets up certain re-

Document Reveals AT&T Plans Network Offering Data Entry, Inquiry/Response

(Continued from Page 1)

tion, three levels can be selected. Priority 1 assures end-to-end transmission in a maximum of 200 msec; Priority 2 assures transmission in 15 sec; and Priority 3 assures transmission in a maximum of 30 minutes.

The standard grade of service will provide for end-to-end transmission of data in a maximum of four hours.

Within the four transmission service grades proposed for the BDN, three transmission delivery options will be available. These designations will be known as "standard," "deliver when authorized" and "timed delivery."

"Standard delivery" means data is transmitted directly to the addressed terminal or host CPU. If the destination device is busy or off-line, the message is held at the serving BDN node. Attempts to deliver are made at one second intervals.

"Deliver when authorized" means data is sent to the BDN destination node and held in the user's general-purpose storage until the terminal or CPU requests it.

Under the timed delivery option, data is delivered at the destination node at the time of day specified by the user.

Local Nodes

Terminals and computers using BDN facilities will terminate at a communications port at a local BDN node. Such BDN node ports, according to the AT&T specifications, will be similar in functions to ports found on communications front-end processors.

The BDN service will include access charges that cover transmission between the user's premises and the BDN node. Terminations at a node will depend on the equipment which the user has attached to the access line.

Port accesses at a BDN node will be configured to support "specific digital communications protocols, equipment and, in some cases, specific software packages," according to the BDN specifications. From the user's standpoint, the BDN node appears to be a "compatible pseudoprocessor."

The network emulates host processor acknowledgments of received transmissions, but this is meant to signify only that data is "properly received" by the network and not by the host CPU or terminal.

According to the BDN document, users will be able to mix equipment used on the BDN network, with ports designed to accept each type of terminal in the user's net.

Several types of device control are described in the BDN specifications. IBM asynchronous Ebcdic line control will be available to support the IBM 2740 Model 2, Data Measurements Model DMS 442-2, Diablo 1550, Memorex Model 1242 and Telex Terminal Communications Model TC 241 terminals "when equipped with features and options compatible with the 2740-2," the Bell document said.

The asynchronous Ebcdic control will support only polled devices, with each device being polled every 500 msec. BDN access for this line control will require a Bell 202 data set or equivalent unit with 30 msec line turnaround delay. This BDN access will be a four-wire half-duplex facility with continuous transmit carrier, the specifications said.

Access Arrangements

Three access arrangements will be provided under this Ebcdic line control — dedicated, outward dial and shared usage. Dedicated access can include two to 20 terminals as long as the terminals are all on the same premises. This type of access includes a dedicated private line between the BDN node and the user's premises, the AT&T specification said.

Outward dial access uses the dial-up phone network to access a terminal with BDN-compatible autoanswer features. The packet service will provide both dedicated and "shared dial" access port.

The third access arrangement available under the Ebcdic line control will be a shared, multiuser, multidrop line. This arrangement will be limited to Priority 3 and standard grades of transmission because of multiple users sharing a single BDN node.

The Ebcdic line control will support terminals operating at 300-, 600-, 1,200-and 2,000 bit/sec. Terminals with buffer storage ranging from 512- to 5,000 characters will be supported. The user must specify the terminal speed and buffer size, the BDN document said.

BDN will also provide the asynchronous Teletype line control used in the Model 33 and the Model 35 terminals. Teleprinters supported under this feature will be the Anderson Jacobson AJ630, General Electric Terminet line, Teletype models 33, 35, 37 and 43 and Texas Instruments TI 733.

CRTs supported include the Hazeltine 2000 and the Teletype Model 40 (Dataspeed 40) models 1, 2 and 3.

The Teletype line control will provide half-duplex asynchronous transmission, Ascii code, dedicated dial access and shared dial access of 110- and 1,200 bit/sec. With this offering, only dial-up access ports will be available, so terminals will have to be equipped with compatible autoanswer dial capabilities, the specifications said.

The AT&T document listed Binary Synchronous access as a third method, but gave no details on its implementation.

Packaged Services

The FDL will allow users to define and tailor their business needs into communications services. In addition, BDN will provide "common user software communications packages" for a monthly fee. These packages will be written in FDL and can be modified by BDN users. User-modified packages will have to be submitted to the BDN Customer Software Support Center for "validation."

The center will test "all customer-written or altered FDL programs to ensure they do not impact other users or network operations."

The four packaged services available on BDN will be data entry, transaction, storage administration and terminal/host addressing. These were described as communications services in the Bell document.

Asked for a comment on BDN, an AT&T spokesman said the company could not comment on services which had not yet been announced.

Any document being quoted with regard to unannounced services would be an internal document and contain proprietary information; in view of this, AT&T would not be able to answer specific questions, the spokesman said.

New NCR Upkeep Policy Riles Users, Dealers

By Toni Wiseman
CW Staff

DAYTON, Ohio — NCR Corp. has generated a ripple of concern in some corners and a furor in others with the rewriting of its maintenance policy.

The new policy "clarifies that NCR does not have an obligation to automatically continue on maintenance service units or systems sold directly from one user to another or through third-party marketing representatives," according to an NCR spokesman. "Any such representation by anyone will not be supported by NCR."

All equipment sold by anyone other than NCR will now be inspected prior to approval for maintenance services. Such inspection was previously required only if the equipment had been out of service for more than 60 days, the spokesman explained.

The new policy, according to NCR, is a "tightening, extension and clarification of language differences and emphasis" in its previous policy. It was also designed "to clear up certain areas where nothing was said before," the spokesman stated, noting that "what is written policy and what is practiced is sometimes a little different."

NCR's opinion is that users are "not up in arms about it, but are concerned about it," he said.

That concern was demonstrated by a series of weekend meetings between several users and NCR executives including Bob Gaines, NCR's vice-president for domestic maintenance.

Before the meetings, Charles Yahn, president of the Federation of NCR Users, said he was "optimistic that [NCR] will come around to what we feel we need." He was still optimistic after the meeting, when NCR guaranteed him it would alter some points and wording. Yahn hoped to have a final draft of the policy by last Friday.

Others, however, are more distraught about the situation. Guy Simo, president of Computer Enhancement Corp., a firm which takes NCR memory in trade for its product and resells it, charged the new policy causes the value of equipment to drop to zero.

This, he said, is because NCR "will not recertify for maintenance any equipment sold by anyone but NCR, including [intra-user] sales."

Simo discovered the policy change during sales negotiations with a customer in Middletown, Ohio. The policy, he said, had been drafted a month ago and was being issued to district offices.

"It is our contention that NCR would have issued this policy internally and would not have let the NCR users know of the policy change. Users would have found out about the changes on a selective basis when needed," Simo charged.

Policy Differences

The basic policy has remained pretty much the same, according to NCR, in that the company stipulates it will inspect equipment to see that it works correctly before it agrees to put the equipment on a maintenance contract. The wording of the earlier policy provides that the equipment qualifies for acceptance for maintenance after an inspection and any charges to the customer will be limited to certain items such as in-transit damage.

The new policy states NCR will install the equipment, make a thorough examination and do the work to put it into satisfactory condition. The cost of the services will be borne by the prospective user.

The old policy provided for payment on an hourly service rate; the new policy calls for a flat rate, he noted.

He said the new policy also contains general statements to the effect that "NCR's first obligation is to support its direct customers. Its field engineering division will support these direct customers and NCR's own marketing effort" before the efforts of others.

Firm Charged In Stock Scheme

(Continued from Page 1)

serves to cover claims against its policyholders. For example, if a policyholder has an accident and the insurance adjuster estimates the damages at $500, then a reserve of $500 is set aside to reimburse the policyholder after the car is repaired.

What the "Clean" program did was prohibit any increase in claims after they were filed. For example, it might later be found that someone was injured in the $500 accident and the claim might rise to $5,000. The adjusted would send in an updated claim for that amount, but the "clean" program would not register the additional $4,500 liability on the company's books.

In many cases the amounts of claims rise before they are finally settled, the investigators noted, adding that on one day called "Black Friday" in the complaint the "clean" system wiped $1 million off Fisco's liabilities.

Because Fisco was not reporting all of its liabilities, its earnings picture looked better than it actually was, the complaint noted. While the program was in operation limiting Fisco's liabilities, the firm was reporting earnings increases of over 100% per year — and this boosted the firm's stock to a high of $36 per share, SEC indicated.

However, when the fraud was uncovered, the firm, which at one time had written $57 million of insurance, had a loss of $39 million in 1973.

ADR's ROSCOE® Improves Productivity And Reduces Manual Tasks At Hibernia National Bank

ROSCOE Gave Our Programmers Their Own Computer "Our 30 programmers and analysts are very high priced people to be spending time keypunching and running around trying to find program decks. To cut that time and get out of the card business, we needed the ability to interact directly with our computer. The logical solution was ROSCOE," said Don Clark, DP Division Vice President. "Within a week after ROSCOE was installed we could see the change.
The individual who had been in a laborious, archaic card environment had his own online terminal. In effect, he had his own computer. He can submit entries, verify them and have them in the system within seconds. "Everybody wants to use ROSCOE now. For online maintenance. Updating. Development programming. Batch submission of testing. Every programming function."

One Big Difference Between ROSCOE and TSO

"Many of our key people who had come from TSO shops thought ROSCOE would require learning many new procedures. It didn't. They all found ROSCOE easy to use with almost no additional training," added Systems and Programming Manager Reg Campbell. "We did, however, find one big difference between ROSCOE and TSO. ROSCOE requires much less overhead. Nearly 70% less, I'm told. It doesn't interfere with batch jobs and operations functions the way TSO did."

Each ADR product is not just a program but a complete package with full documentation and on-site support. ADR is the only software company with 50 branch offices and representatives in over 30 countries—each staffed with ADR-trained technicians.

Meeting Set to Cover Transborder Data Flow

(Continued from Page 1)

Concern for these issues has produced the movement in Europe to protect national sovereignty, minimize vulnerability and consolidate technical achievements through national privacy laws and international agreements. Some U.S. officials even fear development of a "data cartel," sources said.

Most U.S. officials who will be represented at the Vienna meeting hope reciprocal agreements on the protection of data "can be worked out," sources said.

As early as 1975, the Nordic Council, involving Denmark, Finland, Norway and Sweden, established a working group to harmonize national privacy laws and to consider an international agreement on data flows within Scandinavia and to other countries. Several other European nations, notably France and Germany, are also moving in this direction.

Members of the European Economic Community (EEC) are also working to resolve differences among themselves. However, the EEC's commitment to a common DP policy and economic concerns may make any eventual agreement broader, Pipe noted.

U.S. Slow to Organize

U.S. business leaders believe an open, competitive market in which data base producers and distributors can provide their goods and services is the approach best suited to its interests, several industry leaders said.

However, they have been slow to organize to present a common front at the upcoming international symposium. Serious U.S. consideration of the issues surrounding transnational data flows has only come this year.

An interagency task force has been established within the U.S. government, consisting of 16 members from seven federal agencies. The group is chaired by Dr. Oswald Ganley, deputy assistant secretary for advanced and applied technology affairs at the State Department here.

But the six months work it has planned for itself has yet to be done. "The U.S. is late, and doesn't have an industry advisory committee set up yet," according to Brendon McShane, a consulting specialist with General Electric Co. "We are walking into an international symposium without a position. We are going to get killed."

Others in industry — chiefly the Computer and Business Equipment Manufacturers Association (Cbema) and the Information Industry Association (IIA) — have held meetings and drafted speeches for the international conference or will send representatives to Vienna this month, according to Cbema's vice-president Oliver Smoot.

IIA President Paul G. Zurkowski said his members have concluded harm is already being done to American information services in Europe through surcharges imposed on European users of U.S. goods by the public telephone and telegraph (PTT) authorities in these countries.

"While PTT recognition of the value of information is keeping the door open slightly for U.S. information services, other monolithic monopolies (such as the proposed Euronet) are being created which could foreclose European markets to U.S. services entirely," Zurkowski concluded after a July IIA meeting.

Like Carole Parsons, the executive director of the Privacy Protection Study Commission, Smoot doesn't believe the laws on privacy have to be the same in every country in order for international society to function. Parsons will go to Vienna to explain to the symposium the direction U.S. privacy laws will take if the commission's recommendations are adopted by Congress and the President.

THE NEW METHODOLOGY:

"SDM/70's flexibility allows us to match the level of effort to the size of the project."

—Larry Dick, Manager, Client Support,
R Angus Computer Service, Edmonton, Canada

Larry considers SDM/70 to be a real value; he says, "To reproduce an equivalent or similar set of procedures would have required hundreds of man-hours of professional effort. We immediately perceived that SDM/70 was our best choice."

What is SDM/70? It's a comprehensive set of guidelines that steers a project team through the design of systems. SDM/70 covers all of the system life cycle phases, from initiation through the implementation phase and, for operational applications, including guidelines for post-implementation review and for maintenance-related work.

The SDM/70 structure includes five components: **Methods** guidelines that describe how each task of a given phase is to be performed; **Documentation** guidelines that describe how to prepare the documentation for a given phase; **Forms** guidelines that describe how to complete the SDM/70 forms; **Estimating** guidelines that describe how to estimate costs and schedules for the project (5 to 10% accuracy is now a reality), and **Administrative** guidelines that describe how to administer and control project activities.

To find out how SDM/70 can help you, call or write today.

System Takes Over Voyager

(Continued from Page 1)

several days to understand why the computer was acting the way it was. The delay in finding a solution was caused by the "complexity of interfaces of software and on-board computers," the spokesman said.

First of Two Craft

The Voyager mission is designed to explore Jupiter and Saturn and their satellites. There is also the possibility the second probe might go to Uranus or even beyond.

The second Voyager, called Voyager I because it will reach Jupiter first by a faster route, is now scheduled for liftoff on Sept. 6. Its first scheduled liftoff was delayed for a few minor adjustments, one of which was to install two new springs on the boom system, since scientists thought for a while that the problem was mechanical rather than communications related.

The on-board computers, designed by the Jet Propulsion Laboratory (JPL) for Nasa, are programmed for a greater degree of self-care than ever before and can also direct many of the subsystems on the ship.

In addition, the software can be reconfigured to meet changes as they occur, according to a JPL spokesman.

Ambitious Attempt

This is the most ambitious attempt by Nasa to explore the solar system in an effort which is expected to cost more than $400 million, according to sources. A total of 85 scientists incorporated in 11 science teams are working on the project, a spokesman said.

The instruments on board will gather information from the planets and satellites including data on how they interact with solar wind, atmospheric motions, different types of atmosphere, hydrogen clouds and satellites' orbits.

In addition to telling about a particular planet's conditions, the data might aid in discovering the evolution of the planetary system, a spokesman said.

The two Voyagers will transmit pictures and data using cameras and scientific sensors as well as electronic communication devices.

Fresh Energy

The two spacecraft will get a new charge of energy going from Jupiter to Saturn. Through careful targeting, the two craft will be pulled into the planet's gravity and then sent out at higher velocity to the next targeted course, a spokesman said.

The first spacecraft, which was launched Aug. 20, is following a high-trajectory course which will cause it to take longer to reach Jupiter than the second spacecraft which is scheduled for liftoff on Sept. 6.

The first spacecraft launched will arrive at Jupiter around July 1979; the second spacecraft will arrive three months earlier, in March.

Because of the great distances involved in the interplanetary mission, a 12-foot-wide disk antenna, the largest ever used, was installed in the Voyagers. But even with this improvement, communication by radio signal from Jupiter to Earth will take 45 minutes.

This long communication delay required advanced electronic equipment so the craft can be more independent from earth-based control, a spokesman said.

Commands to the spacecraft are transmitted from an IBM 360/75 in the center to deep space stations around the world and then to the space craft.

Down Link Telemetry

The down-link telemetry also goes through the deep space stations by cable or satellite links to a Univac 1108. The telemetry is processed and then displayed on CRTs at the center.

The data is recorded on tape to be processed later on an IBM 360/75 for charts and plots.

There are six custom-designed onboard computers on each Voyager, two which control altitude computer command, two for the ground system and two for the flight data subsystem which performs the formatting and downlinking, a spokesman said.

Calls for Gallic Mastery of Models

French Study Urges Independence From U.S.

By G. Russell Pipe
Special to CW

PARIS — "Is it necessary that all models used to prepare monthly or quarterly forecasts of European economic trends have to be designed in the U.S. and disseminated to Europe via networks belonging to American firms?"

A recent report published by the Ministry of Industry and Research here asked this question as it explored the means currently available to amass sufficient data, tools of analysis and dissemination that could bring self-sufficiency in French planning strategy.

In a frank review of French planners' dependence on U.S. data resources and processing methods, J.M. Treille proposed "The Tools for Economic and Industrial Strategies." "The most efficient econometric tools and their suppliers are to be found exclusively in the U.S., from such services as Data Resources, Inc. (DRI), distributed in France by Tymshare; Chase Manhattan Econometrics; and General Electric Mapcast," Treille said.

American organizations such as the National Bureau for Economic Research, the University of Maryland Inforum model and MIT's mathematical model of economic behavior are the best sources of "economic software" for France, he added.

Despite the availability of basic economic indicators and statistics from the Organization for Economic Cooperation and Development (OECD) and the International Monetary Funds, as well as sources such as the United Nations and World Bank, the "monopoly of tools needed for basing modern national economic analysis are on American informatics networks." Today it is easier to process and interpret data from OECD in France on the DP nework of DRI than the French statistical institute Insee, "which has the data but cannot organize [it] for sufficient accessibility by users."

Interference Feared

Dependency on a foreign power for crucial information resources is at the root of French concern. This is indicated by Treille's "basic questions about the monopoly situation:

"Will the control of the tools and data lead to imposing hypotheses, results and thereby indirectly to policy choices?

"Will all these resources be accessible without regard to French data processing or telecommunications policies?"

And, striking a somewhat political tone, he asked: "Aren't the European economists capable of developing research systems for economic decision-making without injuring cooperation with the U.S.?"

How can this condition be reversed? Treille called first for a mastery of the models, software and integration of data sources by:

- Reducing the use of American networks.
- Improving European supplies of basic data and avoiding the American data banks.
- Initiating research into "reconstituting all or major parts of existing [American] data bases on a continuing basis."
- Constructing more suitable, flexible models by departing from classical approaches to economic analysis.

The econometric service market is largely American, Treille noted, so U.S. commercial networks have become highly sophisticated in organizing the necessary data, creating models and software to effectively prepare economic indicators and industrial planning information.

Europe, on the contrary, is less developed because of lack of demand for such services and absence of a commitment to such an effort, he indicated.

Another factor is that "dynamic data" in American systems is much more readily available than statistical information which the user can obtain directly from European sources. The American data is easily accessible in a form for conversion and treatment; it can be retrieved soon after events or time periods have passed.

Indigenous Industry

The study was a two-year effort designed to present and analyze sources of French economic and industrial data and indicate where the French government and others in Europe may begin an indigenous program. It essentially tells French officials to take a cue from American enterprise and gear up and perform economic analyses by building their own capabilties.

The French abhorrence of foreign dependency is very much present; the emphasis is on what the country must do for itself. Such developments as a national public data network, the Euronet system for exchange of information and even the move by postal, telegraph and telephone authorities to crowd private networks through volume-sensitive pricing seem to indicate that protectionist policies are in the wind.

It seems in the short run, however, that the French cannot restrict the present services because there is no real domestic capability to put in their place.

NOW--CA-SORT 77!

Installs in ten minutes--start saving with first run!

Your FREE 15-day trial will prove everything you have read about CA-SORT 77, the amazing sort software system more than 1700 DP Managers have chosen to use in their own daily routine and environment!

START SAVING WITH THE VERY FIRST SORT RUN

Experience results like these:

- Save up to 50% on I/O activity!
- Save up to 50% on Disk Work Space!
- Save up to 25% on CPU time!

And ... you'll save turn around time, precious core space and find CA-SORT 77 easy to tune for maximum optimization

Overall - - you must improve throughput even during the 15-day FREE trial, or return the system and owe nothing!

CA-SORT 77 IS THE NUMBER ONE DATA-PRO SORT SYSTEM!

Not only is CA-SORT Number One on the Datapro survey - - it is the **only** sort software system to earn a position on the "super honor roll" ... the exclusive upper 1% of all sort systems!

CA-SORT USERS HAVE RECEIVED MORE THAN 50 ENHANCEMENTS SINCE 1974 - - ALL ABSOLUTELY FREE OF CHARGE!

Continuous world-wide research results in more effective use in typical CA-SORT installations! If you had installed CA-SORT in 1974, by now you would have received more than 50 improvements!

CA-SORT 77 incorporates every enhancement ... and is 15% more efficient than the previous release.

So - - try CA-SORT 77 free of cost. Just write or telephone **today**. The complete information kit will be rushed to you along with all the details of the trouble-free 15-day trial! Here's a coupon to start you on the road to savings!

COMPUTER ASSOCIATES

U.S. OFFICES: California, Connecticut, District of Columbia, Georgia, Illinois, New York, Ohio, Texas.

Justice Brief Gives Interpretation of Antitrust

By Molly Upton
CW Staff

SAN FRANCISCO — What constitutes a violation of Section 2 of the Sherman Antitrust Act?

With directed verdicts issued in the antitrust cases brought against IBM by California Computer Products, Inc. and by Greyhound Computer Corp. — and with a reversal of the ruling in the latter case — many observers are asking that question.

The Justice Department outlined its version of what a plaintiff needs to demonstrate in order to prove monopolization in violation of Section 2 of the Sherman Act. The description was contained in a friend-of-the-court brief filed in support of the Calcomp motion asking the Ninth Circuit Court of Appeals here to overturn Judge Ray McNichols' directed verdict and to order a new trial (see story on Page 1).

"Monopoly power is the power to control prices or exclude competition," Justice stated.

The plaintiff must prove both that the defendant possessed monopoly power in a relevant market and that it engaged in conduct with the purpose or intent of exercising that power, according to Justice. However, "proof of a specific intent to monopolize is not required."

This "requisite purpose or intent can be established by examining the defendant's business practices to see if they were designed to acquire or maintain monopoly power or had that effect . . .

"Where a company possessing monopoly power engages in business practices which, though not unlawful in their own right, are more restrictive than necessary on competition in the relevant market, the trier of fact can infer from such conduct that the company acted with the purpose or intent to exercise monopoly power," Justice said.

Thus one does not need to prove the defendant's business policies were "predatory."

The plaintiff need not prove the defendant obtained or maintained his monopoly power through restraints of trade that are illegal under Section 1 of the Sherman Act, Justice said. Such proof, however, would in itself be sufficient to prove the defendant had acted with the purpose or intent of exercising monopoly power.

To determine whether a defendant possesses monopoly power, "the finder of fact must evaluate a number of facts including the structure of the market, the market shares of the companies in the market, the entry barriers into the market and the behavior of firms in the market," Justice indicated.

The determination of whether a firm has a monopoly share in a market should be left to the jury if sufficient statistical evidence is given indicating a company possesses a very large share of a relevant market, the brief stated.

Also, "the issue of whether a defendant has acted with 'the purpose or intent to exercise' monopoly power is largely a factual question which can only be resolved by examining the totality of the defendant's activities and the impact of those activities."

Calcomp Appeals Verdict in IBM Lawsuit

(Continued from Page 1)

ment should be reversed if he did not apply the proper standards in considering IBM's motion for dismissal of Calcomp vs. IBM, according to the brief filed by John H. Shenefield, acting assistant attorney general.

The moves followed closely on the heels of a decision by the same Appeals Court to overturn a lower court's direted verdict and order back to trial the antitrust case of Greyhound Computer Corp. vs. IBM [CW, Aug. 29].

Mindful of the three years and four months the Ninth Circuit took to consider the Greyhound case, Calcomp also petitioned for an expedited hearing.

One Overriding Question

The Calcomp brief observed that the "dispute involves a singular, overriding question of the law: may an alleged monopolist, in reacting to competitors challenging its monopoly position, engage in conduct which is either calculated to or will inevitably operate to effectively eliminate them?"

McNichols apparently agreed Calcomp had established sufficient evidence to permit a jury to decide whether IBM had monopoly power in one or more properly defined "relevant markets," Calcomp indicated.

"The crucial question dispositive of this litigation," Calcomp said, "is whether the acts and practices of IBM in preserving that position constitute a violation of either the monopolization or attempt to monopolize clauses of Section 2 of the Sherman Act, or both."

In addition to citing evidence supporting Calcomp's contentions regarding market share, the brief detailed those steps by which IBM "deliberately sought to preserve its monopoly power by suppressing competitors."

Department Concerned

The Justice Department, in its friend-of-the-court brief, indicated that private antitrust actions play an "important supplemental role" in the enforcement of antitrust laws and frequently involve significant issues of antitrust policy.

Thus, the department said, it is "concerned that the district court did not apply the proper legal standards in considering the motion.

"Summary procedures, such as motions for directed verdicts, are rarely appropriate in antitrust cases because of the complexity of most such litigation and because motive and intent are, in many cases, among the several significant issues which only the trier of fact can resolve," Justice said.

Because McNichols did not explain his decision, it is possible the decision was based on an erroneous view of Section 2 of the Sherman Act, according to the Justice brief.

Justice argued that since Calcomp had apparently established relevant markets to McNichols' satisfaction, it was up to the jury to decide the other two issues — whether IBM possessed monopoly power and whether it had "the purpose or intent to exercise that power."

"These issues, however, are inherently factual in nature and must generally be resolved by the jury after receiving appropriate instructions from the court," Justice said.

Statistical evidence may constitute prima facie proof of monopoly power in a market, but the exact percentage of market share varies from case to case depending on the relevant market, Justice continued.

"Since Calcomp presented evidence indicating that IBM possessed a very large market share, it apparently presented sufficient evidence to send this issue to the jury — assuming Calcomp's evidence was not so inherently unreliable that no reasonable juror could have believed it," Justice stated.

"Logically, therefore, the district judge could not have directed a verdict because of a failure of proof on this issue without improperly weighing the evidence of substituting its judgment for that of the jury."

Observing that business practices that are legal for a nonmonopolistic firm may be illegal for a monopolistic entity, the Justice Department said a jury could have inferred from IBM's conduct that it acted "with the purpose or intent to exercise monopoly power if its business practices were more restrictive than necessary on competition in a relevant market."

THE TERMINAL HEADACHE

When you lease a terminal from RCA, it's like owning one—but without the headaches.

With an RCA lease arrangement, we take on the full responsibility. You get the right terminal to suit your individual requirements. And RCA's expertise is always at your fingertips so you're never at a loss for service.

With data communications specialists in 175 cities, and fifteen warehouses coast to coast—you get prompt delivery and fast installation and maintenance. And a 24-hour dispatching service, too. This is the kind of specialized service RCA offers.

At RCA, part of our job is making your job a lot easier. And that's what takes the headaches out of terminal leasing. Headaches with *your* terminals? RCA can administer quick relief with third party maintenance. For full details and rates, call or write: RCA Service Company, A Division of RCA, Technical Services Bldg. 204-2, Cherry Hill Offices, Camden, N.J. 08101. Phone: (609) 779-4129.

AND HOW TO CURE IT.

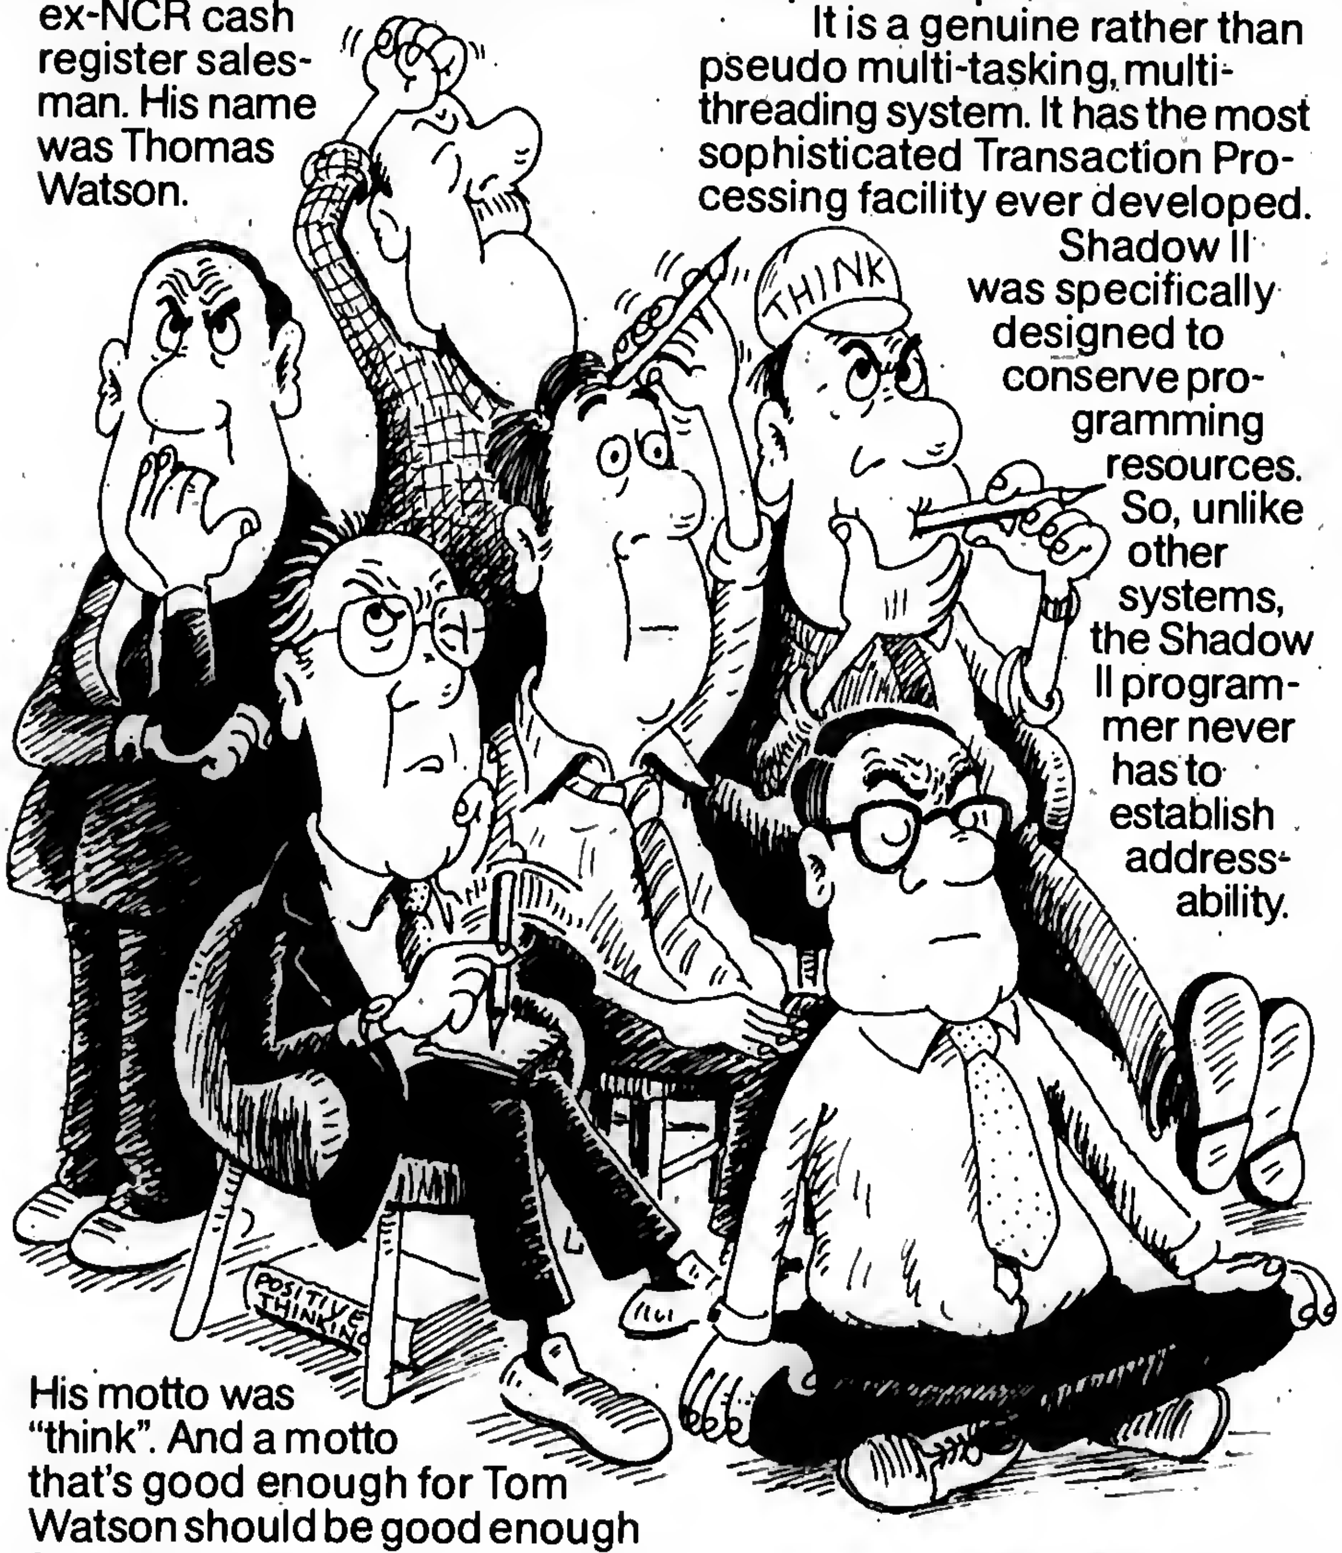
Tom Watson said "Think." So we did.

IBM is a very remarkable company.

It's the seventh largest industrial corporation in the world. More than half of its quarter of a million employees are university graduates.

IBM, whether one likes it or not, produces the world's finest computers.

The company was created in its present form by a Scottish ex-NCR cash register salesman. His name was Thomas Watson.



His motto was "think". And a motto that's good enough for Tom Watson should be good enough for anyone.

So when Altergo set out to create an entirely new TP monitor they did a lot of "thinking".

The result is Shadow II. Today it's brand leader in the very tough European market.

The result of six years' continuous development it has major advantages over its competitors.

For starters it takes just twenty minutes to install. As opposed to the days or weeks it takes to get some of its competitors operational.

It is a genuine rather than pseudo multi-tasking, multi-threading system. It has the most sophisticated Transaction Processing facility ever developed.

Shadow II was specifically designed to conserve programming resources. So, unlike other systems, the Shadow II programmer never has to establish addressability.

Shadow II provides high-level Cobol verbs and Assembler or PL/1 macros for use with either of these languages.

Because Shadow II provides so many more pre-written facilities the coding is far less complex than with other systems.

Shadow II can also save the IBM TP user between 25% and 75% of his main memory and CPU time requirements compared with any other system.

Terminal response times will always be faster with Shadow II – sometimes by a factor of three or four. There are many reasons for this, but one of the more important is that Shadow II provides users with unique high performance access methods to terminals and files rather than using antiquated IBM modules.

In brief, Shadow II is the fastest, most cost-effective and easiest to use TP package in the world.

So, to quote old Tom again, we hope we've given you cause to "think" - about your TP requirements.

Altergo Software Inc.,

Dutch Find Them Contradictory

Newspaper Hits U.S. Privacy Recommendations

By Nancy French
CW Staff

ROTTERDAM, The Netherlands — The European business community is apparently troubled by the way the U.S. Privacy Protection Study Commission has proposed to deal with personal privacy in the world of recordkeeping, judging from an editorial in the *NRC Handelsblad* here recently.

Holland's national financial daily newspaper, considered equivalent to the *Wall Street Journal* in the U.S., called the commission's analysis "impressive," but found its recommendations "fragmented" and "contradictory" in some fundamental respects.

The commission's report indicates "Europe and the U.S. are in danger of each going their own way in protecting privacy" in recordkeeping, the editorial said.

Going separate ways could have a serious impact on data which now flows from country to country as part of international business.

Cited as contradictory was the commission's assertion that it wants those that maintain the data to spend their money on improving their record systems, rather than on expensive court cases. However, the commission's recommendations place all the responsibility for assuring they have improved their systems on the individual data subject.

It is the individual who will have to go to court with his complaints, the editorial pointed out.

Further, "the American report acknowledges that the individual approach to the privacy problem cannot be expected to solve the more systematic aspects such as bureaucracy.

"Indeed, one cannot expect from individual complaints and court cases that they will produce 'people-oriented computer systems,' as it is called in the jargon. To further this, one needs policy initiatives [but] the proposed, semisoft Privacy Board lacks the weight even for that," the editorial charged:

The American commission reached its conclusions without even mentioning European legislative initiatives. "Data traffic between the U.S. and Europe has been called, with good reason even now, the lifeblood of many multinational companies. This is the trend; data transmission is the future.

"That the American business community has succeeded to block penetrating privacy regulation for the private sector can be called a Phyrhic victory. Of course, harmonizing the privacy initiatives within Europe promises to be quite a problem. The German Bundesdatenschutzesetz that was published in February was weaker than the Swedish Data Act of 1973, and now Denmark has published its own 'mild' variety.

"But these diverging European bills at least put a bottom line in the market where the American commission leaves holes," the editorial said. "It is inevitable that European governments will conclude that reciprocity in the protection of personal data traffic . . . is not sufficiently guaranteed.

"Canada has experienced this already from the U.S. From these suspicions to restrictive measures is only a step."

Norwegian Privacy Bill Seeks Licensing

By G. Russell Pipe
Special to CW

OSLO, Norway — The government here has proposed a privacy law that calls for licensing DP installations that handle personal data in both the government and private sectors.

The law, which will be considered by Parliament later this year, gives personal information a broad definition, applying it to identifiable individuals, organizations or foundations.

A rule of relevance to user needs is applied, except that information on race, politics or religious convictions, suspected criminal activity, trial or conviction, health, drug abuse, sex habits and family affairs may not be collected without clear justification.

A control board of seven members will be responsible for monitoring general developments in personal record keeping, advising organizations of ways to improve their practices. It will conduct inspections and maintain a register of all licensed systems.

Licensing would be required of most DP operations handling personal data, specifically those holding sensitive data. Also licensed are agencies that provide credit references, direct mail firms and opinion survey companies.

Applications for licenses will require information assuring compliance with:

- Collection and control requirements;
- Processing and storage procedures;
- Linkage to other personal files;
- Secondary use or transmission to other systems;
- Availability of data to person registered; and
- Right of individuals to demand inspection.

A penalty of up to one year imprisonment has been proposed for violations.

Foreseeing a Scandinavian harmonization of data protection legislation, the Norwegian bill provides that some requirements affecting export of personal data can be waived for certain qualifying countries.

**Give us your best.
We can make them better!**

Honeywell is offering seminars and consulting services on state-of-the-art computer applications.

No matter what kind of system you're using, your people can learn to use it better and more effectively.

We offer seminars on a variety of Systems Sciences – on subjects like distributed systems, security and privacy, data center management, communications and networking, project management, and structured programming.

Seminars are scheduled regularly in major cities. Or they can be presented at your place of business.

For complete details, use the coupon. The sooner the better. The state-of-the-art is changing fast.

While Other States Waver

Vermont Excludes DP Services From Sales Tax

By Nancy French
CW Staff

Protestations against taxing computer and DP services have begun to pay off in three more states, including Vermont, Missouri and Tennessee.

The Vermont legislature has amended the definition of a taxable sale set forth in the Vermont sales and use tax law to exclude "computer and data processing services where tangible personal property is transferred as part of such a service transaction." The exemption applies as long as "no separate charge is made for the tangible personal property and so long as the value of the tangible personal property transferred is essentially an inconsequential element in relation to the value of the service transaction."

The amendment went into effect July 1, 1977, but the law provides that the amendment will be applied retroactively if such treatment is to the benefit of the taxpayer.

The new provision would be applicable to firms engaged in batch processing services, acording to Sanford H. Goldberg and Arnold B. Tanzer, both of Roberts and Holland in New York.

Their opinion was expressed in the July issue of the Association of Data Processing Service Organizations' *Tax Newsletter.*

Some Areas Unclear

The conclusion is not so clear in the area of time-sharing, since the wording of the statute does not resolve the issue of whether time-sharing should be viewed as a DP service or merely as a license to use tangible property, the two attorneys indicated.

The extent to which the statute applies to contract programming and keypunching is also uncertain, they said.

Robert M. Sherin, a non-judicial legislative counsel to the Data Processing Management Association (DPMA), disagrees with the Goldberg-Tanzer opinion on programming and DP services.

According to Sherin, "the law acknowledges the broad profession of software and DP services that has been recognized in a number of court decisions handed down recently. As such, both should be included under the law."

While a similar law was passed by the Ohio state legislature last year, the issue is still being fought on a number of fronts, including New York.

A temporary moratorium on software taxes there [CW, Aug. 29] has provided some short-term relief, but the issue has not yet been resolved.

In Missouri, the Department of Revenue amended its sales tax regulation on computer printouts making them nontaxable. The amendment also provides some refunds for companies that previously paid such taxes.

Meanwhile, in Tennessee, the battle against software taxation is still alive, but the class action suit brought by Sherin, president of Nova Computing Services, Inc. of Miami, is in need of support, according to Sherin.

The Federal District Court for the Middle District of Tennessee denied the state's motion to dismiss the class-action suit filed by Sherin [CW, Aug. 8] and ordered the state to answer a motion for summary judgment.

But the court also gave Sherin until the beginning of September to prove that his suit is really a class action.

Sherin indicated the action needs the support of a person, firm or association that is "substantially affected" by the Tennessee legislation.

Go beyond structured programing

Ned Chapin offers two new workshops on how to reduce software complexity, and on new ways to enhance gains from the structured approach.

These superior new techniques are in practical ready-to-use form. Put them to work for you by registering now for one, or both courses.

Reducing Software Complexity
Shows ways to measure software complexity in objective quantitative terms, and what to do to reduce software complexity. Techniques help in design, implementation, and maintenance. Improve even structured designs and programs. Attendance limited to 24 programers and analysts. 2 days. $425.

Advanced Structured Techniques
Shows ways to improve the gains from using structured design and structured programing techniques, and concentrates on those advanced techniques that are most powerful. This workshop is open only to persons with experience and training in either structured design or structured programing. Attendance limited to 22 programers and analysts. 2 days. $450.

Instruction
Chief Instructor: Dr. Ned Chapin, InfoSci Data Processing Consultant.
Reserve Instructor: Ms. Susan P. Denniston, IntoSci Sottware Consultant.

Dates and Places
San Francisco:
Sept. 29-30 Advanced Structured Techniques
Oct. 13-14 Reducing Software Complexity
Chicago:
Nov. 10-11 Advanced Structured Techniques
Washington, D.C.
Oct. 25-26 Advanced Structured Techniques
Dec. 6-7 Reducing Software Complexity

In-House Courses
InfoSci offers consultation and other courses including how-to workshops at the offices of organizations going "structured" or needing help.

For programers and analysts:
- Structured Design Workshop. 3 days.
- Structured Programing Workshop. 3 days.
- Structured Design and Structured Programing Workshop combined. 5 days.

For managers and project leaders:
- Management of Structured Programing Projects. 2 days.

Information and Registration

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development and testing of APL, BASIC, FORTRAN, COBOL, RPG, Compilers.

OPERATING SYSTEMS

Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER

Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK...

Get in touch today

By Phone: 316/687-6192
By Resume: Mr. Jerry Long, Professional Placement Office, Dept. CW-95
3718 North Rock Road, Wichita, Kansas 67226.

You'll get complete details either way.

An Equal Opportunity Employer M/F

From $378,000 to $2.2 Million

GAO Reports Saga of DP Contract Overrun

By Molly Upton
CW Staff

WASHINGTON, D.C. — When does a $378,000, nine-month contract become a $2 million plus, 44-month contract for a system that was never completed and barely used?

Or, as the General Accounting Office (GAO) seems to be asking, at what point should a contracting agency know it is "throwing good money after bad"?

A report by the GAO details the saga of an award by the Department of Health, Education and Welfare's (HEW) Office of Education (OE) to the North American Rockwell Corp., now Rockwell International.

The award was for the Project Grant Information System, which was to have helped OE management plan and select new projects; award and control grants; and administer programs and individual projects. The system was also intended to control and forecast program budgets and obtain information on educational trends.

The proposal for the system was submitted "unsolicited" by Rockwell and awarded on a sole-source basis. Rockwell essentially proposed an expanded design of a system it had previously designed for OE.

The contract was awarded in October 1969 for a system that was to have been operational by July 1970 at a total cost plus fixed fee of $378,147.

As of June 1973, however, the price was up to $2.2 million and another $842,000 in costs brought the price tag to over $3 million.

The award was terminated before Rockwell completed all the work it was to have accomplished, the GAO indicated, and in March 1974 the OE abandoned the system, citing unreliability and a high cost of operation.

The OE later prepared a less sophisticated system for about $20,000 that it said met the needs that were to be filled by a simplified version of Rockwell's system. However, Rockwell indicated in the GAO report that this system utilized the data base it had prepared.

Both to Blame

The GAO report, "History of a contract Awarded to Develop a Project Grant Information System," prepared at the behest of Sen. William Proxmire (D-Wis.), exonerates neither party.

The contract "grew because of poor Office of Education management and poor contractor performance. The [OE] did not take strong action to make certain that the contractor would complete work on time and within the contract price," the GAO found.

"Frequent changes in responsibility for the contract within the [OE] also hindered its capability to manage the contract," the GAO said.

Responsibility for administering the contract was assigned to five OE project officers and three organizational entities during the contract period, the report said.

Rockwell also changed personnel. Two months after the contract was awarded, the firm had its third project team on the job. The OE project officer said the second and third teams lacked the expertise to perform the task outlined in the contract.

Rockwell, it said, wanted to make some changes in the system because it lacked the expertise to do the work as originally agreed, the GAO report indicated.

Although several OE officials expressed reservations about the system before the contract, the OE approved 16 modifications.

Didn't Observe Rules

The OE "should have placed greater emphasis on criteria outlined in Federal Procurement Regulations requiring consideration of past contractor performance in determining contract fees, including those on contract modifications," the GAO said.

Rockwell had difficulty delivering products which met with OE approval, yet the awards continued. For instance, Rockwell failed to submit all design documents to OE by mid-April 1970, and those that were submitted were judged unsatisfactory by OE, the GAO reported.

Also, the OE did not always comply with the Federal Procurement Regulations and "circumvented [OE] internal procedures in administering this contract."

For example, after the Sole Source Board was formed to review requests over $25,000, the OE granted a $32,000 extension of the contract without submitting it to the board.

In other instances, the contractor worked without a contract because the OE did not approve extensions promptly, GAO indicated.

On the first major extension of the project, the GAO could find no evidence that officials involved in the project had reviewed Rockwell's proposal before the contracting officer made the award.

Although the OE handled the proposal as unsolicited, it was actually a follow-on effort to earlier contract work. "As such, it did not meet OE criteria for an unsolicited proposal," the GAO said.

The saga outlined in the GAO report includes details such as OE's knowledge that Rockwell would assign personnel unfamiliar with the earlier system.

The scope of the project was reduced after the contract price had reached $1.8 million about two years after the original completion date.

"OE officials told us they had found the system as previously proposed too complex. It required too much data preparation and input and provided reports OE management did not use," the GAO stated.

The GAO observed that "because the available contract documents did not always delineate the costs of individual tasks to be performed in each proposal, we could not determine the amount of funds awarded to cover cost overruns vs. increases in the contractor's scope of work nor whether the overruns were the fault of OE or the contractor."

A review of the unfinished simplified system by an outside firm indicated the programs ranged from "barely adequate" to "useless."

HEW Tightens Controls After Learning Its Lesson

By Molly Upton
CW Staff

WASHINGTON, D.C. — Calling the Project Grant Information System (PGIS) a "case study of a systems failure," the Department of Health, Education and Welfare (HEW) indicated it has learned its lesson.

The PGIS, commissioned by HEW's Office of Education (OE), mushroomed from a $378,000 contract to one of more than $2 million as both OE and the contractor, Rockwell International, attempted to arrive at a usable system.

Although many procedural changes recently made by HEW will prevent such a saga from recurring, the changes are not a direct outgrowth of the PGIS project, HEW said.

HEW has established an inventory of its systems and funding for a new system may not proceed until the developing agency within HEW registers it in the inventory.

HEW is about to initiate a long-range planning process for computerized systems which should "help ensure that the program managers, rather than the systems designers, take responsibility for systems resources," according to a report by the General Accounting Office.

Officials at all levels have been made more familiar with procedures to be used with sole-source contracts.

The contract justification and review procedure has been strengthened so stronger and more detailed justification is required before funds are allocated for new, extended or modified contracts, HEW said.

"The concept of PGIS was sound, but probably too large for HEW's state of the art at that time," HEW said. The system "attempted to do too much at one time.

As originally conceived, it would not only monitor discretionary grants, but also provide abstracting, indexing and cross-referencing capabilities. These attributes were (and are) desirable for such a system. Unfortunately, a similar system did not exist in OE at the time," HEW said.

"The size and complexity of the job undertaken was not adequately comprehended. There was an attempt made to design and put together a system that satisfied all sorts of management purposes," the agency added.

A Stretch, Not a Jump

There have been indications for some time that IBM's Systems Network Architecture (SNA) has not been an overwhelming success with users. And hesitancy about switching to SNA has been reported.

But now an industry consultant has predicted that major changes to the structure of SNA are slated within the next few years, According to Howard Frank, president of Network Analysis Corp., the price performance trade-offs of SNA are not well understood [CW, Aug. 15]. And since there is so little operating experience with the environment that SNA needs, there are few users that have seen fit to transform their existing networks.

It now seems IBM "preannounced" the SNA concept to achieve a marketing advantage with users who were on the threshold of making teleprocessing decisions. But users who considered the architecture, together with its required software and hardware upheaval, have found few benefits that have actually been proven in the field.

There is certainly no mass immigration to SNA. And if Frank is correct, it will take some hard performance statistics together with attractive costs to cause users to jump into this environment.

All this may leave IBM with few options other than a major rewrite of the SNA specifications. It may be that SNA was ahead of its time; it is also possible that SNA is actually a way to increase dependence on IBM products or that it is too complex for users to grasp.

Whatever the cause, users apparently will force IBM to make some major modifications in the near future.

In the meantime, there seem to be few users that cannot upgrade their networks within existing, more readily available data transmission options. The message here may be that it is better to stretch existing technology than to jump for the first brass ring that comes along.

No Retreat

A recent survey of minicomputer users showed there is still serious concern about the software support provided by minicomputer vendors [CW, Aug. 29]. About 25% of those surveyed said there is room for improvement in the software provided by their procssor vendor.

The mini business grew up as an "iron-only" area at first; only later did suppliers begin to provide operating system software and applications programs.

Perhaps in this context, software support problems can be excused because they are a relatively new development. But at the same time, vendors of this equipment are multiplying faster than in other segments of the computer industry. And this rapid growth (especially as evidenced by Digital Equipment Corp.) also incurs an obligation to give the user the best possible systems support available.

Part of the sales pitch for minis is that they can do certain jobs more effectively than the number crunchers which preceded them. If this promise is to be kept, there must be high-quality systems support.

The minis continue to offer users economies of scale over mainframes, but if they operate at less than achievable efficiency, they will — like many mainframes — be wasting processor power.

The mini makers have pledged to give users the systems support that is required. This is an ongoing commitment from which these vendors cannot and must not retreat.

Data Past

Five Years Ago
Sept. 6, 1972

WASHINGTON, D.C. — A study released by the General Accounting Office (GAO) revealed that computer performance evaluation techniques — both hardware and software — could increase the productivity and efficiency of computer systems. GAO found the use of such techniques resulted in government savings of 20% to 40% and therefore recommended their use be encouraged by the Office of Management and Budget for governmentwide use.

— — —

WASHINGTON, D.C. — A Nixon Administration-sponsored bill was introduced in the Senate by Sen. Roman Hruska (R-Neb.) to permit greater access to the records in the FBI's Computerized Criminal History data bank of arrest records. The bill, which proposed stricter penalties for misuse of the data, was introduced at the request of the Justice Department in response to a U.S. District Court decision that banned the dissemination of such files outside the U.S. government or local law enforcement agencies.

Eight Years Ago
Sept. 10, 1969

NEW YORK — Data Network Corp., user of Scientific Data Systems (SDS) 940 time-sharing system, sued SDS for $10 million in compensatory damages and $1 million in punitive damages. The suit, filed in federal district court here, charged the equipment was "totally inoperational for repeated and protracted periods." Data Network planned to stop offering service on the 940 and switch its customers to a General Electric computer and an IBM 360/40, a spokesman said.

Letters to the Editor

Leaving Out Quite a Few

I was initially impressed by Jack Stone's attempt to analyze the attributes of a successful DP department [CW, Aug. 22]. I am in agreement with "his" theorem in which he discovers the DP department also contains humans.

However, I am amused that he seeks this management attitude in only one class of DP installation. I am dismayed that Stone had to disqualify an apparently successful installation because it was "science-oriented." Perhaps he could better negatively prove his theorem by limiting his category to people who process payroll on Tuesday in Roman numerals.

Stone is already leaving out quite a few of us.

J.W. McGonigal
Ann Arbor, Mich.

Question of Liability Coverage

Readers of Alan Taylor's Aug. 1 and Aug. 8 columns regarding IBM's reaction to the amended Australia Trade Practices Act should know the following:

IBM, along with a number of other companies, is seeking clarification of one section of the amended act ("Conditions and Warrantees in Consumer Transactions") that may expose a company to open-ended liability. Australian government officials have said some firms have not been able to get insurance coverage for this risk, and IBM Australia insurance brokers say insurance coverage is not available to protect the company against the increased risk.

It is not true, as Taylor stated, that IBM is objecting to the "Unfair Practices" section of the act. That section was virtually unchanged by the recent amendment, and IBM's internal guidelines on ethical conduct of its employees worldwide are in keeping with it.

Taylor also stated that IBM Australia's action could "strangle" IBM customer operations there. That won't happen. It should be noted that contracts in force before July 1, 1977 are not affected by the amended act.

Implications 'Distorted'

The Aug. 22 front-page headline "DP Deprives Workers of Job Satisfaction, Europe Studies Show" is an example of journalistic distortion tht has become far too common in this country. The fact that some study group claims something to be so does not "show" that it is so.

As a matter of fact, an editor with a particular point of view can promote it simply by selecting the right studies and offering their conclusions as fact. Thus we have been constantly advised that one group or another is disadvantaged, one product or another is bad for your health, one business or another is exploiting society — with "studies show" added to imply the existence of hard scientific evidence.

Even more questionable is another headline on the same page: "No Argument: 'DP Causes Unemployment.'" In fact, one of the panelists referred to in the story stated that "on the global level computers will increase employment." Is that what you call "no argument"?

Frederick T. Van Veen
Boston, Mass.

Readers Comment on Degree Requirements

The Human Connection

By Jack Stone
Special to CW

Although I often cavil about the lack of communications in our business, whenever I solicit letters on deeply personal issues, I receive competent analyses. These are usually expressed with proper articulation, easy style and positive intentions.

Now that I have acknowledged all the letters received in response to Regina Litman's letter on the bias against nondegreed DPers [CW, July 4] and completed my initial assessment, I will use this first column on the subject to present two particularly thoughtful letters which provide a basis for understanding the nature of the question and planning future actions.

— — —

The first of these letters is from Earl Chrysler of Kenosha Falls, Wis. who provides a historical perspective:

"... Only a few years ago many employers advertising for programming personal specified 'degree in mathematics preferred." The rationale was not that the person would need to use differential ... calculus as a programmer. Rather, employers appear to have believed that training in high-level mathematics had developed in one the ability to take a statement of a problem and, through the use of disciplined, logical thinking, define the problem and design a procedure for finding the solution to the problem in a minimum of time.

"Further, these persons were accustomed to working with symbols rather than actual numbers. There is a strong similarity between the manipulation of symbols by mathematicians and the manipulation of mnemonic labels by programmers. The value of the symbol and the contents of the address for which the label stands are irrelevant. What is important is the manipulative procedure.

"Why, then, has the change in preference from mathematical education to business education come about? I offer a possible explanation. Before organizations began selecting persons with a degree in business for programming positions, the majority of the programmers would have either a degree in mathematics or no college degree. As time passed, these persons progressed into positions in the systems analysis area.

"When these persons would interact with user department personnel, they typically would have a communications problem. They were computer-oriented and did not know the tasks associated with the functional areas of business, the information needed by persons in these areas or the terminology of the world of business.

"For example, balance sheet, chart of accounts, standard cost, variance report and vendor lead time would be foreign to the former programmers unless programs they had written had required them to learn the definitions of these standard business terms. It probably occurred to all concerned that a person would be more efficient and effective as an analyst if the person were familiar with the structure and operations of various types of business organizations.

"In order to assure that one has such an awareness, the firm would require future analysts to possess a degree in business. If a firm could be sure that persons hired as programmers would never advance to positions as analysts, the firm would probably not be able to justify requiring a business degree for a programming position. Firms, however, do not know which persons hired as programmers will show the ability and desire to do analysis work.

"As a consequence, some firms could reasonably be expected to decide to require a degree in business of all programmers. As the programmers progress to positions as analysts, the organization has, to me, the optimum analyst — one who understands how business organizations function, converses intelligently with both manager and programmer alike, and knows the capabilities and limitations of the hardware and software which will be used to implement a business information system.

"When I see an advertisement for a programmer . . . which specifies a 'strong background in Bill of Materials . . .' I perceive the firm to be one which has a short-range point of view. When I see an advertisement for a Cobol programmer which requires a degree in business, I perceive the firm to be one which as a long-range point of view and believes itself to be acting in the best interests of all concerned."

— —

The second letter is from Duane Abbey of Des Moines, Iowa, and deals with the professionalism side of the issue:

"The 'Degree Requirement' . . . is indeed a difficult situation. It seems to me that there are two primary influencing situations: First is the fact that the field of data processing has not yet fully delineated itself into vocational, paraprofessional and professional levels. Second is the great demand for people who can get the job done regardless of educational background.

"The first situation is starting to be resolved — the whole question of degree requirements is an indication of this fact. The development of this delineation will be a long and arduous task which will be exacerbated by the second situation. Nonetheless, as time goes along we shall see a formalization of job descriptions and standards for various classes of positions within data processing.

"Academic programs are yet to be fully developed within this discipline and, similarly, work on various types of certification and licensing are in progress. The central need is for the development of a recognized body of knowledge and skills. The idea and advent of professionalism is coming to data processing, and it is not too far off for us to automatically think of having a degree just as we do today with engineers, accountants,

Who Should Speak for 'Responsible' DP?

The Taylor Report

By
Alan
Taylor
CDP

There is a tax to be paid by owners of powered aircraft — except under some specific conditions — and such people are expected lo file returns with the Internal Revenue Service (IRS), after registering the aircraft with the Federal Aviation Administration (FAA). The FAA registration, however, covers both powered and nonpowered craft and includes details on manufacturer and model number which could be used to determine whether the aircraft was powered.

Recently, it appears the IRS, when picking up the records and checking as to whether people have filed as they are supposed to, has not been checking the model numbers. It has mistakenly been sending letters to glider enthusiasts, suggesting they are delinquent.

All of which brings up the question whether failure to use the records available to avoid such junk mail is one of the duties of responsible data processors.

That there are some such duties — whether or not full use of available files to prevent junk mail is one of them — seems to be unquestioned by DPers. This I saw in the answers to my recent questionnaire regarding the sale of public records. Everyone seemed to agree such sales should be handled cautiously.

But noticeably absent in the correspondence about the issue were any sources for a definition of those duties. And that is our professional problem now. We need a source for definitions of just what our responsibilities are. Let us look at what is needed and then at what we have from which to make our choice.

Organization Needed

The first thing that is needed, of course, is some form of organization, so that appropriate questions can be asked, information gathered, decisions made and information distributed. It is unlikely that such an organization would be small enough to be run as a charity or that it would be able to sell its publications and attract members in sufficient quantities to be self-supporting. Not just yet, anyway.

So that restricts us. We must find some already existing organization that can be reasonably used as a developer and repository of information.

In addition, the organization should be in touch with the rank and file of the profession, because it is the ordinary practicing members who need to know what precautions to take. It simply is not sufficient to be in touch with committees of various sorts, all talking to each other.

Finally, the organization should itself be neutral in determining the proper duties, even though it should be as aggressive as possible once the ideas have been determined.

So with these three requirements — an existing organization, contact with the rank and file and an ability to stay neutral yet publicize — let us look around and see where such an organization can be found.

The Candidates

There are a number of immediately obvious candidates. Our two standards-oriented groups, the National Bureau of Standards (NBS) and the American National Standards Institute (Ansi), are possibilities. So is the American Federation of Information Processing Societies (Afips). But these three have a basic flaw in that they are simply not in touch with the rank and file data processor. And further, at least as far as the NBS is concerned, they often take strong stances on this type of issue, so cannot be considered neutral.

Our various societies — the Association for Computing Machinery, the Data Processing Management Association, the Society of Certified Data Processors, the American Institute of Certified Public Accountants and the Institute of Electrical and Electronics Engineers' Computer Society — seem equally qualified as potential homes for such a group. They are organized and in touch with various segments of the rank and file through their publications. However, they simply cannot be considered neutral and naturally are competitive to some degree. Dominance by one of them would tend to result in a certain dragging of the feet by others.

Yet the societies form a basis for some of the most informed and knowledgeable comment and suggestions, and they shouldn't be disregarded. So what we really need is an organization with a fourth quality — strong connections with the societies.

This fourth point brings to mind the only existing organization that could successfully handle the job — the Institute for the Certification of

The Strange Case of IBM

By Weaver C. Barksdale
Special to CW

As the great detective strode into the headquarters building of the International Business Machines Corp., he was met by his long-time friend and faithful companion, John Watson, M.D.

"Thank heaven you've arrived, Holmes! My American cousins are most distressed over the condition of the company's common stock. It's a total mystery to us!"

"Come now, Watson. Compose yourself and present to me the facts of the case."

"As you are no doubt aware, Holmes, the company has been quite successful over the years and has produced a record unexcelled in the history of corporate enterprise. Yet the price of the stock remains well below the peak level of 340 that it reached several years ago."

Watson explained the reason. Because of contingent liabilities from several lawsuits, the company has accumulated substantial cash equivalent assets, amounting to about $7 billion at the most recent year end.

With a favorable decision having been recently rendered in one of the cases and with business going well, the directors decided to use some of the cash for the shareholders' benefit. It was assumed that, because the company's stock was so heavily weighted in institutional portfolios, the stock price could not advance because of a significant overhang of supply.

Therefore, a decision was made to absorb some of this excess supply by offering to buy a large amount of shares at a price of 280, which was far better than the prevailing market price of 270.

Very few shares were tendered at 280; the market price rallied to 284, but subsequently fell dramatically. Many thousands of shares were sold at prices as low as 245 when they could have been tendered a few weeks before at 280.

Hearing the tale, Holmes lit his pipe and paced rapidly as he pondered the problem. After a few moments (actually less than half a pipe), his steel-trap mind snapped shut upon the answer. He turned to his friend.

"I have the answer, Watson. The directors stated an hypothesis, tested it and found it lacking; yet they have done nothing to further analyze the problem. They presumed that the supply, or more precisely, the demand for holding the stock, was elastic within its recent price range.

"That is, by raising the tender price above the market price, they hoped to acquire a sizable amount of stock. However, they actually found an inelastic supply."

Their mistake, according to Holmes, was that they addressed the question from the wrong perspective. Since there obviously existed little excess supply of the stock in institutional portfolios, the reason why the price would not rise was that there is lack of demand.

To increase demand, interest in the stock should be broadened, he suggested. One way to do this would be to use the excess cash reserves to further increase the dividend.

With its present cash horde, the company is effectively one of the largest financial intermediaries in the world. The utility of these dollars is much higher, from the shareholders' view, in the hands of the shareholders rather than in the company's coffers.

Another means of increasing in-

Detach here, fold, and place in post-paid envelope attached through binding.

Who Can Be Responsible?

(Continued from Poge 15)

Computer Professionals (ICCP). This group oversees the various programming, systems analysis and DP management professional examinations. It is run by representatives of all the societies and still fulfills all the other qualifications.

The ICCP is in touch with the rank and file through the examinations themselves and is able to stay neutral as far as development is concerned. Through appropriate use of the examinations, it could publish ideas concerning responsibility. And further, the ICCP, while not wealthy, would not have to try to run on the spare proceeds from selling publications.

So I suggest that the profession and the ICCP consider increasing their service to the DP community. If anyone has other nominations for the repository of ideas about responsible data processing practices, please write to me.

Needless to say, I'll keep you informed about any new candidate. Or perhaps some will reject the notion that a repository is needed — and needed quickly.

Readers Enter Degree Debate

(Continued from Poge 15)

architects, management trainees, etc.

"As far as individuals already in data processing or about to enter the field without a degree, I would suggest two things. First, be aware of and accept the idea that professional delineation is coming. Second, discrimination based upon degree requirements is a correctable situation (unlike sex or age discrimination). Thus, individuals in this field without degrees should be prepared to pursue an education with the blessing and financial aid of their employers.

"Data processing is a young field and there is much work to be done in this area. The supply/demand factor in connection with data processing personnel will tend to cloud the issue, but the appropriateness of such degree requirements can only aid in the maturation of our endeavors."

More on this in later columns.

Holmes Solves Case of IBM

(Continued from Page 16)

terest in the stock, ceteris poribus, is to broaden the number of holders. This could be done by splitting the stock at least on a four or five to one basis.

A combination of a stock split and a dividend increase would be most effective. The small investor would be attracted by IBM selling at less than $50 per share and with a dividend yield in excess of 5%.

"Holmes, you're a genius!"

"It's simply a case of supply and demand — straight out of an elementary economics textbook, my dear Watson. Elementary."

How to stretch your DP dollars without getting bent out of shape.

Read our special report on *Stretching the DP Dollar* in the September 26th *Computerworld*.

Working within the tight budget constraints that exist in most DP departments can start with something simple — like a thorough management review of the reports you produce. A few might be outmoded or unnecessary, and these could be eliminated. Others could be produced less frequently; and the reports you rely upon most might be combined. All of which saves not only computer time, but end user, managerial time as well.

There are literally hundreds of other ways to save money and aggravation in your DP operation. And we'll have several experienced people on hand to tell us how they found ways to maximize efficiency in their installations in our September 26th special report. Edited by Frank Vaughan, *Stretching the DP Dollar* will be filled with informative stories like these:

- Making your computer a profit center through timesharing - an applications story.
- Trade-Offs of using a service bureau versus an in-house system — a tutorial.
- Lease or purchase? — Caveats and benefits.
- Designing a computer facility — how it's built is almost as important as what's in it.
- Saving money in a university DP environment — a case study.
- How a municipal government and a state agency cut costs by sharing a system — an applications story.
- Saving money on computer room forms — a survey of innovative methods.

If you're a DP Manager, financial specialist or executive with a flair for doing more with less expense, our September 26th special report will have valuable and interesting information for you. If you market a product or service that helps people save on data processing costs, you should advertise here. Ad closing date is September 9. Get the details from your *Computerworld* salesman. Or call Terry Williams at (617) 965-5800.

Absolutely no distributed processing system offers you all these 10 features except Series 21 from MDS:

1. An intelligent data entry system which installs as easily as a keypunch and is fully operational as soon as you plug it in.

2. Formatted data entry software – fully developed and ready to use.

3. On-site upgradability so you can utilize a powerful programming language specifically developed for interactive processing with CRT/Keyboard.

4. Growth capability so you can accommodate your peak production periods by allowing expansion to up to four operator stations – any time – on one controller.

5. Modular design so you can configure a system to fit the requirements of your various locations – exactly, now and for the future.

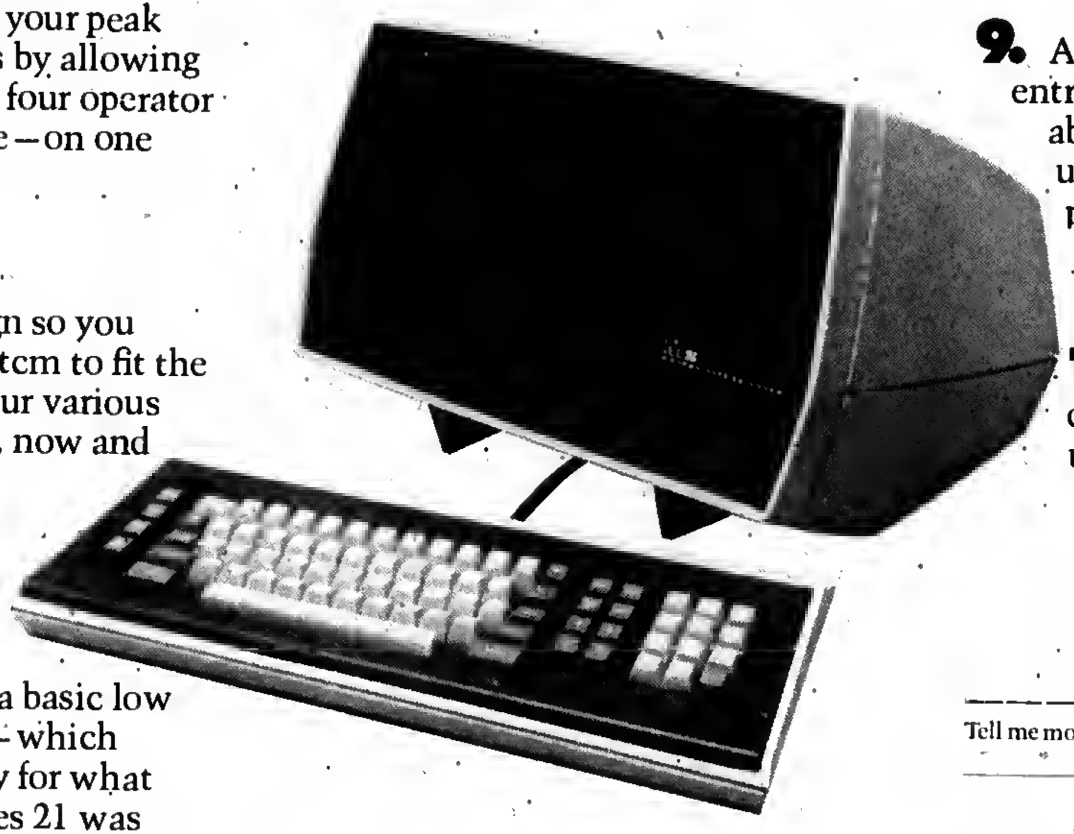
6. A comprehensive line of peripherals, like large capacity disk drives, tape transports and printers, together with powerful systems software enabling high performance transaction processing.

7. Communications in BSC or SDLC, or both.

8. A large 15-inch CRT display in 480 or 1920 characters for easy operator prompting and sight verification of data.

9. A choice of either data entry or typewriter-style movable keyboards so you can use experienced data entry people or those with only clerical experience.

10. Popular flexible diskette recording media using IBM Basic Data Exchange conventions.



You can start with a basic low cost configuration – which means you pay only for what you need now. Series 21 was designed to take into account all your future distributed data processing system requirements by way of its upgradability. A Series 21 system with 4 operator stations costs only $110.50 per month per operator station, including maintenance, on a 3-year lease.

We would like to tell you more about Series 21 – and why we say it's absolutely the best distributed data processing system available anywhere.

Series 21 – a solution for today – and tomorrow. Call MDS Executive Headquarters at 201-540-9080, or fill out the coupon and find out more.

Tell me more about Series 21. I'm interested in applying it to ____________ applications.

For MVS System Tuning

'CMF-Realtime' Documents CPE Trends

SUNNYVALE, Calif. — Systems programmers rather than the operations staff in IBM MVS installations are expected to be the primary users of the Comprehensive Management Facility-Realtime (CMF-Realtime) package that will be released by Boole & Babbage, Inc. later this year.

The package allows the user to monitor selected areas of MVS system activity interactively and to evaluate changes in the operating system as they are made, the vendor said. The reports show both current status of various measurements and trends over user-specified time frames of one or more factors, according to a spokesman.

The "trend" portion of the CMF-Realtime display can show how an individual factor changes over time or how a group of factors interact with each other. Sometimes a single measure isn't enough to show a change in performance, but the combination highlights movement — good or bad, the spokesman explained.

Several of the measures, available on a CRT screen or in hardcopy form, are conventional computer performance evaluation (CPE) concerns — CPU, channel and device utilization; paging and swapping rates, for example — but others are specific to the MVS environment.

System Resource Management (SRM) data, an MVS outgrowth of SMF, is one of the newer measures available through CMF-Realtime. In general, the spokesman claimed, CMF-Realtime represents a "significant extension" to the data-gathering capabilities of IBM's Resource Management Facility (RMF) Version 2 under MVS.

The factors to be displayed or reported can be changed dynamically. If one line of inquiry seems to provide no useful information, the focus can be changed, and changed again, until something interesting is found, the spokesman noted.

Because this product has a different purpose than others with apparently similar output — Boole & Babbage's Resolve, for example — it can be used concurrently with them without any conflict, he added.

CMF-Realtime is expected to be available in early November for an introductory cost of $7,500. Boole & Babbage is at 850 Stewart Drive, Sunnyvale, Calif. 94086.

'DMS/OS' Gains TSO Link

SACRAMENTO, Calif. — Available now as a separately priced optional extension of the DASD Management System (DMS/OS) from Software Module Marketing, the TSO Command Processor supports the use of the basic package in a TSO environment.

The most significant enhancements, according to a spokesman, are deferred archive and restore functions and a dynamic restore function.

The deferred support permits the accumulation of data set Archival and Restoration requests from the TSO user regions. These requests are periodically processed by batch jobs, which record the result of the deferring processing in a file which may then be interrogated by the originator of the request, the spokesman explained.

No changes are made in the Data Set Control Blocks (DSCB) to accommodate the deferred processing. All information is stored in a work file which is purged after an installation-specified period has elasped.

The dynamic restore facility can be used to immediately restore a data set from a user region. A tape drive is dynamically allocated to permit loading of the archive tape and the data set to be restored is dynamically allocated on the target DASD volume, the spokesman said.

A control mechanism is included to permit the installation to set a limit on the number of tape drives that can be concurrently allocated in support of the dynamic restore facility, he added.

The basic DMS/OS system is available for $10,000; the TSO Command Processor "selectable unit" costs an additional $1,500, the company said from The Crocker Bank Building Penthouse, 1007 Seventh St., Sacramento, Calif. 95814.

'Front End' Extends Pay Package

TEWKSBURY, Mass. — The Wang Program Products Division of Wang Laboratories, Inc. has introduced a distributed data collection "front-end" facility for the payroll portion of its Super payroll, personnel and pension management system which runs on IBM CPUs.

The network-based payroll data entry software, Pay/Net, works with operators using Wang's Personal Computer Systems (PCS) as intelligent terminals to the Super host machine.

The Pay/Net help includes prompting messages, immediate verification of entered data and positive control over the operation of the remote site payroll function, a spokeswoman said.

Pay/Net features network data security, she claimed. Terminal identification numbers act as authorization codes to validate access to the network, she added.

The software utilizes industry-compatible protocols and procedures in every component delivered, she said.

The Super payroll system — a prerequisite — costs from $30,000 to $50,000 depending on modules implemented on the user's mainframe. The Pay/Net software costs an additional $10,000 and the PCS hardware costs "about $6,000," the spokeswoman added.

Wang is at 836 North St., Tewksbury, Mass. 01876.

'Hasp-11' Line Gets New Vendor

EUGENE, Ore. — The Hasp-11 family of communications software, developed by Oregon Research Institute to allow Digital Equipment Corp. PDP-11s under various operating systems to run remote job entry applications into an IBM mainframe, is now available from Datanet, Inc., P.O. Box 30008, Eugene, Ore. 97403.

'Oscar' Updated

PITTSBURGH, Pa. — Enhancements in the report generator portion of the Oscar project management system on On-Line Systems, Inc.'s remote computing network now enable users to produce comparative reports in addition to those showing critical path method analyses and resource constraints, according to a spokesman.

With the comparative reports, a project planner can check reported, up-to-date performance against the baseline schedule, he noted.

Status comments for each project activity can be included in the comparative reports. Other enhancements allow the project manager to post status information about activity conditions.

Editing of the original plan while work is under way allows users to add, modify or delete activities to reflect real conditions. Later progress reports are then made against the revised base.

On-Line Systems is at 115 Evergreen Heights Drive, Pittsburgh, Pa. 15229.

Needed Resources Cited in Curriculum Plan

J. Daniel Couger On Education

In last week's column, I described the revised curriculum recommendations for an undergraduate program in computer science, prepared by a special committee of the Association for Computing Machinery (ACM). The committee is soliciting comments on its proposal by Dec. 1 before final publication in early 1978.

The report will supercede an ACM report of 1968, commonly referred to as Curriculum '68; therefore I will refer to the new effort as Curriculum '78.

As explained in the earlier column, the new report provides for a 25-course curriculum model. It also discusses implementation, making some strong, specific recommendations concerning resource requirements.

"Data entry devices such as card punches, teletypewriters and display terminals should be provided for program preparation and communication between student and computer'. . . conveniently located and in a large enough area for both easy and convenient student access and use."

Micros Desirable

The ACM Curriculum Committee on Computer Science believes "microprocessors are quite desirable in teaching details of computer architecture previously only attainable by extensive programming of hypothetical computers, simulators or textbook discussions. They have provided a relatively inexpensive and highly versatile resource whch can be used in a variety of ways.

The availability of one or more minicomputers "will allow the students to obtain hands-on experience as well as the opportunity to utilize interactive systems and programming languages which may not be available or practical on a medium- or large-scale computer system."

This kind of equipment also "allows the student to work on software development projects and other projects that might not be possible due to restrictions on the use of the central facility."

A medium- or large-scale computer "should provide appropriate hardware and software support for the major program. Auxiliary memory is required so that access methods specified in the core courses can be implemented and tested.

"Suitable I/O devices and system facilities are needed so that rapid turnaround is possible, interactive computing is available and programming languages used in the curriculum are supported."

The report implies laboratory facilities are frequently inadequate. "Regardless of what specific items of computer equipment are available to support a curriculum in computer science, effective teaching and research in the field requires laboratory facilities. Computer science is in part an empirical science which invovles implementing procedures as well as studying theoretically based processes.

"Because systems, algorithms, languages and data structures are created, studied and measured via combinations of hardware and software, it is essential that appropriate laboratory facilities be made available that are comparable to those necessary in the physical and biological sciences and engineering disciplines."

Software requires attention equal to hardware, according to the Curriculum '78 report. "For the student to master the material in the core and elective courses, sufficient higher level languages . . . [and] special-purpose systems such as statistical systems, data base management systems, information storage and retrieval systems and simulation systems should be available.

"The student of computer science must have available, in some form, language, programming and systems manuals as well as documentation for programs and other materials directly related to the development and use of systems. This material must be easily and conveniently available to the student at all times."

Staff Requirements

No less than six full-time faculty members are necessary to offer the minimal program, in the opinion of the committee.

While it recommends faculty background primarily in computer science, the committee is realistic enough to recognize this is not always possible.

Additional instructors can come from computer center staff and other academic departments, the report noted.

"Articulation" — setting up vertical communication channels with groups outside the institution where the computer science program is being developed — should occur with local high schools and community colleges which provide input to the program. Equally important is discussion with employers and graduate schools which utilize program output.

Curriculum '68 paid little attention to articulation needs. On reading it, one had the impression that the committee intended it to be the bible to which all affected organizations and persons were to conform.

The recommendations on Curriculum '78 are more pragmatic. They facilitate flexibility in curriculum implementation to cope with varying circumstances and resource levels.

Couger is professor of computer and management science at the University of Colorado.

Package Creates On-Line Code

HOUSTON — Batch programmers working with Hewlett-Packard Co. HP 3000s can create terminal-oriented programs "more easily than they might expect" with the support of the Instasystems software from Systems Communication Corp. (SCC), according to the vendor.

Designed for use from local or remote terminals, Instasystems provides a menu approach to program building and later execution that requires no change in the basic system software provided by HP, an SCC spokesman added.

In a typical operation, the system displays a menu of applications available to a user as soon as the user has signed on and identified himself. Once the application is selected, a new menu offers a choice of functions to be performed, the spokesman continued.

From there it works down to the point of displaying data entry screen formats and accepting data which it provides to as many as eight programs.

Instasystems includes a menu-building command so the support it provides is pertinent to the user or users involved. Beyond that, a HELP command is available that displays unique user-written screens of information that can vary depending on when the call for help is made, he said.

Instasystems can work with files created by any of the HP access methods or with data bases under Image he added, but it also has its own indexed I/O support.

The package is available for lease or purchase. The license fee is $5,100, SCC said from Suite 300, 1721 Pech Road, Houston, Texas 77055.

Multimedia Course Eyes Intelligence

KANSAS CITY, Mo. — Developed by MIT, "Artificial Intelligence" is a multimedia curriculum from The Edutronics Group that investigates "the real nature and action of 'intelligence,' " a spokesman said.

The 24 course modules examine "intelligence" as a product of a family of logical qualities that can be studied abstractly without concern for the particular systems that manifest intelligence. The course provides practical knowledge for those interested in making computers more useful as well as insight for those who wish to understand the nature of intelligence, he said.

The lectures and classroom discussion are presented by associate professor Patrick H. Winston, director of MIT's Artifical Intelligence Laboratory.

Edutronics is at 3435 Broadway, Kansas City, Mo. 64111.

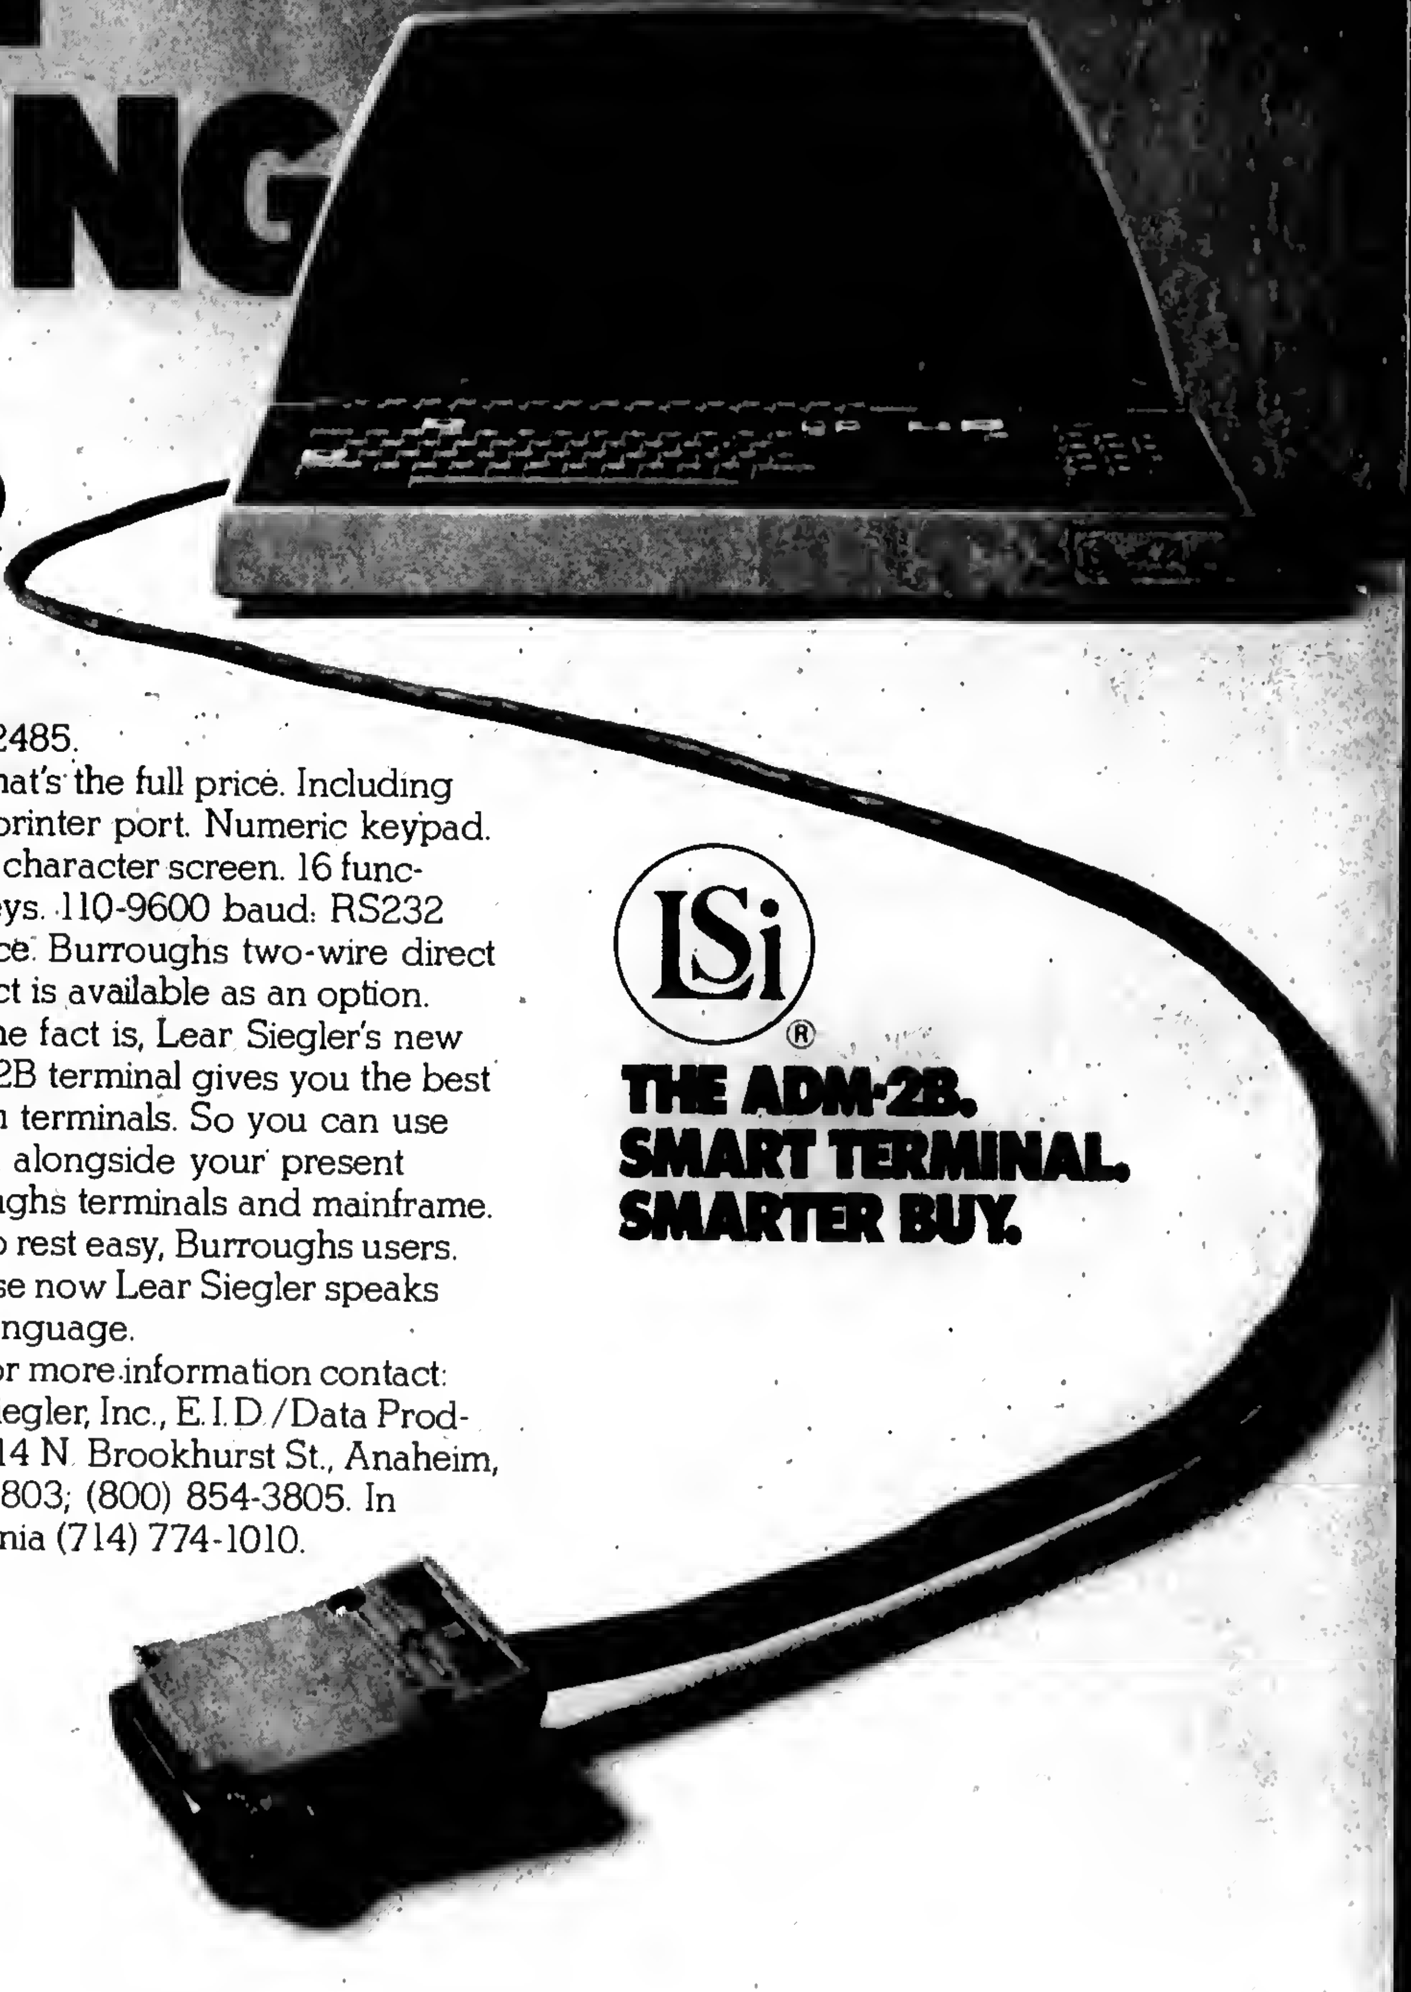
LEAR SIEGLER AND BURROUGHS ARE ON SPEAKING TERMS.



You're probably very happy with your Burroughs mainframe.

But you'd undoubtedly like to have the versatility and dependability of Lear Siegler terminals. If only they were compatible with your present system.

Now they are. Complete with standard Burroughs polling and address line disciplines.

What's more, the ADM-2B's forms mode capability is compatible with the TD-820.

The ADM-2B gives you full text editing capabilities. Including erase to end of line/field/page. Insert and delete character and line. Blinking and blanking fields. And tabbing.

Just flick a switch and you can convert the ADM-2B to a standard ADM-2 with Burroughs line discipline.

Line diagnostic mode is switch selectable—which makes it extremely valuable for troubleshooting.

Of course, there's all the support that Lear Siegler is famous for. Throughout the United States and in many foreign countries.

$2485.

That's the full price. Including serial printer port. Numeric keypad. 24x80 character screen. 16 function keys. 110-9600 baud. RS232 interface. Burroughs two-wire direct connect is available as an option.

The fact is, Lear Siegler's new ADM-2B terminal gives you the best of both terminals. So you can use it right alongside your present Burroughs terminals and mainframe.

So rest easy, Burroughs users. Because now Lear Siegler speaks your language.

For more information contact: Lear Siegler, Inc., E.I.D./Data Products, 714 N. Brookhurst St., Anaheim, CA 92803; (800) 854-3805. In California (714) 774-1010.

'Csar' Enhanced

ATLANTA — The Computer Scheduling and Reporting System (Csar) from Computer Concepts Corp. has been updated so there is less detailed work for the scheduling personnel.

With Csar II, the user identifies only the class and priority a job is to have, its successors and the earliest start time it can reasonably use. From that, the package builds a schedule without the constraints inherent in the original Csar system, a spokesman said.

All information processed by Csar II is maintained in a single sequential file which contains, among other things, calendars and records for each production job scheduled.

Written in ANS Cobol, the batch-oriented Csar II has been used on IBM, Burroughs and Honeywell equipment. In the IBM environment, it requires 128K bytes plus a sort region.

Source code for the scheduling package is available now for $9,500, Computer Concepts noted from 6244-A New Peachtree Road, Atlanta, Ga. 30340.

Package Shows Fortran Values

ANAHEIM, Calif. — The Fortran Termination Monitor, developed by Pilkerton International for its own use in debugging program problems, is now available generally for $50.

Designed to work in any IBM OS or OS/VS system, the package does not interfere with normal Fortran program execution, according to a spokesman. It simply "steps in and captures" the values of user-selected variables whenever an Abend occurs, he said.

These values are often the keys to the problem, but they are sometimes difficult to find, especially in floating-point operations. Cryptic error messages and dumps that require conversion from "hex" to decimal before they can be read make debugging an error-prone, time-consuming task, he added.

The monitor can report on as many variables as the user requests prior to run time, but each requires 10 bytes so there may be limits on how many a programmer can retain even if the software logic has no such constraint, the spokesman noted.

The Terminator prints the current values of the variables if a job is aborted with an error. People on the Pilkerton staff have found it so useful they use it even though it's not a required part of the development process, he claimed.

The $50 the company charges for the software covers the cost of reproducing the program, documentation and the postage, he added.

Pilkerton can be reached through P.O. Box 6372, Anaheim, Calif.

'Soup' Eases Updating

ATHENS, Ga. — The Source Utility Program (Soup) from Cosmic reportedly allows the IBM 360-based Fortran programmer to do symbolic updates to selected subprograms, to compile those updated programs and to update an object file, deleting the old object code.

Soup can be used to create a new source file or an object file. It can also produce a listing or a punched deck of the entire file, of the updated subprograms or of the updated portions of code, according to a Cosmic spokesman.

The source and object files handled by the package — which was developed at the Goddard Space Flight Center — are sequential data sets, normally generated as files on magnetic tape. The routines within Soup have been found to be "much faster" than the standard IBM OS/360 utilities that perform the same function, the spokesman claimed.

Soup is written in Fortran IV and has been implemented on an IBM 360, utilizing 26K bytes of main memory.

Made up of approximately 338 source statements, the utility is available only as a listing which costs $25. It should be ordered as program number GSC-12268/ CW, the spokesman added.

Cosmic is at 112 Barrow Hall, University of Georgia, Athens, Ga. 30602.

'Disk-O-Tek' Eyes Space

ATLANTA — The Disk Organization Technique (Disk-O-Tek) package from NCI, Inc. is a dynamic disk space allocation system controlled by parameters entered in the JCL stream. It was designed for IBM DOS and DOS/VS environments, the vendor said.

Like a number of similar packages, Disk-O-Tek truncates sequential file extents after the file is closed so overallocated space is made available for other uses. This control measure is applied, however, on a file-by-file basis as indicated by the user.

Marker on Vtoc

Because a number of users are expected not to use the automatic truncation feature without some sort of encouragement, Disk-O-Tek puts an end-of-file marker on the volume table of contents (Vtoc) of all sequential files. In Vtoc printouts, then, the user can see just how much space is being wasted, NCI said.

When that happens, he can invoke the truncation for each of the overextended files and Disk-O-Tek will truncate the extents near the end-of-file marker.

The package also has a utility routine that can delete, revive or locate files generically; produce Vtoc lists of space used and available; or produce a file with all active Vtoc records and print information from selected files in character or "hex" format.

Additionally, the utility allows for the printing of a fixed number of records, number of tracks or number of cylinders.

Disk-O-Tek is available under a permanent license for $2,750 or $110/mo, the company added from 6075 Roswell Road N.E., Atlanta, Ga. 30328.

Data Briefs

Expo to Focus On Fiber Optics

NEWTON, Mass. — The Fiber Optic Communication and Information Society (Focis) will present a fiber optics exposition here Sept. 15.

Admission is free to Focis members; there is a $10 admission for nonmembers; and the cost is $15 at the door, a Focis spokesman noted.

Further information about "Fiber Optics How and Why" can be obtained from Focis, Box 2264, Vernon, Conn. 06066.

Decwriter II Prices Drop

MARLBORO, Mass. — Digital Equipment Corp.'s Components Group has announced volume price reductions up to 10% on its LA36 Decwriter II.

The 200-unit price has been reduced from $1,390 to $1,250 each. Other reductions vary according to quantity. Price reductions begin at the 50-unit quantity level, DEC said from One Iron Way, Marlboro, Mass. 01750.

HIS Offers Seminars

WALTHAM, Mass. — Honeywell Information Systems, Inc. will conduct three seminars in different cities on communications concepts for large-scale communications users.

The first seminar will be held in Chicago Sept. 7 and 8; the second will be held in Dallas Oct. 26 and 27; and on Nov. 29 and 30, HIS will conduct the third in Los Angeles.

Information on the courses is available from Dave Cook, Manager of Educational Services, HIS, 110 Cedar St., Wellesley Hills, Mass. 02181.

Atlantic Forms User Group

ALEXANDRIA, Va.— Atlantic Research Corp. has formed a users group to exchange Intershake II programs and test applications.

Information on the Intershake II/Users Group can be obtained from Garland Audielet at Atlantic Research, 5390 Cherokee Ave., Alexandria, Va. 22314.

Stored-Program Controlled

Bell Planning Nationwide Net

MURRAY HILL, N.J. — The Bell System has announced plans for a nationwide communications network that it said will deliver new services and operating efficiencies over the next 25 years.

In addition, Bell has developed a microwave radio system that reportedly will handle three times as many data and voice calls as its current top-capacity long-distance radio link.

Bell's future communications network will involve electronic switching systems (ESS) interconnected by a high-speed signaling system to enable more effective communications, the company said.

The combination of the ESSs and the signaling system is called the stored-program controlled (SPC) network, Bell said.

As the SPC network evolves, users will notice faster setup times for call connections — as fast as two seconds for a coast-to-coast call, according to a Bell spokesman.

Implementation of the SPC network will involve a long-term technical effort, including installation of ESSs in Bell telephone central offices, the spokesman noted.

A complementary part of the effort, he added, will be expansion of the new signaling system, known as Common Channel Interoffice Signaling (CCIS).

Project 'Ahead of Schedule'

Terminal Slashes Reporting Time

By John P. Hebert
CW Staff

NORTH POLE, Alaska — A construction firm headquartered in Houston has reduced time, money and project report errors with a key-diskette communications terminal at its building site here.

Before Litwin Corp. installed the Data 100 Corp. Model 77 key-diskette terminal in "the dead center of Alaska," it needed three weeks to send manpower and construction materials needs reports to the home office, according to LeRoy Fronk, Litwin's DP director.

"If construction was delayed past the central Alaskan building season from March to late September for any reason, Litwin personnel would have to pack their bags and come back after the spring thaw, "and that would cost time and money," Fronk said.

Fronk said Litwin has cut construction project reporting time from more than three weeks to less than 48 hours, reduced errors significantly and given its client, Energy Co. of Alaska, a level of detail in its reports that was not feasible with the previous system.

"This has allowed us to act rather than react to changing conditions and that means the difference between profit and loss," Fronk noted.

Before installing the terminal at its campsite 15 miles north of Fairbanks, Litwin telecopied coded sheets containing labor distribution data and units of work completed from remote sites to its Houston headquarters. From there the information was keypunched and transmitted by a Data 100 Model 76 to United Computing System in Kansas City, Mo., for processing.

The process, which took several weeks, produced reports that compared actual productivity to forecasted needs. The resulting reports, which were printed in Houston for forwarding to the remote stations, detailed how a project was doing from both a financial and physical percent-complete basis.

"The problem was," Fronk noted, "that you rarely had time to react to the data. By the time you received it, it was already outdated and with time breathing down your back, you had to make some very sophisticated guesses."

(Continued on Page 24)

Telenet Files With FCC To Extend Service to Hawaii

WASHINGTON, D.C. — Telenet Communications Corp. plans to extend its packet-switched service for data communications to Hawaii this fall in cooperation with the Hawaiian Telephone Co.

The two carriers last month filed a joint application with the Federal Communications Commission (FCC), according to spokesmen for the carriers.

The proposed service offering is designed as an economic means of communications between computers and a wide variety of terminals operating at low to medium speeds. It will be available on a demand basis with rates based on the volume of data exchanged, Telenet stated.

Trans-Pacific cable facilities will be used to connect the Telenet network in the continental U.S. with Hawaiian Telephone's operating center in Honolulu.

The CCITT X.25 packet-mode interface reportedly will be supported by both carriers, permitting synchronous as well as asynchronous communications.

In a tariff submitted with the FCC application, traffic charges have been set at $4 per thousand packets.

Rates for public dial-in service at 10 to 30 char./sec will be $2.40 an hour from Honolulu to any point on the U.S. mainland, it added.

Dedicated facilities at monthly rates will be provided for asynchronous transmission from 75- to 1,200 bit/sec and for X.25 synchronous transmission at speeds up to 9,600 bit/sec, according to Telenet.

DEALERS...
AJ WANTS
YOU

Anderson Jacobson, a leading manufacturer of data communications products, would like to introduce you to our new minicomputer, the AJ System 1500. And we need your expertise to make our small business system successful.

Here's what we have to offer:

- Good margins
- Exclusive territories
- A small business nucleus of application software at *no charge* to you
- Excellent client accounting software, also at *no charge*
- A multi-programming, multi-terminal system that is *fully* expandable
- AJ field service available in selected areas of the United States
- Floppy or hard disk systems

If you are interested in being a part of AJ's successful future, call or write Bob Reed, National Marketing Manager, for more information.

Bell Planning National Net, Microwave System

(Continued from Page 23)

This will eventually interconnect all the new ESSs, enabling them to share call-handling information in high-speed digital form over communications pathways separate from voice circuits, he said.

Some of the new services reportedly will stem from the SPC network's ability to forward a caller's telephone number to the local central office serving the called party.

Some possibilities for new services in the 1980s include:

- Identification of priority callers by means of distinctive ringing for calls from preselected numbers;
- An automatic callback system that would make note of a busy signal, wait until the line was clear and then dial both numbers and connect the two lines; and
- Preselection of telephone numbers from which collect calls could be accepted without operator assistance, according to Bell.

The SPC network will also offer other services designed specifically for business customers, the carrier said.

The Bell System is now implementing the first stage of SPC network evolution for long-distance call handling; and some coast-to-coast calls presently are being routinely set up by CCIS, according to Bell.

Microwave System

Bell also has developed an advanced microwave system that it said will handle three times as many data and voice calls as its current top-capacity long distance radio link.

The technology of the AR6A system will permit more efficient use of the radio frequency spectrum now available for long-distance telecommunications, according to Bell.

The system is being field-tested beginning this summer in Massachusetts. It will be able to carry 6,000 calls per channel, compared to 1,800 for the highest-capacity microwave radio link now used by the Bell System (TH-3), a Bell spokesman noted.

Bell's AR6A will be the first of its kind to use "single sideband" (SSB) technology for high-capacity, long-distance microwave transmission, he said.

SSB reportedly "packs" more telephone conversations into a radio channel without sacrificing transmission quality. As a result, more information can be carried in a frequency band and the frequency spectrum is used more efficiently, Bell claimed.

AR6A will operate at a frequency of 6GHz and will handle both voice and data signals, he said.

Switching Equipment

Like present radio systems, it will incorporate its own protection switching equipment. If a channel should fail, for example, the equipment is capable of automatically sensing this. It can then switch to another channel.

In AR6A, the protection equipment is controlled by microprocessors, Bell added.

AR6A will be field-tested over a 26-mile radio path between Ashburnham and Wendell, Mass. The trial is being conducted by Bell Labs in conjunction with AT&T Long Lines and Western Electric.

This test, which will continue through 1978, and subsequent ones planned on another six-hop radio route through mid-1980, will determine how the system performs under actual operating conditions, the spokesman noted.

AR6A is scheduled for initial commercial service by mid-1980.

By the late 1980s, SSB systems could account for most of the new long-distance route mileage added to the Bell System's microwave radio network, according to Bell.

Terminal Reduces Job Time

(Continued from Page 23)

Because of the number of variables on any job, the lack of proper information could set an entire project off schedule. "Local productivity is always a question and very hard to track against a standard measure because it fluctuates from area to area. So you could be well ahead of a project somewhere and, given the same manpower, far behind in another," Fronk said.

'No Surprises'

To speed up the data cycle and decrease the number of errors that always crept into the system, Litwin examined two alternatives: local service bureaus and the Hewlett-Packard Co. HP 9830 calculator.

"But communications was the answer. We wanted information at the home office faster and we didn't want to relinquish control of the network because our locations are much too remote to rely on somebody else if something went wrong," Fronk recalled.

The only alternative remaining was a communications terminal and Litwin needed a data entry device capable of binary synchronous communications to recheck transmitted data and capable of emulating IBM's Hasp 360/20 workstation, Fronk said.

In addition, since most of the progress reporting programs had been written, documented and tested, Litwin needed a machine that could easily adapt to software changes.

The petroleum facilities construction firm chose the Data 100 device because of past experience with the company. Litwin has had a Data 100 Model 74 for three years which has been out of commission only twice, according to Fronk.

And Litwin has only made one call to Data 100 on the Model 77 here — because of an electrical power surge — even though the terminal sat at a warehouse in Fairbanks where it had blasts of warm and very cold air from warehouse doors being opened and closed, Fronk recalled.

Data Entry

Now data, including payroll information on local laborers and data on man and machine hours billed against different line items, is entered daily by an operator in North Pole on the system's 256-char. CRT.

The terminal performs table look-ups; range checks, batch balancing and any number of other edits and checks — all functions that were programmed by Fronk and his staff.

"With these intelligent features, we know the data is virtually error-free when we send it down the line," he explained. "There aren't any surprises three weeks later as there used to be."

Once collected on diskette, the data is transmitted at 2,000 bit/sec on Saturdays to Kansas City over Glacial States Telephone and then RCA Globcom lines — a process that takes three to four hours and costs $61 an hour or "about $1 per page," Fronk said.

In Kansas City, it is processed by United Computing System's Control Data Corp. Cyber 175 computer system.

By 8 a.m. the following Monday, the data has been processed and the appropriate data printed on the company's 62 line/min printer here at North Pole.

At the same time, the construction progress and piping reports are also printed out in Houston for headquarters personnel, Fronk noted.

Line Problems

Fronk said Litwin has had line problems at the Alaskan end of the communications network. Glacial States' attitude is that if the lines work properly four out of five times used, then it is good enough for data, he said.

Fronk chose a synchronous terminal over an asynchronous device because of the phone problems and "we haven't had the problems other users there have had.

"The others all said they have horrendous problems trying to communicate with the 'Lower 48,' but they are all using low-speed asynchronous terminals," Fronk said.

"With those low-speed terminals, if you get a hit on the line, it's tough luck and try again," he added.

With the reports being on schedule, and with communications problems at a minimum, Litwin has finished the project at North Pole three weeks ahead of schedule, Fronk said. All things considered, the terminal has ensured that neither Litwin nor its clients were left out in the cold.

You'd be surprised how well the XL40 performs... even in your most demanding applications.

The XL40 and you — a winning combination
The XL40 Distributed KeyProcessing® System is the solution you've dreamed about for your organization's distributed processing requirements. That's why we call it The DREAM Machine for Data Retrieval, Entry And Management — the vital components of effective distributed processing.

Distributed — for responsiveness at the source
Data quality improves — and costs are reduced — when information is managed by the people who know it best. The XL40 was designed to be operated by source department personnel, not highly specialized operators. And PCC's professional education program will smooth the transition even more. In fact, you may be **very** surprised at some of the converts to your XL40.

Turnkey — for instant productivity
It doesn't take magical machinations to get the XL40 up and running fast. Designed for simplicity, the XL40 combines modular hardware and flexible, COBOL-based software to enable your staff to go right to work when the system is installed.

Concurrent — for timesaving operations
In addition to putting processing muscle at the source, the XL40 operates concurrently. While operators are entering data, the XL40 can generate a report and communicate with your central computer at the same time. Files can be retrieved, accessed and updated from source departments, creating a real-time data base and providing up-to-the-minute information.

Reliable — Pertec Computer Corporation
The XL40 is manufactured, marketed and serviced by Pertec Computer Corporation, the world's leading independent manufacturer of computer peripheral equipment and producer of distributed processing and data entry systems, with over $100 million in revenues. And a reputation to boot.

Write to us today for more information about the XL40 Distributed KeyProcessing System — it's your ace in the hole.

Ann Arbor Terminal Controller Allows Single-Line Addressing

ANN ARBOR, Mich. — The Ann Arbor Terminals, Inc. model R2050R CRT controller reportedly permits multiple read-unly displays to be remotely addressed and written over a single communications line.

The controller is intended for industrial and business system applications where multiple CRTs are needed. The unit is said tu reduce system costs by eliminating the need for multiple CRT electronics and multiple computer-to-CRT interface cards.

Four display channels can be driven from une controller and up to 16 controllers can be plugged into one. interface card, a company spokeswuman explained.

The unit displays 20 lines at a density of 50 char./line. Characters are upper and luwer-case Ascii written in 7 by 9 dut matrices.

The unit comes with an RS-232 interface. RS-232 input is regenerated within the unit and output through an auxiliary data connector to drive the next unit in line, she explained..

A "dip switch" on the controller allows the setting of both the unit address and transmission speeds from 110- to 9,600 bit/sec.

Options for the R2050R CRT controller include a fifth video connector and select option, character accent and current loop interfaces.

Prices for the controller begin at $1,095, which includes one display channel. Other prices depend on the number of display channels needed and options ordered, the company said from 6107 Jackson Road, Ann Arbor, Mich. 48103.

Megadata Broadens Line With Stand-Alone CRT

BOHEMIA, N.Y. — The MC77 terminal from Megadata Corp. has been developed fur applications requiring CRTs performing intelligent stand-alone functions with storage requirements of 4K words.

The terminal has a keyboard with up to 84 alphanumeric and function keys and a 12-in. diagonal display.. It can transmit data at speeds from 50 to 38,400 bit/sec in serial mode and 10,000 char./sec in parallel mude, according to Megadata.

The terminal is suited for installations where large numbers of terminals are required, including data entry systems, multidrop communications networks and data transaction systems, the company noted.

The MC 77 is available as a programmable read-only memury (Prom) firmware preprogrammed device, supporting up to 3K of internal program, 1K of program storage and 4K of internal data storage. An unabridged series of computer interfaces is available for it, Megadata said.

The MC 77 can be used as a stand-alone device or up to eight terminals can be clustered and interfaced to one data port.

Prices for the MC77 range frum $1,950 to $2,950 depending on options and quantities needed, the spokesman noted frum 35 Orville Drive, Bohemia, N.Y. 11716.

Soroc Drops Price On IQ 120 CRT

ANAHEIM, Calif. — Soroc Technology, Inc. has reduced prices on its IQ 120 CRT/-keyboard terminal.

The price for end users has dropped $255, bringing the cost of each terminal to $995, according to Soroc, which added quantity pricing has also been reduced.

The cumpany said it is developing "more sophisticated" terminal equipment, scheduled for introduction later this year.

Soroc can be reached at 165 Freedom Ave., Anaheim, Calif. 92801.

USD Has ASR 33 Adapter

PHOENIX, Ariz. — United Data Services Co., Inc. (UDS) has introduced an auxiliary equipment adapter for use with Model 33 Teletype Corp. terminals.

Designed to facilitate expanding the capabilities of computer console teleprinters, and remote time-sharing terminals, the adapter provides the Teletype with an auxiliary I/O port which permits the device to function as an integral part of the teleprinter system, UDS explained.

The auxiliary adapter makes it possible to add a disk/-tape cassette unit, X-Y plotter, punched card reader or other auxiliary terminal device to a Model 33 Teletype.

The on-line communications mode is determined by the external signal line wiring and the auxiliary device is placed in the local loop with the keyboard, typing unit, etc. for off-line preparation or transcribing of data in the Teletype "local" mode, UDS stated.

The auxiliary equipment interface of the adapter directly accepts equipment with standard RS-232 electrical interfacing or, when equipped with an appropriate interconnecting cable, can be used to drive a 20mA. current loop interface, the company added.

Installation reportedly requires nu drilling, soldering or wiring modifications.

The adapter is priced at $110 from UDS at 3024 N. 33rd Drive, Phoenix, Ariz. 85017.

Threshold Has T500 Tester

SAN MATEO, Calit. — Threshold Technology, Inc. has introduced a portable diagnostic test system that it said permits users of its T500 voice data entry terminal to test and repair the terminals on-site at work locations.

The T500 diagnostic system is a briefcase-sized unit that allows immediate field analysis of any fault down to the circuit board level, Threshold claimed.

It must be used in combination with the 4520 interface board, an option now available for all T500 terminals.

The diagnostic system consists of a numeric keypad, an alphanumeric display and a cassette tape unit. The cassette tapes supplied with the system contain digital data needed for diagnostic comparisons and also provide audio instructions to lead the user through sequential test steps, the company noted.

The system also contains port monitors which enable on-line tests to determine if the proper communications signals are being transmitted between the T500 terminal and the user's host CPU. They also test the interaction of the terminal itself with its own operator display and local console; it stated.

The diagnostic device costs $3,000, according to the company, which can be reached through P.O. Box 5332, San Mateo, Calif. 94404.

Form Design 'Crucial'

State Saves $12,000/Mo With OCR Units

By Edith Holmes
CW Staff

WASHINGTON, D.C. — Minnesota's Department of Public Welfare saves about $12,819 a month by using optical character reader (OCR) equipment rather than direct key-to-tape-or-disk machinery to process its medicaid assistance payments, attendees at the recent OCR Users Association conference learned here.

If the department were to go to key-to-tape or key-to-disk equipment to satisfy its data entry needs, 17 additional keystations would have to be acquired to supplement the nine already in operation, according to Robert G. Meyer, administrative assistant with the department's Bureau of Income Maintenance.

"We'd also have to run extra shifts," he added.

The public welfare department went to OCR equipment when the state's legislature decreed that too much money was being spent by the government to pay bills — including medicaid claims filed by such providers of care as physicians, dentists and pharmacies, Meyer explained.

"OCR helps reduce administrative costs so the problem of processing these claims is not as large as it could be," he said, acknowledging that these costs — as with all expenses associated with medical services — continue to be high.

OCR-Readable Forms

Because this data entry technology provides a savings, however, the department of Public Welfare has taken the stand that it must process forms that are OCR-readable. It has done so despite opposition from the providers of care who initially went directly to the state legislature to demand uniform forms, Meyer stated.

The department's willingness to adapt forms and/or the system to permit the use of its Recognition Equipment Inc. (REI) OCR machinery has served to mollify these original objections, he added.

Operational in 1974, Minnesota's system for processing Medicaid claims was one of the first to be federally approved, and thereby eligible for federal funds under the U.S. Department of Health, Education and Welfare Medicaid management Information Systems (MMIS) program, Meyer said.

The state's Bureau of Income Maintenance, which administers the claims payment program through its Medical Assistance Division, uses REI's Input 80 Model C system with nine Total Data Entry (TDE) stations attached to it. Processing power for the program comes from three IBM 370/158s, courtesy of Minnesota's Department of Administration, he noted.

The TDE stations scan the claims forms once. Any errors are corrected manually on a CRT and entered onto the same tape for processing, Meyer continued.

The system includes the ability to send a statement to the medicaid beneficiary to explain what services have been paid for under the federal program, he said.

"We did benchmark OCR equipment in the beginning," Meyer stated. "REI proved to be best at that time at handling our needs."

The equipment can handle almot any font available, reading character by character, he added.

Minnesota's MMIS processed 560,681 forms in the first quarter of 1977. Its OCR equipment read those forms with a 90% accuracy rate, Meyer said.

The providers themselves, however, are the key to any successful medical claims processing system, he stated.

"Most people can't figure out how we got our physicians, dentists and other providers to type their claims," Meyer laughed, noting that OCR systems are much better at reading typed rather than handwritten forms.

"We told the 10,000 providers on the system that they didn't have to type their claims — but added that if they didn't, we couldn't guarantee when they would receive payment," he explained.

Today, 90% of the claims the state receives on paper can be read by the OCR scanners, Meyer said. Providers receive payment in an average of 19 to 20 days.

Few of the state's medicaid service pro-

(Continued on Page 32)

Century to Criterion Conversion Accomplished in Three Weeks

DENVER — "The cost for converting from one mainframe CPU to another can often equal two years of lease expense for the hardware. We did the job, and with no modifications, in just three weeks. During my 16 years in the DP industry, I've gone through seven conversions and this was by far the easiest," according to John L. St. John.

St. John is the director of Management Information Services for St. Anthony Hospital Systems here. He was describing the hospital's upgrade from a 64K byte NCR Corp. Century 200 CPU to a 256K byte NCR Criterion 8570.

The conversion entailed coupling the old and new CPUs, copying existing programs from the 30M byte disks to the 100 M byte replacements and then uncoupling the CPUs. No parallel operation was required and no programs were written.

Because the Criterion is eight times faster than the Century it replaced, St. John said that throughput has been improved 50% to 60%, depending upon the operation. This met the needs for an expanded DP capability while providing time to write modified applications at leisure.

The Criterion's ability to emulate the Century through firmware, enabling the old programs to be converted for the Criterion's use, was a significant feature, according to St. John. He noted that the hospital's latest addition can also function as a Cobol virtual machine and can compile Fortran, Neat 3, RPG and Basic.

The hospital is leasing its Criterion system for several thousand dollars a month less than it would have had to pay for doubling the size of the predecessor Century 200. This hardware economy was a central factor in St. Anthony's installation of the Criterion, St. John noted.

With the knowledge that the Century lease was due to expire in Sept. 1976, the hospital considered it appropriate to review its whole approach to DP, according to St. John. Three possibilities were considered:

- Giving up the in-house facility and going with a service bureau.
- Switching to a facilities management contract.

Recognition 'Long Overdue'

'Ideal' DP Auditor Needs Range of Experience

By Jay Allen
Special to CW

Today's DP audit function is just beginning to receive the attention, budgetary considerations and recognition that is long overdue. It is not surprising to find a tremendous diversity of opinion, thinking and approaches as to the qualifications, role and function of the auditor.

A composite profile of what would appear to make up the "ideal professional" in the DP audit field would be a person around age 31 holding a Masters Degree in Business Administration. The person should be the holder of one or more certificates (CPA, CIA or CDP), have performed systems analysis/design, some limited programming, internal audit experience and some experience with one of the major CPA firms would be nice.

The auditor should be knowledgeable in hardware, terminals and software. The individual's personality should be outgoing yet tactfully aggressive and the person must work equally well with auditors and DP specialists (a few of whom will consider their systems as their private domain which could do without outsider intrusion). An ability to walk on water is helpful.

The more progressive data center management will see the DP auditor as a friend and ally, who through a strong team effort will improve documentation, standards, security, results and in general create a more reliable DP function.

It has been said that the primary objective of the DP audit function is to insure that the systems integrity within the company operations are adequately safeguarded, thet completely reliable financial information is not being compromised and that generally accepted accounting principals are consistently being applied. Before an effective DP audit program can be established, it must be compatible with the overall corporate audit objectives (which are assumed to exist).

Overall Function

It seems that most general auditors or DP audit managers would define their overall function to include some or all of the following responsibilities:

- Participation as a member on the company DP steering committee on all computer related activities.
- An evaluation program to ascertain the effectiveness of data processing systems and operations, consisting of a review of DP costs, plans and future estimates, a review of procedures and standards within the DP and user organizations and post-operational reviews for operational savings and effectiveness.

This includes asking if the new system fulfills the user needs and if all the older systems are really necessary and cost justified or if they are still being run just to fill file drawers.

- To participate in negotiations between the user organizations and DP organization concerning source allocation and operational budgeting.
- Prepare reports concerning operating differences between the user and the processing facility.
- Review and approve the design enhancements of new or existing systems to insure adequate controls will be included and make recommendations where improvements are noted.
- Perform and review DP systems feasibility studies for possible opportunities for cost reductions.
- To prevent intentional or unintentional mistakes in the handling of mechanized information.
- To insure adherence to management policies and consistent accounting practices.
- To insure that the user has an adequate user manual and understands the output.
- To guarantee that all proper standards and procedures are enforced relative to security of the center, terminals, data files, backup, disaster recovery and data base integrity.

For those companies just beginning to implement the function, it may be most practical to do so in stages.

Phase-In Program

Stage one would be an audit within the current systems environment. During the first phase, the DP audit function should make contributions to the DP environment. The audit function should be familiar with the operations of the DP department and operate effectively at this point.

Stage two would develop a systems assurance package.

This stage of development of computing auditing will provide management with a higher degree of assurance that existing computer systems are functioning within established guidelines.

As the first two stages are being completed, the Audit staff will have time to become more expert in systems and programming. The staff will be well versed in DP auditing knowledge, accounting techniques and DP control procedures.

Stage three would monitor systems on a continual basis. As the state-of-the-art in the computer field rapidly progressed, new DP audit techniques must keep abreast of these new computer systems and techniques.

'Preventive' Auditing

The third stage of DP auditing involves a switch from the traditional "after-the-fact" audit to the review of events prior to their occurrence. This preventive auditing should make a particularly valuable contribution to management. Reaching the level of monitoring systems on a continual basis can be considered a long-term project.

Stage four would involve future development and planning. Future planning will allow the audit function to adjust the direction of the audit function as business conditions dictate.

In my judgment, the newly energing DP audit professional and his corporate management should consider that the organizational structure and level at which DP audit is placed is crucial to its effectiveness. It must be completely independent of DP and at a corporate level in which DP management can not dictate or direct.

A definite movement and detailed planning should go into a comprehensive certification program which would lead to certified DP auditors. This would normally include experience and expertise in systems design/programming, hardware/software knowledge, teleprocessing, cost effectiveness and performance evaluation, security standards, insurance coverage, controls and system verification.

As computer systems and technology become more complex, it may no longer be feasible to assume that the firm's large accounting firm can provide timely expertise to one of the corporation's most valuable assets which is the DP function and all corporate data.

Associations Valuable

It seems important that all DP auditors become active and participate in their local EDP auditors association and if a chapter doesn't exist, guidance is available on starting one and how to become affiliated with the International EDP Auditors Association.

Since it is critical that DP auditors be tactfully aggressive and interface well at every level, it may be important for them to attempt to upgrade that part of their personality through a variety of methods available to us today.

We can encourage major universities to offer broader and more specialized curricula in the field of DP audit.

Today's DP auditors have an opportunity and responsibility to provide leadership and training to the vast internal audit profession as to the ways in which the computer can be easily used as a powerful internal audit tool which can save valuable man hours.

Allen is specialist with EDP Auditors Unlimited in Oklahoma City, Ok. 73112.

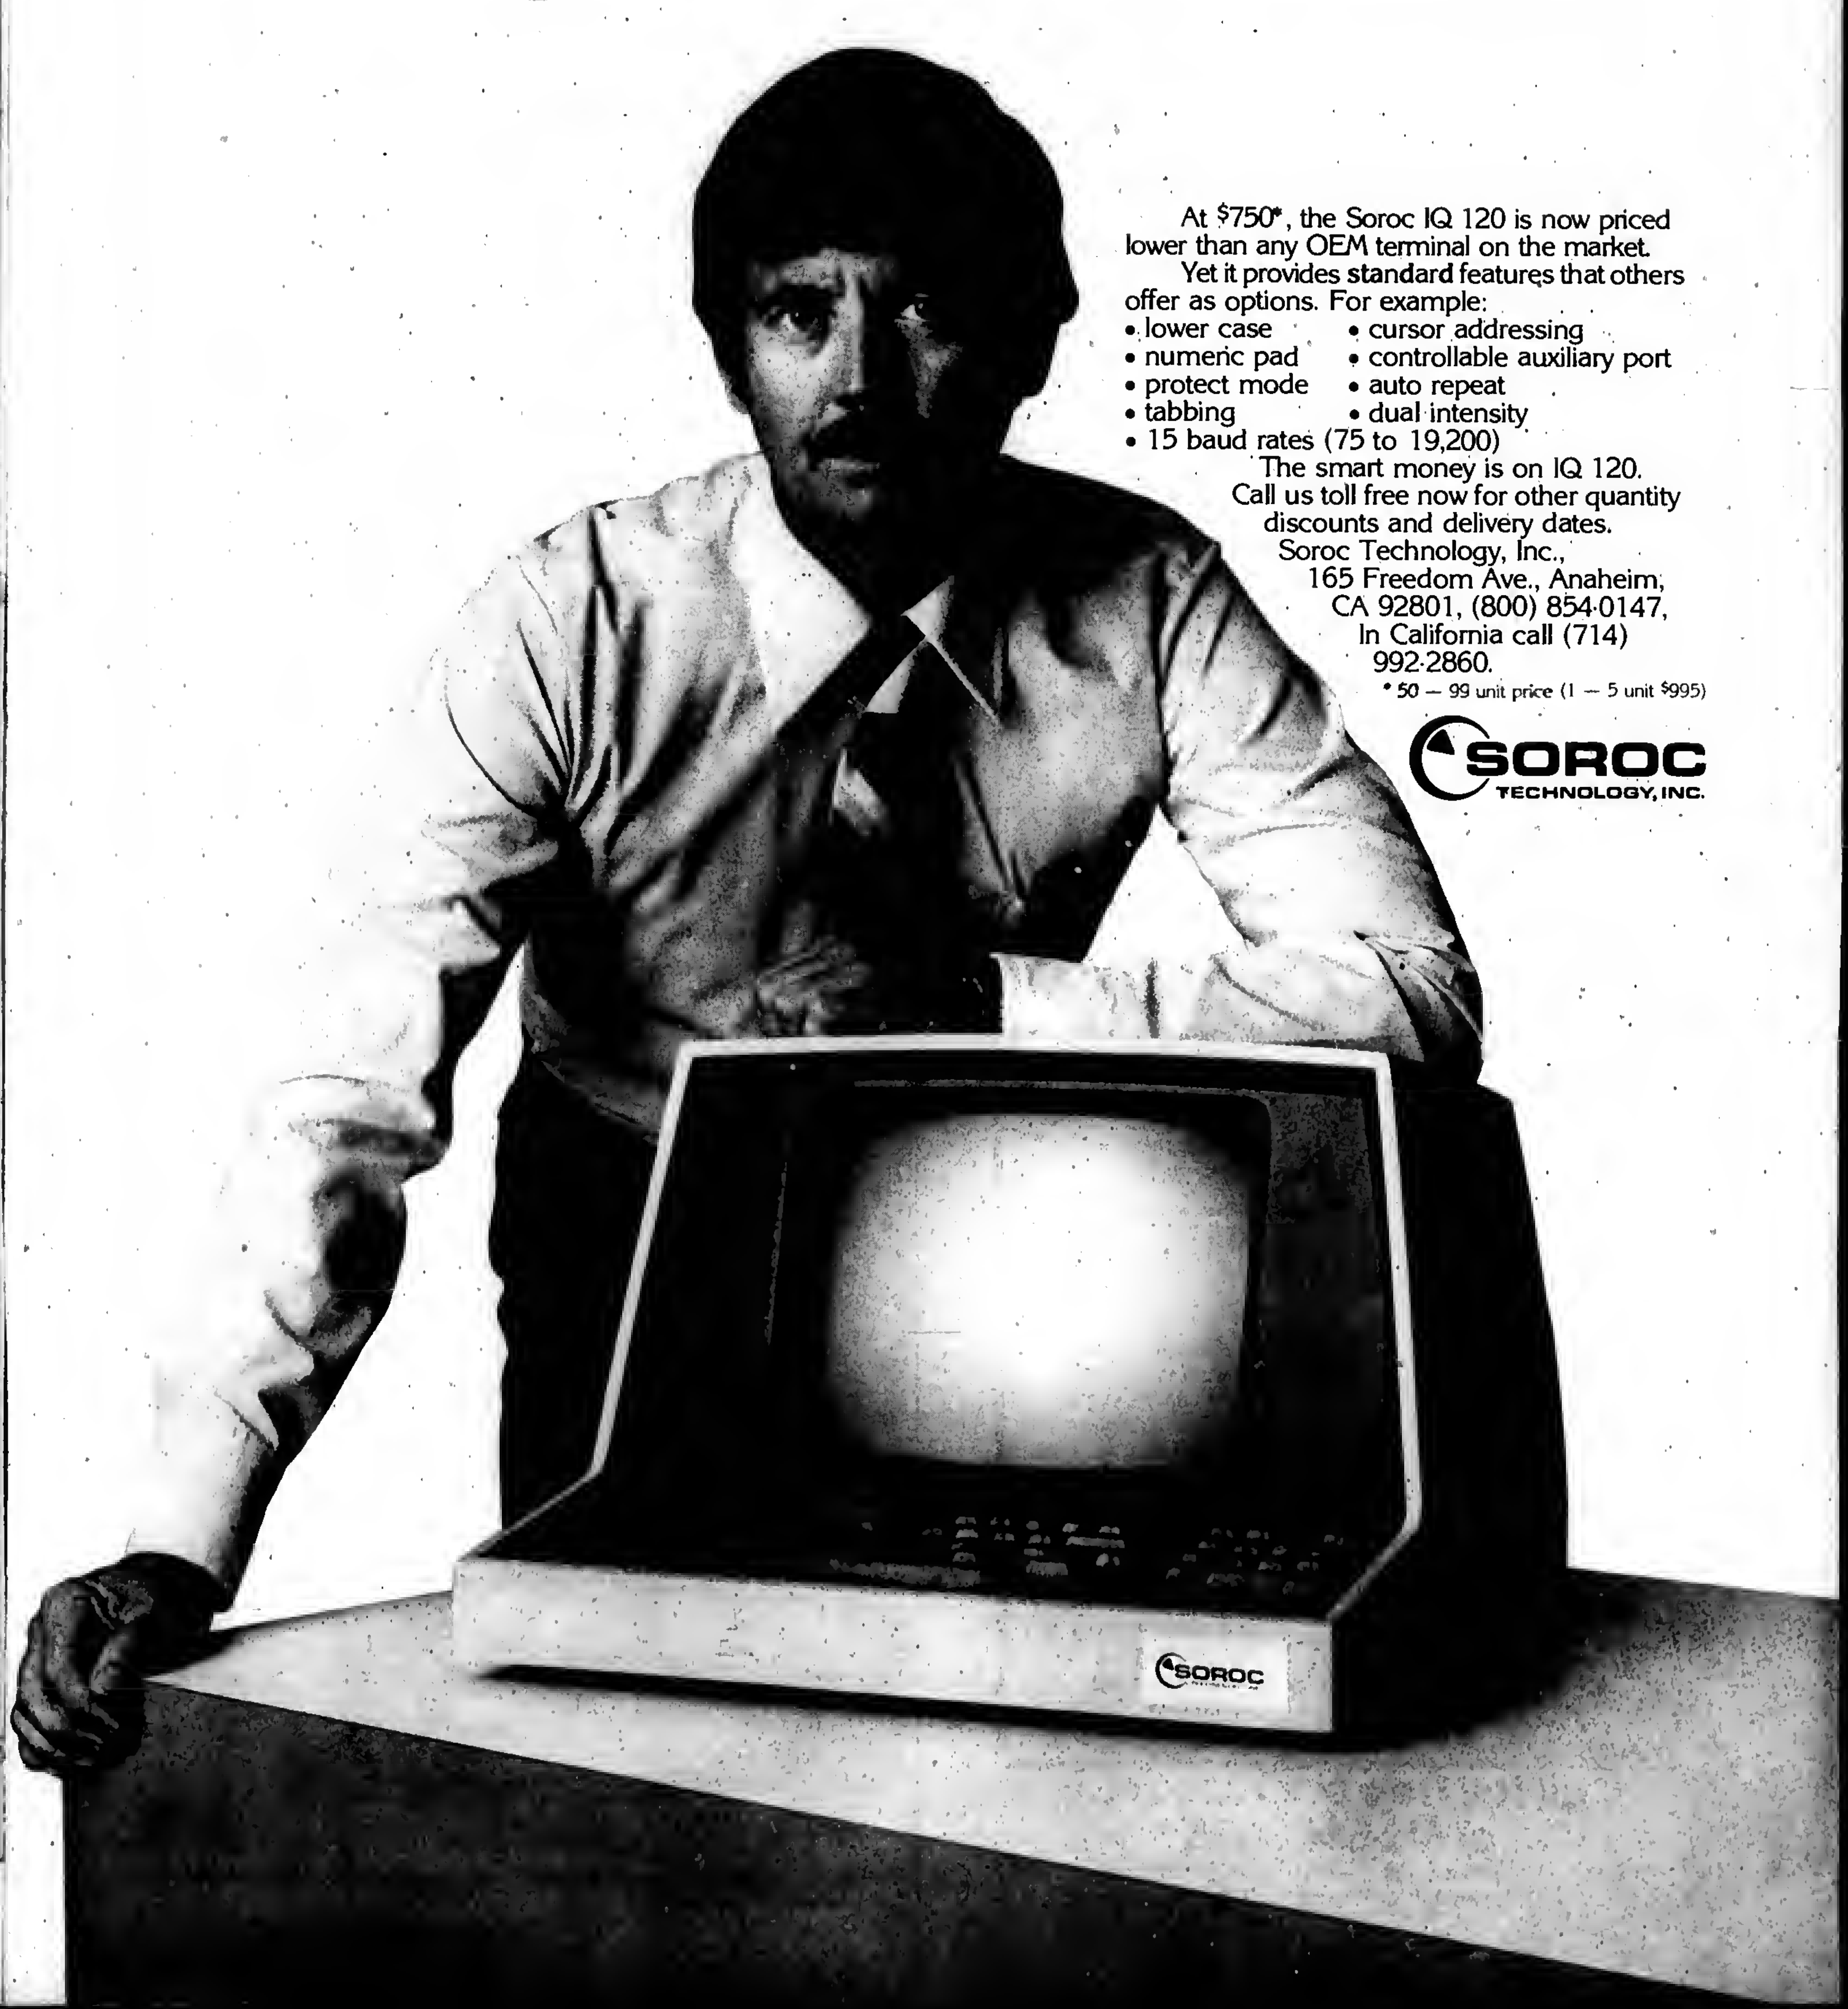
Why settle for less when nothing costs less?



At $750*, the Soroc IQ 120 is now priced lower than any OEM terminal on the market.

Yet it provides standard features that others offer as options. For example:

- lower case
- numeric pad
- protect mode
- tabbing
- cursor addressing
- controllable auxiliary port
- auto repeat
- dual intensity
- 15 baud rates (75 to 19,200)

The smart money is on IQ 120.

OCR Units Save Minnesota Over $12,000/Mo

(Continued from Page 29)

viders aren't involved in this scheme of claims payment, he added. One other incentive the system has in its favor is that it handles approximately 30% of the medical care dollars available in the state.

Medical providers don't want ot lose 30% of their cash flow. They would have to turn away all medical assistance recipients if they didn't participate in the claims processing program, Meyer said.

Much of the compromise between the providers and the state's MMIS has been in the area of forms design, he noted:

Minnesota has 15 different claim forms in use now.

Meyer acknowledged the work of other states in the MMIS area. "Michigan's data entry system was the best we saw, and we have borrowed a great deal from their forms design."

Minnesota has begun to depart from pink forms, which drew provider ire on the basis that they are hard to read. Experiments with brown ink indicate the brown forms microfilm better and can be photocopied, according to Meyer.

"We learned that there are so many areas to be considered in forms design that it's impossible to develop the optimum form in one shot," Meyer said.

Forms need to provide adequate space for entry of data elements. In addition, forms should have "integrity" — flowing in such a way that the claim information at the top of a form relates to the information at its end.

Meyer added that the state is now trying to design its forms in such a way that it doesn't ask for every bit of information needed.

"We are striving to find the lowest data form element denominator by which we can derive some of the necessary data from other information supplied on he form," he said.

The "uniform claim" concept — the use of a single form for all third-party payers — is clearly the best direction for further work in the forms area, Meyer suggested.

Uniform forms would facilitate clerk-form familiarity, standardize procedures and collection codes, and minimize provider staff training on how to complete the claims forms, he said.

Meyer's experience in Minnesota in the development of uniform claims forms has not been as good as he would like it to be, however.

In describing his efforts to work with other interested groups, such as the American Hospital Association, on this problem, Meyer stressed the need for cooperation.

He also emphasized the importance of education as to what OCR is. Describing OCR as "a very cost effective means of capturing data," Meyer noted that people working on claim forms usually haven't had experience with OCR.

Century-Criterion Switch Accomplished in 3 Weeks

(Continued from Page 29)

- Upgrading the in-house facility, but with the possibility of switching to another vendor's hardware.

"We knew that our emergency service was going to grow along with the general needs of the hospital. In addition, plans to increase the satellite unit would nearly double the DP needs of the facility," St. John recalled.

"What we were projecting was 20,000 to 22,000 daily computes transactions. That was a year and one-half ago and we've reached that volume today with more growth certain to come," he added.

After weighing the pros and cons, the hospital rejected the service bureau possibility. The feeling, he said, was that while such firms do offer much in the way of health care DP, their approach is, of economic necessity, a standard one.

Thus, there is built-in resistance to change, and that kind of attitude, in addition to being overly confining presents unwanted obstacles to meeting the changing needs of an institution such as St. Anthony. Also vetoed after consideration, St. John said, was the facilities management concept.

"The theory there," he said, "is that you can get rid of your headaches by putting them off on someone else. But in reality, you don't eliminate them, you just remove one step.

"True, the people aren't on your payroll, but that just makes them less responsive. In addition, if an operator is out ill, your processing gets held up just as it would be if you paid the operator's salary directly. The facilities management people can't do any better at hiring a temporary replacement than you can.

"Then too, there's the matter of accountability. A hospital needs a DP center that is completely responsive to its unique requirements. Arguing about those requirements with someone who isn't even on the staff is not only an unnecessarily bruising experience, but one which is generally unproductive," St. John explained.

Since through a process of elimination the hospital had decided to upgrade its in-house facility, the question then became one of deciding which vendor was best. NCR's record of maintenance and service was given consideration, St. John said, but not undue weight, since it was felt that any of three other vendors could prove equally dependable in these respects.

"The hardware of two of the other vendors was simply too expensive in consideration of what we could get for less money with the Criterion. In addition, the cost for conversion to either system was simply out of reason.

"The hardware of the third vendor was quite competitive with the Criterion on a price/performance basis, but again the cost of conversion was too high," he said.

Benita H. Arrellano, a programmer at St. Anthony Hospital, checks out new Criterion 8570 system.

Via Special CRT/Keyboard

Patients Enter Data Into Hospital's Mini

By Esther Surden
CW Staff

CHICAGO — Patients at Roosevelt Memorial Hospital here enter their own patient histories into a minicomputer-based system via a specially designed CRT, according to Jim Garthwait, director of information for the hospital.

The 144 bed not-for-profit hospital runs a complete patient care system on a 72K Four Phase Systems, Inc. IV/70 minicomputer with eleven CRTs, a 300 line/min printer and two cartridge disks.

After admission, the patient sits down at a terminal and takes his own history. The patient is accompanied by an historian who guides him through the process. A plastic template fits over the keyboad so the patient can only access the 10 numeric keys and two other keys that trigger "next question" and "go back." About 212 questions are asked of the patient, but all of these are asked only if the answers to every question is yes, Garthwait explained.

"Most of the answers to the questions are 'yes,' 'no,' 'I don't know,' or 'I don't understand.' There are a few in which the patient has to give a specific number."

After the patient keys in the information, the historian interviews the patient and asks for information on medicines the patient is currently taking or medicine-related allergies. With this information the historian adds a narrative part to the history. The system then prints out a narrative of the answers the patient gave, which, along with the admitting form, goes into the patient's chart.

Patient History System

The hospital's system of letting the patient "take" his own history began when a group of doctors got together and devised a patient history system on a Digital Equipment Corp. system.

The hospital needed more capability than the DEC equipment could provide and got in touch with a local consulting firm to devise the patient care system, he said.

The system begins to track a patient even before he is physically in the hospital, Garthwait said. Before the patients arrive at the hospital many go through a pre-admission procedure.

When a reservation is received from a doctor an admitting person calls the patient and enters all pertinent information so when the patient comes into the hospital, the record can be recalled, a permanent number provided and the admit date entered.

After the patient history is taken, the patient is put through a battery of lab test. As the technicians in the lab finish the tests, they enter the results on a CRT. As soon as the tests are entered the doctors or nurses have access to them through CRTs on the floor. Hard copies of the test results are printed twice a day, once at 3 p.m.and once before midnight, he said.

An X-ray reporting application is also part of the system, he explained. At Roosevelt, and at many other hospitals, standard narratives are used to describe normal X-rays. The X-ray department at Roosevelt had a typewritten list of about a hundred of the standard narratives, which the DPers have now put on disk.

"That took care of about 40% of the X-ray results that the hospital was reporting," Garthwait explained. The rest are keyed directly into the system.

The day after the patient is admitted, a utilization coordinator receives a report. The coordinator codes the patient's diagnosis into the system, and the system calculates "what the patient's length of stay should be." That triggers a census report for doctors.

When the patient is ready for discharge an admitting clerk enters the final diagnosis and the discharge status. A patient is kept on-line for two weeks, a length of time that is simply a function of system capacity, he noted.

Each night between 11 p.m. and 12 a.m. the hospital's switchboard operator takes the system off its on-line status and switches it to batch to print reports. "One of our design criteria was that the system should operate without DP personnel," Garthwait explained.

Because of the interest generated by the system, the hospital set up a company to market the software called Medical Computer Applications Corp. with which Garthwait is now involved, he added.

DEC MSB-11 Lets Students Use Mark Sense Batch Input

MAYNARD, Mass. — The Mark Sense Batch-11 (MSB-11) from Digital Equipment Corp. is an instructional batch processing system that allows student prepared marked cards, coded in either Basic or Fortran IV, to be used as input.

The PDP-11/04 based system includes 32K bytes of semiconductor memory, dual floppy disk, 180 char./sec line printer, LA 36 Decwriter II console terminal and the CMS-11K desktop mark sense card reader. Basic is included with the system, while Fortran is optional, a spokesman added.

DEC MSB-11

The CMS-11K reader enables the system to accept 40-column punched or marked cards. The system can be expanded to full RT-11 capability which allows it to run multi-user Basic in a timesharing environment alternately with mark sense batch, the company noted.

In addition, current PDP-11/34 users, who have floppy disk storage can add the stand-alone mark sense batch capability through the introduction of a system enhancement package.

The system, with a subset of the RT-11 operating system costs $21,460. With the replacement of the desktop reader with DEC's standard CM-11 card reader the system costs $25,260, according to a spokesman. DEC is located in Maynard, Mass. 01754.

IBM Peripherals Linked to Minis

HOUSTON, Texas — Information Products Systems, Inc. has a device it says allows high performance IBM peripherals to hook up to a medium scale minicomputer.

Called the Selector Channel Emulation Unit (SCEU), it generates the protocol sequences required by the IBM peripheral control unit in response to the operational commands of the minicomputer CPU.

The unit can support up to 255 different device control units at combined transmission rates in excess of 2.4M byte/sec, the company claimed.

A typical system configuration includes a minicomputer, general purpose interface SCEU, Selector channel bus, IBM device control unit and the IBM or IBM-compatible device. The SCEU costs $15,150 with discounts available. The company is located at 6565 Rookin, Houston, Texas 77074.

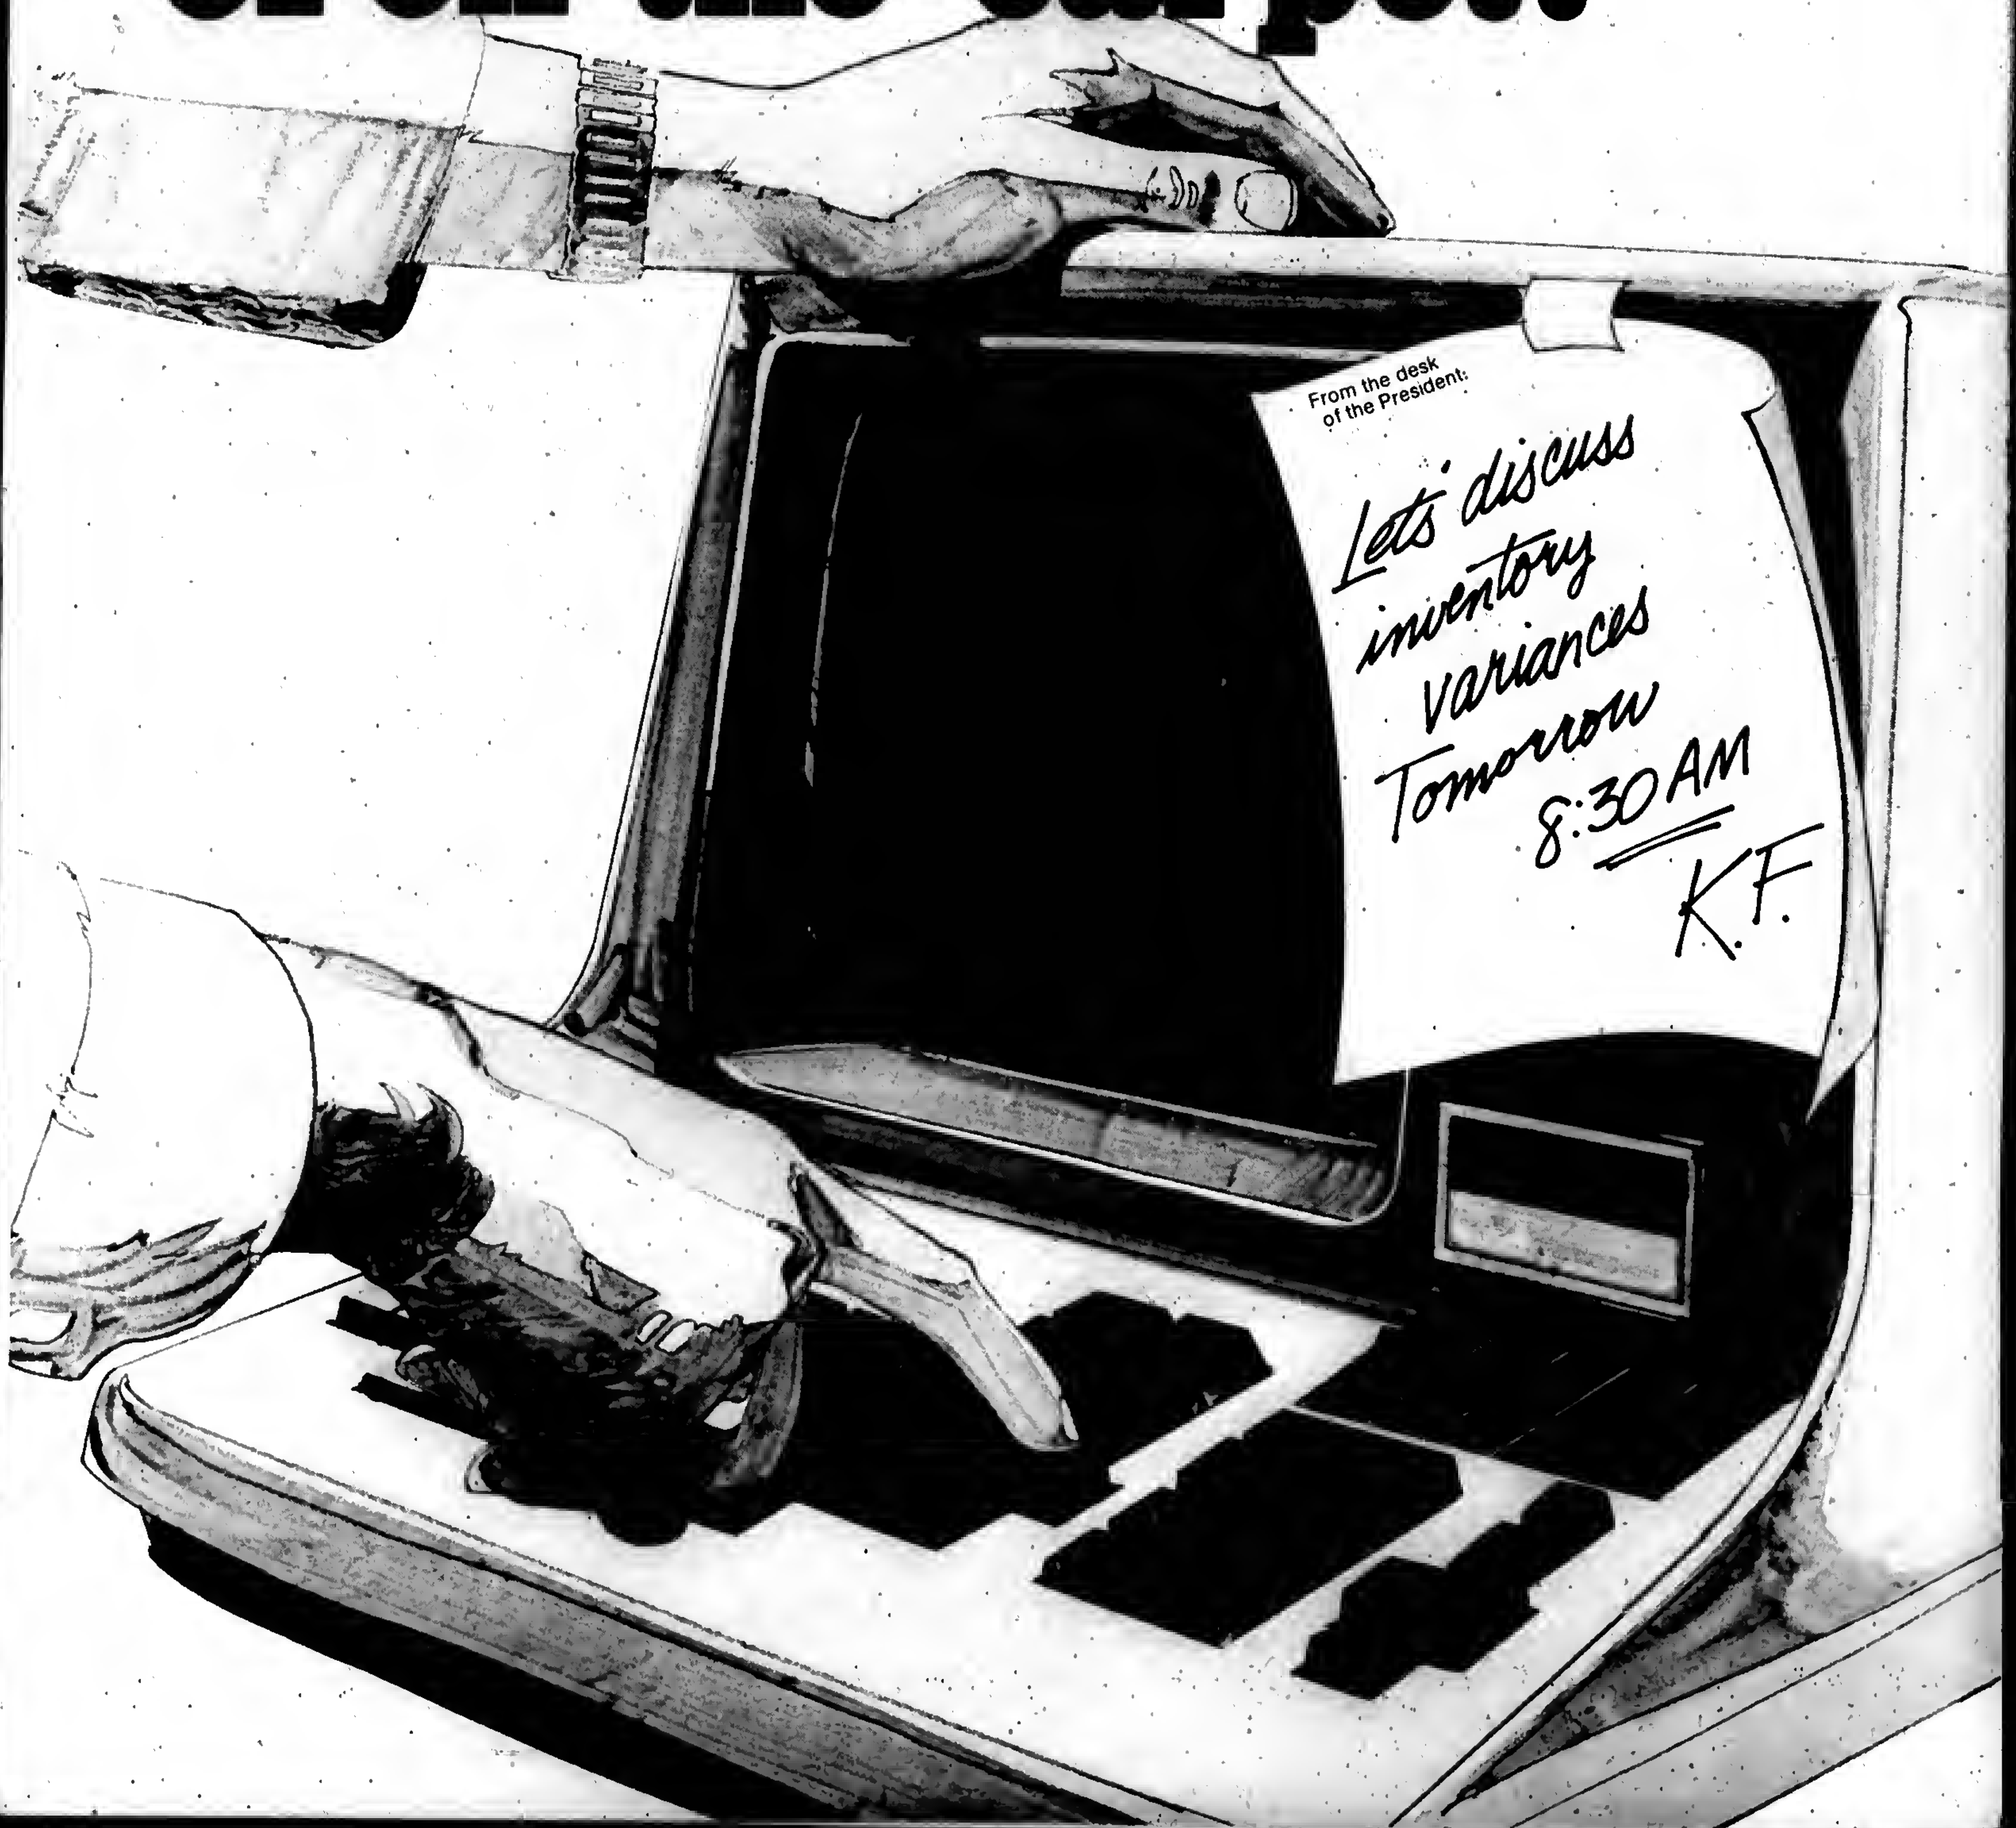
COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

To the VP of manufacturing who'd rather be on-line instead of on-the-carpet:



From the desk of the President:
Let's discuss inventory variances Tomorrow 8:30 AM
K.F.

T

An on-line inventory management system is a nice thing to have when you need answers in a hurry. Especially if the system gives you the controls you need to make sure the answers are not full of surprises.

To our V.P. of manufacturing, such a system is more than a nice idea; it's absolutely essential. By being on-line to an interactive, multiuser Prime computer programmed to handle Prime's specific needs, he has everything under control. Last year, for example, the system helped his organization control the variance between physical and book-value inventory to less than 0.1%!

So if you've been spending too much time on the carpet explaining variances more like 5%, a Prime computer can help you control your inventory as tightly as our V.P. controls ours. In fact, the money you'll save by reducing your variance will no doubt pay for the complete system.

Depending on how many people in your organization need answers in a hurry, you can get a Prime computer that handles up to 63 terminals simultaneously. You can develop the inventory management system that fits your needs perfectly, using the software tools available with PRIMOS, Prime's virtual memory management operating system. PRIMOS gives you access to powerful file processing and CODASYL-compliant database management systems; a forms management system; and a choice of languages including ANSI '74 COBOL, FORTRAN IV, RPG II and BASIC.

Large databases can be managed with ease since on-line disk capacity can be as large as 2.4 billion bytes; main memory as large as 8 million bytes.

Typical systems for database management applications range from $100,000 to $350,000, or about $2,170 to $7,600 per month if leased directly from Prime.

To find out how being on-line to a Prime computer can keep you off the carpet, talk to Robert P. Berkowitz, vice president of manufacturing, Prime Computer, Inc., 145 Pennsylvania Avenue, Framingham, MA 01701, (617) 879-2960.

Prime can help

Datapro Offers Selection Course

DELRAN, N.J. — A course in selection and usage guidelines for minicomputers and microcomputers will be given in four cities this fall and winter by Datapro Research Corp.

The course is intended for people with systems or administrative responsibility for planning and designing business information systems. Anyone responsible for evaluating, specifying, buying or using minicomputers and microcomputers will benefit from taking the course, Datapro said.

Included will be evaluation guidelines and competitive comparisons of existing vendors' product lines and business methods, the company said, as well as discussions of the relative value of vendor features and system integration capabilities.

The course costs $425 for current Datapro subscribers and $475 for nonsubscribers and will be given in Chicago Sept. 29-30, New York Oct. 13-14, San Francisco Nov. 17-18 and Washington, D.C. Dec. 12-13. Information is available from Peggy Quinn, Datapro, 1805 Underwood Blvd., Delran, N.J. 08075.

Digital Pathways Eprom Fits DEC PDP-11 Minis

PALO ALTO, Calif. — Digital Pathways, Inc.'s RMP-116 board, designed for the Digital Equipment Corp. PDP-11, holds up to 16K of read-only memory (ROM) and contains an on-board programmer, according to a spokesman.

The device is said to allow users to place large programs in read-only memory, replacing disks for this function, thus enhancing speed and reliability.

The system is based on the Intel 2716 UV erasable programmable ROM (Eprom) or its masked equivalent 2316 ROM. It can plug directly into a peripheral slot on the PDP-11.

The unit accommodates direct and indirect addressing modes. In direct mode, memory is organized as a set of four blocks containing 4K words. Any block or combination of blocks can be assigned to unused portions of the PDP-11 address space, the company explained.

In indirect mode, all words on the board can be individually or sequentially accessed through a common port having a single peripheral address.

The RMP-116 board and programmer costs $895 and ROM chips are available from various suppliers, a spokesman added from Digital Pathways, Inc., 4151 Middlefield Road, Palo Alto, Calif. 94306.

Turnkey Suits Fuel Dealers

SCOTIA, N.Y. — A minicomputer-based turnkey system for fuel dealers is available from Mohawk Computer Technology, Inc. (MCT).

The on-line, interactive Fuelnova system was designed for fuel dealers with any number of accounts, the firm said. The system is modular and is configured to each dealer's needs.

It can handle transactions for payments, charges and no charges, as well as schedule deliveries using any one or combination of three alternatives with credit-checking capabilities, the firm said.

Management reports covering aged trial balances, sales analysis, budgets and performance can be produced by the system, according to MCT.

The Fuelnova system is comprised of a Data General Corp. Nova 3 CPU with 32K words of memory; a 60 char./sec serial matrix printer; a 10M-byte Novadisk with 5M bytes of fixed and 5M bytes of removable storage; and one or more CRTs.

Prices for a typical system range from $32,000 with one CRT to $36,000 with three CRTs. MCT is located at 8 Sarnowski Drive, Scotia, N.Y. 12302.

Add-On Gives Up to 32K Bytes

MINNEAPOLIS — Fabri-Tek, Inc. has a semiconductor add-on memory for the Digital Equipment Corp. LSI-11 and PDP-11/03 minicomputers.

The LS-IN-11 is said to provide 8, 16, 24 or 32K bytes of memory on a single card using 8K or 16K dynamic metal oxide semiconductor N-channel chips.

The unit uses a two-wide connector and plugs into a single chassis slot position. It is hardware- and software-compatible with the mini and memory segments are switch-selectable.

A 16K add-in memory costs $1,085 from the firm at 5901 S. County Road 18, Minneapolis, Minn. 55436.

Computer Labs Has Mag Tape

GREENSBORO, N.C. — Computer Labs, Inc. has a magnetic tape memory system for the Digital Equipment Corp. PDP-11 minicomputer. Called the T9000, the 75-in./sec magnetic tape transport permits PDP-11 system integration without any software changes, the firm claimed.

The 9-track PDP-11-compatible controller is available in either an 800 bit/-in. NRZI version or one incorporating both NRZI and 1600-bit/in. phase-encoded formats. It runs RSX-11, RT-11 and DOS operating systems unaltered and is also TM11/TU10-compatible on commands and status interrupts, it said.

The 800 bit/in. T9000 costs $8,350 from 505 Edwardia Drive, Greensboro, N.C. 27409.

LSI-11 Gets Eprom Board

BELTSVILLE, Md.— RDA, Inc.'s RMRV-8K is an 8K-word erasable programmable read-only memory (Eprom) board designed for use with the Digital Equipment Corp. LSI-11, according to a spokesman.

The memory board occupies one dual-height module slot in the LSI-11 backplane, he noted. Addressing is jumper-selectable for any two 4K banks in the zero to 28K address space, he added.

The RMRV-8K costs $285, depopulated, from the firm at 5012 Herzel Place, Beltsville, Md. 20705.

Mini Bits

DG User Group Sets Fall Meet

WESTBOROUGH, Mass.— Data General Corp. has announced its plans for its annual users group meeting.

The meeting will take place in San Francisco on Oct. 26-28. Users can choose from concurrent seminars dealing with communications, languages and hardware as well as application case histories.

DG users with questions or suggestions concerning the meeting are urged to contact John Maloney, Data General Users Group, 15 Turnpike Road, Westborough, Mass. 01851.

Distributed DP Course Set

NEW YORK — A course on distributed DP using minicomputers and data bases will be given by Advanced Management Research International, Inc. in Boston on Oct. 3-5 and in San Francisco on Oct. 26-28, a spokesman reported.

Designed for DP managers, systems analysts and corporate management concerned with or responsible for developing the DP services within their organizations, the course will attempt to provide users with "what you need to know" to make decisions.

The course costs $495 for an individual registrant and the group rate for two or more persons is $425. AMR can be reached at 1370 Ave. of the Americas, New York, N.Y. 10019.

TI Cuts 900 Series Prices

HOUSTON — Texas Instruments, Inc. (TI) announced maintenance price reductions across all product lines of its 900 series mini/microcomputers and systems, effective Aug. 1.

Maintenance price reductions averaged 22% for the 990 family and 20% for the 900 series.

TI's Digital Systems Division can be reached through M/S 784, P.O. Box 1444, Houston, Texas 77001.

Seminar to Cover Minis In Health Care Settings

NATICK, Mass. — International Management Services, Inc. will present a seminar on minicomputers for health care applications in Boston on Oct. 26-28.

The seminar will strive to present a basis of comparison for evaluation of various products and techniques. Firm guidelines will be given for the evaluation and management steps will be recommended for analysis, design, selection and installation of minicomputers.

The seminar costs $395 for each prepaid attendee and $445 for billed attendance. Additional people from the same organization can attend the seminar for $425, IMS explained from 215 Oak St., Natick, Mass. 01760.

Correction

English 210, an option available on STC Systems, Inc.'s Ultimacc business system [CW, Aug. 15, Page 33], costs $5,000 to purchasers of that system. It is included as a standard part of the firm's Wholesale Distributor package in the bundled price which starts at about $43,000 including hardware and software, according to a spokesman.

A Source of Micro Bugs

'Noisy' Electricity May Plague Hobbyists

By Michael E. Zeidler
Special to CW

MILWAUKEE, Wis. — Many microcomputer hobbyists are discounting the quality of residential electricity as a source of computer "bugs." Purity is being ascribed to the electricity that is fed to the micro, but this confidence by hobbyists is not justified.

Transients in the electrical power supply are responsible for many mysterious microcomputer bugs.

Quite likely, each of the over 25,000 hobby micros in the country have been tripped into electricity by "noisy" electricity. Many of these errors, being non-repeatable, are getting chalked up and forgotten.

Some of these microcomputer bugs can be directly traced to transients in electrical power supply lines. Loading failures, media-to media transfer errors, memory loss and other 'glitches" may be symptomatic of power quality problems. These transients, which cause the quality of electricity to deteriorate, are introduced by competing appliances, neighborhood users and district surges.

The first time a hobbyist suspects power quality problems may occur when the microcomputer is competing with a dish washer, washing machine or power tool for electricity.

The micro might behave erratically and might refuse to load a tape or might jump to a different routine. The problem will clear up when the competing appliance is in the middle of a cycle and then reappear anew during the next cycle switching.

Transients are also related to neighborhood usage characteristics. A typical pole transformer usually supplies several buildings, some of which might contain heavy equipment which pollutes the electricity with spikes. The problem may be compounded by an insufficient rating on neighborhood pole transformers.

Microcomputers are also affected by brown-outs during periods of peak usage. During a brown-out a utility cuts voltage levels by 5% to head off a black-out.

Since the speed of the clock in the micro is a mathematical function of the input voltage, the clock may slow down during a brown-out, which could cause problems such as I/O transfer errors.

The hobbyist has little or no control over the quality of the electricity that is being consumed by the microcomputer. There is no control over the brown-outs and transients introduced into the neighborhood electrical supply. The hobbyists' control is limited to non-automatic appliances in the hobbyist's residence.

The hobbyist must adopt a defensive strategy to assure reliable microcomputing.The enthusiast can take six preventative steps:

- Recognize the possiblity of harmful transients in the residential power supply.
- Avoid competition between the microcomputer and domestic appliances.
- Avoid computing during peak demand periods or during brown-outs.
- Select large system power supplies.
- Use voltage spike protectors and isolation transformers.
- Identify the source of local transients.

Defensive action will help to minimize the impact of power quality problems.

Ziedler is an independent computing consultant and may be contacted at 2854 North Cramer St., Milwaukee, Wis: 53211.

Micro Bytes

'Shacks' to Retail 8080A Chip

FORT WORTH, Texas — Radio Shack Co. has announced that it will be retailing an 8080A microprocessor unit chip in its stores.

The chip comes housed in a standard 40-pin dual-in-line package and sells for $17.95, the spokesman said.

Heath Offers Catalogue

BENTON HARBOR, Mich. — The latest edition of the Heath Co. catalogue lists 400 electronics projects and features the Heath H8 and H11 microcomputers.

The catalogue is free from the company, Dept. 350-420 at Benton Harbor, Mich. 49022.

EPA Offers Micro Kit

SAN DIEGO — Electronic Product Associates, Inc. (EPA) is offering its Micro-68 computer in kit form at $385 complete with power supply and cabinet.

The kit includes a 6800 microprocessor, 16-key hexidecimal keyboard and six-digit display.

Memory can be expanded from the 128 words of random-access memory included to 768 words.

The MON-1 keyboard operating system is supplied in programmable read-only memory form.

EPA is at 1157 Vega St., San Diego, Calif. 92110.

Kit Has Basic

HIRAM, Ohio — Ohio Scientific has introduced the Challenger IIP, a 6502-based microcomputer that comes complete with Basic.

Challenger IIP comes with keyboard and interface to connect to a CRT.

The unit, with 4-slot backplane and case costs $598 from the firm in Hiram, Ohio. 44234.

Starting A Store

BOSTON — Consumer Computer Marketing, Inc. (CCM) has released a report, "How to Start a Computer Store and Keep it Running.

The package includes a 175-page manual and features an audio cassette transcription of the three-hour session presented at this year's National Computer Conference by Paul Conover, a consultant with CCM.

The report sells for $200 from the Audio Visual Dept., CCM Inc., P.O. Box 7343, Oakland, Calif. 94601.

PCC Offers Reference Book On Personal, Home Computing

By Frank Vaughan
CW Staff

MENLO PARK, Calif. — The People's Computer Co. (PCC) has recently published "PCC's Reference Book of Personal and Home Computing."

The volume contains 10 articles dealing with personal and home computing .The subjects range from a simple glossary that is subtitled "How to Translate Computer People Talk into Near-English;" an overview of personal and hobby computing; a discussion of languages; version three of Palo Alto Tiny Basic and the future of personal computers.

In his preface to the first article, "An Elementary Introduction to Home Computers for the Complete and Absolute Novice" Dwight McCabe, editor, says:

"The computer world can seem like a very strange and forbidding place to the non-initiate who unexpectedly stumbles across it. Computer people seem to enjoy adding to this aura by using an intricate jargon that often seems more related to Hungarian or Urdu than to English. In the past, an introduction to computers for most people resembled being grabbed by the neck and belt and being thrown bodily into a pool. After a period of complete confusion and even despair, everything usually clicked and made sense. Sadly, some drowned."

In the reference portion of the volume, McCabe provides two bibliographies, one general and one on computer music. He also includes membership information on the Association for Computing Machinery (ACM) and the Institute of Electrical and Electronics Engineers, Inc. (IEEE).

In addition, over 200 U.S. and foreign computer clubs are listed along with the club newsletters. Information on hobbyist publications, stores and companies is also included.

The reference book costs $5.95 plus 95¢ for shipping and handling per book. California residents must add 35¢ for sales tax. PCC, 1263 El Camino Real, P.O. Box E, Menlo Park, Calif. 94025, is a chartered, non-profit organization which also publishes three magazines: Dr. Dobb's Journal of Computer Calisthenics and Orthodontia, People's Computers and Computer Music Journal.

ACM Plans Hobbyist Group

NEW YORK — The Association for Computing Machinery (ACM) has formed a special interest group on personal computing (SIGPC). It will be operated exclusively for educational and scientific purposes in the design and applications of computer systems for personal uses, according to a spokesman.

Dr. Portia Isaacson, who chaired the 1977 National Computer Conference, has been appointed chairperson of SIGPC. Isaacson's immediate plans include appointment of other officers, publication of a quarterly newsletter and holding SIGPC's first business meeting at ACM '77 in Seattle Oct. 17-19.

Persons interested in joining SIGPC should write to ACM at P.O. Box 12105, Church St. Station, New York, N.Y. 10249. The dues, which include a subscription to the newsletter, are $5/yr for members, associates and student members of ACM; $13/yr for non-ACM members and a newsletter subscription without membership costs $12/yr.

Further information on SIGPC programs may be obtained from The Micro Store, 634 South Central Expressway, Richardson, Texas. 75080.

Programming in BASIC course. 4 cassette tapes coordinated with 4 printed texts. $19.95. By community college professor. Checks accepted. Tape'n Text, Williamaville Publishing Co., Inc., Box 237, Williamsville, N.Y. 14221.

8080 SYSTEM SOFTWARE KIT for $50.00. Machine readable source. LaForge, Box 410, Boalsburg, PA. 16827.

Microcomputer Software Wanted. Complete RJE software to create 8080 based line printer, card reader terminal compatible with IBM HASP. CW Box 3152, 797 Washington St., Newton, MA 02160.

FOR SALE. IBM 2741 PRINTER. Contact Jack Lang, (513) 258-1450. ISYS, 4134 Linden Ave., Dayton, Ohio 45432.

Axiom Plotter/Printer Bows

GLENDALE, Calif. — A graphic plotter/printer designed to operate on microprocessor based systems is available from Axiom Corp.

The Axiom EX-810 is a full graphics plotter which can print 8,192 dot/sec with up to 512 dot/row. It can function as an 80 column alphanumeric printer with a speed of 160 char./sec.

The unit is intended to be driven by an 8-bit MPU with relatively minimum software overhead and it is equipped with a TTL compatible controller which takes care of all the internal timing functions necessary to drive the printhead and advance the paper, the spokesman added.

Printout is initiated by a single input command which causes the eight-track non-impact printhead to move across the printing field, he said.

The unit costs $795, is self-contained in a case with power supply, paper holder, low power detector and bell. It uses 5-in. wide electrosensitive paper, the spokesman noted from 5932 San Fernando Road., Glendale, Calif. 91202.

N.Y. Hobby Show Planned

NEW YORK — A microcomputing trade and hobby show is scheduled for Oct. 28-30 at the Coliseum here.

Speakers and experts to fill the seminar agenda are being provided by "Byte," the small systems journal. Topics will include items of interest for persons who range from the novice to advanced levels of microcomputing, according to Manfred Peschke, publisher of "Byte."

Manufacturers have, he said, been invited to explain their microcomputer systems along with the experts who will conduct forums on algorithms, software, language compilers and assemblers.

The personal design of microcomputers, kit building and applications are among the topics to be included.

Three-day tickets cost $13, two-day tickets sell for $9 and a one-day admission will cost $5. The show is being produced by H.A. Bruno & Associates, 78 East 56th St., New York, N.Y. 10022.

AJ Set to Sell Used Terminals

SAN JOSE, Calif. — Anderson-Jacobson, Inc., is offering a refurbished terminal at one-fourth its original cost.

Offered is the AJ 841, an IBM Selectric-type terminal and off-line typewriter that originally sold for over $4,000, according to a spokesman.

The terminal is being sold at an introductory price of $995 plus shipping. It will regularly sell for $1,195 from Steve Trillo at the firm's 521 Chariot Ave. office, San Jose, Calif. 95131.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:
Box XXXX
Microcomputing Exchange
Computerworld
797 Washington Street
Newton, MA 02160

Sought Countermeasures

IBM Feared Competition to 360/30 CPU

By Molly Upton
CW Staff

NEW YORK — In 1964 IBM's System 360/Compatibility Committee foresaw competition from independent manufacturers' peripheral equipment and considered likely the appearance of a 360/30 compatible CPU, according to a committee memo on Aug. 21.

The report considered integrating various devices and tying in programs with read only memory as ways of countering possible competition.

The committee found that the 370/30 market presented the greatest potential for a competitive compatible system, according to the memo which was introduced as evidence in the U.S. vs. IBM antitrust trial here.

"A 'super' Model 30, completely compatible, with a price/peformance superior to the Model 30 may be announced by a competitor in late 1965 or 1966," the report continued.

IBM saw competition in the peripheral area coming from both independents and divisions of computer manufacturers, both of whom "are in a position to market devices of comparable IBM capacities at approximately 20% less price," according to the report.

In addition, these firms were likely to heavily market these peripherals to the federal government, IBM indicated.

IBM thought the competition would be in the areas of tape drives and terminals.

The report estimated there would be about 14,600 installed 360/30s by 1970, far more than any other 360 model.

Any direct competitor of the 360 line would have to use integrated circuits, the committee indicated, and it might be "possible to 'leapfrog' IBM because integrated circuitry will be available in the time period under consideration."

The competitive task force saw a problem in motivating engineers to directly copy a machine. "The job of directing engineers to slavishly copy a system when they can see many ways to make improvements on it is a formidable one."

The report considered the possible situations and approaches of three hypothetical firms entering the 360 compatible market and concluded "successful competition to the 360 on a compatibility basis is no easy task."

Among the problems was the question whether the price of integrated circuitry would be low enough by the desired date.

IBM Trial Documents

There were also problems in undercutting IBM's price, IBM speculated. "It appears difficult to provide a system with greater performance and more features than the Mod 30 at such a price and still get a suitable profit."

The most likely solution regarding file compatibility would be to use IBM files.

"This introduces the two vendor problem, a diminishment of the price/performance gained by cheaper competitive I/O, and an additional level of complexity in replacing Mod 30s which run under the operating system or which have file-oriented applications," the report stated.

It would also be a problem to offer an entire range of systems that would compete with IBM's offer of upward and downward mobility, IBM indicated.

And lastly, any potential competitor would have to reckon not only with IBM, but also possibly with other entrants in the same plug compatible CPU market, according to the study.

To Minimize Exposure

To minimize the potential exposure of the Model 30, the committee suggested IBM investigate the following possibilities:

- Programming systems tied in with read only memory.
- Emphasis on 2311 file for 16K programming system support.
- Improved scientific performance of Models 30 and 40,
- 1401 compatibility mode,
- Improved throughput through I/O developments,
- Evaluation of solid logic technology (SLT) vs. integrated circuits.

Mini, Micro Peripherals Market Placed at $37 Billion in 1986

By Toni Wiseman
CW Staff

NEW YORK — Minicomputers and microcomputers are predicted to reach a cumulative market of $30 billion by 1985.

By the following year the minicomputer peripherals market will total $37 billion cumulatively, with minicomputer software totaling $3.4 billion over the same decade, according to Frost & Sullivan, Inc. (F&S), a market research firm here.

"Software and peripherals have become the most profitable portions of a minicomputer system," the report stated.

F&S found that there are some 200 independent companies which currently produce miniperipherals in addition to the minicomputer mainframers themselves.

And, competition among the mini manufacturers, independent peripherals companies and software houses is extremely fierce, with all three groups soon to be supplying complete turnkey systems, it said.

The battleground has particular significance to the independent peripheral company, F&S said, because "it will have to incorporate either a minicomputer or microcomputer CPU into its own product line and sell a complete computer system or else be at the mercy of the CPU manufacturer."

This fact might explain Pertec Computer Corp.'s recent acquisition of Mits, Inc., it suggested.

During the next decade, the largest dollar sales will be in alphanumric display terminals, printers and magnetic disks, which together represent over 50% of total miniperipheral dollar sales, the report said:

The alphanumeric display terminal's large sales are due to its use as a major on-line data entry unit which replaces batch processing with transaction type processing, it said. With the trend toward multiple terminals, F&S predicted the number of units sold in 1986 to jump to 2.8 billion units valued at $1.13 billion, compared with 150,000 units valued at $150 million in 1976.

"The floppy disk, and the one-million byte mini disk, have opened computerization to the small businessman and will see annual sales increase from a present $100 million to

(Continued on Page 40)

It's only logical that you should consider a used 370/165 while waiting for your new IBM 3033.

While you're waiting up to two years for delivery of a new IBM 3033, you can increase your processing power and save money. Just lease or buy a used 370/165 from COMDISCO.

Twice as fast as a 370/158, yet only half the cost, a used 370/165 from COMDISCO makes a lot of sense. When you re-think about it, why wait to get more computer power at less cost? A 370/165 from COMDISCO is the logical choice.

Re-THINK

Write today or call your nearest Comdisco office

COMDISCO
THE LOGICAL CHOICE

Atlanta (404) 256-5956 • Fort Worth (817) 534-1774 • Minneapolis (612) 854-8107 • New Jersey (201) 568-9666 • San Francisco (415) 944-1111

IBM Planned to Counter 360/30 Competition

(Continued from Page 39)

Looking at the I/O competition, the committee recommended IBM institute:

- Reviews of all policy and contract changes from marketing as well as financial aspects,
- Development of price/performance improvements in the data storage device area,
- Increased reliability and human factors designed in I/O equipment,
- Study of ideas for integrating devices, programs and possibly, diagnostics so customers will favor IBM terminal devices,
- The continued practice of disclosing interface specifications only after the final specifications test.

Thus in 1964 IBM was thinking of several ways of integrating its systems to thwart competition.

Tying in programming systems with read only memory would make direct replacement of the system more difficult, IBM said.

If the 16K version of the 30 used an operating system via the 2311, this could make replacement inherently more difficult, the committee explained.

And linking users to the 1401 could also thwart users from switching to other machines. This could be done through a one-time charge or free provision of a 1401 compatible mode or a program switch which would allow intermixing of 1401 and 360 programs under an operating system, the report stated.

If substantial inroads were made on the 30 base, a model 25 which had full compatibility, not just subset compatibility, with lower performance and lower price "would retain for IBM many installations exposed by price alone rather than by price/-performance," the task force said.

OEM America Meets
at the Invitational Computer Conferences

In Boston... in Houston .. in Orange County, and in six other cities, OEM decision-makers meet the country's top computer and peripheral manufacturers at the Invitational Computer Conferences — the only seminar/displays designed specifically for the unique requirements of the quantity user.

In one day, at each 1977/78 ICC, guests will receive a concentrated, up-close view of the newest equipment and technology shaping our industry.

Some of the companies which participated in the 1976/77 Series were:

Amcomp, Ball Computer, Braemar Computer, Calcomp, Centronics, Cipher Data, Computer Automation, Computer Operations, Control Data, DEC, DIVA, Data 100, Data Systems Design, Dataflux, Dataram, Diablo Systems, Digi Data, EECO, Florida Data, General Automation, General Instruments, Hazeltine, Hewlett Packard, Honeywell, Houston Instrument, ISS/Sperry Univac, Interdata, Kennedy, Lear Siegler, MDB Systems, Microdata, Mohawk Data Sciences, Monolithic Systems, Omron, PerSci, Pertec, Pioneer Magnetics, Plessey Microsystems, Printronix, Remex, Shugart Associates, Tally, Tandberg Data, Tektronix, Threshold Technology, Tri-Data, Varian Graphics, Wangco, Xylogics.

The Schedule for the 1977/78 Series is:

September 7, 1977 Newton, Mass.
October 4, 1977 Minneapolis, Minn.
October 27, 1977 Palo Alto, CA.
November 17, 1977 Houston, Texas
January 19, 1978 Orange County, CA
February 2, 1978 Ft. Lauderdale, Fla
March 2, 1978 St. Louis, Mo.
April 4, 1978 Hasbrouck Heights, N.J.
April 6, 1978 Valley Forge, PA

Invitational Computer Conferences

Invitations are available from participating companies or the ICC sponsor. For further information contact B J Johnson & Associates, 2503 Eastbluff Drive, #203, Newport Beach, Calif 92660 (714) 644-6037

Mini Gear Mart Growing

(Continued from Page 39)

$215 million by 1986," the report projected.

Higher capacity magnetic disk cartridge/disk pack sales will increase from $375 million annually to $1.4 billion over the decade, with ten-year sales exceeding $8 billion, F&S stated.

Printer sales will increase from 44,000 units valued at $300 million in 1976 to 280,000 units valued at $1.3 billion in 1986, for a ten-year market of $6.7 billion, the report predicted. The majority of these will continue to be serial printers throughout the decade, though faster (over 600 line/min) printers will begin to gain popularity.

"The add-on memory, which isn't considered a mini-peripheral today, may eventually perform the auxiliary storage function when its cost/performance ratio improves. However, while we see the add-on memory increasing due to user desire to expand present systems, its impact as a major storage medium is not envisioned in the foreseeable future," the report observed.

Add-on sales were projected to grow from 22,000 units valued at $110 million in 1976 to 150,000 units valued at $325 million in 1986. Total sales over the decade should amount to $2.16 billion, the report indicated.

"Software sales for the minicomputer will be basically application program packages for the small businessman who needs to have the computer manufacturer or software house perform programming," F&S said.

Total sales for minicomputer applications packages will exceed $575 million in 1986, reaching a ten-year total of $2.8 billion, it stated.

While system software will have lower sales, it will nonetheless grow from $30 million in 1976 to $75 million in 1986, with a ten-year total of $525 million, the report predicted.

"The minicomputer software market, due to the basic need for customization to each user's requirements, will still be the prime area for the independents.

"No one company, or small group of companies, has the capability to meet the software needs of each possible application and subapplication area.

"The small businessman needs to establish a personal relationship with the vendor. For that reason, the independent company will retain the most significant share of this market," F&S stated.

The study noted that minicomputer manufacturers now regard software as a key computer element, and expect profits on it to make up for low hardware costs. "Software is the wedge they use to differentiate one system from another," it said.

All of this has prompted minicomputer manufacturers to substantially increase software development efforts and to restructure software marketing. The practice of licensing software so that a customer pays monthly payments is spreading throughout the industry in contrast to the previous practice used by computer companies to charge a one-time licensing agreement, according to F&S.

In addition, most companies offer only short warranty periods on the software and do not back up the product against defects over the life of the package.

Dumb Terminal™ is a trademark of Lear Siegler, Inc.

Amdahl Stock Swings Up After IBM Announcement

SUNNYVALE, Calif. — The price of Amdahl Corp.'s stock has soared from 30-1/2 on Aug. 3, the day after IBM announced the delivery schedule for its 3033 processor, to 41 on Aug. 24. And it is still climbing.

One analyst noted that Amdahl stock earned $1.70 a share last year, compared with a loss of $6.29 for the previous year. In the first quarter of this year earnings were 69 cents a share compared with 18 cents a share in the year-ago quarter.

"I don't think there's much stopping them in the near future," he declared.

Gene Amdahl, president of the firm, said he attributes the stock's recent upswing in part to the IBM announcement and in part to the fact that security analysts have finished analyzing the firm's second quarter results and feel better about his company's prospects.

Harry Edelson, vice-president of research with Drexel Burnham Lambert, Inc., a brokerage firm, agreed the financial community feels better about recommending Amdahl stock for several reasons.

First, Amdahl will be doubling its manufacturing capabilities in the next six to eight months. "It's had enormous gains with just manufacturing five computers a month. It'll probably go to 12/month within a year and from that you could certainly do some extrapolation," he said.

Amdahl has also been able to hold its margins level after the 3033 was announced, Edelson noted.

Manufacturing Source

In addition, Amdahl now has an alternative manufacturing source — itself — which means it no longer relies solely on Fujitsu Ltd., which spread the risk thinner, Edelson said. And, where it used to have to carry a lot of spare parts inventory and three or four people for each installation, it is now able to save on these areas as more systems are sold, he added.

Finally, Amdahl plans to start building computers in Ireland. This will ameliorate its tax rate since it will have a favorable tax position there for a number of years, he said.

"I think that stock market-wise; if IBM annouces a 3032 and/or 3031, there could be a stock market impact on Amdahl — it may only be brief.

"I'm not sure it would affect its operating statement, but Amdahl is a speculative stock in that it's small, growing rapidly and you always have to be concerned about potential announcements from IBM and their effect, not so much on operating results, but on stock price," Edelson stated.

He suggested that Amdahl's impact on IBM has been "overdone.

"Just as IBM is taking some of the excess demand in the minicomputer industry, maybe Amdahl is doing the same thing in the mainframe area," he said. He estimated that 75% of Amdahl sales are additive, not replacements.

Amdahl basically agreed, saying he did not feel Amdahl had hurt IBM in any way, but rather was filling orders IBM could not fill because of production capacity limitations.

In other words, his firm is not, in the short term, stealing orders from IBM. But they are probably orders which, in the long term, would have been filled by the giant.

Update to Focus On Semi Impact

PALO ALTO, Calif. — The far-reaching impact of rapid advances in semiconductor technology will be highlighted at "Technology Update for Executives," to be held Sept. 25-30 at the Naval Postgraduate School in Monterey, Calif.

The conference is cosponsored by the Naval Postgraduate School and the Western Electronics Manufacturers Association (Wema), the trade association for the electronics industries.

The week-long program features intensive courses conducted by experienced educators from the Naval Postgraduate School and specialists from industry.

Registration is open to nonmembers as well as Wema members. For information contact Wema at 2600 El Camino Real, Palo Alto, Calif. 94306.

Adapso Sets Analysts Meet

MONTVALE, N.J. — The Association of Data Processing Service Organizations (Adapso) has scheduled its fourth annual financial analysts meeting for Sept. 27 at the Biltmore Hotel in New York.

At the meeting, International Data Corp. will present its recently completed marketing, financial and statistical survey of the computer services industry.

In addition, the meeting will feature a series of talks dealing with the current status and future of the industry as it relates to whether IBM will reenter the services market.

Speakers include Charles Lecht, author of "Waves of Change" and president of Advanced Computer Techniques Corp.; Robert E. Weissman, president of National CSS, Inc.; and Nancy Scull, director of corporate planning for International Data Corp.

Adapso is at 210 Summit Ave., Montvale, N.J. 07645.

Think about the world's most popular video terminal. Chances are you're thinking about the Dumb Terminal.™

Because with a 24-line screen, and 1920 bright, easy-to-read characters as standard equipment, it would be difficult to come in second best. Especially at a price of $895. (Even for the Dumb Terminal.™)

In fact, the more you look at it, the smarter it is to think Dumb.

International News

Turkish DP Arena Found Sluggish, Growing

ANKARA, Turkey — The first modern computer entered Turkey in 1961, but there is yet no established Turkish information processing policy, according to a study by the U.S. Department of Commerce.

The Turkish electronics industry currently is limited mainly to assembly operations though efforts are being made to establish a full range of manufacturing facilities. Presently, U.S. firms supply about 90% of the country's computer requirements, Commerce said, noting that business and industry generally are more receptive to computer utilization than is government.

Commerce expects computer imports, which are currently running at about $5 million a year, to grow slowly over the medium term to about $8 million a year, due to financial as well as technological limitations.

Since there is no established information processing policy, computer projects sometimes surface suddenly on an ad hoc basis. However, the State Planning Organization (SPO) is preparing legislation which will formulate a general information policy for the country, Commerce said.

At present, SPO also studies, coordinates and approves computer procurements for the public sector, while the Union of Chambers of Industry, Commerce and Commodity Exchanges of Turkey performs this function for the private sector, according to Commerce.

The government-established Turkish Electronics and Trade Corp. (Testas) has plans to manufacture a wide range of electronic equipment including process control systems and computers. To that end, it is contacting international electronic manufacturing firms for technical assistance and licensing agreements, Commerce said.

"Currently, apart from this, there are no known serious licensing, joint-venture or manufacturing efforts in the area of computer equipment, although completion of DP systems is becoming popular through other equipment manufacturers' agreements, which some Turkish companies successfully employ," the study said.

Insufficient or poorly defined application and utilization standards, legislative problems, structural administrative difficulties, shortage of DP personnel, fear of personnel displacement and low government salaries are among the factors inhibiting increased computer sales in Turkey, Commerce suggested.

There are about 150 accounting machines installed in Turkey today, 87% of which were supplied by U.S. firms and 13% by a Turkish company through OEM agreements with various U.S. companies. There are also some 20 laboratory and special process control computers, located mainly in universities and scientific research organization — not in industry.

The installed base of general purpose computers is only 136 (93% U.S. — supplied), with the largest systems installed by the Turkish Armed Forces and two universities.

Commerce estimates that by 1982, the installed base should grow to 428 accounting machines, 28 laboratory and process control systems and 444 general purpose computers.

In terms of potential for growth, the most promising immediate potential for additional systems applications are business and financial planning, management sciences, manufacturing applications and branch bank mechinization, Commerce said. Additional banking/insurance utilization and broader university applications who potential in the medium-term (2-5 years), it added.

1978 National Computer Conference
call for participation
JUNE 5-8 — ANAHEIM, CALIFORNIA

You are invited to participate in the 1978 National Computer Conference.

HOW TO PARTICIPATE IN NCC '78

1. Write a paper for review.
2. Prepare a short talk for an open information exchange.
3. Send us your ideas on topics you would like to hear about at NCC '78.

TOPICS (NOT EXHAUSTIVE)

People and Society

Legislation and its Impact
Communications and Regulatory Policy
Computing Careers and Education

Applications

Applications of Computers to Solve World's Resource Problem
EFTS
Office Automation

Foreign Orders & Installations

The Finnish Ministry of Education has ordered three Univac 1100/11 systems. The first two systems will be delivered to the Universities of Oulu and Tampere this year, and the third to the University of Jyvaskyla early in 1978.

The Ministry of Communications of India has ordered 30-channel pulse-code modulation equipment from Fujitsu, Ltd. The PCM-30 system will be delivered to New Delhi, Bombay and Poona this autumn, and will be in operation by the beginning of 1978.

The Voluntary Health Insurance Board of Dublin, Ireland has ordered a Model 62/60 system from Honeywell. The equipment will handle claims processing and policy renewals.

The University of the Bundeswehr Hamburg, operated by the West German defense forces, has ordered a Univac 1100/21 system, to assist in its training program.

The European Center for Medium-Range Weather Forecasts has ordered a Cray-1 system from Cray, Research, Inc.

The Dublin Savings Bank has ordered an NCR Corp. Criterion 8550 system to help accommodate the growth of its transaction-processing network.

Both the Johnan Credit Bank and the Yasuda Trust and Banking Co. of Tokyo have ordered Univac 1100/42 systems.

Computerworld CW-977

WE CAN HELP YOUR COMPUTER TO DO MORE OF THE WORK.

UCC software is solving problems in more than 1,500 installations. Worldwide. We can help your computer do more of the work, too. With software systems like:

TAPE MANAGEMENT: UCC ONE's 500 installations represent about ¾ of all installed OS tape management systems. UCC ONE manages your tapes and protects valuable data from loss or destruction. It provides real-time tape status. Eliminates costly, handwritten records and the expensive mistakes they breed. Gives you better control and greater efficiency.

DOS UNDER OS: UCC TWO lets you continue to use your DOS programs – without reprogramming – while you convert to OS. You plan the conversion or consolidation to fit your work schedule, instead of the other way around. You can consolidate your DOS operation into your OS/VS environment today. Or, you can spread the conversion – and the costs – over months. UCC TWO is the best path to OS and 500 users have proven it.

DISK MANAGEMENT: UCC THREE/ADAM solves the problem of inefficient DASD space usage. Based on user specifications, it automatically scratches unneeded, unused and invalid data sets. Or it will migrate the data sets to tape, based upon any combination of criteria – such as usage frequency, size and retention period. Then, UCC THREE keeps the problem from recurring by controlling data set allocation. Fragmentation and the need to periodically compress packs is reduced. Accurate reports on your current space utilization are produced.

PDS SPACE MANAGEMENT: UCC SIX is the only software package that eliminates PDS compression – because it automatically inventories and controls PDS disk space. It spells the end for ABENDS and "dump and restore" operations caused by exhausted PDS disk space. You even save money on your disk investment, too.

IMS DATA DICTIONARY/ MANAGER: UCC TEN is the standard IMS dictionary, with over twice as many installations as the Program Product offered by its nearest competitor. Not only does UCC TEN give you superior control over your data base environment, it also defines your data communication network, produces 3270 screen formats and generates IMS Stage I SYSGENS. Now, at last, you can get the benefits you expected from IMS.

RESTART/RECOVERY MANAGEMENT: UCC FIFTEEN lets you restart at the proper job step – instead of at the beginning. The OS catalog is corrected, unnecessary direct access data sets are deleted, and GDG biases are properly altered for the rerun. Automatically – so manual errors in restarting and rerunning are eliminated.

FINANCIAL SOFTWARE: The UCC General Ledger/Financial Control System is the most advanced and complete system of its type. Full general ledger accounting. Budgeting. Cost allocation and profit center reporting. It can generate over 100 standard reports. Plus, it has an easy-to-use report writer that the Accounting Department can use – with a minimum of EDP assistance.

SUPPORT: It takes more than code to make a good software product. It takes dependable, long-term maintenance and support of these products. And support is just one more way that we're helping the computer to do more of the work in more than 1,500 separate installations.

Cassette Bows

NEWTON UPPER FALLS, Mass.— A cassette recorder that receives data at rates up to 500 word/sec is available from Memodyne Corp. for $1,030 in single quantity.

The 3773 may be used with microprocessor-based data logging, communication and process control systems as well as with CRTs, minis and keyboard printers, the firm indicated.

The unit contains a reel-to-reel transport drive with two moving parts and cards for servo functions, read and write, control and buffer.

Read and write speed is 20 in./sec and search and rewind speed is 100 in./sec.

Memodyne Corp. is at 385 Elliot St., Newton Upper Falls, Mass. 02164.

OEM Products

Range of Print Heads Announced

Infomag Offers Dot-Matrix Unit

GOLETA, Calif. — Information Magnetics Corp. has entered the data printer market with a dot-matrix head. The unit, designed as a replacement for the Victor unit, is a compact printer with a duty cycle rating up to 200 char./sec, according to the firm.

The head, which comes in models 120, 160 and 200, can be adapted to most dot-matrix data printers, according to the firm.

It has a 9 by 7 dot matrix with a rated life of 200 by 10^6 characters minimum, the firm said.

The head can print an original plus five copies of forms up to 132 characters wide.

The head costs about $100 when purchased in quantities of 10,000 from Information Magnetics Corp., 5743 Thornwood Drive, Goleta, Calif. 93017.

Unit Prints 3 Line/Sec

ELMSFORD, N.Y. — The PR2100 series of impact printers from Sheldon-Sodeco Printer Co. print at speeds up to 3 line/sec for numeric and 1.5 line/sec for alphanumeric.

The 21-column printers have "spanning hammers" that form characters for each group of three columns, which reduces the number of moving parts, the firm said.

Units use standard paper tape and cost $130 in quantities of 100 from Sheldon-Sodeco Printer Corp., 4 Westchester Plaza, Elmsford, N.Y.

Victor Has 110 Char./Sec Entry

CHICAGO — Victor Comptometer Corp. has unveiled a print head which it said represents a 20% improvement in duty cycle over the firm's previous model.

The 129-112 print head features a 7-wire dot matrix and prints at 110 char./sec. Weight is 9 oz.

In lots of 1,000, the unit costs $59.50 from the firm at 3900 N. Rockwell St., Chicago, Ill. 60618.

3350 Disks Get Clock Writer

SANTA MONICA, Calif. — Pioneer Magnetics, Inc.'s Clock and Sector Track Writer is designed to write the fixed-head timing track on the 3350 "Winchester"-type disk memories, the firm said.

The clockwriter is one model of Pioneer's PM 2390 series, which allows the writing of a closed clock track at bit rates as high as 24M byte/sec, the firm said. The instrument can also write custom sector and address patterns as well as open clocks with any gap length up to 100 microsec, Pioneer said.

The unit can also be used to measure frequencies to 25 MHz, measure amplitude and/or frequency modulation. It detects area or pinhole defects and measures track following servo performance. Other features include origin or index writing, simultaneous track writing, variable bit symmetry control and selection of sector and address patterns via front panel switch, the firm said.

The PM2390 costs $9,950 each with delivery in 90 days from Pioneer Magnetics, Inc., 1745 Berkeley St., Santa Monica, Calif. 90404.

Part & Parcel

SUNNYVALE, Calif. — Shugart Associates lowered prices on its SA400 minifloppy disk drive as much as 15% effective July 1.

The price for 500 drives is reduced from $250 to $215, for example, the firm said. The firm said it is in high-volume production of the units, shipping 1,500 to 2,000 drives a month, and expects to reach 4,000/mo by year's end. Shugart is at 415 Oakmead Pkwy., Sunnyvale, Calif. 94086.

• • •

Intel Memory Systems In-2010 is a static semiconductor memory card with read and write cycle time of 115 nsec. Maximum capacity of the card is 8K by 32 bits, plus a parity bit. The card is 11.75 in. by 15 in. and costs $2,850 in lots of five to nine. Intel Memory Systems is at 1302 N. Mathilda Ave., Sunnyvale, Calif. 94086.

THE MINICOMPUTER/MICROCOMPUTER CONFERENCE AND EXPOSITION

DECEMBER 6–7–8 • CONVENTION CENTER • ANAHEIM, CALIFORNIA

YOU'LL BE PART OF:

- More than twenty conference sessions consisting of about 90 papers covering applications and design of MINI/MICRO computer systems and peripherals.
- Special courses presented by the Institute of Electrical and Electronic Engineers (IEEE).
- An anticipated audience of 10,000 industry professionals from all over the world.
- The largest West Coast computer exposition in over two years, featuring "hands-on" product demonstrations by leading suppliers.
- and . . . Sunny Southern California!

POSITION ANNOUNCEMENTS

SYSTEMS ANALYSTS

We are a rapidly expanding national real estate development and management company, seeking qualified systems analysts. We are currently running a Digital PDP-11/70 using RSTS-E. All applicants should have a minimum of four years of D.P. experience primarily in the design and implementation of data management and financial systems. Experience with RSTS-E and data communications is desirable. Salary is commensurate with experience. Please send resume and salary requirements to:

MELVIN SIMON
& ASSOCIATES, INC.
Data Processing Dept.
P.O. Box 44230
Indianapolis, Ind. 46244
Equal Opportunity Employer M/F

PROGRAMMER ANALYST

ADVANCE YOUR CAREER

....with one of the leaders in providing highly sophisticated on-line real tima data processing services to the Consumer Finance and Banking Industries. The opportunity is now availabla for you if your experience is:

* PARS/F - ACP Systems Programmer Analyst 2-4 years experience in PARS/F or ACP systems.
* 360/370 AL Applications Programmer Analyst 2-4 yaars axperience IBM AL for financial applications in an on-line environment.

Salaries/fringes are excellent. Relocation assistance provided. Suburban location with diversified cultural and recreational activities.

For confidential inquiries, send your resuma or call collect to:

B.M. Dann, Parsonnal Manager
ACTION DATA SERVICES
SERVICE BUREAU COMPANY
7822 Bonhomme Avanue
St. Louis, MO 63105
(314) 862-7700, Ext. 292

CONTROL DATA CORPORATION

STRUCTURED PROGRAMMING

If you have a working knowledge of "structured" system development techniques, YOURDON would like to talk to you.

YOURDON is *the* leading consulting firm in the area of structured programming, structured design and structured analysis. Our technical staff includes Ed Yourdon, author of *Techniques of Program Structure & Design*, and co-author of *Structured Design*, as well as P.J. Plauger, co-author of *The Elements of Programming Style* and *Software Tools*. We are looking for one or two people to joio our technical staff of consultants and educators. The person we are looking for has:

- **At least 2 years of experience (more experience may or may not be helpful!)**
- ***Practical* experience in structured programming, structured design and structured analysis.**
- **Experience in COBOL and at least one other language on at least two computers.**
- **An ability to communicate effectively in writing and in oral presentations.**
- **A yen to travel 100,000 miles per year to spread the gospel of structured systems development techniques throughout the USA, Canada, Europe, South America and Australia.**

If you're the person we're looking for, you can expect to get:

- **An above-average salary.**
- **Vacations in Fiji.**
- **Further training in structured techniques from the leading experts in the field.**
- **Encouragement to develop your own ideas and present them in papers, conferences and books.**
- **A workload sufficient to keep you busy 12-14 hours a day — Including Saturdays and maybe even Sundays.**

This is not the sort of job the average data processing professiooal would want. But then we're not looking for an average person. If you think *you* might be the kind of person we're looking for, send your resume to:

Mr. Jeffrey Frazier
YOURDON incorporated
1133 Avenue of the Americas
New York, New York 10036

Systems Analysts

West Coast Opportunities
Airline Reservation Systems

TYMSHARE, Inc., a national computer service company for travel agencies, needs systems analysts for the design and implamentation of airline and travel ralated applications.

Your background must include PL/1 and 370 with experience in airline reservations systems.

Send resume in confidence to: M. Mercer, Tymshare, Inc., 20705 Valley Green Drive, Cupertino, Calif. 95014. Tymshare is an equal opportun-ty employer.

TYMSHARE INC.

MARTIN MARIETTA DATA SYSTEMS

ORLANDO, FLORIDA

A Leader in Advanced Computer Systems, and One of the Largest Full Service Data Processing Facilities in the Southeast, Has Immediate Requirements for:

SENIOR SYSTEMS PROGRAMMERS

Five years experienca in TSO/TCAM, JES2, HASP, or MVS. Capable of designing and writing programs in assembler and PLI with emphasis on network communication and IMS.

SOFTWARE DATA COMMUNICATION SPECIALISTS

Two - thrae years experiance working with COMTEN front-end processor or equivalent in the data communication field. A working knowledge of OS/VS, JES2, BTAM, RTAM, and TCAM. Capable of programming in basic assembler languages or high level languages.

IMS/VS ONLINE BUSINESS APPLICATION PROGRAMMERS

Must have three to five years of detailed application design and programming, plus two years minimum of IMS on-line experience. Ability to design and devalop programming specification in COBOL and DL/I.

Our operating environment is Dual 370/168 running MVS/JES2 interfacing with TSO, IMS, COMTEN and other 370 (138/145). Our nationwide network transmits in excess of a billion characters daily.

We offer an excellent fringe benefit package. including position, major medical, vacation and holidays. For immediate consideration, please send resume including salary requirement to:

William Dalton
Martin Marietta Data Systems
P.O. Box 5837 -- MP #357

Equal Opportunity Employer - M/F.

The Mini with a Mighty Future!

The minicomputer marketplace has tremendous potential and is increasing in size by leaps and bounds. At Sperry Univac, we are committed to becoming a major force in this markat. Our V-77 family of high performance minicomputers is a fast, powerful trio that relate to most mainframes. This mini family presents an affordable high performance solution to existing computer problems. Each mini can work individually as a stand-alone computer or together as a true network hierarchy. They are specifically designed to grow and adapt to a variety of applications from scientific to data communications.

Challenges come in all sizes for Sales Engineers & Analysts

Commissions

We have one of the industry's best incentive plans tor Salea Engineers.

Sales Engineers

If you have...

a minimum of 2 yeara mini-computer sales experience in the Data Base, Data Communications and/or Distributed Processing marketplace AND technical competence in hardware and software plus a record as a cioser who maintains account relationahips and gets new and repeat business, check our Sales Opportunities - you can't miss.

Growth

We are growing - not promising - and this means real career opportunities for the short term and the long term.

Field Analysts

If you have ...

at ieast 2 years experience with Data Base, Data Communications and/or Distributed Processing applications and consider yourseif creative with a proven record in defining innovative solutions we have pre-saies analyst positions which will provide you real challenge and push your technical competence to ita highest level.

SYSTEMS RESEARCH SPECIALIST

TO FILL AN OPEN POSITION IN AN EXISTING DATA PROCESSING RESEARCH AND DEVELOPMENT FUNCTION.

Typical assignments involve:

- research into and analysis of:
  - new hardware and software developmants.
  - advanced applications and programming methods.
  - telecommunications equipment and techniquas.
  - applicability of calculators and office machinas.
  - distributed processing technology.
- davalopment of service and performanca standards.
  - MVS operating thru-put.
  - systems load and capacity measures.
  - data base (IMS) parformance measures.
  - TSO parformanca and turn around.
- participation in management prasentations
- development of hardware/software plans
- davalopment of hardware/softwara justifications.
- development of hardwara/software written evaluations.

To Qualify:

- Bachelor's degree in Engineering, Mathematics, Chemistry, Physics, Computer Science or other discipline with at least 50 quarter hours in a combination of these subjects.
- experienced programmer:
  2-3 years of assembler programming at least 5 years' experience designing and/or programming computer applications.
- preferred experience:
  systems support programming - MVT & MVS previous programming CICS, VSAM, BTAM previous experience in TSO, CPS

Software Integration Engineer

Amdahl Corporation has earned an international reputation as builder of the most advanced large computer systems. Since our first shipment two years ago, we have delivered a quarter of a billion dollars worth of computers to the world's major companies and institutions. The company is exciting, the environment stimulating, and our compensation and benefits are excellent.

As a Software Integration Engineer at Amdahl, you will participate in engineering software reliability testing and integration of hardware diagnostics and control systems programs for our 470V computer systems. You should have a knowledge of and experience with most of the following: computer organization, logic design, minicomputer operating systems, software reliability, and higher level and assembly languages (PL/1, 370 Assembler, NOVA Assembler preferred). You have an MSEE or a Computer Science degree with a minimum of 2 years' related experience. Please indicate 425-E on your response and direct it to Employment Manager, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. We are, of course, an equal opportunity employer.

Join the TI Minicomputer Team

Texas Instruments is seeking highly motivated and creative individuals in its rapidly growing Digital Systems Division in Austin, Texas. Selected individuals will join the 990 minicomputer team which is one of the new thrusts of the corporation. You'll enjoy life in Austin—one of the fastest growing major cities in the U.S. It's got the kind of riches every city wants. Beautiful lakes and hills. The South's largest university. Outstanding parks and public schools. And Texas has no state income tax. Join Texas Instruments—a name synonymous with technological achievement and product reliability.

System Analyst/Project Leader

Develop software for the exciting 990 Computer Family. Performing functional systems design of Software Projects. Requires implementation of operating systems, data communications, languages, data management and utilities. Will assume project management status after initial training and performance period. Aptitude in assembly language required. Familiarity with PASCAL desirable. BS or MS in Computer Science, mathematics, physics, or engineering with 4-10 years' experience.

System Software Designers

Take a career jump into the TI minicomputer software team. Duties will include the design and development of extensive systems level diagnostics software for 990 computers in a stand-alone and real-time environment. Excellent knowledge of assembly language programming, diagnostic software and digital logic design required. BSEE with computer science background and 3-7 years' related experience.

Product Marketing Engineer

A real opportunity to conduct market analysis and definition for minicomputers and intelligent terminals. Duties will expand to include writing new product marketability specifications, preparing business plans, competitive analysis and making pricing recommendations. Also, responsibilities will include some sales training regarding market analysis and new product strategies. Requires comprehensive knowledge of intelligent terminal/minicomputer business with related experience in product planning. Requires BS/MS in Computer Science with BA/MBA or related business experience.

In Austin, Texas

Marketing Applications Engineers

Work in the forefront of new product development at TI. Duties include analysis of customer requirements and systems design. Direct daily communications in advising and counseling current and potential customers in TI's new distributed processing product lines. Individual will also develop demonstration packages and provide general technical and new product support. Software background, knowledge of digital communications and 3-7 years of directly related experience required as well as BSEE, Computer Science or related technical degree.

Product Planner

Duties would include product/marketing analysis for specific opportunities, conducting competitive analysis, developing specific marketability specifications and communications to management. Requires a BS in Engineering with an MBA preferred, and 4-7 years' experience with 2-5 years in the minicomputer or data processing industry.

Product Services Engineers

A career development opportunity in the support of new computer products from conception to field maturity. Duties will require coordination of service planning-maintenance philosophy, spares requirements, tooling, RMR, training and field installation and sustaining product until field and product reach service maturity by product and/or by account. Similar responsibility will include policy development for product maintainability, serviceability and test design. BSEE with a minimum of 2 years of design or sustaining of minicomputers or related peripherals.

Technical Writers

Experienced digital hardware and software technical writers are needed to join in the development of TI's rapidly growing minicomputer business. Electrical Engineers and computer programmers with good writing skills should also apply.

Send resume in complete confidence to: Lee Cooke, **Staffing Manager/P. O. Box 2909, M.S. 2106/Austin, TX 78769.**

D.P. MANAGEMENT

(Relocate Hartford, Conn. Suburb)

We are a major Financial Institution with critical personnel needs in all areas of Data Processing. These needs have been necessitated by our substantial growth. Our current equipment consists of IBM 370/168/158 & other smaller mainframes (as well as mini computers). We utilize the latest software & data base technology. In addition, we have an on-going committment to an internal training program. A partial listing of the current openings includes:

- **MANAGER-DATA SECURITY/ADMINISTRATION.** 5+ years general data processing with emphasis on data base administration, EDP audit & data security.
- **INTERNAL CONSULTANT (3).** Responsible for consulting to senior management regarding all major developmental efforts.
- **PROGRAMMER ANALYSTS.** 2+ years OS/COBOL &/or BAL. Some design experience will be helpful.
- **SYSTEMS PROGRAMMERS/EVALUATORS.** Knowledge of telecommunications, large scale IBM systems required. Internals & performance measurement helpful.

As we noted above . . . this is only a partial listing. In addition, we seek a Manager, EDP Audit, a Manager of Telecommunications & a Hardware Planning Specialist.

WE welcome all sincere inquiries & will respect the confidentiality of any communications with us. Please forward your resume or a brief description detailing your background to:

Programming Opportunities in Oakland, California

We have immediate openings at our headquarters office for:

PROGRAMMERS — Business Applications

Our programmer staff is growing. We need two experienced Programmers to help us convert to on-line teleprocessing. This is an excellent opportunity to get in at the beginning of this phase of our development of new applications, and to take responsibility for rewriting and updating existing programs. Business applications will include general ledger, accounts payable and receivable, payroll, EEO and personnel reports.

If you have at least one or two years of recent work in COBOL, we would like to talk to you. This type of experience is necessary. If you also know RPG II or have knowledge of the Univac 90/30 computer system, so much the better. Join our congenial DP staff. Write us today.

Good location in downtown Oakland, In Kaiser Center, very close to BART. Send your resume today to Employment Supervisor, Dept. 73, P.O. Box 12156, Oakland, Ca. 94604.

CSC

PROGRAMMER ANALYSTS

Let's Talk About Your Future With CSC's SYSTEM SCIENCES DIVISION

Naturally, you are seeking an opportunity that will capitalize on your education, training and experience . . . a dynamic position that will offer a steady flow of career-building assignments that challenge the best that's in you.

You'll find all this and more with CSC's System Sciences Division where we are deeply involved with several projects for which we are seeking skilled and imaginative Programmer/Analysts. One is an FAA assignment to develop and implement Air Traffic Control Systems; the others are in support of NASA projects . . .

AIR TRAFFIC CONTROL SYSTEMS

We are seeking experience on IBM 360/OS or Minicomputers (XDS-Sigma series preferred) in any one of the following areas:

- Simulation/modeling of air traffic patterns. Knowledge of JOVIAL a plus
- Design and implementation of data base management systems
- OS/360 System generation and maintenance
- Diagnostic design, development or enhancement and hardware orientation
- Software test and validation including development of tools to test and validate real-time software systems
- Software Quality Assurance
- Performance Analysis & Modeling
- Human Factor Studies (N.J. only)

Assembly (BAL) and/or high level language (preferably JOVIAL) highly desirable.

Positions are available in Atlantic City, New Jersey or Jacksonville, Florida.

SPACE SCIENCES

Current positions in support of our Goddard Real-Time System, Spaceflight Tracking Data Network and On/Off Site Project for the NASA Goddard Space Flight Center require a degree in Computer Science, Math, Physics, Astronomy, Meteorology or Engineering with experience using FORTRAN and/or Assembly languages on large-scale or mini-computers. These skills will be applied in the following concentrations:

- Telemetry application with multi-computer configuration
- Integration and testing of real-time display software
- Data base management
- Real-time scientific applications
- Network management
- Computer-to-computer communications
- System requirements definition
- Analysis and application of climatological data
- Simulation/modeling of real-time systems
- Optical Analyst (MS, PhD-Physics or Astronomy)
- 360/370 OS systems programming

CSC offers a liberal relocation policy in addition to a complete benefits package. For immediate consideration, please send resume or call:

We're Looking for Software Designers Who are Interested in Change!!

Change! A new industry, new career potential, new technical challenge in Telecommunications!!

Telecommunications is one of the most rapidly growing segments of the software frontier. We have major projects underway now . . . forerunners of our long-term commitment to significantly advancing the state-of-the-art. We're working from definition and design through development and implementation in areas such as CAD, Data Base Systems, Simulation, Fault Recovery, Diagnostics and many areas of software design in an on-line, real-time environment.

SOFTWARE DESIGN

We're looking for an indepth background in the development of systems software and a minimum of 3 years' experience in structured design, testing and documentation of programs running on large data base, multi-file systems in real-time. Familiarity with HIPO design documentation, TSO usage and software simulation techniques as well as PL1; Fortran and assembler languages for the 8080 and PDP 11 programming is also important.

DATA BASE DESIGN

This position requires a minimum of 5 years' experience in the planning development, design and implementation of data base software, including data base management systems administration. Your primary responsibilities will be the development of data base system for a large on-going project including the implementation, support and administration of systems.

COMPUTER AIDED DESIGN

We are looking for an extensive background in the design of CAD/CAM systems and the development of interactive access by the users of CAD/CAM functions. Required is 5-10 years' experience in both hardware and software aspects; DA systems operations, and design, and systems engineering. Your initial responsibilities will include evaluation of existing systems, and working with a project team in the Architectural Planning of a major new system.

MINI-COMPUTER PROGRAMMERS

We have specific assignments available on project development teams responsible for the design implementation of various telecommunication processing systems utilizing mini-computers as the processing element. Responsibilities will include the development of software programs for real-time operating systems as well as unique hardware elements incorporated into the systems.

San Diego opportunity in advanced-technology EDP SYSTEMS DEVELOPMENT

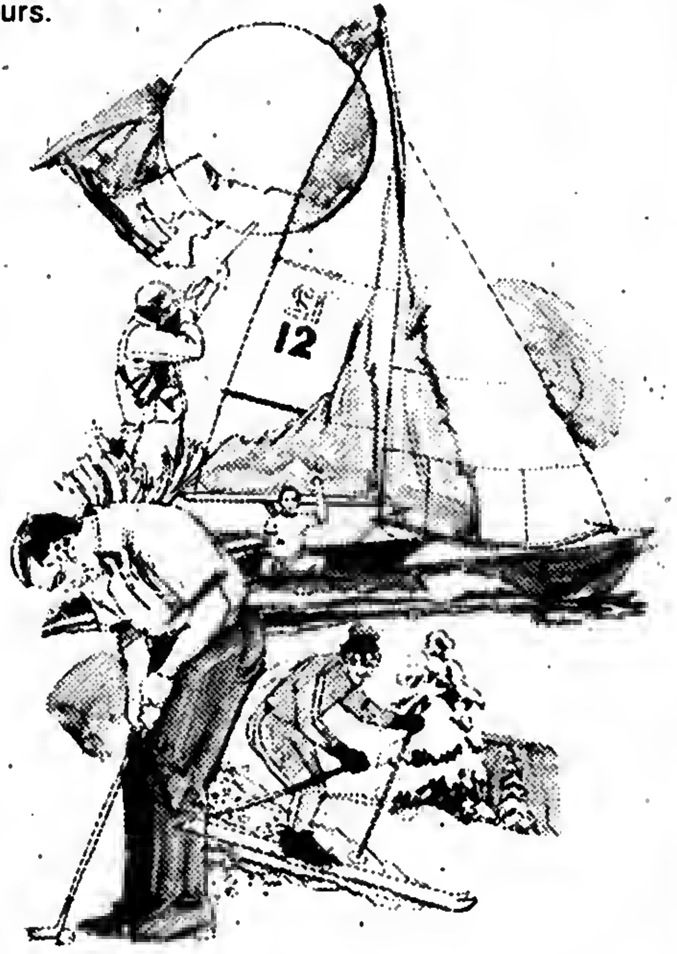
Want to combine the ideal career opportunity with your favorite lifestyle? NCR Special Systems Division needs your help now in developing advanced, high-technology EDP systems for customers around the world. You'll be doing important work in our Sorrento Valley facility, just three miles from the ocean and only minutes from Torrey Pines, La Jolla and downtown San Diego. You can live in the setting of your choice—beach, valley, mountain, country, small-town or urban—and still be only a short drive from work. Spend your leisure hours golfing, swimming, hiking, getting advanced degrees from major universities, attending theatrical, music, art and sports events, or soaking up the year-round sun. Pick your climate, too—from mild coast to dry desert. San Diego is a place of extraordinary choices—and right now the choice is yours.

COMPUTER PROFESSIONALS

The Special Systems Division has opportunities for software professionals in a broad range of disciplines and in all experience levels. Our current and firm future programs require top people with experience in any of the following areas:

- TELECOMMUNICATIONS SOFTWARE
- FILE PROCESSING
- NETWORK DEVELOPMENT
- LARGE MAINFRAME, MINI and MICRO PROCESSOR
- OPERATING SYSTEMS
- COBOL APPLICATIONS
- ASSEMBLY LANGUAGE

Assignments will include the development and implementation of various EDP systems for specific customers as well as the development of future NCR total systems; both requiring state-of-the-art knowledge.



Our benefit package is what you would expect from a major blue chip corporation. What you might *not* expect is the relaxed and very creative environment of this small, highly specialized division. The facilities are modern, comfortable, designed to provide an atmosphere in which every employee can achieve an uncommon degree of personal and professional satisfaction. May I offer you the opportunity to judge for yourself? Please send your resume (with salary history) to me,

Thom Harris, Employment Specialist

SYSTEMS PROGRAMMER

Our Corporate Data Processing Center, located in Fullerton, California, has immediate openings for Systems Programmers to become actively involved in converting our present system software to a new virtual system software in order to exploit the power of our recently acquired Amdahl 470V/6 computer. In addition, we are in the planning stage for installation of a data network capable of switching remote users to any of the several host systems located throughout Hughes Aircraft Company.

Positions exist for experienced persons in the following areas of expertise:

- On-Line Systems Programmers with experience on at least one of the following IBM Subsystems: ATS, IMS, System 2000 or TSO.
- Operating Systems Programmers/Analysts with experience in installation and support of the IBM MVS operating system. In particular JES 2/JES 3 or systems measurement and performance tuning.
- System Planners with experience in evaluation and selection of data processing equipment in the areas of: DASD Storage, Tape Storage, Mass Storage, Intelligent Terminals.

Applicants should have demonstrated ability to formalize evaluations and present alternatives to management.

Positions exist at all experience levels. Candidate selection will depend on experience, capability, and self-motivation.

Qualified applicants should send their resumes to: Professional Employment, Department N-1, Ground Systems Group, P.O. Box 3310, Fullerton, CA 92634.

Systems Programmers

Come to Amdahl on the San Francisco Peninsula for Creative Job Satisfaction.

Join the progressive staff at Amdahl's Corporate Computer Center on the San Francisco Peninsula, and enjoy working with the company's own 470 system running MVS and VM. Please direct your response to Phil Beckhelm, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, California 94086. We are, of course, an equal opportunity employer.

MVS SYSTEMS PROGRAMMER

You will be responsible for the generation, installation, modification, and maintenance of software on the Corporate Computer Center system utilizing MVS. This includes the SCP, JES2, TSO, program products and utilities. Extensive knowledge of VS2 internals and concepts in a production environment is required. Additionally, experience with VS2 utilities, Assembler Language, and SMP is a must. Direct MVS experience desirable. Please indicate 753-E on your response.

SYSTEMS PROGRAMMER

You will be responsible for performance and utilization monitoring for MVS and VM on the Corporate Computer Center system. This will include tuning of system and application software, load forecasting, and capacity planning. Extensive knowledge of VS internals and concepts, performance measurement, and tuning is a must. Additionally, experience with hardware and software monitors and SMF data reduction is required. Please indicate 753-E on your response.

PERSONNEL SPECIALISTS.

Because of the continuing growth of Aramco in Saudi Arabia, the Aramco Services Company has increasing needs for persons with Employee Relations Systems expertise in our Houston, Texas office.

The job.

We are at the beginning stages of setting up a computer monitoring system that will allow us to improve our total personnel operation. We need a person who can function as our liaison with our EDP Department in this project.

If you have a background with on-line systems and a high level programming language such as FORTRAN, COBOL or PL/1, you may be the person we're looking for. You must also have been involved with the design and implementation of an on-line data/information system. This position offers excellent career opportunities in both the Personnel and EDP areas.

Your benefits.

Employment with Aramco offers career opportunities that include not only a good salary, but one of the best benefits packages in the industry.

Interested?

If so, and you're qualified, send us your resume and salary history. We'll be back in touch with you as soon as possible.

SOFTWARE ENGINEERING PROFESSIONALS

Upgrade your future...

Now... new opportunities are opening up for software engineering professionals at E-Systems, GARLAND DIVISION.

OPPORTUNITIES... for real time software engineers with ALC experience on large scale computers.

OPPORTUNITIES... for real time software engineers with 16-bit mini-computer experience.

OPPORTUNITIES... to work on a team of professionals to generate new data processing concepts and carry them through to implementation.

OPPORTUNITIES... to enjoy an attractive salary and fringe benefits offered by E-Systems.

OPPORTUNITIES... to participate in developing and producing state-of-the-art electronic systems for data management, digital communications and highly complex data processing systems.

OPPORTUNITIES... to participate in a formalized in-plant upgrading/on-the-job software training program.

To qualify, you need a degree in Math, Engineering or Computer Science disciplines and an interest in being involved in state-of-the-art Electronic Systems Engineering.

Make a good living where the living is good. There's no question – living is good in the Dallas area. Our public school systems have earned national recognition for excellence. We're one of the fastest growing areas in the nation, yet our housing dollar still buys considerably more home in Dallas than it would in most other metropolitan areas. We're surrounded by lakes, and blessed by beautiful weather year 'round. We back professional, university, and high school athletic teams, and we support our symphony, theaters, the civic opera and several museums. But, best of all, most of us are down home friendly people.

PROGRAMMERS

SYSTEMS PROGRAMMERS

Fluor Corporation, a dynamic and internationally respected leader in the engineering and construction field, has immediate openings for CDC Cyber 170 systems programmers with SCOPE OR NOS/BE experience.

OPERATING SYSTEM SUPPORT

- A minimum of 2 years' experience maintaining a CDC SCOPE 3.4 or NOS/BE operating system.
- Proficiency with CP and PP COMPASS
- Experience in analyzing dumps from system failures and generating/locating corrective codes.
- Familiarity with basic internals of SCOPE or INTERCOM

The individuals selected must be able to maintain a stable version of NOS/BE at current PSR levels. Additional duties will include installation of local modifications, evaluation of system performance and user consultation.

PRODUCT SET SUPPORT

- A minimum of 2 years' experience with internals of compilers and compiler object time routines
- Proficiency with CP COMPASS and/or SYMPL
- A working knowledge of FORTRAN and COBOL

The individuals selected will be responsible for maintenance of product sets, installation and testing new versions supporting applications programmers, writing utilities and specialized subroutines in the area of application support.

Our employees enjoy excellent benefits including profit sharing and savings investment program. Positions are located in our new innovatively designed facility in the Newport Beach area. Relocation allowance available.

Field Engineering Specialists

Amdahl Corporation has earned an international reputation as builder of the most advanced large computer system. Since our first shipment two years ago, we have delivered a quarter of a billion dollars worth of computers to the world's major companies and institutions. The company is exciting, the environment stimulating, and our compensation and benefits are excellent.

We seek Field Engineering Specialists who have a minimum of 5 years' experience in maintaining large-scale systems with in-depth training on compatible CPUs. You will have company support in assisting the Amdahl customer in his mixed-vendor environment to maintain full operations in his center. You will have the opportunity to work with multiple customers, to guide and support field engineers and to use your technical expertise for your own personal development and the growth of the Amdahl Corporation. Openings exist at Amdahl headquarters in California and temporary assignments are available in the Far East with a permanent assignment following. Please indicate 580-E on your response and direct it to Employment Manager, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. We are, of course, an equal opportunity employer.

THE ALANTHUS "WALKAWAY" LEASING PROGRAMS FOR IBM /370 EQUIPMENT ARE BETTER THAN ANYTHING. PERIOD!

- Our programs are not "new." We've been at it for more than six years and are pleased to count many of the world's leading business organizations as satisfied customers. To date, we've closed more than $200 million in IBM/370 lease business domestically and overseas.

- Unlike most other leasing companies, we invest in and own a large share of our equipment. We are not simply "packagers" who work for a front-end fee and then disappear.

- We're more than competitive on rate and term. Indeed, we're prepared to meet or beat any bona fide, competitive short-term lease offer on any model in the IBM/370 line. If somebody else can save you money, it's almost certain we can save you more.

- Our hallmark is flexibility. We'll buy, sell, trade, make equipment available from our own inventory to meet urgent delivery schedules, etc. We're equally accommodating on lease terms. For example, unlike some of our competitors, we don't insist on retaining the investment tax credit on new equipment. If you want it, it's yours.

- Our lease documentation doesn't weigh ten pounds. Basically, all you'll see is a simple four page lease and an equipment schedule. You won't be burdened with trustees, beneficiaries, tax indemnification clauses and the like.

- We act fast. At Alanthus there are no investment committees or similar obstacles to quick decisions.

- We're not a "here today, gone tomorrow" type of organization. We're a publicly-held company whose stock is actively traded in the over-the-counter market. Last year was our sixth consecutive year of record revenues and profits, with revenues exceeding $30 million and pre-tax operating profits approaching $3 million. If you don't believe this kind of financial strength and "staying power" is important in our business, we'll put you in touch with some of our customers who'll tell you what it's meant to them.

We think we can help you too! Give us a chance to prove it by calling us, collect, at our executive offices in Stamford, Connecticut (203) 348-4820.

Conventional Stop Lights Found Gas Gluttons

By Jeffry Beeler
CW Staff

MINNEAPOLIS — American drivers could save more than a million gallons of gasoline daily if conventional stop lights were replaced with computerized traffic control systems, according to a report issued by Honeywell, Inc.'s Traffic Management Center (TMC) here.

The report, prepared for the Federal Highway Administration (FHA) and the Federal Energy Administration, details the findings of a 1976 study of driving conditions in three U.S. cities and their effect on fuel economy.

In that study, Honeywell used FHA-supplied data to develop computer models of street sections in the three cities. Those sections included the Urban Traffic Control System (UTCS) network in Washington, D.C.; the intersection of Shattuck and Alcatraz in Berkeley, Calif., and parts of the Hawthorne arterial highway in Los Angeles.

With the computer models, Honeywell then simulated each city's driving conditions and noted the effect of variables like traffic control procedures, traffic volumes and street characteristics on gasoline mileage.

More specifically, the fuel consumption study entailed models of six typical traffic control situations. Some of the situations simulated and evaluated by Honeywell included a street-crossing system known as a "pedestrian scramble," arteries with exclusive bus lanes, one- and two-way streets and roadways with pretimed and "fully actuated" signal systems.

In pretimed systems, the length of the signal cycles remains constant regardless of traffic levels; in fully actuated systems, cycle lengths vary with auto volume.

Other simulated situations focused on variations in traffic demand and on traffic signals with varying cycle lengths.

Among their findings, experimenters concluded that a fully actuated traffic control system on Los Angeles' M St. would yield

Dope/DP Caper Linked to Agent

NEW HAVEN, Conn. — A special agent for the U.S. Drug Enforcement Administration (DEA) allegedly embezzled computer printouts from the Narcotics and Dangerous Drugs Information System (Naddis) for use in a scheme to identify DEA informants and facilitate importation of marijuana, according to a grand jury indictment issued here.

The indictment against special agent Paul A. Lambert and alleged coconspirator George E. Girard Jr. included charges of embezzlement, receipt and sale of DEA records, plans to import marijuana from Mexico, possession of cocaine and defrauding the U.S. through interfering with the DEA's conduct of business.

Girard allegedly planned to use information from the DEA and other government sources to avoid border patrols while flying in marijuana from

Hit Ratio 'Not Impressive'

Study Questions Worth of NCIC

By Edith Holmes
CW Staff

WASHINGTON, D.C. — The National Crime Information Center (NCIC) has not proved its worth as a crime-fighting tool despite 10 years of operation, a preliminary report by the Scientists Institute for Public Information (Sipi) concluded here recently.

Prepared in response to a congressional committee's inquiry into NCIC operations, the report said that for such "a vast system, containing over six and one-half million records with 250,000 transactions per day, the 'hit' ratio was not demonstrated to be impressive.

"The actual benefits of NCIC still remain in the area of surmise, rather than demonstrated results," the report said.

Sipi's Task Force on Science and Technology in the Criminal Justice System, which made an on-site inspection of the NCIC at the J. Edgar Hoover Federal Bureau of Investigation headquarters in the nation's capital, said the system has about 1,000 hits per day. Fifty percent are for stolen vehicles, 20% to 25% are for wanted persons and the rest are scattered over six other categories.

"The maintenance of the huge NCIC system, growing every year, may be subject to question when there is no demonstration that the 1,000 daily hits provide a significant benefit to law enforcement, and [when] comparable information may be available by other means, at cheaper cost and with less significant problems involving intergovernmental relations," the report maintained.

Officials at the FBI, which manages and maintains the system, defended their operations and criticized the report

New I/O Proposal Reflects Diluted Standard Support

By Molly Upton
CW Staff

WASHINGTON, D.C. — The National Bureau of Standards (NBS) is apparently watering down its support for a channel-level I/O interface standard for federal government users.

In a proposal recently submitted for public review and comment, NBS revised the requirements that would make federal agencies adhere to the standard in selecting computer systems.

The changes reflect a "compromise" with mainframe manufacturers who oppose the standard, an NBS spokesman said.

The revisions do not alter the technical specifications, which were designed to allow the attachment of IBM-compatible peripherals to any CPU, but rather allow government agencies more latitude in their purchases.

The original standard — which is based on the IBM channel interface — was drafted by the American National Standards Institute (Ansi) X3T9 committee and by the NBS as a proposed Federal Information Processing Standard (Fips).

While that original Fips proposal required all channels of new and replacement systems to conform to the specifications, the new revision requires only that the system "support one to four interfaces and allows agencies to procure equipment with no such interfaces.

"All such interfaces shall be specified

Edelstein Names Examiner To Search IBM Tape Files

By Catherine Arnst
CW Staff

NEW YORK — Judge David N. Edelstein, apparently agreeing with government charges that IBM has withheld certain damaging information from government trial attorneys, has appointed an examiner to search the firm's corporate files.

The information the Justice Department wants is IBM's Lease Base Machine Inventory (LBMI) and Purchase Base Machine Inventory (PBMI), both part of IBM's management information system. These tapes are alleged to contain an accounting of all IBM equipment delivered and installed since 1960.

The government contends IBM could provide the court with an accurate measure of the systems market IBM allegedly monopolizes.

IBM contends such information does not exist, and if it does, it is only on an ad hoc and unreliable basis.

Edelstein ordered that Herbert H. Isaacs, a director with Arthur Young & Co., be appointed to report to the court what tapes, other files, programs, documentation and other information [IBM] possesses and whether [IBM] has produced such material which will enable the plaintiff to determine cer-

(Continued on Page 5)

IBM 3033 Overbooked?

If you are number 801 on IBM's 3033 delivery list, maybe you should consider pricing some other system.

IBM is planning to manufacture only 800 Model 3033s, despite having orders for more than 2,000 systems, according to Australia's *Computer Weekly* newspaper.

IBM would not confirm or deny the rumor, saying only that such information is proprietary and of a nature that IBM does not discuss.

Micro Exhibitors Vie for Business

By Frank Vaughan
CW Staff

ATLANTIC CITY, N.J. — Two hobby computer shows were held on the East Coast in the space of four days recently — Computermania in Boston and PC '77 here.

Though both were devoted to microcomputing, they took on quite different personalities.

Technical sessions at the hobby gatherings ranged from concurrent seminars held during exhibit hours at both shows to additional preshow workshops here.

Most subjects relating to microcomputers were covered, including interfacing, programming, debugging, music and applications.

Slow Start

The Boston show seemed destined to a slow start when, just before the doors opened for the first day, almost 40% of the exhibitors had failed to show up or set up displays. This, combined with the spaciousness of the exhibit hall, gave the impression of a show that might not get off the ground. Even the building failed to cooperate as, shortly before opening, a huge lighting fixture fell from the ceiling and crashed into an aisle.

The first place for which most people headed was the well-publicized Radio Shack display. Crowds packed eight to 10 deep became a constant sight at that exhibit, evidencing the success of the promotion, which had focused on the Radio Shack TRS-80 microcomputer system.

Retail computer stores also drew large crowds as they offered visitors an opportunity to examine mixed-vendor systems and comparative systems. Components sales firms also attracted large crowds. The do-it-yourselfers came with checkbooks and shopping lists in hand, and many returned on Saturday to take advantage of last-day markdowns by vendors that were reluctant to take unsold merchandise "back home."

Coverage of Computermania and PC '77 continues on Page 75.

Yet many of the show's visitors left disappointed. Many were businessmen who were given the "surface illusion that they could solve all their business problems for $595 with a simple little computer. But they can't," according to Sonny Monosson, president of Boston's American Used Computer Corp. Monosson described the attendee's options as a "delightful computer hobby or a devastating business mistake."

Estimates of attendance at the three-day event ranged from a high of 14,111 paid attendees reported by show sponsors to lows of 5,000 to 7,000 reported by several exhibitors and other observers.

Atlantic City Exciting

PC '77 here had an entirely different flavor, though. A genuine excitement could be felt as exhibitors set up. That excitement was continued as the crowd began arriving several hours early to overflow the Shelburne Hotel's lobby and spill out onto the famous boardwalk. The long line for hall entry lasted much of the morning, yet visitors remained cheerful during waits of more than an hour.

The stars of the show had to be Radio Shack and Heath Co. This was the first public showing of the Heath systems and many visitors said they would have come just to see the firm's offerings. As it was in Boston, one could hardly get by the Radio Shack exhibit at times, despite the wide aisles. It was virtually impossible to get past Heath much of the time.

No attendance figures on PC '77 were available from show organizer John Dilks, who works as a computer-switching equipment installer for the telephone company. But exhibitor estimates ranged from 8,000 to 12,000 for the two days. Attendance at the related technical sessions was generally high and meetings of computer store owners as well as a manufacturers' association gathering drew relatively large groups.

MUSCLE

Sure, MVS gives you more power. But watch out for sorting charley horses!

(SyncSort's preferable to liniment.)

Call (201) 568-9700.

Get into shape with a free sorting survey.

Do you ever get the feeling that the Computer Giant would like to see *everybody* go to MVS?

We do. Particularly when we read ads like "MVS: Real Muscle for Large Systems," which appeared in a recent DP Dialogue. The lead paragraph went like this:

> "Processing a complex job stream makes unique demands on operating system software. And in a communications-oriented environment, the system must be able to handle large volumes of work in an unpredictable mix of batch tasks and terminal transactions."

So far, so good. MVS *is* a powerful tool in multi-programming, and heaven knows we have nothing against it. Some of our best friends use it. (In fact, *more than half* of all MVS users sort with SyncSort.)

But you have to be careful of software programs that don't fit into multi-programming. Otherwise you may end up with a painful charley horse in all that new muscle.

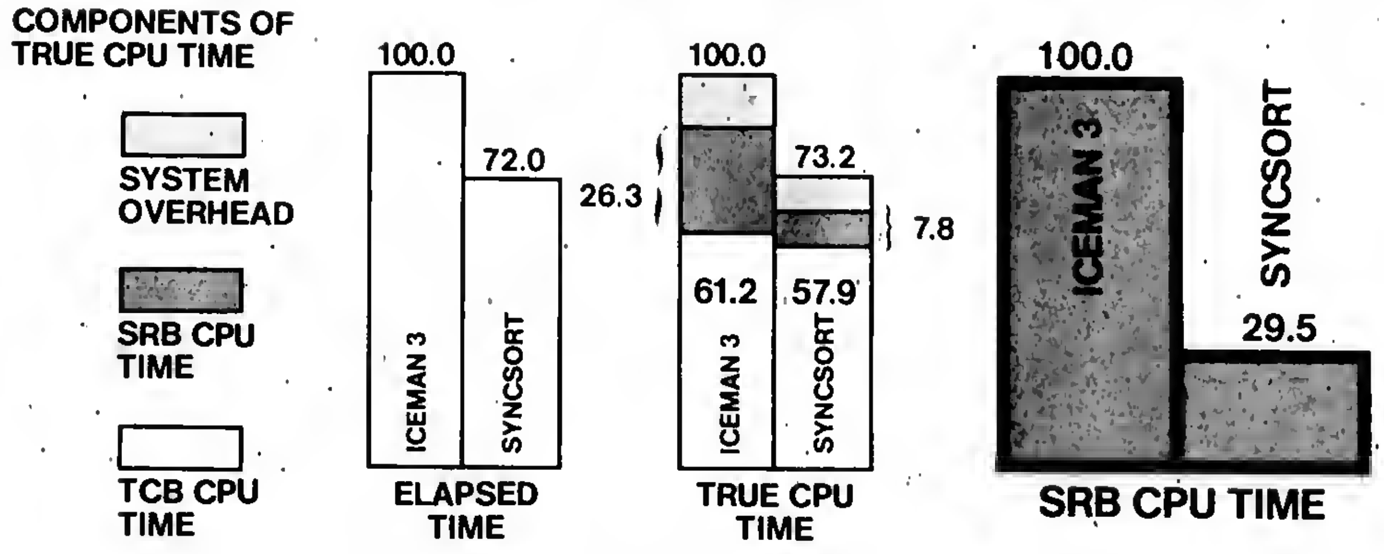
Take sorting operations, for example. They represent a big chunk of those "large volumes of work in an unpredictable mix." In fact, your MVS system may spend 20 or more percent of its time doing *nothing* but sorting.

If you happen to sort with SyncSort III-and-a-half, you're going to have no problems whatever. It's a natural for busy, multi-programming operations. But if you happen to have chosen the Computer Giant's 5740-SM1, Release 3, look out. for "locked up" CPU time.

In MVS, there are two components of True CPU Time, apart from systems overhead. They are:

- TCB Time (Task Control Blocks) — which is *interruptible*. If the CPU wants to switch signals and run another job, the message gets through.
- SRB Time (Service Request Blocks) — which is *non-interruptible*. The line is *always* busy. And this directly affects the performance of other jobs in a multi-programming mix.

Take a look at the charts below. They compare SyncSort's overall MVS performance with IBM's 5740-SM1, Release 3. And the two on the right pinpoint the SRB Time differences.



No matter what system you use, SyncSort will give you major savings in computer resources. But it's particularly useful in multi-programming, where that "go to jail" time is reduced by a whopping 70%.

We call it "time off for good sorting behavior."

Latest I/O Interface Proposal Draws Criticism

By Molly Upton
CW Staff

The proposed changes to the federal government's implementation of the channel-level I/O interface standard "make a mockery out of the federal ADP standards program," according to Norman Ream, who was the first director of the National Bureau of Standards' (NBS) Institute for Computer Sciences & Technology.

"I'm bitter. I think [NBS] bent over backwards to satisfy the system manufacturers and it's a totally unenforceable standard," he said.

There's no requirement for an installation of the interface in the first place. If an adapter is to be used, there's nothing that requires manufacturers to demonstrate and verify its capabilities, he said.

The adapter's capabilities and cost benefits should be considered as part of the total evaluation of the system, Ream continued.

Harry S. White, associate director of ADP standards at the Institute for Computer Sciences & Technology, indicated that the revision is "a little softer" and represents "what's to be considered a reasonable compromise."

The mainframers are admitting the revision is more palatable; however, they still don't admit the need for a standard, he said.

White admitted federal procurement officers will probably encounter some complexities with the new proposal, especially in the area of cost benefit appraisal.

The changes were developed by the NBS technical division and NBS decided to go with the revision and see "to what extent it flies," White indicated.

Ream does not think the latest proposal will go through. "I don't think [Jack] Brooks' staff or Congress will stand still for this," he said, adding he expects the House Committee on Government Operations, headed by Brooks (D-Texas), to protest strongly.

NBS had not yet received any formal comments on the proposal, White said, but a spokesman for Brooks' office indicated there are plans to submit a comment.

'Very Political Process'

A.G.W. (Jack) Biddle, president of the Computer and Communications Industry Association (CCIA), commented that standardization has become a "very political process" with the mainframers threatening not to do business with the federal government under the original proposed standard.

Ream, in a draft of a letter to Commerce Secretary Juanita Kreps, described the shortcomings of the proposal and the effects it will have on the federal government's standardization efforts.

Although Ream recognizes Kreps is subject to much pressure, he said "if you give an inch you will find yourself and the department and the Fips [Federal Information Processing Standard] program on a slippery slope at the mercy of the forces that have their own blind and perverse logic."

"The failure to adopt a standard for the last 10 years has acted and continues to act as a severe restraint to competition in the federal procurement process," Ream stated.

It also has resulted in selected manufacturers obtaining indirect subsidies of at least $250 million, Ream said.

He estimated the government paid the $250 million over and above what it would have if a standard had existed requiring the ability to interconnect foreign peripherals.

"The increasing and almost overwhelming reliance of the federal government and its activities on information and the use of ADP operations . . . has developed to the point where action must be taken to protect the general public," he said.

"We have to have as part of our ultimate federal information policy the ability to fully interconnect competitively procured equipment," he declared.

For if one becomes dedicated to one manufacturer, "you have no way out but to go with [it] and if one manufacturer decided to take a walk for a few weeks, that could bring everything to a complete halt," he said.

The NBS report, "Fiscal Year 1979 Brooks Act Program Issue," distributed last May, identified the interface standards program as the most critical, Ream said. "If this one doesn't go, you might as well forget the others such as device-level interfaces."

Ream planned to send a copy of his letter writtn to Kreps to Sen. William Proxmire (D-Wis.), whose subcommittees on the priorities and economy in government issued a report in 1970 indicating the federal government could save money through interconnection of equipment.

Draft Reflects Diluted Standard Support

(Continued from Page 1)

as separate mandatory options, the cost of which will be considered in the evaluation conducted as a part of the system or system component selection process," according to the new proposal.

The reason for specifying that a system need only have four interfaces conforming with the standard is to prevent the standard from serving as a basis for sole-source procurement on the number of channels offered by various mainframe makers, according to Harry S. White Jr., associate director for ADP standards at NBS.

Verification of operation of the interfaces in conformance with this standard must be provided, through demonstration or other means, prior to the government's commitment to acquire the system, the new proposal states.

In installing a system with none of the standard interfaces, the government must obtain contractual assurance that the "required number of interfaces conforming to this standard can and will be supplied at any time during the designated life of the system at specified cost to the government."

Regarding modification of systems, the old proposal specified that the standard interfaces should be included on equipment added to or replacing gear that originally met the standard specifications.

Acquisition Alternatives

The new proposal, however, specifies only that "acquisition alternatives that comply with this standard shall be considered competitively with other alternatives, so as to meet the government's data processing requirements at least cost."

These alternatives shall include "those available through exercising the contractual options for interfaces conforming to this standard which were established at the time of initial system acquisition," the proposal continued.

Subject to Review

The new proposal indicates the standard shall be subject to review by NBS within five years after its effective date, "taking into account technological trends and other factors, to determine whether the standard should be reaffirmed, revised or withdrawn."

The conditions under which a waiver may be obtained were shortened under the new proposal to simply "heads of agencies are permitted to waive the requirements stated in this publication. However, such waivers shall be coordinated in advance with NBS."

The effective date of the new proposal is Oct. 21 of this year compared with the originally scheduled Jan. 1, 1978.

Written comments should be sent to White at the Institute for Computer Sciences and Technology, U.S. Department of Commerce, National Bureau of Standards, Washington, D.C. 20234.

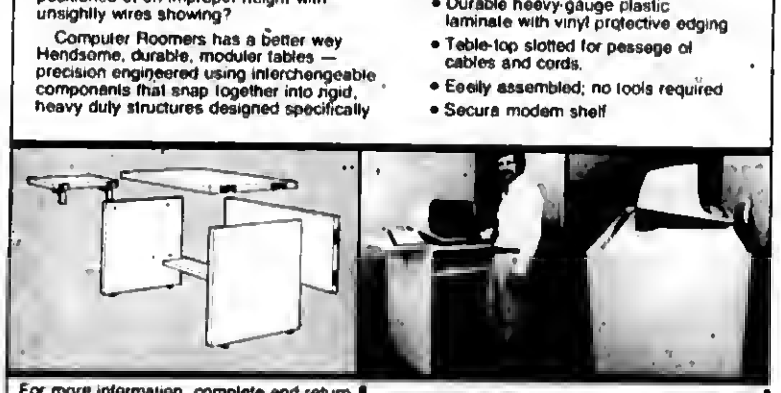
MODULAR TERMINAL TABLES...

by Computer Roomers, Inc.

You invest sizeable sums of money on computer equipment. So why perch your expensive gear on a wobbly table or desk top positioned at an improper height with unsightly wires showing?

Computer Roomers has a better way. Handsome, durable, modular tables — precision engineered using interchangeable components that snap together into rigid, heavy duty structures designed specifically for terminal equipment. Twelve standard sizes to choose from. Priced as low as $130.00. Other features include.

- Durable heavy-gauge plastic laminate with vinyl protective edging
- Table-top slotted for passage of cables and cords.
- Easily assembled; no tools required
- Secure modem shelf



For more information, complete and return the attached coupon. Or contact:

Agent Cited in Data Theft

(Continued from Page 1)

Mexico and also planned to sell the data to others, according to the indictment.

He and Lambert planned to use data from the DEA to identify prospective importers, purchasers and distributors of drugs as well as possible government informants and the status of current investigative efforts, according to the indictment.

Lambert allegedly accessed the Naddis system three times — on July 8, 19 and 21. As of July 28, he had printouts on five individuals, the indictment said.

The Naddis system, based on an IBM 370/155, requires entry of an access code from a terminal. Once on the system, the user has access to all stored data, a DEA spokesman said.

Lambert normally had access to the type of data involved in the charges against him, the spokesman added.

Lambert has been suspended without pay from the DEA pending resolution of his case, a DEA spokesman said.

Both men entered pleas of not guilty before the U.S. District Court here following the grand jury indictment. No trial date has been set and the two are out on bond, court sources said.

Attorneys for both Lambert and Girard declined to comment on the case.

Jury to Hear Corporation's Defense

IBM Foiled in Bid to Ring Down Forro Curtain

By Molly Upton
CW Staff

SAN FRANCISCO — IBM will finally have a chance to practice its defense tactics before a jury in an antitrust case — Forro Precision, Inc.'s suit against the corporation.

Judge Ray McNichols has denied IBM's motion for a directed verdict, placing the responsibility for the finding of guilt or innocence in the hands of the jury.

The case is not based solely on antitrust grounds. It also includes charges by Forro that IBM interfered with its business while investigating alleged trade secrets thefts.

IBM's counterclaim charges Forro with unlawful market presence and misappropriation of trade secrets.

Commenting on McNichols decision, an IBM spokesman said: "We recognize that [directed verdicts] are rarely granted. We have every confidence in our defense and the merits of our counterclaim."

Two other antitrust cases brought against IBM by Greyhound Computer Corp. and California Computer Products, Inc., and heard by juries received directed verdicts.

The Greyhound decision was recently overturned and the case ordered back to trial [CW, Aug. 29]. McNichols' ruling in the Calcomp case is being appealed.

The only other antitrust case in which IBM presented its defense was brought by Telex Corp., but that was heard by Judge A. Sherman Christensen without a jury.

Forro dropped its claim under Section 1 of the Sherman Act but is continuing to press for damages under Section 2, a Forro source said.

To expedite matters, Forro and IBM have stipulated what the market was and IBM's share, rather than having expert witnesses give their versions, he continued. IBM defined the market as the worldwide electronic data processing and services mart and estimates it has 35%, he added.

Forro is seeking damages of $2.5 million to $9 million.

If the jury finds IBM guilty of antitrust violations, Forro would be entitled to treble damages. Punitive damages could be awarded on some of the other counts, the spokesman explained.

The trial is expected to end soon, he said.

Examiner Picked To Search Files

(Continued from Page 1)

tain information."

In this order — his third directed to the subject — Edelstein expressed his frustration over being faced with attempting to bring about a resolution of this controvery.

Previous Orders

The subject of the LBMI and PBMI files has come before the court twice before on (Sept. 19, 1975 and Nov. 30, 1976) and both times Edelstein has ordered IBM to produce the information.

"While there is no question that [IBM] has undertaken to produce information to [the] plaintiff pursuant to the court's orders . . . the court is not persuaded that the production that has been forthcoming from IBM comports with the spirit and intent of those orders," Edelstein wrote in his order of last month.

Thomas D. Barr, IBM's lead counsel in this case, claimed that "I have personally and continually assured [the Justice Department] that IBM has made prompt, full and complete production under that [Nov 30, 1976] order . . . [The Justice Department] has plainly not looked at what it has and earlier [its] counsel have explicitly rejected what its new trial staff members now want. This whole matter has been placed in the hands of the most junior of plaintiff's counsel. They do not — and really cannot be expected to — understand the material which they have been given.

"If they had reviewed the material with which they have been furnished and understood it, I believe this motion would not have been made," Barr wrote in an affidavit filed with the court.

By asking for an examiner, "plaintiff no longer even wants the responsibility of asking for what it wants," Barr continued. An examiner would be "nothing more than a court-appointed assistant to help the department do the job it can and should do for itself."

Last November, Justice Department attorneys requested that an auditor be appointed to determine whether IBM has the information it was seeking. At that time, Edelstein determined such an appointment was unnecessary. In his most recent order, however, he determined that "the conduct of defendant and the highly technical nature of the production . . . presently constitute 'exceptional conditions' warranting the appointment of an examiner."

Isaacs' power as an examiner will be broad, giving him access to all files, documents and employees of both parties. He will then file a report with the court. Either party may appeal the report, however.

Only Perkin-Elmer gives you two terminals for the price of one.

Mix or match any two of our unique forms handling accessories. Combine journaling with single- or multi-part forms printing by mounting journal-roll holder and front forms-insertion device . . . or pair front-insertion with a pin-feed tractor accessory . . . or snap on two pin-feed tractors. In seconds, you can mount any combination that meets your needs. Report Charges NCIC Has Not Proved Worth

(Continued from Page 1)

Some of the criticisms in the report were invalid and some were wrong; in addition, the scientists failed to acknowledge the need for a high-speed method of detecting wanted persons and stolen goods in a society in which criminals can be very mobile, the FBI officials said.

"The system creates a high risk of detection" for criminals, according to Frank B. Buell, the FBI section chief in charge of NCIC operations. "There's just no question about it."

But the scientists involved in the inspection found otherwise. Included in Sipi's task force were Daniel D. McCracken, who chaired the task force and is vice-president of the Association for Computing Machinery; Joseph. Weizenbaum, professor of computer science at MIT; and Dr. Myron Uretsky, director of the Management Decision Laboratory at the New York University Graduate School of Business Administration.

Rep. Don Edwards (D-Calif), a former FBI agent who heads the House Judiciary Committee's Subcommittee on Civil and Constitutional Rights, helped arrange the meeting between Sipi and the FBI officials responsible for NCIC, according to John J. Kennedy, director of the task force.

Edward's subcommittee, which has oversight responsibilities for the FBI, will hold hearings beginning Sept. 29 to discuss NCIC operations in hopes of educating members of Congress about the system. The computer scientists on the task force and FBI officials will be among the witnesses appearing.

No Regular Audits

The Sipi Task force found there is no regular auditing of NCIC data and procedures by a relatively independent auditing authority. Currently, each state audits its own Computerized Criminal History (CCH) Information.

"Neither the FBI nor any other agency except the submitting state audits what goes into the system and how it goes in," the report stated. The task force added that "independent audits, both announced and unannounced," are crucial to maintaining data accuracy and integrity.

Further, there have been no studies, evaluations or reports which give hard data on the benefits to criminal justice as a result of NCIC, the task force said.

NCIC downtime is "excessive," the task force concluded following its July 12 visit to the installation. There are about 30 hours per month of unscheduled downtime and about two hours to three hours per month of scheduled downtime.

"Although the system has 94% uptime . . . this would be an unacceptable record in most commercial enterprises," the task force pointed out.

The FBI plans to request funds for some "costly equipment upgrading designed, in part, to solve this problem of downtime," the report added.

The Sipi group also commented on the FBI's methods of editing old records out of the system. "Expungement from the system does not mean true expungement of a record," the report said.

NCIC necessarily maintains backup tapes and a log for system reliability purposes, the study noted. However, because backup tapes and a log exist, "expungement" from NCIC "really means that the expunged data is not available on-line, but does exist on tapes that are kept at FBI headquarters," the report stated.

One of the side benefits of not completely editing old data out of the system is to defend law enforcement personnel from lawsuits by pointing to data that was previously maintained in NCIC, the report said. At least eight lawsuits resulting from the use of NCIC information have been filed to date, one involving the Operations' section chief.

The task force found arrest records remain in the system without updating of the outcome of the arrests. "As the system is now operated, a person will have an arrest record maintained indefinitely in CCH whether or not he is ever convicted in a court," the report noted.

Describing the NCIC correction and updating procedures as "cumbersome," the task force expressed the belief that people should be informed periodically if a record is being maintained concerning them, a practice not followed at present.

"There are serious security and privacy considerations when between 6,600 and 7,000 terminals can access NCIC nationwide," the task force said. "As the number of terminals increases, with a potential of 45,000 local, state and federal criminal justice user terminals, the opportunities for abuse also increases."

Despite nearly six years of CCH operation, only 11 states are participating in that portion of NCIC by providing some input; of these, only two states provide the system with all their arrest records, the report said.

CCH records make up about 16% of the total number of NCIC records.

Traffic Lights Waste Gas

(Continued from Page 1)

50% fewer delays, about 25% greater fuel economy and 50% higher vehicle speeds than a pretimed signal system.

TMC experimenters created the traffic models with a Control Data Corp. Cyber 74 system at the University of Minnesota here. Besides the 145,000-word mainframe, the all-CDC configuration included a Model 405 card reader, Model 501 line printer, a seven track Model 607 tape drive and a Model 844/21 disk drive unit.

Honeywell obtained the data on which the Berkeley and Los Angeles models were based from highway studies conducted by the California Transportation Department, which in turn forwarded the information to the FHA. Data for the UTCS model was collected by the FHA itself, which conducts its own highway studies in the Washington area.

To ensure the accuracy and reliability of their data, both the California Transportation Department and the FHA hired trained traffic engineers to supervise their studies, according to Lee Sanderson, director of research and development at the TMC.

Although it recommended the report as a guide in planning urban traffic control strategies, Honeywell cautioned against generalizing its test results to other localities. The test results "are heavily dependent upon the specific types of traffic scenarios studies," the report warned.

Six Experiments

In the first of their six tests, experimenters attempted to gauge the effect of one- and two-way streets on gas mileage and traffic conditions. Using a computer model of Washington's UTCS network, they found that, compared with two-way streets, one-way streets averaged 25% higher speeds during peak traffic periods and 19% higher speeds in off-peak hours.

This greater traffic flow translated into an 11% and 13% rise in fuel economy during off-peak and peak periods respectively. The experimenters attributed the improved gas mileage to the one-way streets' fewer stops and shorter delays.

In a second experiment, Honeywell researchers performed a similar comparative analysis of a conventional pedestrian movement system and a pedestrian scramble system, which allows walkers to move in all directions across an intersection, including diagonally. A computer model of the Shattuck-Alcatraz intersection showed the scramble system provided 35% to 48% less fuel economy than the conventional pedestrian system and slowed auto traffic 66%.

Another of the six tests used simulations of the UTCS network and Los Angeles' Hawthorne Blvd. to assess the effect of various traffic signal cycle lengths on gasoline mileage. Using a software package developed by the British Road Research Laboratory, the experimenters found cycle lengths that optimize traffic flow are shorter than cycles that optimize gas mileage.

The researchers also observed that lengthening the intervals between signal changes increases both traffic delay and fuel consumption.

These findings confirmed earlier studies of the impact of cycle lengths on fuel efficiency and traffic flow rates, the report noted.

In a test relating gasoline mileage to traffic congestion, computer simulations of the Washington UTCS network showed average vehicle speeds dropped from 12.8 mile/hour to 11.6 mile/hour and then to 8.6 mile-/hour as auto volume jumped from .75 to 1. to 1.25 times nominal levels. As traffic density increased, fuel consumption efficiency declined 22%.

Experimenters noted similar results for computer simulations of the Hawthorne Blvd. network, Honeywell reported.

Tests on the impact of exclusive bus lanes, meanwhile, showed that buses "cause a degradation in overall performance." In simulations of the M St. network, experimenters found that removing a traffic lane from general use decreased vehicle speeds 18% to 45% and gas mileage 15% to 37%.

For Efforts as DP Educator

DPMA Picks Couger 'Man of Year'

By Don Leavitt
CW Staff

PARK RIDGE, Ill. — The Data Processing Management Association (DPMA) has chosen Dr. J. Daniel Couger, professor of computer and management science at the University of Colorado and a regular *Computerworld* columnist, as its 1977 Computer Science Man of the Year.

The award is given in recognition of outstanding contributions to the field of computer science, the DPMA said. This year's presentation will be made during Info/Expo 77, the association's annual conference, on Oct. 12 in Washington, D.C.

Previous recipients of the award, originated in 1968, have included Capt. Grace Hopper — the DPMA's first "man of the year" and Dr. Gene M. Amdahl, founder of Amdahl Corp., who was last year's winner.

Couger earned his award largely because of his influence on the development of computer-oriented curricula in collegiate business education.

"Couger has had more impact on the improvement in education for future managers than any other single individual in the U.S.," according to his nominators.

When Couger entered the teaching ranks in 1965, after 13 years in industry, he was appalled by the lack of computer content in the business school curriculum. His national survey in 1966 indicated that only 11% of all accredited schools of business required computer efficiency of students, according to the DPMA.

After that, Couger exhibited a "missionary zeal" in bringing about a change. A survey earlier this year showed that 94% of all accredited schools of business now require a computer proficiency, largely a result of Couger's effort, a spokesman said.

Couger brought about this change through a four-phase program: 1) writing a book, *Computer and the Schools of Business*, which contained guidelines on adopting and expanding computer curriculum within budget constraints; 2) conducting faculty seminars for more than 1,000 educators representing more than 300 schools of business, on the advantages of computer use in their classes; 3) developing the *Computing Newsletter for Schools of Business*, subscribed to by more than 600 schools; and 4) writing the manual *Fortran for Schools of Business*.

Couger served as associate dean of the University of Colorado's school of business between 1968 and 1972, having joined the faculty at the Colorado Springs campus in 1965. Just prior to that, he was chief of computer plans and controls at Martin-Marietta Corp.

Author of five books and coauthor of five others, he is a member of various DP and educational associations and has lectured in 33 countries.

He received a distinguished faculty award from the University of Colorado in 1975 and in 1973 was awarded second place in the selection for the Dow Jones award, presented each year by the American Association of Collegiate Schools of Business for innovative curriculum among all U.S. schools of business.

Couger now is serving on the editorial board of three professional journals and is coeditor of a series of books in business data processing, published by John Wiley and Sons, Inc. He continues to edit *Computing Newsletter for Schools and Business*.

He is an international lecturer for IBM and has served as consultant for IBM, Control Data Corp., Dow Chemical Co., Hewlett-Packard Co. and NCR.

Couger is listed in *Who's Who in Computing*, *Who's Who in the West* and in *Outstanding Educators in America*.

IBM Fails to Appeal Ruling on Greyhound

ARMONK, N.Y. — IBM has failed to take advantage of the 14-day period in which it could have appealed the decision ordering the Greyhound Computer Corp. antitrust suit against it back to trial [CW, Aug. 29].

Its only remaining option now is to petition the U.S. Supreme Court.

The firm has not decided whether to go to the Supreme Court, a spokesman said.

IBM could have filed an appeal for a hearing before the entire panel of the Ninth Circuit Court of Appeals' justices or for a rehearing by the three justices who issued the opinion.

IMPROVE COBOL PROGRAM PERFORMANCE. DRAMATICALLY. AUTOMATICALLY. GET THE FACTS:

Now, over 500 MFT, MVT, VS1, SVS and MVS sites worldwide are obtaining dramatic savings in COBOL CPU time and storage requirements *automatically* by using OPTIMIZER II, a program product from Capex.

Using techniques inaccessible to your programmer or compiler, OPTIMIZER II works as a final phase to any IBM OS or OS/VS compiler, automatically analyzing and optimizing every path, every loop, typically eliminating more than 30% of the compiled instruction. It's transparent—no system or source program changes are required.

And since it works at the machine language level, its savings are available even for your best hand-tuned programs.

Results: COBOL programs run faster and use less system resources. Storage requirements are reduced. Capacity is increased. Turnaround is improved. You get more from your current system; even more when you expand or upgrade.

OPTIMIZER II is a proven package. It's easy to install and benefits are immediate. More about how and why is yours for the asking:

Decide Not to Compete

Vendors Protest Pre-Bid IBM Order in Dallas

By Jeffry Beeler
CW Staff

DALLAS — About a year before this city began accepting ~~bids~~ on computer systems for its new city hall, a city official apparently ordered $2 million in data processing equipment from IBM.

As a result, Burroughs and Honeywell Information Systems scrapped their plans to vie for the contract and never bothered to submit bids.

Univac also declined to bid on the contract and asked the city to rebid the system as a package. Assistant city manager Jim Favour balked at that suggestion which, he claimed, would give IBM's rivals an unfair competitive edge.

Since Aug. 1, when it officially began accepting bids for the system, the city has received proposals from IBM and three other vendors — Control Data Corp., Itel Data Products Corp. and Thomas Nationwide Computer Corp., a third-party leasing firm.

City officials will not award a contract until they have finished evaluating all four systems and have submitted their recommendations to the city council for review. City manager George Schrader said he expects a decision from the council by Oct. 1.

The controversy arose after spokesmen for both Burroughs and Honeywell charged that Roy Allen, director of data services here, placed a position order for two IBM 370/148s a year before the city began taking bids from other computer vendors.

'No Obligation'

Allen replied, however, that in asking for a position order he was not obligating the city to take the IBM equipment. He argued that he was merely trying to ensure he could obtain the systems on time if the city later decided to use them.

For this reason, Allen said he did not have to clear the IBM position order with the city council, which must approve all municipal purchases of more than $10,000.

Despite Allen's assurances, Don Emrick, Burrough Corp.'s branch manager, said the position order effectively eliminated vendors like Burroughs, Univac and Honeywell from competition for the city hall contract. None of the three firms submitted bids on Aug. 1, and Burroughs and Honeywell never received bid requests from the city on July 11:

In a letter to Schrader, Wayne Howard, a Univac account executive, complained that Allen's actions had discouraged all vendors but IBM from competing for the city hall order. Howard also claimed that even before issuing any bid requests for the prospective computer system, city hall officials had had their new building, which will open in January, electrically wired to meet only IBM specifications.

The wiring decision proves the city had already selected its computer vendor before issuing its recent bid requests, Howard added.

Allen claimed, however, that the new building will be able to accommodate both CDC and Itel Data Products equipment in addition to IBM units.

Request to Start Again

Arguing that the city's restrictive contracting practices had deprived the community and its taxpayers of potential benefits from the computer industry's latest technological developments, the Univac account executive asked Schrader to withdraw all existing bids and start the bidding process over again.

Burroughs' Emrick admitted he becomes "irked" when local and state government agencies apparently preselect their computer equipment instead of opening their contracts to competitive bidding.

Allen denied, however, that the city had preselected IBM as its DP contractor. Besides sending bid requests to various computer vendors, the city solicited proposals through advertisements in daily newspapers, he said.

Although CDC bid almost $800,000 lower than IBM for the CPUs, the Minneapolis-based firm did not include the cost of disk storage devices in its estimate. IBM bid about $1.6 million for the disk units, compared with Control Data's bid of $836,000 for the mainframes alone.

Though Favour rejected the idea of rebidding the city hall systems, he did agree to discuss the contract question in a meeting last year with Univac representatives and two other municipal officials — Schrader and Mayor Robert Folsom.

Univac routinely requests meetings with top local officials when negotiating contracts with city governments, Allen claimed.

Minnesota 11th State To Enter FBI System

WASHINGTON, D.C. — Minnesota has become the eleventh state to enter and update records in the FBI's Computerized Criminal History system.

The other states that now participate include Arizona, California, Florida, Illinois, Michigan, Nebraska, North Carolina, Ohio, South Carolina and Virginia.

Phone
Phone

We've found one or two companies that couldn't use the new Xerox 1700 terminal.

It happens. But not very often. Because, of all the 1700's we sell or lease, over 98% find permanent homes. And for plenty of good reasons.

Most companies who do interactive work want very high print quality and that's exactly what they get with the 1700. The quiet, reliable HyType II prints sharp, crisp characters even at 45 cps.

Full ASCII character set, forward and backward printing and 1/120" horizontal and 1/48" vertical resolution lets you print charts, curves, formulas, or musical scores with the touch of a key.

And you know that if something goes wrong, Xerox is going to be there to make it right.

If you think your company could use the new Xerox 1700, call 213/679-4511, Ext. 2231. Or write Xerox, Dept. A1-15, 701 Aviation Blvd., El Segundo, CA 90245.

Then all you have to do is find a desk to put it on.

Xerox Computer Printing.

XEROX

Sociologist: Computers Widening 'Power Gap'

By E. Drake Lundell Jr.
CW Staff

TORONTO — "The gap between the powerful and the not-so-powerful will tend to widen as computer use grows," a sociologist told a session at a recent conference here.

Elihu M. Gerson, president of Pragmatica Systems, Inc. and a former sociology professor, said this effect of computer use raises two problems — first, how to control or eliminate the negative impacts of computers and, secondly, how to provide "some minimum level of access to computer power" for all members of society.

"As with any other technology, control over computers and their impacts tends to follow lines of authority and cleavage which already exist," he said.

"Thus, the most general effect of computer use is to increase the relative advantages of some groups vis-a-vis others," he added.

Gerson called this effect the "Matthew Principle" after the passage in the Bible that states: "For unto everyone that hath shall be given; and he shall have abundance: but from him that hath not shall be taken away, even that which he hath."

Help Powerful

As an example of how computers help the powerful, Gerson cited the case of a firm with over $1 billion in yearly sales. Such a firm can "afford to use elaborate computer systems to support complex market analyses, automated production lines, flexible pricing structures, highly detailed cost-effectiveness studies and many other profit increasing activities."

But its competitor with only $10 million in annual sales can afford only a small amount of computer power and few sophisticated applications.

"Similarly, a government agency concerned with minimizing the expenditure of public money (or maximizing the collection of taxes) can bring very substantial information processing technology to bear on the problem of identifying and eliminating ineligible clients from welfare roles.

"Even the most egregious abuse of individual welfare benefits will not support the computing power needed to monitor a government agency's operations," he said.

"Most of the problems associated with computer use have been with us in one form or another for many years, and perfect computer systems and procedures will not eliminate them," Gerson said.

"Privacy and security, reliability and accuracy of accounting, civil liberties, quality of work life and similar topics have long been subjects of concern; the importance of the computer for these areas is in the way in which computer-based systems can multiply the speed and scope of the intrusions, errors and impositions which people suffer," he added.

Because of this, the need to control or eliminate negative impacts of computer systems becomes political.

"We must consider not only the problems caused by improperly designed or implemented systems, but the distribution of advantages conferred by computing power as well," he said.

Gerson suggested the impact of computing "be measured in terms of the changes in relative distribution of resources brought about by computer use. Thus, every application and system would be assessed in terms of the advantages and disadvantages brought about by the system to each party that has some contact within the system."

For example, if an electronic funds transfer (EFT) system reduces float by $1 billion, "then the EFT system has, in effect, transferred $1 billion from banking customers to banks," he said.

Traditionally, costs and benefits of computer use have been assessed from the point of view of the purchasers of computer equipment and services; the measurement of effects has been in terms of dollars, Gerson said. With his system costs and benefits would be measured not only in terms of dollars, but also in terms of time, skill and morale, he noted.

"Time, like money, is a resource which is unequally distributed in social organizations," he pointed out. "One of the most notable impacts of computing technology is the power of the computer to rearrange the distribution of time in organizations." Computerization "may make significant changes in the pace of rhythm of other activities," he added.

These temporal changes will have both negative and positive effects, he said, noting that while some applications may eliminate drudgery, they may also reduce the number of jobs.

"Computers play an equally significant role in the redistribution of skills," he said. They often increase the range of skills available to an organization, but at the same time" reduce or eliminate the opportunities of individuals in the organization to develop new skills."

Question of Morale

The impact of computers also has to be assessed from the viewpoint of morale, according to Gerson. Effective systems may increase morale, he said, by making work easier and more convenient; poor ones decrease morale by creating more inconveniences than they eliminate.

The indirect effects of computerization on morale are also important, he indicated, including the possible reduction in interpersonal contact after computers are installed.

Programmers . . .

Teach yourself assembler language

It took us more than three years to develop the manuscript for just two books in assembler language — one for DOS users, one for OS. Now, we sell these books with an ironclad guarantee. If you can't learn assembler language from them, you can return them for a full refund . . . no matter how long you've had them.

During the last few years, we have sold hundreds of these books to DP professionals for self-education. The results speak for themselves.

Less than 30 out of every 1000 buyers have returned our texts. And many felt compelled to write. Some examples:

> *"Your book is fantastic. I can't begin to measure the help it has brought me."*
>
> *"Thanks to your books, I'll be ready when the day comes for me to advance from operations to programming."*
>
> *"Despite the fact that I work for Univac, I will recommend your books to all of our customers. We have nothing this good."*
>
> *"I found the book to be a great help in that I could review the basics of assembler language but in addition got an introduction to some new techniques and file handling."*
>
> *"Thank you for the sheer pleasure of discovering a technical publication worth reading."*

Once you finish one of our assembler language texts, you will have several new skills. You will be able to debug using storage dumps . . . regardless of the language you're using. You will be able to write and use BAL subprograms. You will be able to maintain and develop complete assembler language programs . . . even ones involving ISAM and direct files.

In addition, you will have a deeper understanding of what actually happens as one of your programs executes. As a result, you will be more independent, more in control of your system.

4 Reasons Why Our Books Are Effective

1) These books were written by an expert from industry, Kevin McQuillen. He's been a DP manager, consultant, and manufacturer's rep so his books are chock full of solid, practical, real world advice.

2) The content of these books is based on an analysis of the tasks normally required of an applications programmer. That's why these books contain everything of use to the average programmer, and very little that isn't. That's also why these books give substantial coverage to job control language. The DOS book covers DOS and DOS/VS. The OS book covers MFT, MVT, VS1, and VS2.

3) These books are organized by function. A complete subset of BAL is presented in the first chapters of the book, and later chapters cover such functions as debugging, table handling, subprogram linkage, and file handling. When material is organized in this way, you learn more quickly because you always see purpose.

4) Each book contains dozens of complete program listings. They start with card-to-printer programs and end with programs that create and retrieve direct files. In between there are listings for routines and programs that perform code translations and input validations, set up the linkage between mainline modules and subprograms, load and use tables in storage, create and retrieve sequential and ISAM files, and so on. As a result, you will have many models of professional coding techniques upon which to build.

Content

The intent of these books is to develop a basic programming skill in assembler language. As a result, the initial emphasis of each book is on a professional subset of BAL along with the related debugging skills. If you did nothing more than master this material (chapters 1-5), I think you would justify the cost of the book several times over.

Beyond this, table handling, subroutine and subprogram linkage, and sequential and ISAM file handling are given primary emphasis. Since these are common programming functions, this material is valuable background regardless of the language you normally use.

Finally, these books show you how to write macro definitions (great background for working with software packages), how to code bit manipulation and translation routines, how to isolate the fields in free-form input data (a common function in teleprocessing programs), and how to work with direct files. This type of material starts you on your way to the more sophisticated tasks required in a computer installation.

30-Day Trial and Unlimited Guarantee

Because there are so many ineffective books in our field, I don't expect you to take my word for any of this. All I ask is that you try our books. That's why I gladly make this two-part offer.

First, I'll give you a 30-day trial period. If you return the books within that time, forget the bill. No questions asked.

Second, if you discover after 30 days that you can't learn assembler language from our books, return them and I'll refund your money. There is no time limit on this guarantee.

So mail the coupon today. For each book ordered, I'll bill you $15 plus postage (and sales tax in California). If it works as I've guaranteed, it will repay its purchase price many times over.

Attention: Training Managers

If you are in charge of training for your company, write today for a free trial copy. Based on our experience so far, our books will outperform any other instructional materials currently available. And they will improve the effectiveness of any course you're now using. If you prefer to call, our number is 209-229-8111

Mike Murach & Associates, Inc., 4905 North West Avenue, Suite 102,
Fresno, Ca. 93705

Gentlemen: Please send me the copies of *System/360-370 Assembler Language* that I have indicated below. I will take up to 30 days to review them with no obligation. After that, if the books don't prove to be effective, I will return them for a full refund. I understand that I will be billed $15 plus postage (plus sales tax in California) for each book ordered.

Quantity Version

_____ **DOS (407 pages)**

_____ **OS (450 pages)**

SAVE $2.50 . . . Send cash with order and your price is $12.50 per book plus 50c for postage and handling (plus 75c sales tax in California). The unlimited guarantee still applies. If you return the book, you will receive a prompt refund.

DP Service Keeps Farmers Abreast of Finances

By Jeffry Beeler
CW Staff

RICHMOND, Va. — Take a good look at the farms you pass the next time you take a drive through the countryside. Those old bastions of tradition and rustic simplicity are finally about to enter the age of computerization, and when they do almost every farmer but Old MacDonald will feel the impact.

Of course, disk drives and printouts are still a long way from replacing red barns and silos as mainstays of rural Americana. But the move toward increased farm computerization is already under way, and — in this state at least — the trend is sure to continue if Stephen Dennehy has any say in the matter.

Dennehy, a 22-year-old agricultural economist, works as a field representative of the Virginia Agribusiness Management Association (Vama), a state-funded agency organized in 1974 to encourage increased computer use among the estimated 35,000 Virginia farmers who stand to benefit from such equipment.

Each working day, Dennehy travels the back roads of 13 Tidewater Virginia counties in an attempt to recruit new customers for Vama's computerized farm management accounting system. For an annual fee of $300 per subscriber, that service provides farmers with the detailed financial statistics that Dennehy says growers need if they are to compete successfully in this era of increasingly sophisticated farm equipment.

Subscription Process

To subscribe to the service, farmers merely spend about half an hour completing a prepared income and expense report, which they mail on the 10th of each month to Vama's administrative headquarters in Lynchburg. There, the questionnaire data is keypunched and entered into a 256K-word Honeywell Series 60 Level 66 time-sharing computer at Lynchburg's Fidelity American Bank.

Other peripherals in the Vama computer configuration include a Honeywell Model 500 tape drive unit and four Honeywell printers, including two Model 300s and two Model 200s.

Ten days after the income and expense reports arrive, the computer generates monthly financial statements that provide farmers with detailed records of their personal and business credit, cash flow, labor costs, current net worth and other matters of financial interest.

Once a year, Vama's computer system also generates depreciation schedules and profit/loss statements that include dozens of expense breakdowns like costs per acre and costs vs. revenue.

Reporting Eased

Dennehy credited this wealth of computerized accounting data with simplifying the preparation of farmers' federal income tax reports.

Each line on the system's monthly and yearly financial statements is numbered to correspond to a similar line on the standard 1040 federal income tax form.

When the time comes to file his return, a farmer merely transfers the information on his Vama financial statement to the corresponding slot on the 1040 form.

Dennehy also credited the computerized accounting system with improving farmers' chances of obtaining much-needed bank loans. "The day is gone when a banker can tell how a farmer is doing simply by going down to his place and inspecting his crops," the field representative said.

Little Acceptance

"Farmers are traditionally the worst bookkeepers in the world. What we're doing is offering them the same management tools that people in every other business have had for years," he said.

Thus far, however, the system has won precious little acceptance among its prospective subscribers despite its advertised advantages, Dennehy conceded.

He attributes the low acceptance rate in part to a longstanding rural bias against computers. Many farmers are reasonably satisfied with their financial situations and question the need to rock the boat, he explained.

There isn't a single single-
that can touch Tandem in

To begin with, we're twice as good. With multiple processors. It's as simple as this. On-line means on-demand, and one processor won't do. Because any processor, even one of ours, can fail. And if that failure occurs during a peak period of transactions, you're out of business while it's down. And out of luck if you miss your re-start point or clobber your data base. And out of control if you lose or duplicate the transactions in process when the failure occurs.

You need a NonStop™ System.

Tandem has built the world's first multiple processor system, designed from scratch in both hardware and software, to provide non-stop processing—even during a failure—with no penalties in the speed, capacity, throughput or memory utilization of the system.

And it can grow without penalty. Starting with a basic two processor system, users can add processors, memory or terminals incrementally all the way to a fully expanded system of sixteen processors supporting 2048 data communications lines, with individual files of up to four billion bytes fully supported by a comprehensive data base management system. But the best part is that you never have to reprogram. Ever. Your Tandem NonStop System just gets bigger and better. At remarkably low cost.

Why the big ones fail.

The big mainframes are expensive to begin with. And even they can fail. Which can leave you high and dry in the on-line environment. But there are other difficulties with the big numbers, too. Of prime consideration in the on-line world, they offer very limited throughput for their price. And by the time you've hung a lot of communications lines on them, they suffer a derating which makes their performance even less attractive.

And whereas you may eventually need that kind of horsepower in your on-line system, chances are it's an expensive overkill at the outset. What you need is a system which will do the job efficiently on the way in, and grow as your needs grow, in modest price increments. It makes the big systems people wish they were more flexible.

One mini just won't make it.

Minis have made a name for themselves, justifiably. But in the world of on-line, where needs keep growing, the one mini system just can't cut it. With the architectural limitations inherent to a single mini system, growth can build system overhead so fast you'll grind to a halt before you know it.

And strap-ups will kill you.

The answer might seem to be to strap two processors together. One goes down, and the other takes over. Right? Wrong. It's not that simple. System software for a single processor system won't run on the strap-ups. And the fate of any transactions-in-process at the time of a failure is unknown. As is the state of any records being updated. And growth beyond the original system capacity is well nigh impossible.

What you really need is the one multiple processor system designed for multiple processor operation. Tandem's NonStop System.

The four major "on-line" considerations.

When anyone is considering an on-line system, regardless of size, there are four primary points to consider. Throughput. Availability. Data Integrity. Transaction Protection. The system must be able to handle the job. It must be there when you need it. You must be sure of the integrity of your data base. And you must be sure you don't lose or duplicate a transaction. Even during a failure. No single processor system anywhere can provide that assurance. It takes a multiple processor system designed for the on-line environment, and Tandem is it.

For better throughput, spread the files.

We built the Tandem NonStop System with geographic independence of programs and files. They're handled automatically under Enscribe, our Data Base Record Manager. And instead of having one processor with one bottlenecking channel and a

The Tandem 16 NonStop System is composed of multiple, independent processors with dual redundant communications paths. The unique interaction between Tandem hardware and software assures not only continuous operation, and the integrity of your data base, but also throughput unmatched by any other computing system of comparable cost.

Career Project Extended

NOTRE DAME, Ind. — A University of Notre Dame program to stimulate minority students' interest in technical careers has been expanded and funded for a second year.

The program, which uses computer games and programming, received $58,064 this year from the Committee on Institutional Cooperation Plus/Midwestern Program in Minority Education to support its work with minority high school students.

In 1976, terminals were placed in several Indiana junior high schools; students communicated with Notre Dame's IBM 370/158 by telephone. The program has now acquired its own computers and been extended to two middle schools and a senior high school.

Designs Program for Vendor

Pupil Trades Tacos for Terminals

MINNEAPOLIS — Last summer, Bonita Heid waited on customers at a taco stand. This summer, the St. Cloud State University senior designed a computerized program to maintain a sequence of labels while and after a program is being debugged.

Heid was one of four St. Cloud students engaged in an experimental internship program between the Minnesota university and Data 100 Corp., a manufacturer of computer terminals based here.

For her work, the 21-year-old mathematics major received $4 an hour, up to 16 hours of college credit and a chance to work in a computer company while she's trying to decide on her career. "We goet three months to see whether we liked this kind of work," she said, "and they got three months to decide whether they liked us."

Apparently the company did. According to Michael DiPaolo, Data 100's product support manager and the person responsible for initiating the exchange, "we gained the services of four highly motivated people in a vital area — but one that's not always easy to recruit for.

"We always wanted to get at these software projects," he noted, "but our people have always been tied up with larger projects. With our 'new employees,' we finally had that chance."

Like Heid, the three other students — Jeff Schmitz, Bill Hagenbuck and Paul Aubrecht — are all seniors in the school's computer sciences program and will graduate within a year. "That makes them excellent prospects for these jobs later on," DiPaolo said.

For its part, St. Cloud is able to provide its computer sciences students with meaningful work experience. As Robert Johnson, computer sciences and mathematics professor, said, "We are pleased that the students are getting valuable hands-on experience and not just the dirty work."

processor system anywhere an "on line" environment.

fixed priority system, Tandem's NonStop System distributes the work and the files across multiple processors, multiple discs, and multiple channels. Enscribe controls the pattern and the flow for maximum efficiency. Because of simultaneous disc accesses, there's a dramatic improvement in response time. It's one of the performance benefits about a multiple processor system which you can't get on a single processor system.

Ease of programming, by design.

Historically, multiple processor systems have been a bear to program. Not with Tandem. Guardian, Tandem's operating system, lets you write your programs as usual. You can add more processors, or memory, or terminals as you need them. No need to rewrite programs. Ever.

And we make it easy to write the programs in the first place, with COBOL or with TAL, a powerful language designed for fast, flexible programming. The software development tools of this mini-based system rival those of far more expensive systems, and include NonStop operation, data communications, mirror volume capability, full file protection, screen formatting programs, and a host of housekeeping utilities.

When you're thinking "on-line," think in Tandem.

Which means think in multiples. Few, if any, "on-line" systems can be installed and forgotten. The number of transactions, the number of terminals on-line, or the number of applications programs to be run on the system keep growing. Most likely, all three will multiply.

Which is traumatic unless you've started with the one system on the market which can grow with you—even if the growth occurs during the initial configuration phase—without having to start all over again.

NonStop growth and NonStop protection, too.

Because the Tandem System was designed for NonStop operation in both hardware and software, it offers an extraordinary measure of protection against a failure in any processor, I/O channel, disc drive, or in the software. No other system offers this measure of assurance.

When a failure does occur in any segment of the system, its back-up counterpart completes the task, without a hitch. Since all programs are geographically independent, and the operating system both distributes and monitors all work-in-process. recovery from a failure is instantaneous. There is no restart; no backing up to a hopefully safe point.

The system monitors its own operations, performing all tasks in a distributed fashion across the multiple processors. Even when a CPU goes down, another CPU is immediately aware of the failure and picks up the task in process and completes it. No data and no transaction need ever be lost or duplicated. The integrity of the data base can be fully protected. It is truly unusual, but it's one reason why we say no single processor system anywhere can touch us in the "on-line" environment.

NonStop software.

Guardian: Operating System.

NonStop operation.

Automatic re-entrant, recursive and shareable code.

Virtual memory system.

Geographic independence of programs and peripherals.

Enscribe: Data Base Record Manager.

Provides relative, entry-sequenced and key-sequenced files.

Each file may be up to four BILLION bytes.

Up to 255 alternate keys per file.

Optional mirror copy by disc volume.

Envoy: Data Communications Manager.

Languages: COBOL, TAL.

NEWTON — Is computer art Art?

The answer, oddly enough, is no, according to Edmund C. Berkeley, editor of *Computers and People*, a magazine that has sponsored a computer art exposition in its August issue for 15 years.

"All my opinions about computer art are expressed in my August editorial," Berkeley responded when approached by *Computerworld* for an interview.

Besides, he said, "I don't think it matters whether I like it or not, I think it's more important what ordinary people think about it." And ordinary people, according to Berkeley, don't find computer art very satisfying.

In his editorial, "Computer Art and the Eye of the Beholder," Berkeley contends people without any loyalty to the computer find computer art "boring" — "only avant-garde editors of computer books seem to want copies of the art now and then," he noted.

Why? Because of its "abstractness." Computer art fails to "represent common objects and scenes;" further, it fails to show objects portrayed "in their detail and historical perspective."

Finally, the artists don't overlay their "pictures" with any "representation of emotion, mood or artistic interpretation," Berkeley said.

"People understand and enjoy art far more when they can look at the entire scene and find many interesting and challenging things to observe. The basic quality of great pictures is that one can look at them over and over, and for a long time, and discover still more delight and interest — and 'beauty.' The beholder can say, 'I like that. It makes me think and dream. It speaks to my condition.'

"It seems to me that for a beholder, interest and delight in art depend on recognition of objects and scenes; richness of detail, history and impressions; all suffused by an artist's deft technique for conveying invisible emotion and feeling. Thus a rich collection of messages, intellectual and emotional, are conveyed from the artist to the beholder, and beauty becomes a joint enterprise for them both.

Do I hear an argument?"

Yes — from Grace Hertlein, art editor of *Computers and People* and editor of *Computer Graphics and Art* who "respectfully" replied to Berkeley's comments and also defended computer art — its status as an art form — and offered some suggestions for improvement. Hertlein, who describes herself as "an artist turned computer artist," is an associate professor in the Department of Computer Science at California State University in Chico.

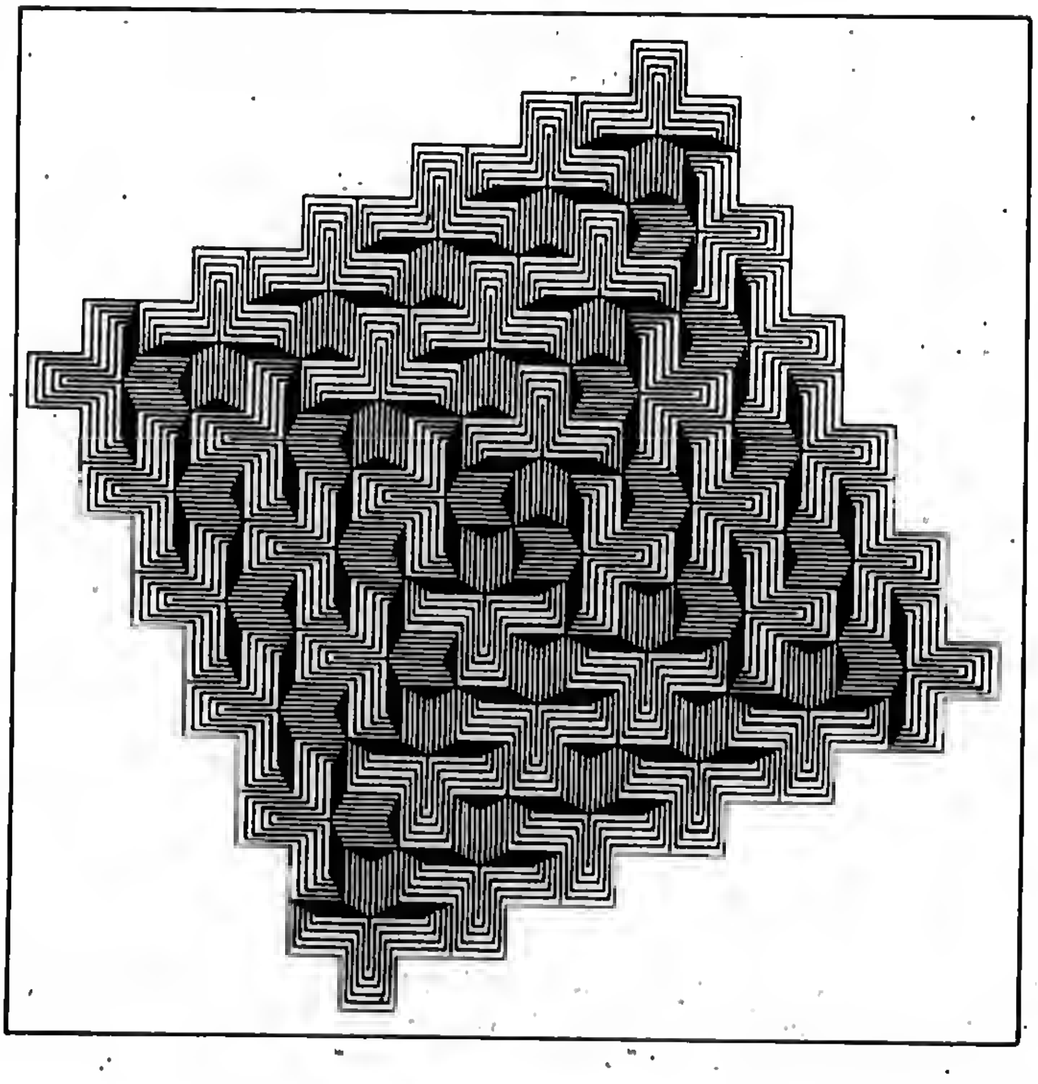
"Edmund Berkeley is absolutely right that the beholder should be stimulated, moved and repeatedly moved, that we should discover more and more of interest delight and beauty in a work of art," she believes.

"But 'beauty' is an overworked word. We need to find new words. The drawings of Leonardo da Vinci are not beautiful, but they are moving, revealing and fascinating.

"Man will continue to find his face and his world meaningful in the future. Therefore these patterns of man and his world should be included more in computer art," she agreed.

However, Hertlein defends computer art as a "young" art form. "It has gone from an accidential happening, practiced by physicists and systems analysts, to become an art that is popular with many kinds of people" in about 15 years, she pointed out.

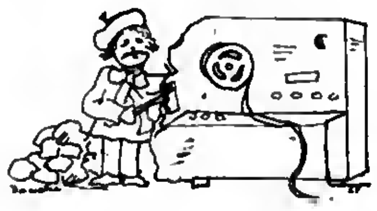
ZUP TZE 33 by Paul Shao and Kenneth F. Dunker, professors at the Department of Architecture at Iowa State University in Ames, Iowa. An example of modular optical art, ideally suited to the computer and derived via a transformation algorithm. (Courtesy *Computers and People*, August 1977)



Computer art is characterized by "a great deal of pattern manipulation." Designs are input and varied "via transformations and randomizations" which result in "interesting visual patterns. These might make nice wallpaper or wrapping paper; but too often they are not exciting and moving enough to be considered as art," she said.

She also conceded that the types of designs input into the computer are often "aesthetically wanting." Too often one limited design is repeated topsy-turvy. As such it "tickles our senses briefly; but it hardly ever accomplishes more than this surface, brief pleasure," she explained.

New Masters



"Often I see in print and exhibitions work that I would return to a first semester computer art student to develop more fully," Hertlein said.

But, is it fair to compare an art form that is only about 15 years old with art that is thousands of years old? Hertlein asked. Cave art goes back 17,000 years. If one chooses to disregard cave art, Egyptian and Mesopotamian art still date back as many as 4,700 years, she noted.

Further, "hundreds of thousands of artists have practiced Art, contrasted with a few hundred who are currently engaged in producing computer art," she added.

As for Berkeley's contention that computer art is "flat, and two-dimensional, made up of many lines, lacking solidity and lacking perspective," Hertlein agreed with his assessment and even called it "sound." Much computer art possesses these qualities because of the types of computer systems used to create them.

For example, she said, "point-to-point programming encourages linear, flat designs of a lean, minimal nature. Few systems have digitizers and tablets. Many graphic systems do not have a curve-fit routine and therefore forms are excessively angular."

Further, "a good proportion of graphic systems do not have a user-oriented 3-D routine for artist use," she added.

An Evans-Sutherland Frame Buffer system that allows the computer artist to literally paint colored computer art with dimension and solid-appearing patterns costs $250,000, she said. And few installations can afford such a system.

But there are other limitations, too, according to Hertlein. "Not all campuses and installations have generous computer graphics systems. Many have only printout capacity."

Furthermore, programming languages for computer art "are not highly developed, and often they are not transportable," she pointed out. "An ideal graphics language as such does not exist, but it might someday."

In computer science "the name of the game is to make a device or system do what it was not intended to do. Artists are becoming more knowledgeable about system limitations, and they are becoming more knowledgeable about programming and about art in general," she said.

Hertlein agrees that "representational" art, which features recognizable patterns from the world of man and nature rather than abstractions, is more satisfying, but often commonplace to the point of being boring. She defends the forms resulting from science and mathematics as "equally viable" as representational forms.

"Since mathematics and science are part and parcel of computer art, the innumerable forms from these disciplines are highly desirable as design sources," she argues.

Hertlein, in contrast to Berkeley, feels "a special delight in perceiving the instantaneous moment." The historical rendition of an event such as the eroding of a mountain, for example, is "another pleasure."

The prints of the famous artist Maurice Escher are an example of both. "Perhaps we need to be more open about deciding what computer art should and should not be lest we follow the example of manual art with its diverse, fashionable dogmas," she said.

Hertlein doesn't disagree the point that her fascination with computer manipulation of numbers and images is the basis for her fascination with computer art. "We are like the doting parent or teacher" — doting on computer art because we are computer people, she admitted.

"If we were to see the same art accomplished manually, we might find it quite uninteresting. We may be too fond of the computer and whatever it can do," she added.

Berkeley expressed little fondness for computer art that looks like something "a man could do." He did agree, however, that computer art that is too complex for a man to do manually can be interesting and attractive.

But computer art is often better than people think, according to Hertlein. More than 90% of computer art illustrations found in texts and even in catalogs and brochures for computer art exhibitions are printed in black and white because of cost. Without seeing the originals in color "we cannot fully know the work of art."

Another factor militating against the acceptance of computer art as Art is the general "antitechnology movement in this country," according to Hertlein.

"Because of the lack of exposure to computers and technology itself, many individuals believe technology debases mankind and art," she said, but "because of our experience, we know that it is the purpose, the method of using technology, that makes the difference. The person behind the computer is very important.

"As an artist turned computer artist, I have encountered a great deal of genuine animosity from manual artists. But I have encountered a great deal of encouragement from computer people."

As an example, Hertlein described an incident that occurred while she was hanging an exhibit of works by 250 invited international computer artists in a university gallery in Los Angeles. The works were large, well matted and framed; the majority were in color.

People were already gathering, and "words of praise flooded the gallery. As we completed our work we put up a large sign: 'International Computer Art.' It caused a furor. The word 'computer' brought forth damning comments, replacing the accolades volunteered a few minutes earlier," she said.

"As visual arts chairman, I remained behind to informally lecture and answer questions about art. However, no explanations, no comments could undo the apparent prejudice of the beholders."

Only when computer art is displayed in exhibitions and galleries with acceptance of the "computer" as an art medium, just as watercolors and oils are accepted, will computer art be evaluated fairly, she said.

The potential of computer art to emerge as a full-blown accepted art form is clear." I believe the breakthrough of computer art as a popular art form is likely to occur within the next years," she said.

Is This Art?

New York, Pacific Stock Exchanges Plan Link

By Edith Holmes
CW Staff

NEW YORK — The New York Stock Exchange (NYSE) and the much smaller Pacific Stock Exchange last week announced their intention to electronically access each other's trading floors.

In the meantime, representatives of the Pacific and four other regional exchanges — the Midwest Stock Exchange in Chicago and those in Boston, Philadelphia and Cincinnati — plan to meet in Chicago this Wednesday to discuss the expansion of their own intermarket hookup.

A link between the Pacific Exchange — which had a recent total weekly average of 791,000 shares — and the "Big Board" — with its average daily volume of 22 million shares — would allow dealers to match a buyer in California with a seller in New York, according to an NYSE spokesman.

No start-up date has been projected for the NYSE-Pacific link, and it is not clear whether traders and their customers would be charged for the use of the service, the spokesman said. "An awful lot of detail has to be fleshed out," he added.

The hookup between the "Big Board" and the Pacific Exchange, however, could "evolve into the key element of the national market system called for by Congress," NYSE chairman William M. Batten said.

Batten invited the other regional stock exchanges to join in the link, but the regionals' own system could eventually provide competition to the NYSE plan.

Business Increase Expected

The Pacific Exchange expects the New York-Los Angeles hookup to produce a sharp increase in business for the Pacific Exchange, a stronger competitive position for California-based regional brokerage firms and benefits for investors who would gain access to a broader market, Pacific chariman Edward W. Wedbush said.

It is uncertain whether the Securities and Exchange Commission (SEC) would have to approve the plan, however. An SEC spoksman said the commission will study the pact to assure it is consistent with federal stock trading laws.

At the Chicago meeting on Wednesday, Regional stock exchange officials will take up the expansion of their limited system operated by Weeden Holding Co., parent of stockbroker Weeden and Co.

Weeden has linked the Pacific, Boston and Philadelphia exchanges in a system called "wham" for Weeden Holding Automated market.

Listing 50 stocks and allowing interexhcnage trading, Wham matches buy and sell orders on a first-come-first-served basis and doesn't allow dealers to request that their transactions be made on a specific floor, a spokesman said.

On Wednesday, Weeden will propose that other regionals be allowed to join the system, renamed RAM for Regional Automated Market. The company hopes to make this expanded system operational with a limited list of stocks by October.

Weeden hopes its system will become the single national stock exchange hookup. "Ultimately, all markets could be linked up through RAM," the company's spokesman said.

Cornell Gets NSF Grant For Chip Research Facility

WASHINGTON, D.C. — The National Science Foundation (NSF) has given Cornell University five years and $5 million to find out how much more memory can be packed onto a chip.

The grant provides for the establishment of the first national facility for research on electronic devices with dimensions of less than one micro — about one sixtieth of the diameter of a human hair — and for studying the fundamental properties of the materials used in their fabrication, according to an NSF spokesman.

To be called the National Research and Resource Facility for Submicron Structures, the laboratory will look for better ways to produce tiny patterns that can be incorporated into a wide range of electronic devices. Such techniques will ultimately be used to improve communications, increase computer capacity and make possible advances in the biological sciences.

Dr. Joseph Ballantyne, professor of electrical engineering at Cornell, is directing the initial planning for the facility. He said the technology planned for development in the new laboratory will allow researchers to inrease by 10 times the density of components in an integrated circuit.

In addition to its use in the expansion of the technology in this area, the laboratory will also be employed to train graduate students, engineers and scientists in the field and to stimulate research on submicron structures in physics, chemistry, chemical engineering and related fields, the spokesman said.

Alexander Named HRIS Director

WASHINGTON, D.C. — Boyd L. Alexander, who has served since March as acting director of the House of Representatives Information Systems (HRIS) — the computer and information systems support arm to the House of Representatives — has been appointed the organization's director.

Alexander came to Capitol Hill from the Office of Management and Budget's (OMB) Information Systems Division. He replaced Dr. Frank Ryan, who left the position as head of HRIS to become Yale University's athletic director.

Another former OMB Information Systems Division staff member, Franklin S. Reeder, has been named deputy director of HRIS.

Now Used to Print Tickets

System Expected to Expand Stadium Services

By Jeffry Beeler
CW Staff

CHICAGO — They might have to wait a while, but managers at Chicago Stadium expect an automated ticket-printing system to eventually expand their range of customer services and cut their production expenses.

Because stadium officials installed it only last October, the minicomputerized system has not yet had a chance to yield either of its expected benefits, box office manager John Stroth explained. "It's a new system, and we're still making design changes in it," he said. "It usually takes a year or two to get everything on a new system working correctly."

But when the system finally does become fully operational in a few months, stadium officials will be able to maintain mailing lists, notify customers of upcoming events and perform other functions and services that previously had been beyond their capabilities, Stroth said.

The system will also allow stadium managers to trim their ticket-printing costs, although Stroth admitted "it's a little too early at this point to estimate exactly what the savings will be."

More Than Enough

When they relied exclusively on outside services for their printing needs, Stroth and his colleagues had to order a full complement of tickets for every event they hosted. Unfortunately for them, many of the events that take place at Chicago Stadium — hockey games, ice shows, rock concerts and the like — draw less than a full house, so, in some instances, stadium officials were forced to buy more tickets than they could sell.

Today, with the minicomptuer system, they buy some of their tickets from Ticketron, the New York-based supplier, and then print any additional tickets in-house as the need arises. As a result, they order only as many tickets as they can sell, Stroth explained.

Before they installed their own printing system, Chicago Stadium managers obtained their customer tickets from a local commercial printer. Although they had no complaints with the printer's service, they concluded that an in-house ticket-printing system, with its ability to perform many extra functions, "was the way to go in the future," Stroth recalled.

Leased from Ticketron for $35,000 a year, the desk-sized computer system manages season tickets, changes customer seating arrangements on request and does billing and promotional mailings in addition to its primary job of printing tickets. Except for the forms cutter, the stand-alone Ticketron 2000 system consists almost entirely of Control Data Corp. hardware, including a 32K-byte Cyber 18 central processor, a Model 1811/1 CRT terminal and a Model 1827/30 line printer.

After the system becomes fully operational, Stroth and his associates plan to replace the configuration's two 250K-byte floppy disk drive units with a much larger capacity drive. This improvement will allow Chicago Stadium managers for the first time to perform several DP tasks simultaneously, the box office manager predicted.

They will be able, for example, to print tickets for one stadium event and at the same time change seating assignments for a subsequent attraction. The existing system, in contrast, can't perform any additional DP tasks while it's printing tickets.

Topic of Distribution Set for HIS Seminars

PHOENIX — Honeywell Information Systems, Inc. will conduct two seminars on the distributed environment and networking for executive and technical personnel in the user community.

The product-independent seminars include a management session of two days and a 10-day session for those with extensive systems experience.

An introductory seminar for upper and middle management will be held Nov. 9-10 in Boston. The tuition is $250, which includes a workbook.

The 10-day distributed environment session is scheduled for Dec. 5-16 in Phoenix. Tuition is $1,250 including workbook, materials and computer time.

Further information is available from Hal B. Becker at HIS, P.O. Box 6000, M.S. K-99, Phoenix, Ariz. 85005.

Scholarship Aid Program On Small System Itemizes Prospective Funds Sources

By Esther Surden
CW Staff

MANCHESTER, N.H. — Where to get the money to send the kids to college is a common concern of parents today. A nonprofit program run on a small business system at New Hampshire College here is helping to alleviate this burden.

The program is the combined effort of New Hampshire College, which has exclusive processing rights, the Citizens Scholarship Foundation of America, Inc. (CSFA), which is developing the files, and the College Entrance Examination Board, which is responsible for quality control and dissemination of the information to the students, according to Joseph F. Phelan, executive director of CSFA.

The Ford Foundation is also involved via a three-year grant totaling $95,982.

Under the scholarship aid program, an applicant from any of the New England states, Indiana or Minnesota can receive a listing of at least 10 sources of funding for $10, according to William A. Hunzeker, assistant professor at New Hampshire College.

The program is in the process of being expanded to include Illinois, New Jersey and Texas and is expected to cover Michigan, New York, North Carolina, Ohio, Pennsylvania and Virginia in the near future.

The program began in 1972 on an NCR Century 100 that handled all of the college's educational and administrative needs. The growing use of the system for special projects prompted the college to upgrade to an IBM 3/10, which has since been upgraded to a 3/15D.

"At the time we began, CSFA asked several computer companies if this particular thing could be done. Two didn't answer the request for proposal, another company came in with a high bid and IBM said it was nearly impossible to do," Hunzeker recalled.

CSFA then allowed the college to tackle the project. Hunzeker challenged some students to do it and they came up with a program for the NCR Century 100.

The program "worked reasonably well, although it served only the state of New Hampshire and had a very small data base of about 500 sources of aid. It took the machine about a minute and a half to two minutes to put out a list that averaged about 13 sources of aid for each applicant," he said.

When the college switched from the NCR to the IBM system, it also tried to convert the programs. It found, however, that because of the file structure the same functions that had taken a minute and a half to two minutes on the NCR machines now took five minutes on the IBM system.

"But we did such a low volume it didn't make a lot of difference," Hunzeker said.

In 1974, CSFA contacted the college to see if the program could be expanded on a national level. The college rewrote the software and upgraded from the 3/10 to a 96K System 3/15 and changed from Model 5444 disks to 3340 disks. Just last month it upgraded again to the 3/15D.

To obtain the data needed for the scholarship matching, CSFA employs qualified part-time summer help to do actual field work that includes canvassing high schools and colleges, interviewing scholarship sponsors and compiling relevant data.

All input is prepared on diskette on an IBM Model 3741 key entry unit. The source document was designed to be transparent to the person filling it out. A coder goes through his computer-generated code book and assigns appropriate codes to the particular application form, reads from the application form and inputs onto the diskette, Hunzeker said.

"We are going to get away from this now," he noted. When the College Board sends out the application, it will effectively be a code book and "it will make the student do the lion's share of the coding."

The college plans to modify the system to use optical scanning as volume increases.

Zip Code Method

A "sophisticated" program is used to find the members of the data base that meet a particular student's qualifications, Hunzeker said.

"One of the primary requirements for printing an award is geography, so I use the Zip Code method of searching through the data base. I actually have two data bases. The programs split the information entered on diskette into two sources and there is one data base, containing nothing but requirements, that is specially coded," he said.

The requirements data base is searched in a Zip Code order starting with the local level because that's where the student has the best chance of getting funding, he indicated.

"The computer effectively has been programmed to selectively search. Some glitches in the system force it to learn better ways of searching as it goes along," he stated.

The search now takes 15 seconds, including the printing of 20 sources, he claimed.

The system is presently handling about 5,000 students, but has the potential to handle 1,000 a day with "no trouble," he added.

World Bank Supports Colombian Project

WASHINGTON, D.C. — The World Bank here has loaned $60 million to Colombia to expand its telecommunications facilities.

Colombia's Empresa Nacional de Telecommunicaciones (Telecom) hopes to improve telephone service to small towns and rural areas by 95,000 lines, connecting approximately 75,000 additional subscribers to its communications network.

Costing $167.7 million, the project will also involve the installation of microwave radio and multiplex equipment to increase circuit capacity by about 8,800 internal long distance circuits, connecting 2,200 rural communities to the telephone system.

Whither the Weather? Model Might Explain

By Jeffry Beeler
CW Staff

BETHLEHEM, Pa. — Scientists here are using a computer model of U.S. wind patterns to try to find the cause of the recent unfavorable turn in the world's weather.

Developed by a Lehigh University research team, the model could help explain U.S. weather aberations like last winter's record-breaking low temperatures and the prolonged drought that has parched many of the western states.

The computer simulations also could lead eventually to improved short- and long-term weather forecasts and yield knowledge about warming and cooling trends in the earth's climate.

Scientists disagree about the long-term outlook for the world's weather. Some meteorologists contend that recent extremes in the world's weather signal a gradual cooling in the planet's temperature and the onset of a new ice age.

Other meteorologists argue that the slow build-up of atmospheric carbon dioxide from auto and factory emissions will create a "greenhouse effect" that will raise the earth's temperature enough to melt the polar ice caps and flood low-lying coastal regions.

Data provided by the computer simulations here could help reveal which of these bleak predictions, if either, is right.

The research, supported by a two-year National Science Foundation grant, is being conducted by Doctors Alister Macpherson and Peter Hilton, professor and associate professor, respectively, of mechanical engineering at Lehigh University. Dr. Melvin Shapiro of the National Center for Atmospheric Research in Boulder, Colo., is assisting the project.

Macpherson and Hilton have focused their research on the north-to-south shift and other fluctuations in the polar jet stream, a high-velocity current of air that flows from west to east around the world at a latitude roughly coinciding with Boston, the Great Lakes and Seattle.

For several years, the seven-mile-high current of air had shifted northward and brought relatively mild winters to the eastern half of the country. Last year, however, it moved suddenly and inexplicably south and sent winter temperatures plummeting to record lows.

By studying the jet stream, Macpherson and Hilton hope to learn how the phenomenon affects long-term global weather patterns, how it spawns weather fronts and how local meteorological disturbances like severe storms affect its stability. They also hope their work will reveal the cause of the jet steam and answer other basic meteorological questions.

"If we knew where the jet streams come from and what causes them, we'd be 80% along the way toward a good five- or six-day weather forecast," Macpherson explained.

Output Plotted

To achieve these benefits, Macpherson and his associates devised a computerized world model that makes 12-, 24- and 48-hour weather forecasts based on theoretical meteorological data like wind velocity and barometric pressure readings, which the researchers feed into their 128K Control Data Corp., 6400 CPU.

The results of the computer's predictions are generated on two flatbed plotters — a California Computer Products, Inc. Calcomp 563 and a Calcomp 565 — in the form of a map section overlaid with symbols like lines of constant temperature and pressure.

The researchers' configuration also incorporates four CDC disk drive units — two Model 844/21s and two Model 844/41s.

Without some sort of computer model, conducting a sophisticated study of the relationship between jet stream activity and weather conditions would probably be impossible, Macpherson said. He regards improved weather forecasting as the chief benefit of using a computer model in studies of the polar jet stream.

Meteorologists rate the accuracy of their weather forecasts with a standard dubbed the "skill score." "If, for example, weather forecasters predict half an inch of rain and three-quarters of an inch falls, they give themselves 70 points," the mechanical engineering professor explained. The same standard also applies in forecasting wind speeds and other common weather variables.

When predicting weather by hand, meteorologists average a skill score of about 60%, Macpherson estimated. With the Lehigh University computer model, by contrast, the researchers typically achieve a 70% rating.

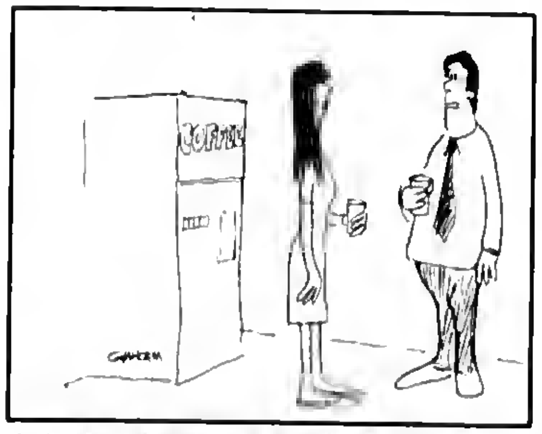
"The computer model we have developed has improved weather forecasting accuracy by about 10%," he added.

North East CMG Sets Meeting Next Week

BOSTON — How to present performance data to management will be one of the topics covered at next week's open meeting of the North East Computer Measurement Group (CMB), according to acting chairman Jeffrey Buzen of BGS Systems, Inc.

The all-day session will take place here next Monday, Sept. 19, at John Hancock Institute, across the street from Hancock Tower.

There will be a $2 registration fee and anyone is welcome. Other details are available from BGS Systems, P.O. Box 128, Lincoln, Mass. or from Buzen at telephone number (617) 890-0000.



'I Just Installed the Perfect System, and Now the Department Head Wants To Change It.'

How to Create a WINNING PROPOSAL

. . . a step-by-step guide to proposal preparation

- U.S. Government and Military proposals
- Commercial and OEM proposals
- R & D proposals
- Civil Project proposals

"The best book on proposals ever written"

How to Create a WINNING PROPOSAL

250 PAGES—FULLY TABULATED

How to create a WINNING PROPOSAL is a proposal methods and procedures workbook. it covers the entire proposal process from start to finish—giving detailed instructions on contents, structure and methods of preparation for both solicited and unsolicited proposals. "WINNING PROPOSAL" is so effective it is used by NASA, GSA, DOD, ERDA, HUD, HEW and other government agencies as an aid in proposal evaluation. It provides step-by-step instructions on:

- **How to organize** the proposal contents—what goes where in the management, technical and cost sections
- **How to develop** an effective "win strategy," mobilize the proposal team and control the input of various team members
- **How to analyze** and respond to RFP's, RFO's and IFB's
- **How to cost-out** engineering, research, manufacturing and production projects
- **How to develop** (and use) task descriptions, manpower estimates and a work breakdown analysis
- **How to write** a winning technical section, a winning management section and a winning cost section
- **How to plan,** schedule and manage the entire proposal effort . . . *successfully!*

Government requirements are covered in an overview of the U.S. procurement network, how it works, and how you can increase your "win probability" in competing for prime and subcontracts. "WINNING PROPOSAL" also contains a list of both government and commercial information sources to assist you in your pre-proposal research efforts.

Copies are available from Mercury Communications, Inc. $65.00 (pre-paid) includes 3-5 day delivery inside the U.S. In Calif. add $3.90 tax. For outside U.S. $76.00 (Int'l Money Order) includes air delivery. For multiple copy discount information, call 408/425-8444.

Programming Course Uses Hand-Held Unit

By Denise Petski
CW Staff

DALLAS – High school students can soon be taught computer programming with a hand-held calculator through a course introduced by Texas Instruments, Inc.

Developed by the University of Denver Mathematics Laboratory, the course is designed for students with no prior knowledge of programming techniques or previous experience with hand-held programmable calculators.

The course format allows a teacher to utilize the materials with individual students, small groups or an entire class. Sections of the course may be used to enhance mathematics or science classes, or the entire package can stand alone as a separate mini-course in programming, according to a company spokesman.

The course will help prepare students in high school and beyond who are interested in careers as computer programmers, since the essential concepts and techniques used in programming calculators are directly related to those used with larger DP systems.

The hand-held calculator is an ideal learning tool for programming because it is immediately available to teachers and students who otherwise would have to wait, after writing programs, for access to a larger computer, according to the company. Also, initial and continuing costs for a computer-based course could be much higher than for one that uses calculators, it added.

The course emphasizes the "natural side" of programming, covering techniques which involve logical thinking and organization of problem solving steps in a straightforward order.

Lesson materials were designed to move students into simple, straight-line programming quickly. Students then proceed to program techniques involving conditional and unconditional transfers, loops and subroutines.

Included with the course is a teacher's guide setting lesson objectives and details, with additional suggestions on the adaptation of programmable calculators to the classroom.

The course will be available this fall through authorized dealers. Texas Instruments, Inc. can be reached at P.O. Box 5012, Dallas, Texas 75222.

National Fire Data Center

WASHINGTON, D.C. – Seven states will begin reporting their fires to the National Fire Data Center at the National Fire Prevention and Control Administration (NFPCA) within the next year.

Awarded assistance grants by the Department of Commerce, the states will use the monies to establish or adapt statewide fire data systems, an NFPCA spokeswoman said.

Delaware, Iowa, Michigan, Minnesota, Rhode Island, South Dakota and West Virginia will divide $112,000 in NFPCA assistance money, using these funds to help develop and operate statewide fire incident reporting systems. The data systems will be developed or adapted to be compatible with those in other states, the spokeswoman stated.

Local fire departments will contribute their fire incident and casualty report information to their states. Statewide summaries of this data will be prepared, and participating local jurisdictions will receive feedback reports.

The center will use the data to produce national estimates and develop a data base for answering information requests from government, industry and the public.

You recognize the problem: People representing you all over the country are in constant need of quick answers to questions from their customers or clients. Life insurance agents, for instance, require direct access to policy information stored in the home office computer.

The Bell System also recognizes the problem. We've gone even further and come up with advanced data communications systems, terminals, printers, modems. Like our new 43 teleprinter, the attractive

DP Helps Find Way of Feeding Bangladesh

COPENHAGEN, Denmark — Researchers used computer technology in planning a major new grain distribution network in Bangladesh to help feed that nation's rapidly growing population of more than 75 million, which is crowded into an area smaller than the state of Iowa.

To do so, Operations Analysis Corp. (OAC), a worldwide operations research consulting organization based here, called on Control Data Corp.'s Cybernet Services to conduct feasibility studies on the physical and economic planning of the new grain facilities project.

OAC's objective was to find the best system for the distribution and storage of 15 million tons of grain and to ensure that the grain comes from the production areas and goes to urban areas.

"We wanted to be certain that the new facilities integrated with existing facilities, provided a complete system with minimal capital, operating and transportation costs," Bjorne H. Sorensen, OAC project manager said.

Transportation Problem

Transportation was one of the main problems because many railroads and roads were destroyed in the civil war which ended in 1971. To help beat this problem a task force of experts went to Bangladesh and gathered information about such factors as transportation, costs of building different types of structures, distribution of production, distribution of consumption and entry of imports.

Seventy locations suitable for building storage facilities were selected. Each location had crossroads, railroad junctions or rivers; sometimes all three were available.

In addition, different kinds of storage facilities could be built: steel or concrete silos, flat storage spots or bag-handling facilities. Some existing facilities also could be rehabilitated.

"If your only decision problem was to build or not build at each of these 70 locations, you would have 2^{70} possibilities according to Sorensen. "That is a huge problem."

Fixed Flow Program

In Copenhagen, the analysts chose a fixed flow program developed by CDC to set up their problem. Output from the program showed how much grain should be shipped from each production or import location to each of the potential storage sites and from there to each demand point.

OAC then drew a map showing what the flow should be from the different parts of the country and then recommended the kind, size and location of storage facilities, based on mathematical calculations processed through the Cybernet center here. Its recommendations then were used to establish the distribution network in Bangladesh.

OAC began using Cybernet Services in 1971. Initially, it bought time and developed its own software programs. Today, the company uses a number of mathematical programming, statistical analysis and structural testing programs available through the Cybernet applications library.

answer queries from 110 offices?

and attractively-priced desk top unit that is compatible (without system conversion) with virtually all in-house and time-sharing systems. And our new Dataphone® 300/1200 data set which, when used at both the CPU location and at each terminal, allows them to operate at 0-300 or 1200 bps with a single group of computer ports by automatically adjusting the speed of incoming signals.

Solving problems in data communications is an all-out commitment of the Bell System. If you haven't talked systems with your local Bell Account Representative lately, you're missing something.

The system is the solution.

EFT Commission Gains FTC's Foer

WASHINGTON, D.C. — Albert A. Foer, assistant to the director of the Federal Trade Commission's (FTC) Bureau of Competition, has been named a commissioner on the National Commission on Electronic Fund Transfers (EFT).

Foer has been working closely with the commission since its inception, according to FTC Chairman Michael Pertschuk. In addition to possessing an antitrust background, he is known as an expert on privacy issues and has published a study entitled "The Personal Information Market: An Examination of the Scope and Impact of the Fair Credit Reporting Act."

Foer will be a member of the EFT Commission's committees on sharing, competitive impact and consumer issues.

The commission is an independent advisory agency which must report to Congress and the President this fall on its findings and recommendations concerning the development of EFT systems.

On-Line Analyses Defuse Tokyo Traffic Jams

By Ivan Berenyi
Special to CW

TOKYO — A large on-line real time computer system is being used here to analyze traffic flow and prevent the kind of traffic jams that have come to give big cities a bad name.

More than 2,900 traffic lights here have been brought under computer control to date — a number that has doubled in the last 12 months; according to Osamu Nakamura, chief of the Tokyo Metropolitan Police Department's Traffic Control Division.

Computer analysis of traffic flow enables early action to defuse potential jams by reordering the sequence and duration of traffic light changes, according to Nakamura.

Data Collection

The traffic flow data is gathered on-line from more than 3,200 ultrasonic vehicle detectors installed at roadsides throughout the city center. More detailed information at peak-flow pressure points like the famous Ginza or Akasaka Mitsuke intersections comes from 19 closed-loop television cameras, phone calls from officers on the beat, radio-equipped patrol cars and rush-hour helicopter surveys.

All the incoming data is analyzed by a Nippon Electric Neac 2200 Model 375 computer, with 524K-byte core capacity. In the traffic control center an illuminated map of the city center shows in color-codes the changing status of the city's traffic — white for "good flow," orange for slow-down and red for full-scale jam. Visual display units give more detailed information, such as the precise flow of traffic at any one intersection.

Control of the traffic lights is handled by six 64K Neac 3200 process control minis, communicating with the central processor through two 32K Neac 3100 front ends.

Continuous Expansion

"The system is being expanded every year in terms of the area covered, the number of computers installed, intersections controlled, vehicle sensors used and TV cameras mounted. Two of the Neac 3200 computers were installed in the last year alone," Nakamura explained.

The system is a merger of two former traffic services — the 10-year old Traffic Information Center, which used to gather data manually from police officers pushing buttons in police boxes to represent traffic flow; and the Computerized Signal System, set up in 1969 when the first Nippon Electric computer was installed.

The Traffic Information Center data was previously processed by two Technomaster control processors made by Matsushita Control Industrial Co. These have now been discarded, and the Matsushita Macc-7 computer complex, earlier dedicated to coordinate traffic lights along certain routes as a slave to the computerized signal system, was phased out.

Fight Continues Over DP Taxes In Oregon, R.I.

The fight against software taxation in various forms continues in Oregon and Rhode Island.

Oregon Governor Robert Straub has signed into law a bill that exempts software from property taxation by defining it as intangible personal property, according to a spokesman in the tax research bureau.

The new law will be effective Oct. 4. The state has no sales tax, he added.

Petitions in R.I.

In Rhode Island, Puritan Life Insurance Co. has filed two petitions in its efforts to eliminate a sales and use tax assessment for the years 1971 to 1977 on software, according to William W. Fitzgerald Jr., assistant counsel.

Puritan is seeking rulemaking procedure that would eliminate an administrative rule that says software should be taxed as tangible personal property, he indicated.

The firm has also filed a request for a hearing on its own assessment, but has asked that the rulemaking procedure be held first, he said.

The petitions were filed with the state tax administrator.

Distributed Confusion

There are almost as many approaches to distributed processing as there
By letting your needs dictate the right solution, Hewlett-Packard can help

You already have a large EDP investment. The last thing you need is a distributed data processing plan that makes your present operation obsolete. Or that will be out of date itself in a few years.

At Hewlett-Packard, we've worked out several ways to simplify the problems of putting your computer power where the work is. Our systems can help you make the most of your system, let you computerize many functions you're now doing manually, and still give you central control through links to your big computer. And they're so versatile that they can adapt to future changes in distributed data processing.

This all-around-performance makes the HP 3000 an ideal departmental computer. You can dedicate it to solving a wide range of problems such as order processing, inventory control, cost accounting and materials requirement planning.

You'll see a dramatic improvement in efficiency at your plant or sales office or distribution center. At the same time, you'll have a better data entry system with the capacity to edit and check data before transmission to the central computer. By reducing inaccurate entries, you can shrink your communications costs.

Our system is also easy to expand, either within a department or into a complete network of computers that share information and programs.

Putting an entire network of computers at your fingertips.

We've developed new software, DS/3000, that turns a series of HP 3000s into the simplest, most functional network available today. You can sit down at a terminal and use the programs, files and data in any interconnected HP 3000. You don't need a special program to do it. Simply identify the computer you want to talk to and you're on-line.

With the same ease, you can shift programs and files from one HP 3000 to another. And you can do local and remote processing at the same time.

Imagine how much faster remote sites can get accurate, up-to-the-minute information this way than they could by depending on the overworked central computer!

How a small computer handles big computer jobs.

The HP 3000 has versatile executive software that manages all the computer's resources. Advanced design gives it the speed and power needed to handle more jobs more quickly than comparably priced computers. (Our U.S. prices start at $110,000.)

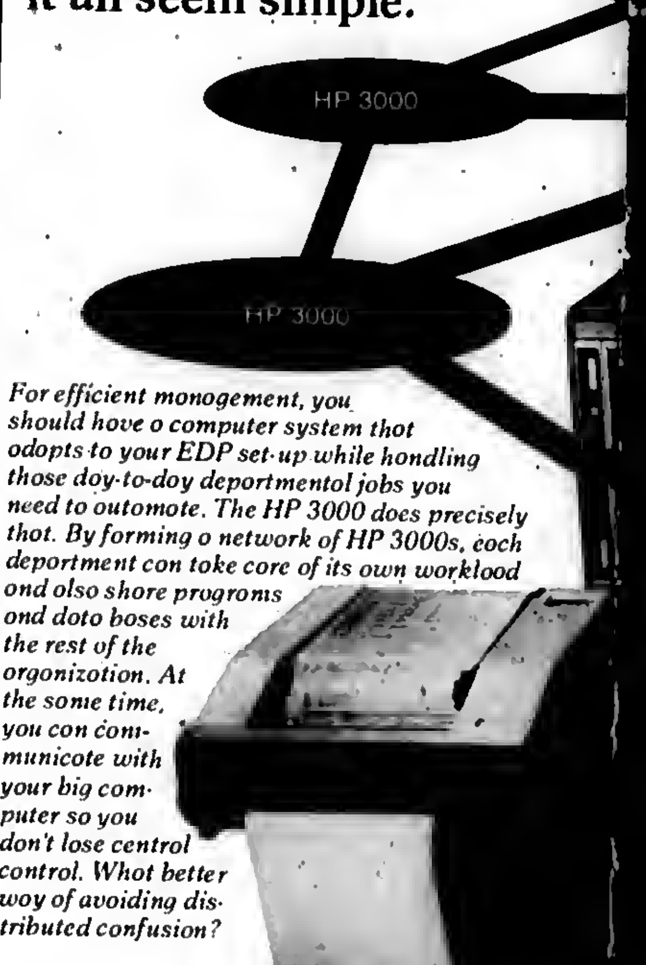
While you're getting information from the computer on one of the terminals, the system can be running batch programs.

You can also use as many as six "big computer" languages, run large programs on our small system and develop software quickly and inexpensively. (A very important consideration when you look at the climbing costs of programming.)

The executive software is so advanced that it will remain the heart of our computers for years to come. So you can keep adding to your system without having to throw your old programs out the window.

And the built-in flexibility of the HP 3000 helps you stay up with all the latest trends, no matter what direction distributed data processing takes in the future.

The HP 3000: The system that makes it all seem simple.



For efficient management, you should have a computer system that adapts to your EDP set-up while handling those day-to-day departmental jobs you need to automate. The HP 3000 does precisely that. By forming a network of HP 3000s, each department can take care of its own workload and also share programs and data bases with the rest of the organization. At the same time, you can communicate with your big computer so you don't lose central control. What better way of avoiding distributed confusion?

But Agencies Call It Premature

Senate Gets Bill for Earth Resources System

By Edith Holmes
CW Staff

WASHINGTON, D.C. — A bill that would establish an earth resources and environmental information system has been introduced here by the Senate Subcommittee on Science, Technology and Space and is under study by the Carter Administration.

As presently designed, the bill — S. 657 — would make data about the earth obtained by satellites available to the private sector, a spokesman for the Senate Committee on Commerce, Science and Transportation said.

During five days of hearings held this summer, the agencies that would be charged with responsibility for such a system — the National Aeronautics and Space Administration (Nasa) and the Department of Interior — argued that an earth resources and environmental information system for the public is premature and surrounded by too many uncertainties, the spokesman stated.

OSTP Hesitant

The Office of Science and Technology Policy (OSTP), headed by Dr. Frank Press, science advisor to the President, also expressed its reluctance to serve as the coordinating mechanism for the information system, he added.

Other witnesses in and out of government who appeared before the subcommittee, however, indicated they would be enthusiastic users if Congress would establish the system, the spokesman said.

Press has organized an interagency working group with Nasa and Interior representatives to consider the feasibility of the system and the public's readiness for it.

Awaiting the interagency group's report, the Senate Subcommittee considers S. 657 a "vehicle for opening the subject up" and would like to draft a bill that would receive Nasa, Interior and OSTP support, the spokesman said.

"Our whole purpose was to get the executive branch to look at the possibilities of this information system in more than a fleeting way," he stated.

He stressed that when all views are heard, Nasa may not be in charge of the operational end of the system — launching and maintaining the satellites — while Interior handles the distribution of the information collected.

While S. 657 focuses particularly on the Landsat earth satellite program, the information system established could well include data collected by any number of application satellites. As an example, the subcommittee spokesman cited Seasat, a satellite that will be launched next year to monitor the oceans, providing valuable fishing and weather information.

Not only has the time come for this data to be publicly available in this country, there is a need for it internationally, he stated. The U.S. might find such an information system a valuable offering to the international community at the conference on science and technology for development which the United Nations plans to hold in 1979.

SCDP Relocates

MEMPHIS, Tenn. — The Society of Certified Data Processors (SCDP), formerly located in Hudson, Mass., is now headquartered here.

Its address is Suite 532, 2670 Union Extended, Memphis, Tenn. 38112.

The new office, managed by SCDP member Thomas Briggs, is expected to provide better service and decrease costs to SCDP members.

are computer companies offering them.
you clear up the confusion.

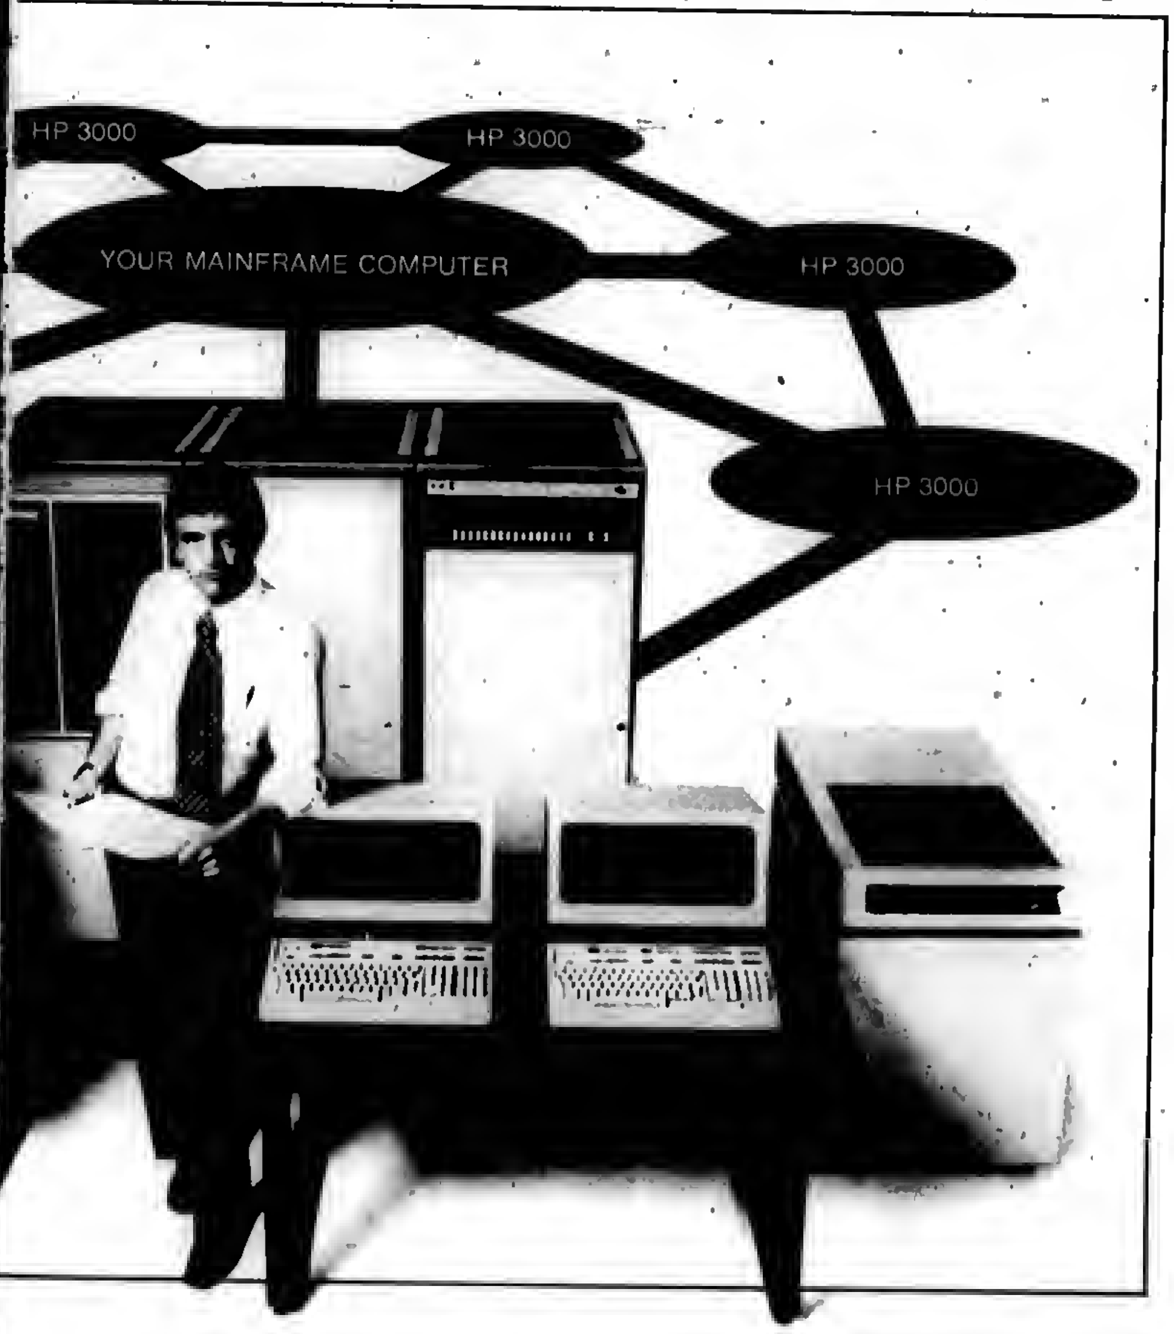
Turning raw numbers into usable information.

Your big computer has data base management to consolidate related information into easily accessible files. This capability is just as important at remote sites.

It allows your key people to call up the facts they need instantly, and get them in an easily understandable form without wading through reams of paper.

The HP 3000 has an extremely effective data base management capability. With its help, the computer will generate forms, titles, page and column headings, data sorted by categories, subtotals, totals and averages. And, through DS/3000 software, you can call up any HP 3000 data file in your network.

Data base management on the HP 3000 has proven so efficient that it was recently named to the Datapro Software Honor Roll, placing it among the 38 top software products in the country.



It takes more than a good product to make it a safe buy.

Support has always been a top priority at Hewlett-Packard. For our computer customers, we have complete service before and after the sale, with on-site training and full documentation. Nearly 1000 Customer and Systems Engineers provide regular maintenance and give you applications and programming assistance. They work out of offices in 65 countries around the world, offering you efficient service at a remote location as well as at your headquarters.

So if you want to take the confusion out of distributed processing, now and in the years ahead, call your nearest Hewlett-Packard office listed in the White Pages. Ask for a Computer Systems representative. Or write for more information to Bill Krause, Hewlett-Packard, 11000 Wolfe Road, Dept. 304, Cupertino CA 95014.

Another Wait for Users

The Bell Data Network (BDN), AT&T's answer to the public packet network, has been expected for some time. But now a document has surfaced giving details of the projected network offering as of November 1976 [CW, Sept. 5].

The BDN document is most interesting for what it does not say. The "Service Offering Statement" made no mention of an X.25 compatibility, although that may still be included when the network is announced.

The exact date BDN service will begin is believed to have been postponed several times within AT&T. Reportedly, the features of BDN will depend heavily on the findings of the Second Computer Inquiry.

The BDN document, using the most liberal interpretations of what constitutes communications processing, includes data entry, inquiry/response, remote job entry and message distribution. If AT&T can convince the Federal Communications Commission (FCC) these are functions associated with communications, then BDN will probably be announced shortly afterward.

But a definition of what constitutes communications processing is a key issue in the reopened Computer Inquiry. Vendors of DP services and suppliers of equipment are expected to protest the Bell concept, which would relegate DP functions and their associated software to the regulated domain of the telephone company.

A decision in the FCC inquiry could take some time. In the meantime, AT&T will be under pressure from other emerging packet networks to make a move toward BDN. Whether this will mean an initial limited version of the BDN service is known at this point only to the top brass at the phone company.

There are some industry experts who watched AT&T's Transaction Network Service (TNS) with great interest. These sources saw in TSN the first steps toward a public packet offering, even though TNS was aimed at a limited financial-type user.

The firm most directly affected by BDN would be Telenet Communications Corp., which depends on AT&T long-line facilities to provide its packet-type service.

Meanwhile, data communications users will have to wait until the regulatory roadblocks are debated and disposed of one by one. Whether BDN will be offered in the form outlined in the Bell document is open to question. AT&T may have to perform some significant fine tuning on the concept if the FCC proceedings are not favorable to its pleadings.

The issue of whether BDN will become a regulated phone company service strikes at the very heart of the computer/communications boundary dispute. There is little doubt that AT&T has the resources and ability to offer a BDN service. However, whether it will be allowed to do so is up to regulators and, perhaps after that, the courts.

Trying to define the limits between the nonregulated DP industry and the regulated communications industry is certainly an important issue. But customers who could use the BDN service to optimize their business telecommunications operations get little comfort from waiting for the regulatory machinery to grind slowly on to another "final" solution.

Data Past

Five Years Ago
Sept. 13, 1972

WHITE PLAINS, N.Y. — IBM raised the rates for systems engineering (SE) services, some field engineering (FE) services and the minimum monthly maintenance charges on selected pieces of equipment. A 5% to 10% price rise for SEs affected the greatest number of users, while the higher rises for FE services affected only customers with purchased machines.

— — —

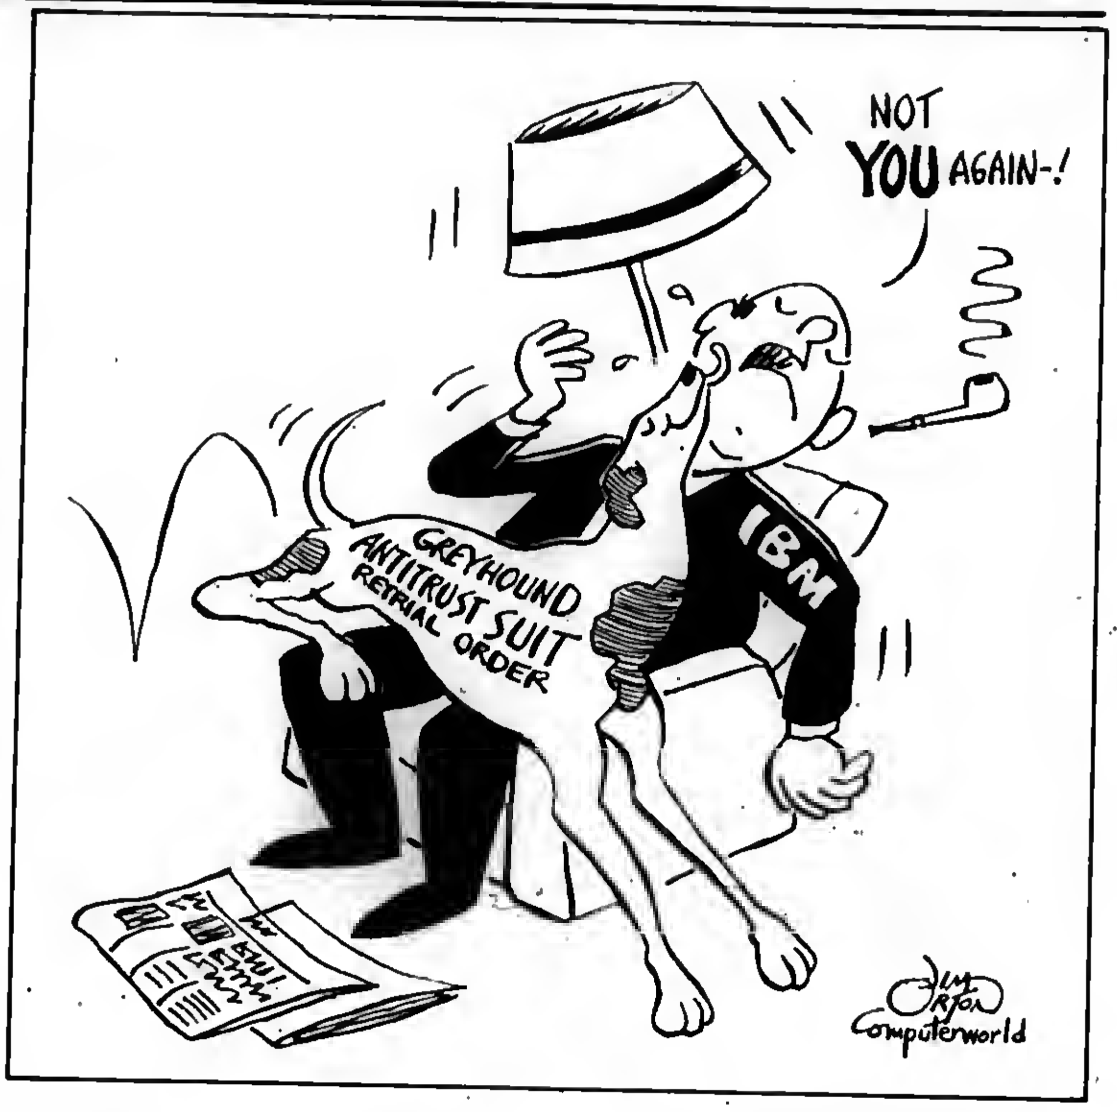
SALT LAKE CITY, Utah — Univac introduced a programmable front-end processor that could support non-IBM terminals as well as replace IBM communications controllers. The 3760 communications controller, said to be plug-compatible with IBM 360/370 mainframes, marked Univac's initial offering of an IBM replacement.

Eight Years Ago
Sept. 17, 1969

LEONIA, N.J. — Compuscan, Inc. announced an optical character reader capable of learning new characters or entire alphabets online. The Model 370 was priced at $900,000.

— — —

CUPERTINO, Calif. — Information Storage Systems, Inc. introduced the ISS 714, a disk drive "fully compatible with IBM's 2314." The company claimed the 714 had an average access time of 32 msec compared with 60 msec for the 2314-A1 and 75 msec for the older 2314 system. Startup time of the ISS 714 was said to be one-third that of the 2314.



Letters to The Editor

Spectra Not IBM-Compatible

I was astounded by Jerry Nesmith's claim in the Aug. 29 issue ["Credit Should Go to RCA"] that in 1970 RCA had a CPU that would run IBM operating systems. The Spectra 70 had a different interrupt system, I/O architecture and storage protection system from the IBM 360, and the later 3, 4, 6 and 7 were just repackaged Spectra 70s.

If RCA ever had a compatible CPU, it was never part of the commercial product line.

Seymour J. Metz
Rockville, Md.

Iverson Inventor of APL

The Aug. 22 issue provided good coverage of the recent International Federation for Information Processing (Ifip) congress held in Toronto. I would, however, appreciate it if you would publish a correction to the report of the planning session of which I was chairman.

The article ["Inconsistent Data Seen Major Snag in Planning"] stated I was one of the inventors of APL. This is patently incorrect. APL had only one inventor, namely Kenneth Iverson.

Ian P. Sharp
President
I.P. Sharp Associates Ltd.
Toronto, Canada

He Couldn't Be More Wrong

After reading Joe Rigo's response to the Certificate in Data Processing (CDP) exam challenge issued by Ken Lord [CW, Aug. 29], I couldn't be happier that Rigo is not one of my employees. At his age, he should be striving to learn new concepts and methods instead of sitting back on his laurels and blaming his lack of knowledge on old age.

Without knowing anything about the exam's content, Rigo stated that tests like the CDP exam "are for kids just out of school." He couldn't have been more wrong.

The questions on the CDP exam should not be compared to "sixth grade lists of major exports of South American countries," any more than the questions of the bar exam should be compared to Dell Crossword puzzles. I suggest that Rigo learn what the test questions are like first-hand before he stereotypes the exam.

I cannot imagine anyone saying he knows just enough for today's job and will learn what is necessary for tomorrow's. Such people are more aptly called vegetables. They are not the type of people who have helped in the advancement of data processing. If it were up to people like Rigo, I'm sure most of us would still be wiring 407 boards.

Yes, poor Rigo is quite correct when he says he would flunk the exam. And that is one more indication of the exam's merit.

David T. Guidos
Torrance, Calif.

Three Cheers for Rigo

Hooray for Joe Rigo!

As a "computer professional" who started on the Univac I in 1957 and quit the Association for Computing Machinery in protest many years ago when a college degree was added as a requirement for new members, I'd like to play on Joe Rigo's team.

Ken Lord's letter was amusing and rated a chuckle. Joe Rigo's reply deserves a cheer.

William Kohlbrenner
Guilford, Conn.

A Case of 'Disconnect'

Reader Ponders Conflicting Life, Job Goals

By Jack Stone
Special to CW

Painter Hoffman's letter about DPers' relationships with their families [CW, Aug. 8] has had a profound effect on those with whom I've talked. But, no one has expressed his feelings so sensitively as the writer of the following letter:

Dear Jack:

Painter Hoffman's letter brought tears to my eyes. Having just lost, through divorce, a wife and family of 20 years, I think I'm qualified to comment on the DPer's side of the disconnect.

I'll grant Painter's conclusion that those of my ilk tend to think remotely and to subject feeling to insatiable scrutiny. I'll even grant her frustration when her spouse ran out of gas on Christmas night. Just now, Jack, am I forcing myself to again observe the sunrise over the pastel houses, the color of flowers strewn along the winding path and the sounds of birds and insects carried on the breezes.

But most importantly, after 20 years of marriage, during 15 of which I have been involved in this industry, I'm finally beginning to again see people for what they are, get to really know them, and, in the process, get to like myself again. After two decades of marriage and a decade and a half in DP, I've finally asked myself, "Is that all there is?"

In so doing, logical thinker that I am, I have to ask how it happened. What turned a youth so full of promise into a person whose very ideas are subject to open attack? True, many can be blamed, but I do not overlook myself for that blame, for where I should have been strong, I conceded, and where I should have been gentle, the strength — too much of it — came out.

Like many a young American male, I was programmed for "success" by my parents who had not achieved a degree of success that satisfied them. It was important, as far back as I can remember, to become educated, to have a nice house, to be a family man and — and I can still hear my mother's words — to "make something" of myself. In retrospect, there have been times I sincerely wished to have followed my initial impulses to drive a truck.

But the programming was absolute, and one so programmed is attuned to grab each opportunity and to exploit it to the fullest. Such was the case with me. My chance to get into DP came along in a flash, and I took it, totally — I cannot now say blissfully — unaware that for the next nearly two decades someone would be constantly waiting to extract the pound of flesh.

True, I was interested. True, there was magic in knowing it was my program which made the lights blink and the tapes turn. What started as an opportunity became a fascination, an all-consuming passion to conquer this intellectual Mount Everest. On the other side of this seemingly insurmountable cliff stood the promise of Shangri-la.

The Human Connection

Little did I realize that my intellectual efforts were merely the satisfaction of the needs of others to exploit my potential to move that 16 tons of coal every day. Conquest of each successive peak was followed by reward, a reward which carefully and neatly disguised that I was selling my soul, byte by byte, to the company store. And for each conquest I made, there were two more waiting to be tackled. And always there was somebody more concerned with how you climbed the mountain, rather than the fact that you did it at all.

As the rewards and "success" came, the box systematically closed in, forming a harsh trap from which there was no escape. On the one hand there were the needs for shelter and support of a growing family, which, when coupled with an ever-increasing set of economic demands, never quite permitted one to get solidly established or to get ahead.

On the other hand, there were the constant granting and withholding of reward, privilege, opportunity and exploration afforded by employment. But they could never be separate. Without the latter, the former was not possible by itself, and it was certain that the demands of the former would increase, not decrease. What was one to do?

Well, what I did was to become mobile, first in terms of employment, as only change in employment could satisfy the rate of growth required to satisfy the economic needs. All the traditional values of stability, loyalty and adequate compensation for earnest endeavor could simply not be satiated by remaining in one place. On the one hand, it had to come faster than it was coming, while on the other, I found one artificial roadblock after another be it a degree, mode of dress or whatever. Granted, some I created for myself. My only regret is that I didn't retreat when I began to recognize it. Again, however, I could not, for I had been programmed for responsibility.

My ex-wife, though not expressing it in a manner that was clear to me, recognized it in 1968 when she said it was here where the roots would

(Continued on Page 24)

A Workable Approach

Don't Risk Getting Sacked for Being Ethical

If an employer asks his computer people to do something illegal and they refuse, they should not be fired. Nor should they be fired if they refuse to do something that falls in the gray area between right and wrong or if they refuse to do something the employer said he would not ask them to do when he hired them.

But exactly how can a DPer be sure he won't be sacked if he refuses? That's the problem that has sunk so many DP codes of ethics — and it's the key to DP responsibility.

The Taylor Report
By Alan Taylor CDP

But there are other items to be considered before a system of DP responsibility can be set up. The first is the recognition by employers and employees alike that there are dangers in DP and that they are dynamic.

Some old dangers will dissolve as we adopt new methods or as it becomes economical to test for gray areas. Other dangers will be born, or identified from time to time, and sometimes end up in legislation.

More often, however, they will be restricted to specific professional and industry codes and methods of handling DP. And a responsible DP system has to recognize both that such dangers may exist without having been pinpointed as illegal and that responsible DP should face up to this as well as illegal DP activity.

Future Scenario

The way this approach might work could be as follows: A programmer goes into a job interview, and everything is OK. When the final details are worked out, he is told to go over to Personnel to arrange for his physical and get his "DP Policy Statement."

The personnel officer gives him a form (see box) rather like one of those "disclosure" statements about interest of loans or deliberate overbooking on airlines that have become so popular of late.

The prospective employee is asked to sign the policy statement after reading it, and it becomes as much a part of his agreement with the firm as anything else. It gives both him and the firm restricted rights to have DP checked for dangers and to have the work performed without ethical worries.

If he later runs into problems, this policy statement spells out what his procedure is, how much — if at all — he can complain and safeguards his job. Yet it permits ethical issues to be raised.

Of course, there are some visible effects that would go down to the computer room and the programmer's desk. Whatever the company policy is, the DP designer will have to review the design to check that it conforms with the policy and to include in the documentation details of how such a check was done so the people who later run the system can tell whether a situation really was checked out or simply overlooked. And management instructions regarding the conditions in which some gray area parts can be run will also have to be part of the design documentation.

Similarly, the operational area will have to know where these

Attatulish, Inc. DP Policy

The Attatulish DP policy represents the corporation's understanding that the use of computers sometimes has unwelcome side effects and recognizes the corporation's intention to minimize or eliminate those side effects whenever found.

It has therefore adopted the provisions of the [insert name of trade association] guidelines, a copy of which is attached, and expects all of its employees to be guided by them whenever any question of computer operations is raised or when any invasion of privacy by computer is suspected.

In addition, your participation is invited at the annual seminar on computer responsibility in Attatulish held in January.

Issues not otherwise resolved quickly that could involve any unprofessional use of computers should be brought to the attention of the director of [insert appropriate title] at any time.

This policy statement, incorporated as part of an employment contract, could go far in establishing a workable and effective set of professional ethics.

Reader Bemoans Family, Work Conflicts

(Continued from Page 23)

be put down and they wouldn't budge. But that didn't stop me. The pressures were still the same. If you had a project, you had employment. If you didn't, that was it. And all the time there were increasing needs to be met. It wasn't the frills which were required — it was the necessities.

Then, there came a point where it became perfectly obvious that no employment in and of itself would ever provide them. In the need to do even more, I went into business for myself. Yes, I dressed it all up in "objectives," ambition, self-reliance and independence. But the simple truth was that I was caught in a vice from which there was no escape — at least no honorable escape.

My creativity was thwarted and the pressures allowed no time to relax. The only difference was that tho hills I now climbed were hills of my own making and the coal I moved was in reality my own coal, except that it was continually being consumed faster than I could mine it. The demands of working for oneself now intensified the work and travel schedule and the home situation worsened — to the point that we all began to ask, "Is that all there is?"

Creativity has a way of getting out. Thwarted creativity has a way of coming out in a very negative manner. That happened to me.

And now the bubble has burst, and I'm left — alone — to pick up the pieces and to try to put them back together again in some semblance of reason. I'm deprogramming myself now, but the burden of knowing that it wasn't in time to be of benefit to my wife and kids is heavy indeed, as they must now make the same mistakes I did. The pressure is still there, but it is more remote, and my sense of responsibility demands that for the rest of their young lives I must continue this way, if only to ensure their survival until they can find a way to stand on their own feet and make their own mistakes.

Letters to Stone should be oddressed to him at Suite 222, 2233 Wisconsin Ave. N.W., Woshington, D.C. 20007.

By that time, my service to this industry will itself have reached two decades, and at that age I'll be just another throwaway to an industry which has concentrated on youth, and I'll emerge a person much worse for the experience. But hopefully, I will emerge a person. I haven't been a person for a very long time.

Jack, if you decide to use this letter or any part of it, I urge you to implore your readers to let their spouses read it with but a simple plea: Stop! There has to be more than this. Find a way, within or without this industry, to prop open the trap before it springs shut, for if you ever do escape, you do so at your own peril. It would be far better to ensure that you never even get into the trap.

Policy Allows Ethical DPers

(Continued from Page 23)

items are and understand them as well as it understands the other operating instructions. But, by and large, the impact on the installation will be minimal. It will just tell where the DPers stand with the employer, and prevent them from getting sacked on the one hand and keep the computers from being used unethically.

Only one last question remains — and that is as to why DPers really need ethics. The answer seems to lie in the siamese twin relationship between the system and programming areas, which decide everything and do nothing; and the operators, who do everything and decide nothing.

Neither group really wants to be involved in something unethical, but until the two sides are put together after the decisions are made, the problem can be easily overlooked.

Only by having some procedure such as outlined here can everyone involved in computers know they can be ethical without risking being sacked.

'We Couldn't Afford One, so the Art Department Came Up with This!'

Win

Fran Tarkenton's Super Bowl Tickets

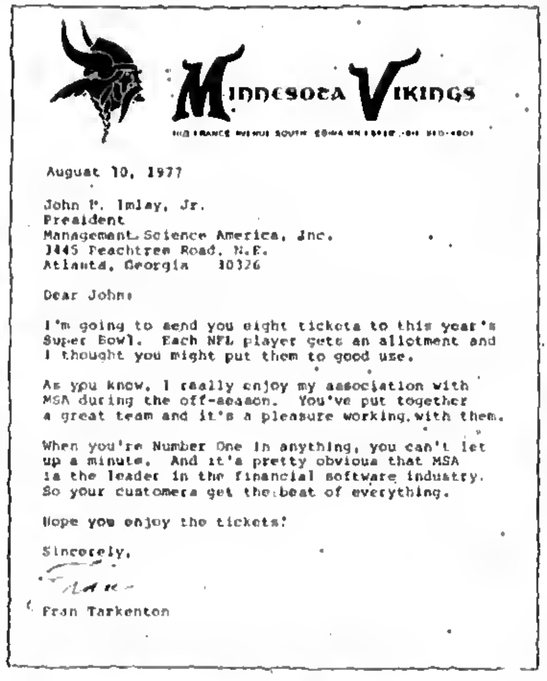
Enter MSA's "Super Pool" and win a free trip to the Super Bowl. Free airline fare, free accommodations at one of New Orleans' luxurious hotels, and free tickets to the biggest game of the year, courtesy of Fran Tarkenton and MSA.

New Orleans

All you do is peer into the future and pick the winning team of each upcoming NFL Monday Nite Football game (plus one extra game to make things even), plus a tie breaker for the season. All are ABC televised games.

Circle the winners, do not pick ties, clip the entry blank and send to MSA Super Pool, 3445 Peachtree Rd., N.E., Atlanta, Georgia 30326.

"That's all there is to it."



MINNESOTA VIKINGS

August 10, 1977

John P. Imlay, Jr.
President
Management Science America, Inc.
3445 Peachtree Road, N.E.
Atlanta, Georgia 30326

Dear John:

I'm going to send you eight tickets to this year's Super Bowl. Each NFL player gets an allotment and I thought you might put them to good use.

As you know, I really enjoy my association with MSA during the off-season. You've put together a great team and it's a pleasure working with them.

When you're Number One in anything, you can't let up a minute. And it's pretty obvious that MSA is the leader in the financial software industry. So your customers get the best of everything.

Hope you enjoy the tickets!

Sincerely,

Fran

Fran Tarkenton

Circle the Winning Team for Each Game.

Oct. 3	Oakland	at Kansas City
Oct. 10	Los Angeles	at Chicago
Oct. 17	Cincinnati	at Pittsburgh
Oct. 24	Minnesota	at Los Angeles
Oct. 31	N.Y. Giants	at St. Louis
Nov. 7	Washington	at Baltimore
Nov. 14	St. Louis	at Dallas
Nov. 21	Green Bay	at Washington
Nov. 28	Buffalo	at Oakland
Dec. 5	Baltimore	at Miami
Dec. 12	Dallas	at San Francisco
Dec. 17	Minnesota	at Detroit

Tie Breaker:

The team scoring the most points in any one of these games will be ________ (Team).

The game in which the most points will be scored will be ________ (Date of Game).

The number of points scored will be ____ (Number).

Send this entry blank to:
MSA Super Pool
3445 Peachtree Road, N.E.
Atlanta, Georgia 30326

Please Print

Name ________

Title ________

Company ________

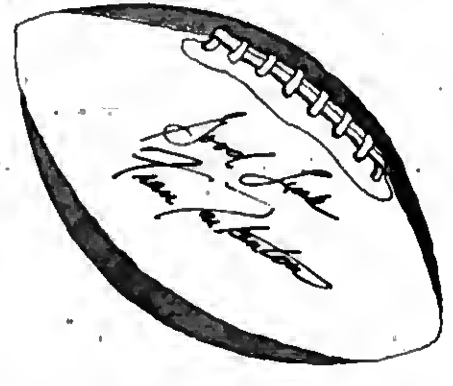
City ____ State ____ Zip ____

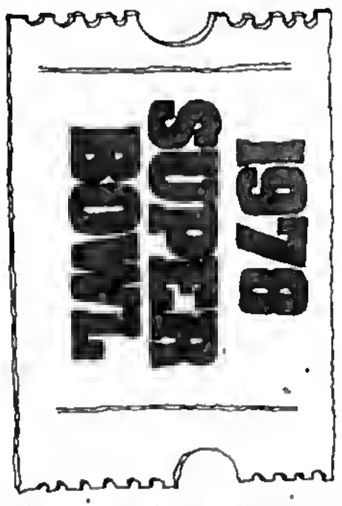
Telephone ________

Void where prohibited by law.

There will be one winner of a Super Bowl Trip for four, two winners of a trip for two, and twenty third place winners who will each receive a leather exhibition football, autographed by Fran Tarkenton.



Entries must be postmarked no later than Sept. 30. Facsimiles of the entry blank are acceptable, however, only one entry per person. An independent judging firm will announce the winners in late December.

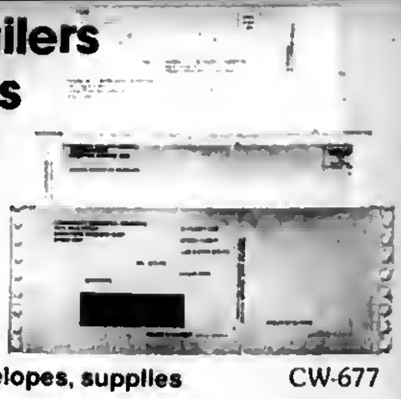


So get busy, sports fans. Make your selections and send them in. Someone will win these glorious, fun-filled Super Bowl trips to New Orleans next January, and it could be you!

MSA
THE FINANCIAL SOFTWARE COMPANY

MSA markets financial accounting software packages including: General Ledger, Payroll, Personnel, Accounts Payable, Accounts Receivable, Supplies Inventory, and Fixed Assets

Free samples of continuous mailers in form/envelope combinations that reduce preparation costs and help stop errors.



Don't waste time and money collating, inserting, sealing, and metering a mailing, running the constant risk of human error, when our *Envo-Mailer*® continuous self-mailers can reduce these preparation costs and help stop errors.

Use them for notifying, billing, persuading, polling, or contacting customers, prospects, members, subscribers, voters, patients, students, alumni, or anyone else.

Specify as many message copies as you need, outgoing and return envelope, even inserts such as checks, ID cards, labels, coupons.

Mail postage-free card for free samples.

'Ultimate' Method an Illusion

Users Facing Better Structured Designs

By Kenneth T. Orr
Special to CW

In his recent article [CW, June 6], Gopal Kapur certainly hit upon a significant topic — the confusion over structured technology. I find many people share Kapur's confusion. Since it first became a buzzword a few years ago, the use of the word "structured" in conjunction with programming has taken on a variety of meanings, many of them quite different from one context to another.

A few years ago, there was a basic agreement about what structured programming was. It meant, more or less: "GOTO"-less programming, hierarchical design and top-down development.

Indeed, there was a great deal of agreement and very little practical experience. At that time, very few people had used any or all of these tools to design reasonably sized programs — much less to design systems.

In the last four or five years, we have learned nearly as much about systematic systems development as we have in the last 10 or 12. Surprisingly, from the tone of Kapur's article, you might infer there is not much of substance behind all this literature.

But this is not the case. Indeed, the very fact that there is so much being written today about structured programming and structured systems design indicates something very important is going on.

While I think Kapur's conference is probably a good idea, I seriously doubt that such a conference is likely to produce the agreement on the subject he would like to see. Indeed, I have participated in a number of such meetings, including a Guide meeting in Chicago in November 1976 and a structured systems conference in Paris recently. And in all of the various structured conferences I have attended, I find participants who are enthusiastic about the effects of structuring on systems and programming, while at the same time having their own ideas as to the exact meaning of "structuring."

No, Kapur is apt to continue to feel frustrated. Indeed, since he teaches structured programming, he has his work cut out just keeping up with structured programming technology, not to mention keeping up with structured systems design and structured data base design.

I noticed that Kapur didn't mention Jackson, Yourdon, SADT, or Langston-Kitch structured methodologies. That just shows you how quickly things develop in a new area.

Mixed Group Best

From experience, I would suggest that the best way to learn about structured technology is not by gathering a group of skeptical managers together to discuss whether structured programming is what they are already doing. In most cases, we have found it is far more productive to get together a mixed group of people that includes people who have been using the technology for a copule of years, along with some others who are interested in finding out what is currently going on.

My firm has hosted two users' conferences on structured systems design in the last two years, and I feel the experiences discussed at those conferences would convince even the most skeptical manager.

The structure experience is now worldwide. I recently visited an organization near Paris (Societe Placoplatre) which has been involved in structured programming with Warnier and his group since 1969 and is now into structured data base and structured systems operations as well.

It is my guess that, unfortunately for Kapur, there will be more — rather than fewer — structured methods coming out in the next few years. My guess is that it will only be after some extensive shakedown period that these methods will begin to converge into a common technology.

But waiting for the ultimate is folly — it simply won't happen. In fact, organizations that choose any of the structured methods are apt to be better off than they are right now, simply because of the advantages resulting from the discipline required to structure a system. And those who move directly into applying structuring at the systems level will be in an increasingly good position.

In the last few years, we have seen a number of different camps emerge, all flying the "structured" flag. As a result, many managers

(Continued on Page 30)

Removing the rose-colored glasses.

A realistic look at *Data Base Management Systems* in the October 31st *Computerworld*.

In the ten years since Data Base Management Systems were introduced they've grown to a multimillion dollar subindustry in their own right. As late as 1973, less than 1,000 DBMS were installed; but International Data Corp. estimates that over 5,000 are in use today, and this number will increase to 8,200 in the next two years. This phenomenal growth has been fueled by the hoped-for benefits of DBMS, which include increased programmer efficiency, the elimination of redundant information in the data file, and greater ease in coping with system upgrades and reprogramming.

But a data base management system should be evaluated carefully before you commit to purchase. They have developed such a reputation as problem solvers that people tend to expect more from them than they can achieve, while overlooking or minimizing the effort required.

We'll have several experts on hand to help you arrive at a realistic understanding of DBMS in our October 31st special report edited by Don Leavitt. Here is a sampling of the kinds of articles you'll see:

- Combatting the "Holy Grail" syndrome — Being realistic about the benefits that are possible in relation to the effort required; how to assess whether DBMS will enable you to reach your goals.
- How well are installed systems living up to expectations? A review of typical problems that need to be overcome.
- The role of the Data Base Administrator in DBMS — including considerations like the physical arrangement of the data base.
- How dictionary packages, report writers, etc. interface with DBMS software.
- A review of selection criteria and the implementation process.
- How DBMS ties in with distributed data processing — matching intelligent front ends with intelligent back ends, for example.

As this short preview shows, our special report on Data Base Management Systems in the October 31st issue will interest people who are considering DBMS, as well as people who already have one installed. And if you market Data Base Management software, remember that your ad will reach more of your primary audience here. Ad closing date is October 14. Your *Computerworld* salesman has all the details. Or call Terry Williams at (617) 965-5800 to reserve space for your ad.

The Search Is On...

J.R. Pompa
Vice President & General Manager, SMISD

The newly chartered **Small/Medium Information Systems Division (SMISD)** is headquartered in Billerica, Mass., with facilities in Brighton and Lawrence, Mass. We have responsibility for two product operations. The Minicomputer System and Terminals Operation (M&TO) is responsible for the planning, design, development, and manufacture of Honeywell's family of compatible minicomputer systems — the Level 6 — and a family of keyboard/display terminals that satisfy a broad range of functional requirements. Our General Products Operation (GPO) is the focus for our medium scale systems, including the Level 62, 64 and peripherals.

The creative, talented and dedicated team of professionals who developed our product offerings are now actively building on that success with the next generation projects. To meet the goal we're looking for additional top quality people in all disciplines of computer design/development and production to join them.

Our strong commitment to grow in this market assures you a challenging technical environment and significant growth opportunity. It gives you a chance to work with state-of-the-art products that have market acceptance, a team of excellent people and a committed, focused management team.

In short, future-oriented computer professionals who want the unusual opportunity to utilize their abilities in a true growth environment, will find it at SMISD.

S.G. Jerritts
Vice President & General Manager, USISG

At Honeywell's **United States Information Systems Group (USISG)**, we are enthusiastic about our future as a full-line supplier of computer systems and services.

Headquartered in Waltham, Massachusetts, we have responsibility for Honeywell Information Systems' total business in the United States — the largest segment of Honeywell's expanding worldwide computer business. The United States Information Systems Group represents a comprehensive business focus involving all of our technical, manufacturing, marketing, management and administrative resources. In addition to our Marketing and Services Division and two Systems Divisions, which are described below, our operations include Finance and Administration, Employee Relations, Internal Data Systems, Market Research, Competitive Analysis, Business Planning and many others. In the United States Information Systems Group we foster an entrepreneurial spirit and dynamic leadership that integrates all of these activities into a concerted, competitive effort.

Our commitment to meeting the world's ever increasing data processing requirements has led us to an extensive talent search for professionals who can help us shape our future impact on the computer industry. In our search we remain committed to the principle of equal employment opportunity without regard to race, sex, religion, national origin, age or physical handicap.

Whatever your area of expertise — whether it's hardware or software engineering, sales, manufacturing, finance or administration — we are prepared to offer you one of the most exciting opportunities of your career.

The contributions of the many talented employees who make up United States Information Systems Group have given us a successful, achievement-filled 22-year history. Now we are ready to build upon those successes and we would like your ideas and your achievements to be part of that growth experience.

I personally encourage you to explore the broad scope of opportunity within United States Information Systems Group — in many product areas, and in many locations throughout the United States. More detailed information on the opportunities is available elsewhere in this ad.

R.R. Douglas
Vice President & General Manager, MSISD

The Marketing and Services Information Systems Division (MSISD) has specific responsibility for the sales and service of Honeywell's full line of computers in the United States. Our significant and aggressive expansion program covers the spectrum of mini, small, medium and large computer systems. To implement and achieve the goals set, we will provide as many as 400 additional computer professionals a unique opportunity to further their careers in sales, systems support and service engineering.

Organizationally, MSISD is structured in three major directions — commercial marketing, federal government marketing and field service. Our Headquarters are in Waltham, Massachusetts and we have offices in major U.S. cities with growth opportunities in all locations.

Dynamic professionals will find rewarding and satisfying opportunities within our progressive and dedicated environment.

Take the time to look at us now and you will discover what we know — Honeywell is moving very fast and very successfully.

N.N. Feldman
Vice President & General Manager, LISD

The Large Information Systems Division (LISD) is headquartered in Phoenix, Arizona. We have responsibility for Honeywell's large computer systems business, including our highly successful Series 6600 and its successors, the Level 66 and 68 (Multics) large systems.

We take pride in our employees' professional competence, dedication and "make it happen" attitude. We set tough goals for ourselves, and we're constantly searching for better ways to do our jobs. We offer exceptional challenge — and opportunity — to the creative and dedicated professional.

We're currently seeking a number of software and hardware professionals to augment our skilled teams in creating the next generation of Honeywell's advanced state-of-the-art large systems.

If your expertise is in the software or hardware area we are interested in you for openings in: advanced operating systems, database and file management, distributed processing and networking, languages and compilers, applications development, transaction processing, test and diagnostics, technical writing, systems test, micropackage engineering, system performance analysis, logic-digital design, LSI bipolar circuit chips design and development, and also the fields of quality control and process control engineering.

Yes, "The Search Is On" at Honeywell Information Systems to find outstanding computer professionals in every facet of computer technology, marketing, manufacturing and support functions. Honeywell's extensive commitments to its ever-expanding role as a major manufacturer of a full line of computer systems offers outstanding professional and personal growth challenges to qualified individuals.

Whatever your expertise, the probability is that your career goals may be consistent with Honeywell's current and long-range plans. Why not forward your resume or fill out the coupon and direct it to the appropriate following individuals.

'Software,' 'Program' Not the Same

'Program Writing' Fits Copyright Class Only

By Martin A. Goetz
Special to CW

A feel compelled to respond to the July 11 editorial about the National Commission on New Technological Uses of Copyrighted Works (Contu) and John Hersey's dissenting opinion.

As a long-time advocate of "software protection," I believe that some of the existing controversy is a result of the imprecise use of the terms "software" and "programs." While those terms have often been usad synonymously, I do not think they are interchangeable. A program can be in hardware (hard-wired) or in firmware (read-only or programmable read-only memory) and may not he at all soft.

Applied Data Research, Inc. (ADR), like IBM and many other companies, develops program products and has used the copyright system to protect its program "writings" for more than 10 years. The Copyright Office has been ragistering programs since the early 1960s.

Interestingly enough, Contu was not originally established to detarmine if programs were copyrightable, but to determine the status of conventional works of authorship when these writings are created, stored and processed by a computer. Contu's Oct. 8, 1976 preliminary report states on page 14:

"One of the first significant questions facing the commission was whether the protection, possibly through copyright of proprietary rights in computer software, should be within the scope of its mandate."

I learned earlier this year that Contu was leaning toward recommending the copyrighting of programs — not because copyrighting is the most reasonable, logical protection method, but because it was preferred over patenting.

I have been quite concerned with Contu's reasoning because the copyrighting of programs does not conflict with the "patentability of software" and therefore should not be a subject of contention.

ADR has spoken before the commission and is actively following the Contu hearings via the published transcripts. We support the commission's majority report and do not agree with John Hersey that a new registration system is desirable because tha existing copyright laws are applicable and adequate.

We do urge the DP community to note Hersey's description of a program, which really hits the nail on the head when considering the "software patentability" question. He says that programs, when axecuted by a computer, are a mechanical (or electronic) device.

ADR has argued that point for many years. The patentability question focuses on whether programs, when put in a computer, are devicas and part of a machine.

In fact, in the previous Supreme Court reviews regarding software patentability, the central question was: "Is a mochine process that is patentable if implemented in hardware (a circuit) equally patentable if implemented in software (a program)?"

I believe this question will again be the issue before the Supreme Court. The patentability of the "machine process implemented in software" is open to widely differing opinions and John Hersey's viewpoint may help influence the Supreme Court to rule that software can contain patentable subject matter and is part of a machine. But, in my opinion, a "program writing" is clearly only copyrightable.

Goetz, senior vice-president ot Applied Doto Reseorch, Inc. in Princeton, N.J., is choirmon of the Association of Dato Processing Service Organizotions' Softwore Protection Committee.

Two heads
really are
better than one.

Structured Design Better

(Continued from Poge 27)

see structured anything as just another set of programming tricks. A small number, though, have seen "structuring" for what it is — a technological revolution. These have heen the people who have taken over the structured theory and have made it work on real problems.

Constantine, Myers and Yourdon have done an excellent job of studying and documenting the characteristics of good and bad programs. But it is even more important to be able to have a methodology that tells you how to develop a good program from the outset so that you know it is correct when you are done.

That is what the Warnier, Jackson and Langston-Kitch approaches do. Jackson's methodology does it fairly well at the program level, and the Warnier and Langston-Kitch approaches do it at all levels: systems analysis, systems design, data base design and program design.

Software's Turn

For two or three decades now, tho hardware folks have been learning to deal with management in the midst of constant technological change. Changes in software have heen somewhat less dramatic, but also less productive. Now that breakthroughs have been made in the logical design of programs, data bases and systems, software management is going to be dealing with the same management problems the hardware management people have had to face on an ongoing basis.

The systems we build in five or 10 years will bear little relationship in terms of accuracy, cost, time or reliability to the ones we are building today. We are already well into our third generation of structured systems tools and techniques, and the effects are beginning to snowball.

The principal problem for today's data processing management is not just one of catching up, but one of planning to keep up as we learn more and more about doing things more productively. What was being taught in 1972 as the state-of-tha-art is already out of date.

We must be prepared to deal with the future, not the past.

Kenneth T. Orr is vice-president, Advonced Systems ot Longston, Kitch & Associotes, Inc. in Topeko, Kon.

Are Promising Programmers Slipping By?

Reader Commentary

By Jack M. Wolfe
Special to CW

In their selection procedures for programmers or programming trainees, some personnel directors administer a programming aptitude test that is, in effect, a speed test. Such a test is likely to be biased in favor of the college graduate, who is generally test-wise; he knows how to take a multiple-choice type of test that usually cannot be completed within the time limit allowed.

A company using such a test in the selection screening is likely to lose the careful, deliberate worker who rereads specifications for precision of interpretation and desk-checks carefully for accuracy in execution. Such a worker will seldom complete a test in which speed is a significant factor.

But such a worker may possess just the right attributes and good work habits for successful work in programming. Such a worker, moreover, will prove to be the one who is actually faster on the job because he will have less debugging and testing to do in bringing his jobs to successful completion.

A study of the relation between speed and score was made using the "Aptitude Assessment Battery: Programming," a test I developed which is generous in its allowance of time. Although the average time required for the completion of the test is about three hours, the time limit has been set at five and a half hours, which has been found to accommodate 99% of the persons who have taken the test.

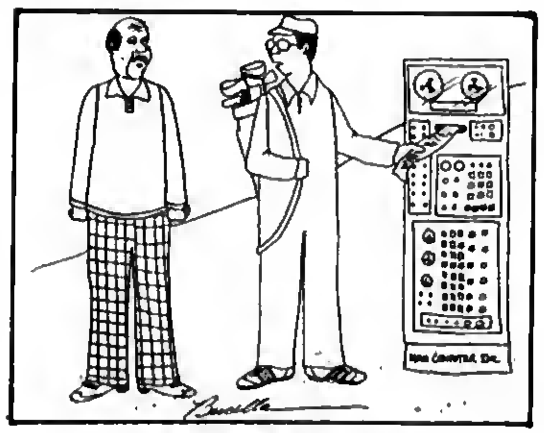
The test itself has been validated for on-the-job performance in programming by an agency of the U.S. government.

In a study of the results of more than 700 programmers and programming trainees with regard to speed and score, the group tested was distributed as follows:

	Slower 50%	Faster 50%
Higher scoring 50%	22%	28%
Lower scoring 50%	28%	22%

Thus the relationship between speed and aptitude for work in programming, as measured by this test, is not a very strong one. The coefficient of correlation represented by this table is only .12, which shows a positive correlation but not a strong one.

The speed factor in a screening test will cause the rejection of many capable persons. Consequently, a company will be meeting its needs for programming personnel by employing some persons who earned their higher scores by working with greater speed, rather than with greater precision.



'it Says: Use a Nine Iron!'

Even when the group studied was the superior group consisting of the highest scoring 25% of the programmers and trainees tested, the wide dispersion in speed was again observed:

Fastest 25%	34% of Superior Group
Next 25%	25% of Superior Group
Next 25%	20% of Superior Group
Slowest 25%	21% of Superior Group

Thus a substantial portion of this superior group, about 40%, would very likely have been eliminated from further consideration if the personnel department used a screening test in which speed was an essential factor.

A personnel director may feel satisfied that his use of such a test is appropriate because the screening test scores have been found to correlate satisfactorily with the grades assigned by the company's instructors in its training classes. But grades in training classes do not constitute the proper criterion for validating a screening test. Tests in training classes are also strictly limited in time.

It is sometimes claimed that the problems on a screening test are arranged in ascending order of difficulty and that the persons who did not finish the test would very likely have been unable to do the remaining problems even if they had more time. This claim is obviously untrue for the slow worker who did well on the problems that he did reach on the test.

And every researcher in testing is surely aware that there are numerous occurrences where a person makes errors on "easier" problems and then correctly completes other problems that are rated as more difficult.

As a practical matter, however, it is essential that some time limit be established in aptitude testing. Otherwise there will be some applicants who will just sit all day and go over their work virtually endlessly.

In establishing a time limit on its screening test it would be reasonable for a company to set such a limit at the point that will enable 90% of its applicants to complete the test. The test scores can then be used to rank the applicants, rather than for the assignment of percentile ratings as established in the tahle of norms issued by the publisher of the test.

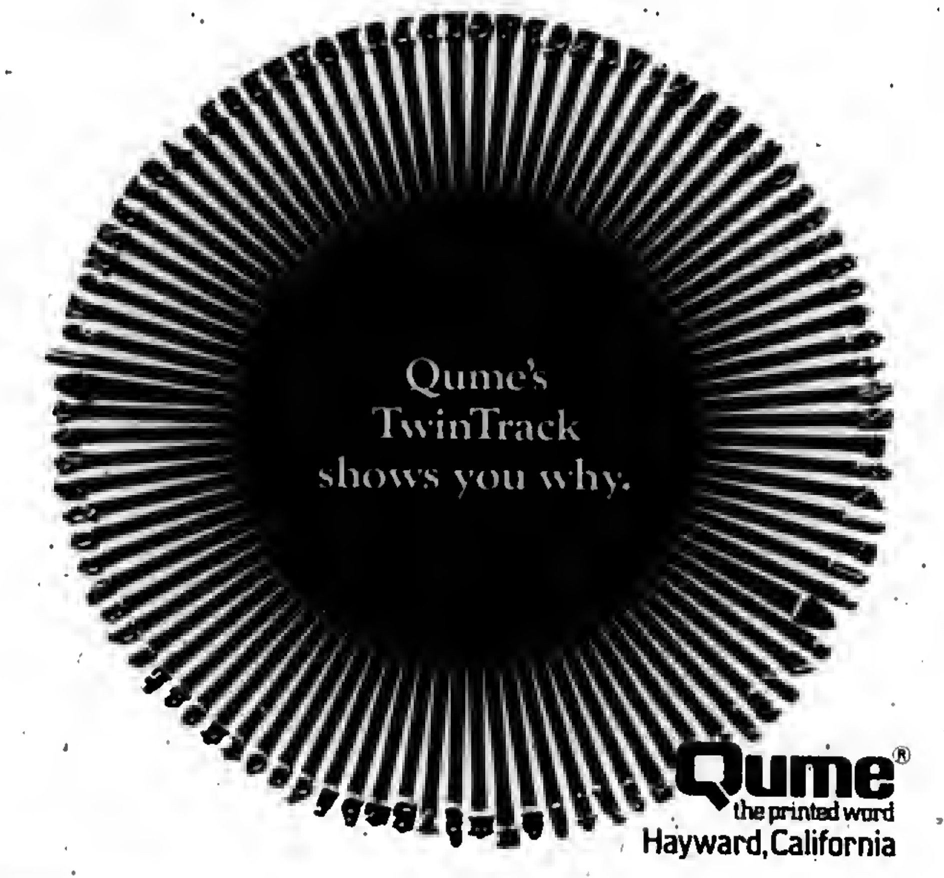
Even the presentation of the work in training classes adheres to a rather well filled course outline. Thus the training class ratings favor the faster workers and are likely to underestimate the more capable but slower workers.

In on-the-joh programming, a person works at what is basically his normal pace. In his actual work in programming, his seeming slowness because of his careful desk-checking of his work as he goes along will pay off in effectively making him a fast programmer in bringing his jobs to a successful conclusion.

But such superiority is not as likely to show up in his training class as his subsequent work on the job in programming.

A company can ill afford to let highly capable talent slip through its fingers unrecognized. Nor is it fair to the applicant who may thereby be discouraged from applying to any other company and may remain at an occupational level lower than that for which he actually posses potential.

Wolfe, o member of the boord of directors of the Associotion for Computing Mochinery's Speciol Interest Group on Computer Personnel Reseorch, is president of Progromming Speciolists, Inc. in Brooklyn, N.Y.



They love me...they love me not...

Terminal manufacturers can be very fickle. Warm and tender when they write the order, most grow cold and unresponsive when you need service or repairs.

Trendata doesn't care for love-hate relationships. We're looking for something more meaningful, more fulfilling. So we offer you no-cost terminal evaluation, nationwide service by our representatives (not someone else's), one of the broadest range of terminals and peripherals available, and a wide variety of purchase, lease and rental programs.

And because our customer affection is boundless, we offer you all the supplies and accessories you need—ribbons, type elements, tape cassettes, copy holders, acoustic cabinets and forms stackers.

If you're having trouble communicating with your computer or computer terminal representative, call or write Trendata for a rendezvous.

DP Business Should Have Professional Standards

Dear Joe Rigo,

I found your comments very interesting [CW, Aug. 29]. I, like yourself, am growing old. Although not 44 yet, I have been in DP now for 12 years. I started out on tab equipment and watched it grow, and I agree with your idea of nothing replaces experience. I have yet to see a person come directly out of school and sit down and write an efficient and dependable set of code.

In my years of working with DP and in business I have repeatedly noticed several discrepancies. I have seen people who are the opposite of Carmine Vona — people who, because of their bad DP habits, have virtually destroyed companies. These companies and the people who run them do need protection from the pseudo-data-processors.

This, in my estimation, is what the Certificate in Data Processing (CDP) is all about. It isn't for our generation; but we, with our varied experience, can and must make it work for succeeding generations. At the present, we are like the accountants were before CPAs. No ethical control. No social responsibility. No commitment. We cannot tell whether a beginning programmer or computer operator will be able to do the job.

Now don't get me wrong. I'm not saying the CDP and the Certificate in Computer Programming (CCP) will resolve everyone's problems. As always, we will have bad computer operators and accounting clerks; bad programmers and bookkeepers; bad systems analysts and comptrollers/CPAs. But we will have a set of standards, and non-DP people will have someone to turn to. If we then do not police our own, we will have socialized data processing. Not a threat, but a possibility.

So, Joe, you and I can either get our CDPs or we can continue much as we do today. It really doesn't matter to us. But, I also agree with Gary Casper; we need to professionalize our business, before someone does it for us, for the public good.

Walter A. Blankinship Sr.
San Antonio, Texas

Certificates Not Useless

The Reader Commentary section of the Aug. 29 issue was very interesting reading. Joe Rigo reminds us of the fact that the Certicate in Data Processing and/or the Certificate in Computer Programming (CCP) do not necessarily qualify a person as a computer professional. I agree!

However, Rigo failed to mention that professional people like Carmine Vona are not the average, run-of-the-mill data processors. The qualifications of any good systems analyst should, by definition, make everyone around him look good. While technical expertise is very necessary in implementation of computer systems, it is not, in my opinion, the critical factor that divides the average analyst from the outstanding person.

A good analyst is dedicated, realistic, well organized, highly motivated, accepts constructive criticism and insists upon user participation and management review and support. The good analyst sees the computer as another tool made available by company management for the solution of the problem.

Too many systems people see the computer as the end rather than as a means to the end. Very often, sophisticated computer systems are designed to satisfy the ego of the systems person instead of providing the user with meaningful information that is cost-effective and useful.

The good analyst believes training is an essential part of system implementation. He is not afraid of developing the capabilities of other team members assigned to the project.

The good analyst utilizes proven project management techniques to ensure projects are implemented on time and within budget.

Unfortunately, for every successful systems analyst I have seen, I can point to dozens of unsuccessful, unqualified people who have blazed their way up the ladder of success at the expense of their fellow workers.

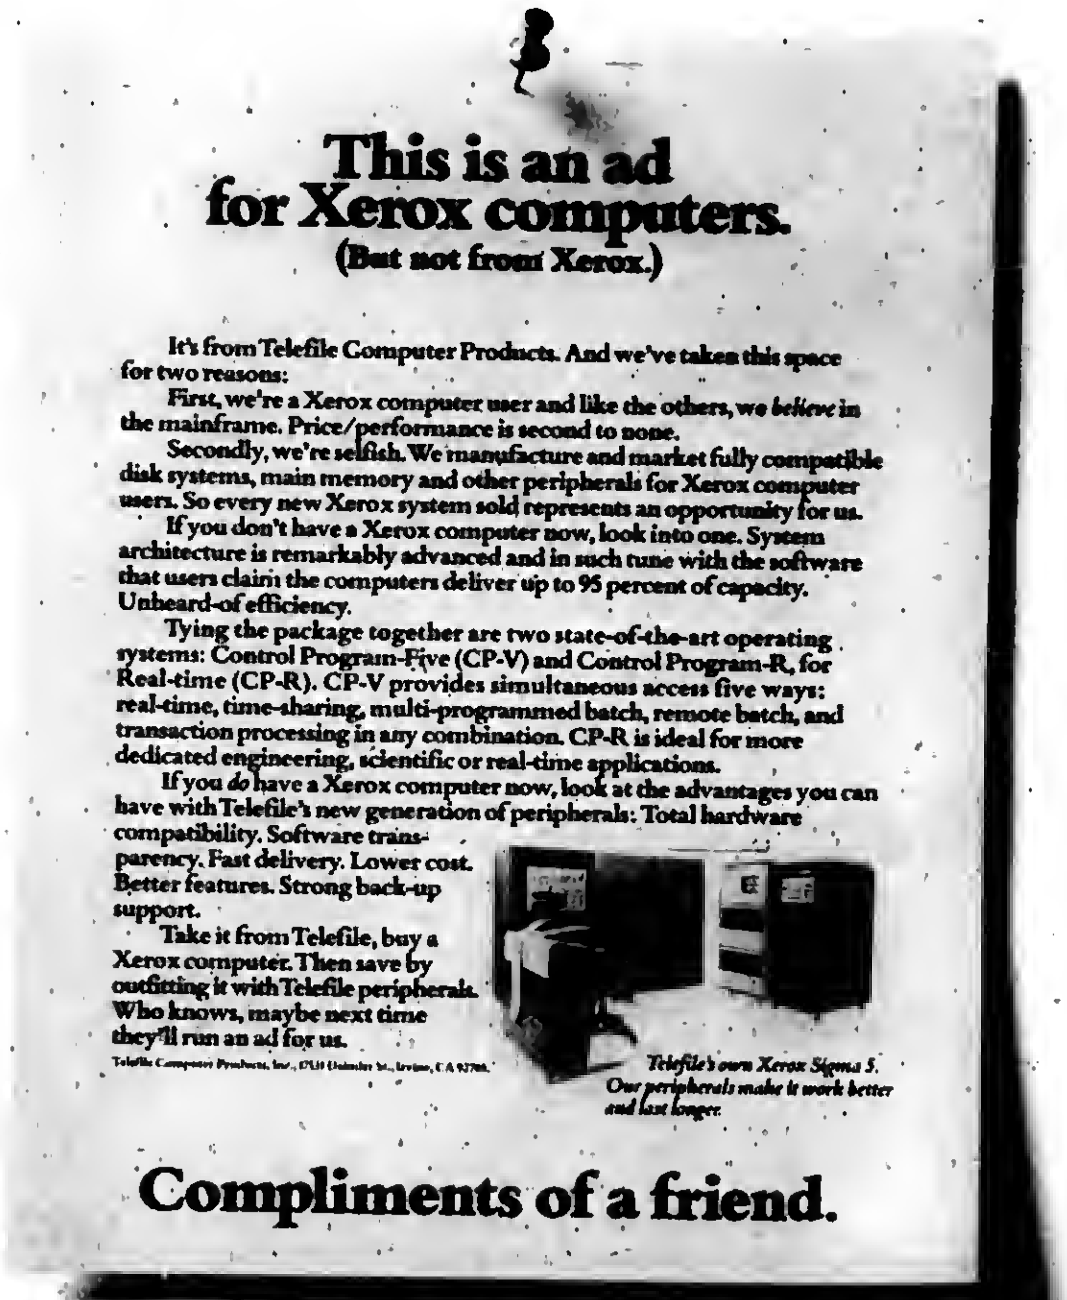
Obviously, the CDP and CCP, like the formal BA, BS, MBA, etc. do not by themselves replace the invaluable experience gained through years of active participation in the "school of hard knocks." The use of CDP after your name should be as important to the DP professional as the MD is to the doctor.

Perhaps the CDP is not as important today as many people would like it to be. However, to take the attitude that the CDP, the CCP and a code of ethics are useless ensures that our profession will continue to be cluttered with unqualified egotists ready to force their sophisticated garbage on an unsuspecting user community.

While Prof. Casper's comments obviously cannot be taken as gospel for the DP community in general, they can be applied to evaluating a significant percentage of its members.

Perhaps the problem can be eliminated. However, without the involvement and leadership of the qualified professional, this is an impossible task.

Richard M. Dawson
Oberlin, Ohio



This is an ad for Xerox computers.
(But not from Xerox.)

It's from Telefile Computer Products. And we've taken this space for two reasons:

First, we're a Xerox computer user and like the others, we *believe* in the mainframe. Price/performance is second to none.

Secondly, we're selfish. We manufacture and market fully compatible disk systems, main memory and other peripherals for Xerox computer users. So every new Xerox system sold represents an opportunity for us.

If you don't have a Xerox computer now, look into one. System architecture is remarkably advanced and in such tune with the software that users claim the computers deliver up to 95 percent of capacity. Unheard-of efficiency.

Tying the package together are two state-of-the-art operating systems: Control Program-Five (CP-V) and Control Program-R, for Real-time (CP-R). CP-V provides simultaneous access five ways: real-time, time-sharing, multi-programmed batch, remote batch, and transaction processing in any combination. CP-R is ideal for more dedicated engineering, scientific or real-time applications.

If you *do* have a Xerox computer now, look at the advantages you can have with Telefile's new generation of peripherals: Total hardware compatibility. Software transparency. Fast delivery. Lower cost. Better features. Strong back-up support.

Take it from Telefile, buy a Xerox computer. Then save by outfitting it with Telefile peripherals. Who knows, maybe next time they'll run an ad for us.

Telefile Computer Products, Inc., 17131 Daimler St., Irvine, CA 92705.

Telefile's own Xerox Sigma 5. Our peripherals make it work better and last longer.

Compliments of a friend.

What we've done for Xerox users, will now be done for Univac.

Xerox computers aren't getting older. They're getting *better.*

And that's all the more remarkable since Xerox *hasn't built one in years.*

Computer Enhancement is the reason.

It's a new industry being pioneered by Telefile. Applying latest technology, we revitalize computers so they can do more work faster. It may mean faster memory or peripherals. Or simply "black boxes" that extend a computer's capability beyond previous design limits.

Take Xerox. Since early 1975, when our ad appeared, Telefile has announced over 24 new Xerox-compatible products.

Compact main memory, high speed printers, communication processors, solid state RAD's, array processors, and on and on.

Most have powerful performance, reliability, and cost advantages over the Xerox units they replace. More important, they're available.

Recently, we announced a new mass store facility that brings "Winchester" disk drive technology to Xerox users – something previously available only to IBM users.

Telefile has even taken over complete system maintenance at some sites. Our service network now stretches to over 20 cities and it's growing monthly.

And now to give Xerox users room to grow, Telefile is embarking on the development of *two new micro-programmed Sigma mainframes* for introduction in 1978. One will run four times faster than Xerox' biggest machine, yet cost only about half as much.

That's computer enhancement. To Xerox users it means a way to take their computer investment and superior software into the 1980's in style.

Univac users, you're next.

Telefile
Enhancing computers is our business.

Letters to the Editor

More Than Certification

Many articles have been printed by *Computerworld* and others on the subjects of licensing and certification. The article by Jim Brown in the Aug. 1 issue informatively and nonemotionally addressed the question of whether the Certificate in Computer Programming (CCP) will repace the Certificate in Data Processing (CDP).

Several points that are really tangent to the main argument are regularly raised by opponents of licensing.

First, if, as Brown stated, "The ICCP [Institute for Certification of Computer Professionals] said that '. . . at the present time there are no generally accepted definitions of job functions . . . or agreement upon knowledge and skills to practice in these jobs . . . ,' " then how is it possible for certification to provide a uniform measure of knowledge and performance potential?

It would seem that some definition has to exist if it can be tested. Therefore, some definition exists which can be licensed.

Second, much uproar continues to obscure the reason for licensing DP professionals. The uproar belongs, and rightly so, to those individuals who do not wish to practice public DP.

Doctors, lawyers and accountants who do not practice their professions on patients or clients are free to apply their skills and knowledge as they wish without licensing or certification. The same should apply to data processors. Only those individuals should be licensed who desire to offer their services to the public on a professional-client basis.

Certification can be of significant value in a licensing program. Licensing, however, can go further; to define job functions; to establish knowledge and skills required to practice; to provide for continuing education in order to assure high quality of service; and to enforce, not merely promulgate, standards of conduct and performance.

Self-assessment and peer group evaluation can be imortant. To those of us who worked for our certificates, it was important.

I believe certification and licensing cannot be mutually exlusive. The two programs should serve those who desire to be served. For those individuals who choose neither certification nor licensing, I wish you success.

Thomas C. Alewine
Columbia, S.C.

Need Clearer Explanation

Jim Brown's article puts some of the previous articles on certification into realistic perspective [CW, Aug. 1]. However, it raisos an important point that I feel needs clarification.

Brown stated that "certification encourages continuing education." Could he or the Institute for Certification of Computer Professionals (ICCP) explain this? I think that having attained a Certificate in Computer Programming or Certificate in Data Processing an individual would tend not to continue his professional education.

My wife is a registered nurse and a condition of her license renewal is 30 hours of continuing education every two years. Is the ICCP talking about certification or licensing?

If they are involved with certification, not licensing, could someone explain the relationship, or requirement, between their program and continuing education?

James R. Shannahan
Santa Clara, Calif.

Architecture, Not Machines

In regard to the story "PDP-11 Leading Choice for Military Standard" [CW, Aug. 8], I would like to make two corrections. First, the figure given as $3 million a year for Department of Defense software expenditures should be $3 billion.

Second, the article makes reference to "the [Digital Equipment Corp.] machines," which may give the wrong impression about the Military Computer Family project. The proposed standardization would be on the PDP-11 architecture, not DEC machines.

If implemented, this standard would enable the services to procure militarized hardware from several suppliers, all building to the government-specified architecture (i.e., instruction set), while utilizing their own hardware technology. In effect, the government would obtain a license from DEC to utilize the PDP-11 architecture, and would be free to pass on that license to potential suppliers, solely for the purpose of building militarized (not commercial) hardware.

Lt. Col. Alan B. Salisbury
National Defense Univeristy
Washington, D.C.

Tip for Saving Energy

The examples of saving energy in the June 23 issue of CW require expansion and reverse logic ["CPU Heat Harnessed; Utility Saves Face" and "IBM Plans Buildings That Conserve Energy"].

We can conserve as much energy in summer as we are now planning to save in winter by designing CPUs, other office machines, home appliances, etc., with a hood and blower if they don't already have a blower as refrigerators do.

John W. Ecklin
Alexandria, Va.

This is an ad for Univac computers.

(But not from Univac.)

It's an unsolicited testimonial from Telefile Computer Products. And we've taken space again for two reasons:

First, for sheer number crunching and handling of large data bases, Univac computers are in a class by themselves (how else could they thrive under a quarter century of IBM competition?).

Secondly, there are hundreds of *older* Univac installations that could benefit significantly from Telefile's computer enhancement capabilities.

Key to Univac's success has been its evolutionary approach to systems design. The new 1100 Series machines are direct descendants of the Univac 1108, first installed in 1964 and still running strong.

But as 1108's and other models have grown older, remarkable evolutionary advancements in memory, peripheral and mass storage facilities have grown up around them. One way users could upgrade was to change out the mainframe into a gleaming new model. Univac makes it easy by keeping the software compatible.

Think of Telefile as being *counter-evolutionary.* We reverse the tides of time by applying new memory and accessory design to computers hobbled by the past.

Take our new fully compatible add-on memory for Univac computers. By taking advantage of latest technology, it runs faster, takes up less floor space, and runs on only one-third the power of the Univac memory it replaces. No software changes are required. And costs *are cut about 70 percent.*

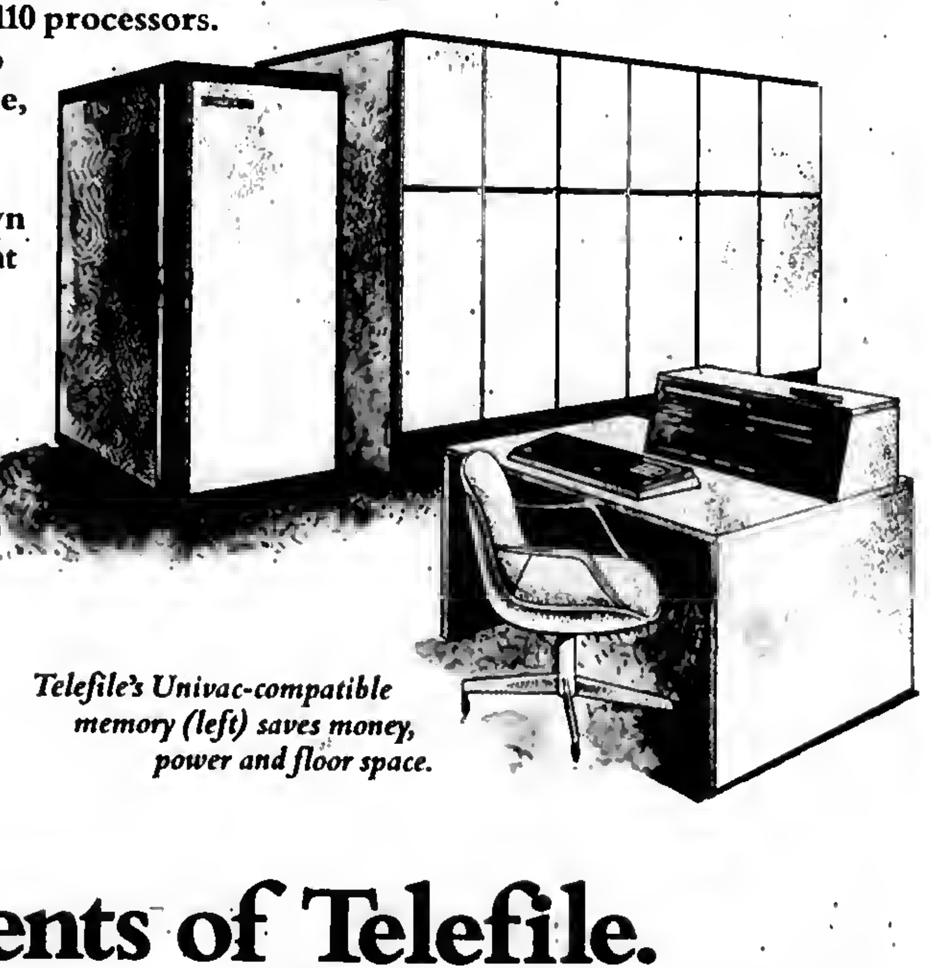
We currently offer unitized memory for 1110, 1100/40 and 1106 processors; and multi-modular memory for Univac 494, 1106, 1108, and 1110 processors.

Both memory types are currently up and running on Univac computers. On one, overall system throughput has been boosted by a remarkable *30* percent!

But this is just the start. Coming down the line are a solid state drum replacement and disk systems that leapfrog 3330 technology. Not to mention some other exciting developments we'd rather not mention right now.

We don't expect Univac to run an ad for Telefile, but someday the users migh

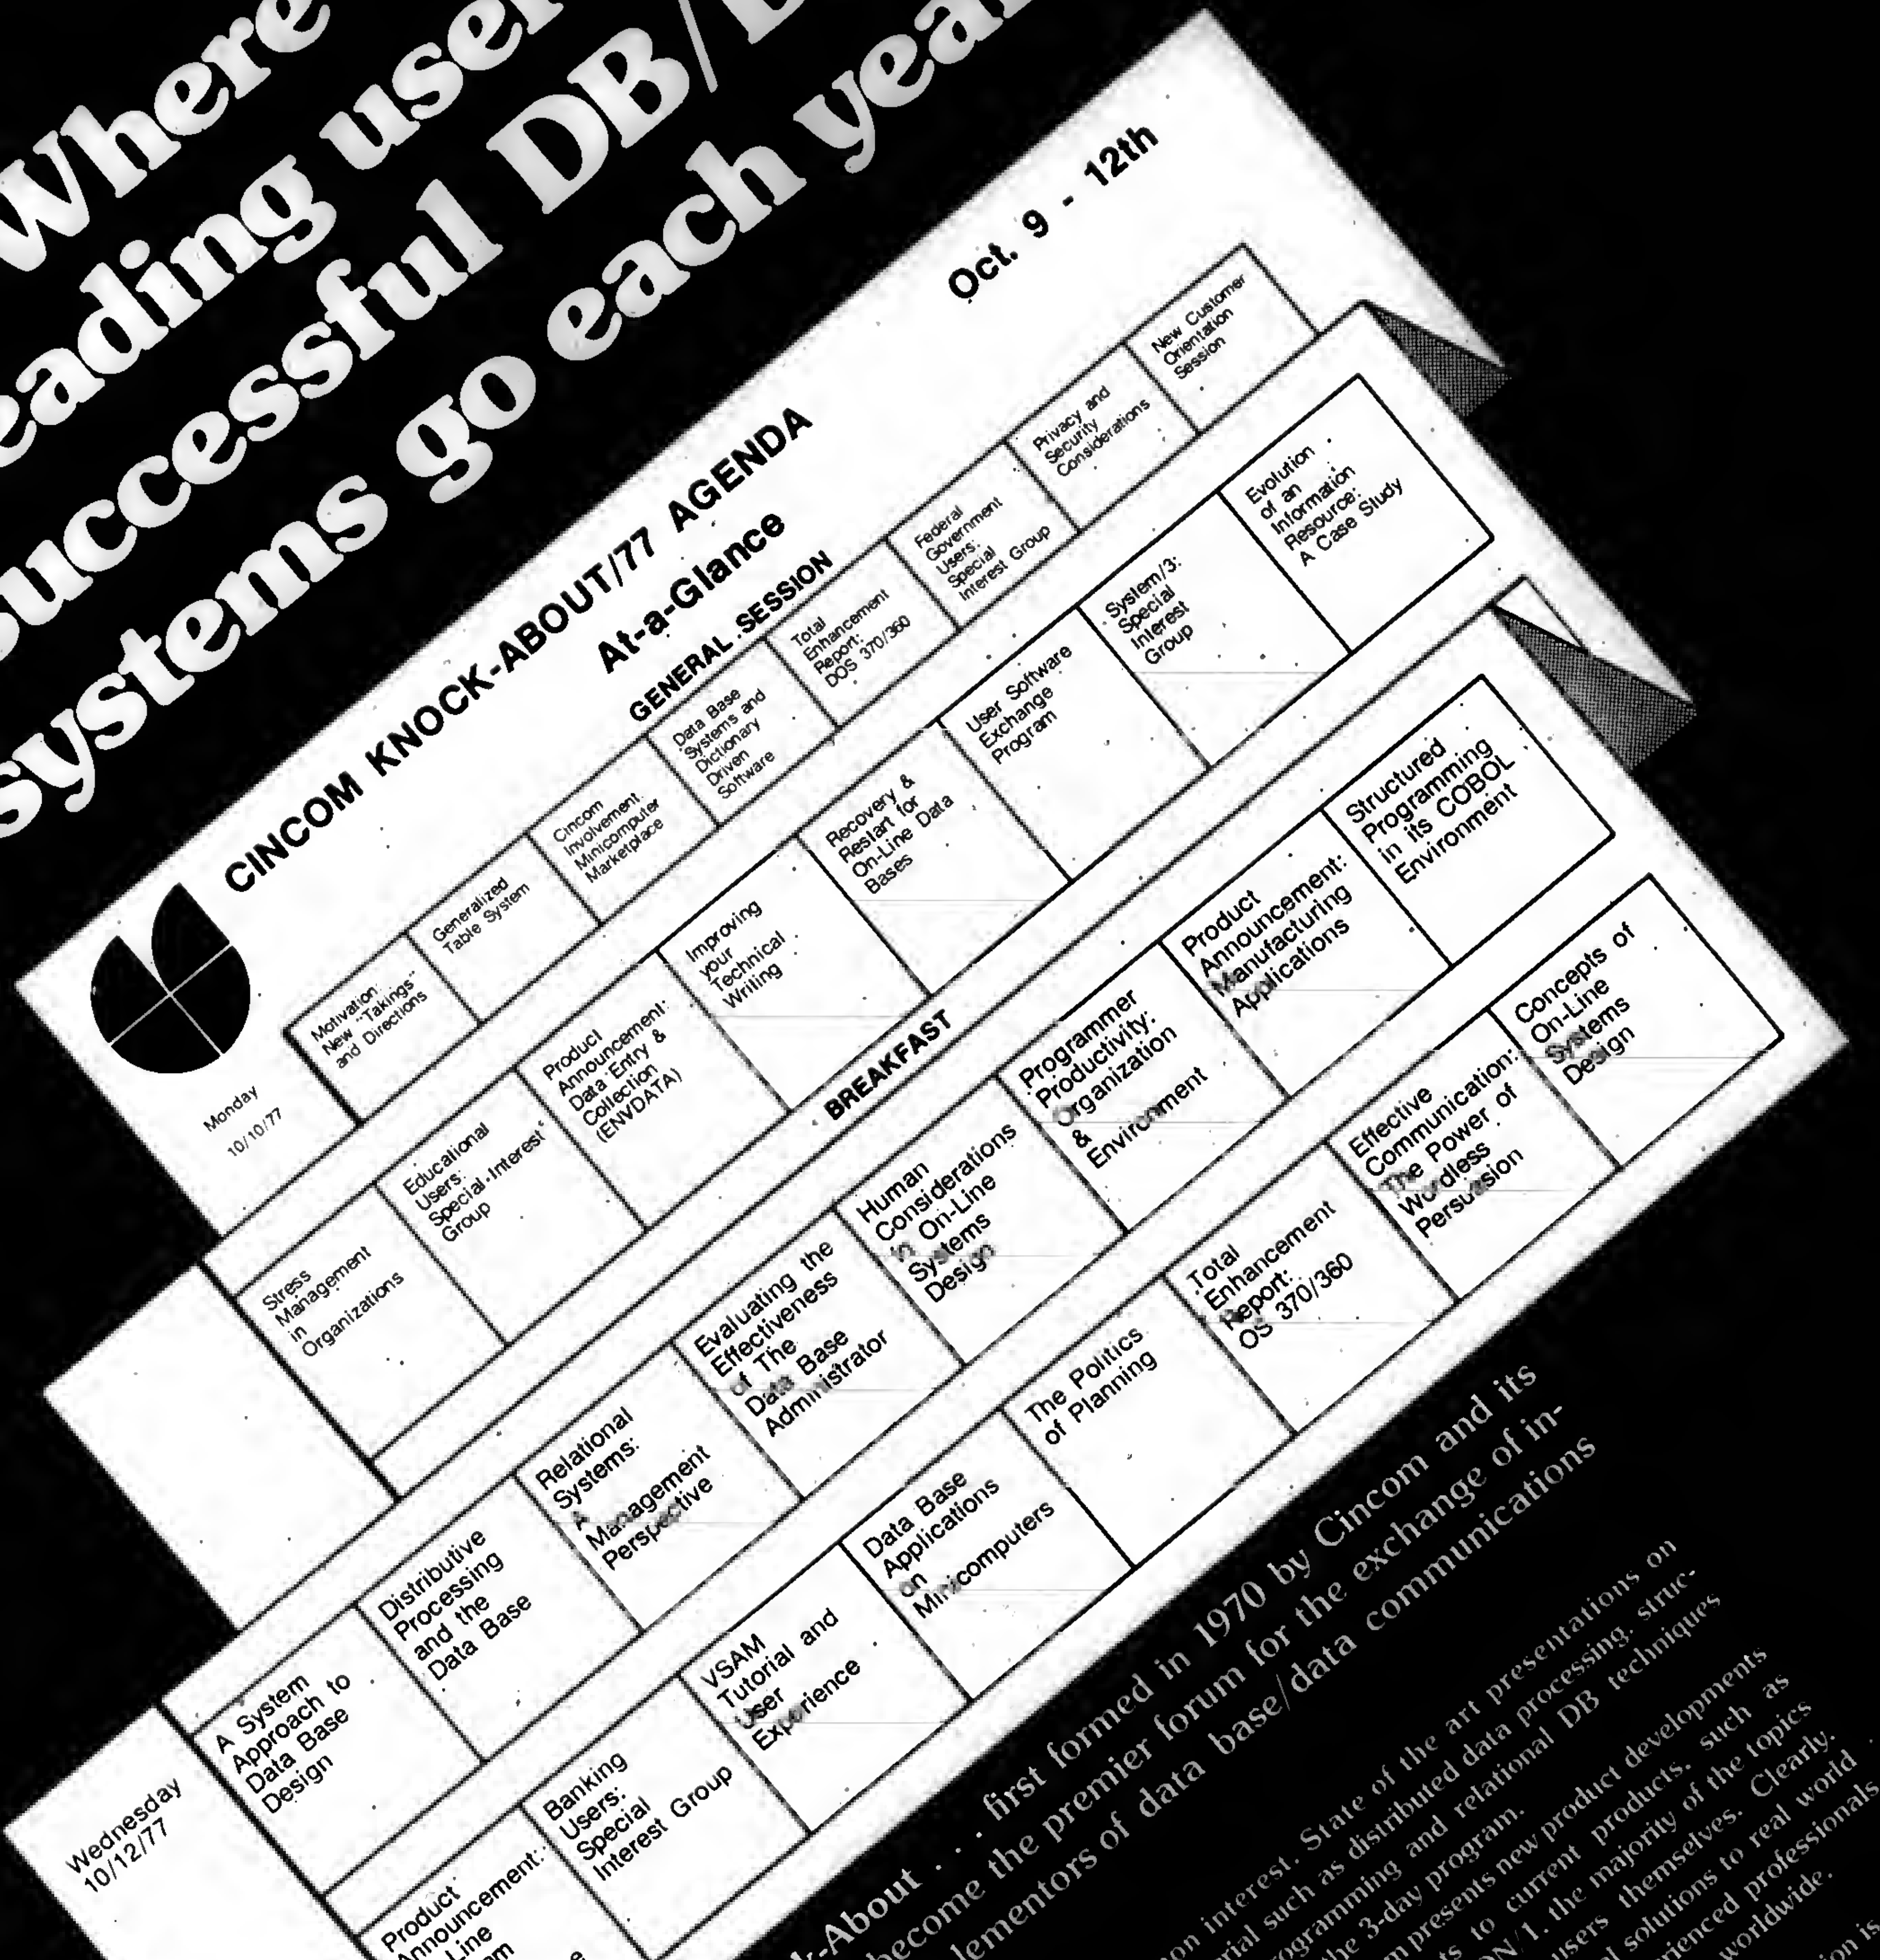
Write: Telefile Computer Products, Inc.,
17131 Daimler St., Irvine, CA 92714.
Phone: (714) 557-6660.



Telefile's Univac-compatible memory (left) saves money, power and floor space.

Compliments of Telefile.

Where do leading users of successful DB/DC systems go each year?



CINCOM KNOCK-ABOUT/77 AGENDA

At-a-Glance

Oct. 9 - 12th

Monday

10/10/77

GENERAL SESSION

- Motivation: New "Takings" and Directions
- Generalized Table System
- Cincom Involvement: Minicomputer Marketplace
- Data Base Systems and Dictionary Driven Software
- Total Enhancement Report: DOS 370/360
- Federal Government Users: Special Interest Group
- Privacy and Security Considerations
- New Customer Orientation Session
- Educational Users: Special-Interest Group
- Product Announcement: Data Entry & Collection (ENVDATA)
- Improving your Technical Writing
- Recovery & Restart for On-Line Data Bases
- User Software Exchange Program
- System/3: Special Interest Group
- Evolution of an Information Resource: A Case Study

BREAKFAST

- Stress Management in Organizations
- Evaluating the Effectiveness of The Data Base Administrator
- Human Considerations in On-Line Systems Design
- Programmer Productivity: Organization & Environment
- Product Announcement: Manufacturing Applications
- Structured Programming in its COBOL Environment
- Relational Systems: A Management Perspective
- The Politics of Planning
- Total Enhancement Report: OS 370/360
- Effective Communication: The Power of Wordless Persuasion
- Concepts of On-Line Systems Design

Wednesday

10/12/77

- A System Approach to Data Base Design
- Distributive Processing and the Data Base
- Data Base Applications on Minicomputers
- VSAM Tutorial and User Experience
- Banking Users: Special Interest Group
- Product Announcement: On-Line Program Library Maintenance System

Cincom Systems' Knock-About . . . first formed in 1970 by Cincom and its client user group . . . has truly become the premier forum for the exchange of information between successful implementors of data base/data communications systems.

Over 600 Cincom customers will gather at Knock-About '77, October 9-12, to attend and participate in 75 sessions presented in 8 concurrent tracks. The breadth and depth of the agenda (sample above) will enable each person to tailor a meaningful program to his or her professional responsibility . . . manager, system designer, programmer, data base administrator, on-line specialist, etc.

Special interest groups have been scheduled to provide the opportunity for industry-oriented interaction and in-depth discussions of subjects of common interest. State of the art presentations on material such as distributed data processing, structured programming and relational DB techniques punctuate the 3-day program.

While Cincom presents new product developments and enhancements to current products, such as TOTAL and ENVIRON/1, the majority of the topics are conducted by the users themselves. Clearly, the emphasis is on practical solutions to real world problems, contributed by experienced professionals from our resource of installations worldwide.

If you are a Cincom customer, we hope to see you at Knock-About '77. If your organization is considering data base or data communication software, why not contact Cincom Systems immediately. We can help you prepare your organization's DB/DC success story in time for presentat at the next Knock-About (April, 1978).

Cincom Systems, Inc.

We Create Efficiency.

DPMA OKs CDP Special Interest Group

By Don Leavitt
CW Staff

PARK RIDGE, Ill. — The Data Processing Management Association (DPMA) has granted provisional status to a special interest group for Certified Data Processors. Acting president of the group is Beverly Madron, an assistant professor of data processing at Western Kentucky University.

Madron would welcome the names of members of DPMA and others holding the CDP designation who would be willing to help her organize the new group and plan meetings. She said anyone could contact her at Grise Hall, at the university in Bowling Green, Ky. 42101.

"Our initial thrust will be an industrywide education effort to recognize the Certificate in Data Processing (CDP) as a viable and useful mechanism for the individual holder and others to measure the knowledge and competence in our always evolving field," Madron said in explaining why the group is being organized.

The group will be aiming for the type of acceptance toward the CDP that, for example, the CPA enjoys in the field of accountancy. Some companies now encourage employees to work for the CDP; more should and our group will be spending much time spreading the word," she added.

The special interest group will make an effort at coordinating its work "in some way" with that of the Institute for Certification of Computer Professionals (ICCP), the organization that now administers the CDP exam. Madron made no mention of the possibilities of working with the independently organized Society of Certified Data Processors (SCDP).

Exam Preparation

"We plan to become involved in CDP exam preparation courses and review materials," she added, noting there is currently no organized national effort to provide review classes or to review the more and more numerous teaching aids supposedly designed to prepare for the exams.

CCP Confusion

Madron noted also that there has been some confusion over the introduction this fall of a new examination program by ICCP, leading to a Certificate in Computer Programming (CCP) designation for those who pass it.

"For those who believe such additional levels of certification may dilute the prestige of the CDP, there are those who feel just as strongly that such stratification of the broadly inclusive label of data processor will improve the visibility of the CDP, which after all is directly aimed at managerial and similar senior level persons," Madron commented.

The DPMA special interest group also plans to tackle the issue of continuing education after certification. Preparing for the exam is a major educational effort with definite career path advantages. "However," Madron cautioned, "the longer the program is in existence and the more time that passes following certification, the more necessary becomes some form of continuing education. I'm sure the group will address this concern.

According to the association, there is a $10 annual membership fee for the new group, and as long as the group has provisional status within DPMA, members of the special interest group for Certified Data Processors need not be members of the association.

'HSM' Swaps Dasd, MSS File

WHITE PLAINS, N.Y. — An IBM program product, to be available early next year, is said to arrange data efficiently in a storage hierarchy including the IBM 3350 and 3330 direct access storage devices (Dasd) and the IBM 3850 mass storage system (MSS).

The Hierarchical Storage Manager (HSM) package keeps "active" data sets on the faster Dasd units, but moves more dormant ones to the lower cost-per-Mbyte MSS. It also makes backup copies of altered data sets, which can be retrieved on command, according to a spokesman.

The "migration" of data sets between the storage media can occur at a regular time each day or a predetermined time interval that can be more or less than 24 hours. The choice is up to the installation and can be changed with conditions, he added.

As HSM moves the less active data sets to MSS, it frees Dasd space for new applications. Since new projects are often on-line, this resource is generally in critically short supply. Since HSM "backs up" only altered data sets, however, it also saves some resources in that task which can be used for other operations, the spokesman continued.

By managing the "migration" chores without operator intervention — except to set the original parameters — the system also reduces or eliminates media handling and manual data management and backup procedures, he said.

HSM operates with OS/VS2 MVS Release 3.7 on IBM 370/145 and larger CPUs, including the 3033 processor. HSM is compatible with Release 2 of Version 1, Resource Access Control Facility (RACF) data security software and can operate with multiple hosts, he added.

HSM will be available in the first quarter of 1978 for a monthly charge of $350.

'Goes' Runs On-Line

SAN DIEGO, Calif. — The Gemini Order Entry System (Goes) was designed by Gemini Associates for firms with a high volume of customer orders who need to reduce time lags between receipt of orders, shipments of the desired products and subsequent payment of the invoice, a spokesman explained.

Written in Cobol, Goes currently uses Cincom's data base management system Total and teleprocessing monitor Environ-1, but it can easily be adapted to any equivalent systems, Gemini said.

Operating either on-line or in batch, Goes is said to feature customer verification and credit checking, as well as current receivables balances; automatic input to all affected departments; automatic generation of shippers and invoices; product location within stores; finished goods inventory, including product allocation and relief; and an interactive system of prompting correct data entry, a spokesman said.

Goes can be purchased for $20,000 or rented for $550/mo.

Gemini Associates can be reached through P.O. Box 81949, San Diego, Calif. 92138.

'Maps' in Basic-Plus 2

PALO ALTO, Calif. — Ross Systems, Inc. has released Version 2 of its Management Aid for Planning Strategies (Maps) software, a generalized financial modeling and reporting package. Maps operates on a Digital Equipment Corp. PDP-11, using RSTS/E and is available in both Basic-Plus and Basic-Plus 2.

Built around a user language intended for nontechnical people, Maps creates its output from matrix descriptions of the rows and columns desired.

In addition to formatting capabilities, Maps contains a file maintenance system, the ability to ask "what if" questions, and a capability of consolidating reports, the company said.

Maps is offered on a timesharing basis or can be licensed to operate in-house for a one-time license fee of $10,000.

Ross Systems is at Suite 208, 1900 Embarcadero, Palo Alto, Calif. 94303.

On-Line Systems Keep Canadians Cars Moving

Special to CW

OAKVILLE, Ont. — An on-line system developed by the Ford Motor Co. of Canada, Ltd. is reportedly helping Ford and Mercury car and truck dealerships throughout this country to provide better customer service, reduce operating costs and maintain precise day-to-day control over the operation of their businesses.

The system, named Dealership Computer Services (DCS) is one of three major on-line systems developed at Ford. The others are Warranty Claims Processing and Accounts Payable. All have been designed and programmed using the facilities provided by Task/-Master, a teleprocessing monitor from Turnkey Systems, Inc. of Norwalk, Ct.

All of Ford's on-line applications operate in a single region of an IBM 370/168 under OS/SVS.

DCS itself consists of three major components: an order entry, inventory control and inquiry system for parts and accessories; a system for ordering new vehicles; and a complete dealership accounting system. Each component is a modular element of the total DCS package, allowing each dealer to selectively implement specific applications based on individual needs.

With DCS, each dealer has direct access to the centralized files of parts and vehicle data maintained by Ford.

Len Sanci, owner of Oak-Land Mercury Sales, Ltd. in Oakville, is very pleased with the success his dealership has had with the system. "It has streamlined our entire operation primarily because it's such a complete package. Through the same terminal we can order cars, order parts, track the status of parts and handle all of our accounting transactions."

One of the biggest advantages of the system, according to Sanci, is in the area of car maintenance and repair, where the availability of a single part can be critical. "In car repairing everything is an emergency. Under the old system, we had to phone in our order, and we didn't know until the delivery truck arrived that a part wasn't available. In the meantime we've tied up a mechanic, tied up a stall and disappointed a customer," he said.

"Now, all we have to do is walk over to the terminal, type the order in and we know immediately whether all the parts are available. If a part we need is out of stock at the distribution center, the system not only tells us where the nearest dealer is who has one in stock, it also lets us know when the next shipment will arrive from the manufacturing plant. That kind of information is invaluable in controlling our shop," he asserted.

Accounting Benefits

Jack Mason, secretary/treasurer of Oak-Land Mercury, reported additional DCS benefits from a financial control and accounting standpoint. "By entering all of our sales, accounts payable and accounts receivable transactions through the terminal, we can keep current on a day-to-day basis," Mason said.

Each transaction entered into the system is checked against the files maintained by Ford of Canada at its headquarters here "Errors are detected immediately and corrections can be made on the spot," Mason noted.

"Under our old accounting system we created a paper tape and had it sent out for processing. We didn't find out about any errors until two days later when the listing came back. In addition, because we're on-line with Ford, we have access to the latest pricing and part number data including 'replaced-by' information that just wasn't available under the old system," he said.

The ability to support "almost every type of terminal on the market" was just one of the reasons that Task/-Master was selected, according to George Ridout, a computer specialist responsible for technical support of Ford's on-line systems. "Probably the major reason we picked the package was because it was a full-feature monitor that would fit on our computer.

"In addition, because we are very performance-oriented, the ability to select only those functions of Task/-Master that we needed through customizing meant our system would operate with minimum overhead," he noted.

Although Ford has since removed some of its storage restrictions in going from an OS/MVT environment to SVS and a larger machine, it still considers Task/Master's basic efficiency a major advantage.

Having a monitor that is easy to work with is also important to Ford. It has allowed development work for new on-line systems to be done by analysts and programmers who were already familiar with the user department's needs, but not necessarily expert in on-line programming.

The on-line applications currently in operation at Ford of Canada are only the "tip of the iceberg" when compared with what the future might bring, according to Gordon Reade, manager of technical systems services. "Advances in technology have allowed us to evolve more and more into an organization that operates in 'real-time,' where as soon as a transaction enters the system at one point, an appropriate response is generated at another. We're not there yet," Reade said, "but the time between an action and a corresponding response is getting smaller and smaller all the time."

IF YOU'RE MAKING FINANCIAL DECISIONS WITHOUT TIMELY INFORMATION, YOU NEED THE MMS GENERAL LEDGER.

When your financial management makes decisions without accurate, timely information, they might as well be blindfolded.

But you can give your decision-makers *all* the information they need, in *any* format they feel comfortable with, and deliver with fast-ball speed.

All you need is the MMS GENERAL LEDGER. The proven financial reporting system, it's scoring an impressive record in more than 800 major corporations around the globe.

A data-base system, MMS GENERAL LEDGER knows how to handle all the league-leaders, including DOS, O/S, IMS, IDMS, DL/I and TOTAL.

If your requirements need a heavy-hitter, the MMS GENERAL LEDGER is available with an additional *ON-LINE MODULE* that makes financial reporting a whole new ball game.

Best of all, MMS GENERAL LEDGER is only one member of Software International's all-star team; which features Accounts Receivable, Accounts Payable, Net Change MRP, Filetab Report Writer and three for Systems/3 — General Ledger, Accounts Payable and Accounts Receivable.

When the pressure is on and you can't afford mistakes, call or write Software International. Get the champion performer, MMS GENERAL LEDGER.

Take me out to a whole new ball game of financial reporting. Please send me more information about:

Perkin-Elmer: System Integration by Design

Our design engineers spend a lot of time talking to each other. In fact, we insist on it.

Thanks to all the talk at the drawing boards, we can offer you systems that perform. At peak efficiency.

We realize that the more fully you can utilize the power of your system, the happier you'll be.

That's why we design every single product to suit the system. And every system to optimize its parts.

Perkin-Elmer Data Systems designs and builds a complete line of minicomputers from our Interdata division; mass storage devices from our Wangco division; and I/O terminals from our Terminals division. They're all designed for system integration.

Excellent price/performance. Complete software. Field-proven hardware. Integrated sales and service. Worldwide customer support. Perkin-Elmer Data Systems supplies the tools and support you need.

Give us a call at our toll-free number: (800) 631-2154. We have a lot to talk about.

Structured Maintenance — Part I

Approach Trains User to Read 'Alien' Code

By Edward Yourdon
Special to CW

Structured programming, structured design and structured analysis have revolutionized the development of new computer systems in the past few years. Numerous case studies and surveys have documented impressive gains in productivity, reliability and maintainability of these new systems.

But what about existing systems? It is estimated that at least 50% of all software activity in the U.S. is spent maintaining existing systems — and for many large organizations, the figure is closer to 75% to 80%. Most of these systems were developed long before anyone knew about modular programming, structured programming or any other "modern" development techniques — so it is no surprise that they continue, even after 10 years, to be unreliable and difficult to maintain.

So, what can be done to improve the state of affairs for these wretched old systems, with which we must live for another five to 10 years? Fortunately, there is a new discipline emerging, structured maintenance, which is aimed specifically at the technical problems encountered by maintenance programmers. Those problems are usually such things as:

- Nobody remembers specifically what the system is supposed to do, nor does anyone really know with any certainty what the system *does* do.
- It is often difficult to relate specific actions (or outputs) of an existing system to the specific "chunks" of code (we hesitate to use the word module) that produce those actions.
- If a programmer changes code in an existing system, it is almost impossible to know whether any other part of the system will be affected.
- It is extremely difficult, frustrating and unpleasant learning to read "alien" code developed by another programmer.

Components of Method

Structured maintenance includes: techniques to document the structure and interconnections of existing systems; guidelines for reading alien code; guidelines for modifying, retesting and debugging alien code; economic models for deciding when existing systems can profitably be rewritten; manual and mechanical techniques of "restructuring" all or part of an existing system; and the use of walkthroughs and teams to decrease the errors and boredom associated with maintenance.

Most of the documentation techniques have been used successfully for the development of *new* systems; what is interesting is that they are now being used to document existing systems. These techniques include Heirarchy plus Input-Processing-Output (Hipo) and structure charts, data flow diagrams and — in the rare cases where complex, decision-oriented logic has to be deciphered — decision tables.

These techniques have been successful in recent maintenance efforts because the existing documentation is usually obsolete; the existing documentation and/or the existing code presents a "low-level" view of the system, without providing the overview that the maintenance programmer needs so desperately; and the existing documentation almost never warns the maintenance programmer of the subtle interconnections between one "chunk" of the program and another.

Reading Techniques

Structured maintenance also concentrates on techniques for reading alien code — almost as if it were an exercise in archaeology. It is ironic that we train most programmers in "write-only" mode — that is, we train them to *write* computer programs without ever teaching them the nontrivial art of *reading* computer programs. Imagine what things would be like if we taught English, French and Spanish that way!

What does a programmer have to learn to be able to read programs successfully? Perhaps the most important thing to learn is the importance of taking notes. Reading a program usually raises questions that can't be answered immediately or it suggests modifications that the programmer would like to make "some day.".

In our work, we recommend that the maintenance programmer keep five "diaries": bugs, maintainability issues, usability issues, efficiency issues and mysteries and unanswered questions.

Yourdon is chairman of the board of Yourdon, Inc., New York, and author/coauthor of several books on "structured" DP techniques.

'007' Packages Code Data

WILBRAHAM, Mass.— Hansco Data Processing, Inc.'s 007, a user key-controlled encryption/decryption routine, can be invoked by standard calls from application programs on IBM 360/370 CPUs, according to a spokesman.

The routine comes in two versions, Civilian/007 and Federal/007. Both are based on mathematical manipulations ordered by user-supplied 8-byte activating keys, allowing up to 1.7 quintillion possible ciphers, Hansco claimed.

Civilian/007 protects data through a unique two-stage algorithm; Federal/007 is a software implementation of the Data Encryption Standard now required by the federal government for sensitive and valuable data, the vendor explained.

Requiring only 2.5K bytes of main memory, the routine is self-relocating and reentrant and can' be used in almost any IBM 360/370 environment. Either version is available in object form for $495; BAL source decks can be provided at additional cost.

Hansco can be reached through P.O. Box 236, Wilbraham, Mass. 01095.

Mini Quarterly Now Two Books

NATICK, Mass. — The *Minicomputer Software Quarterly*, published by International Management Services, Inc. and available for $85/yr., has grown 60% since it was first released a year ago. It is now in two loose-leaf volumes.

The quarterly will continue to be indexed by application area and cross-referenced by minicomputer and by source language, a spokesman said. The book now carries over 500 program descriptions, each covering the product's technical points, the vendor's support, cost of the program and name and location of the vendor.

The publisher is at 215 Oak St., Natick, Mass. 01760.

Join the more than 1000 DP Managers now using the Johnson Job Accounting Report System.

erisa?

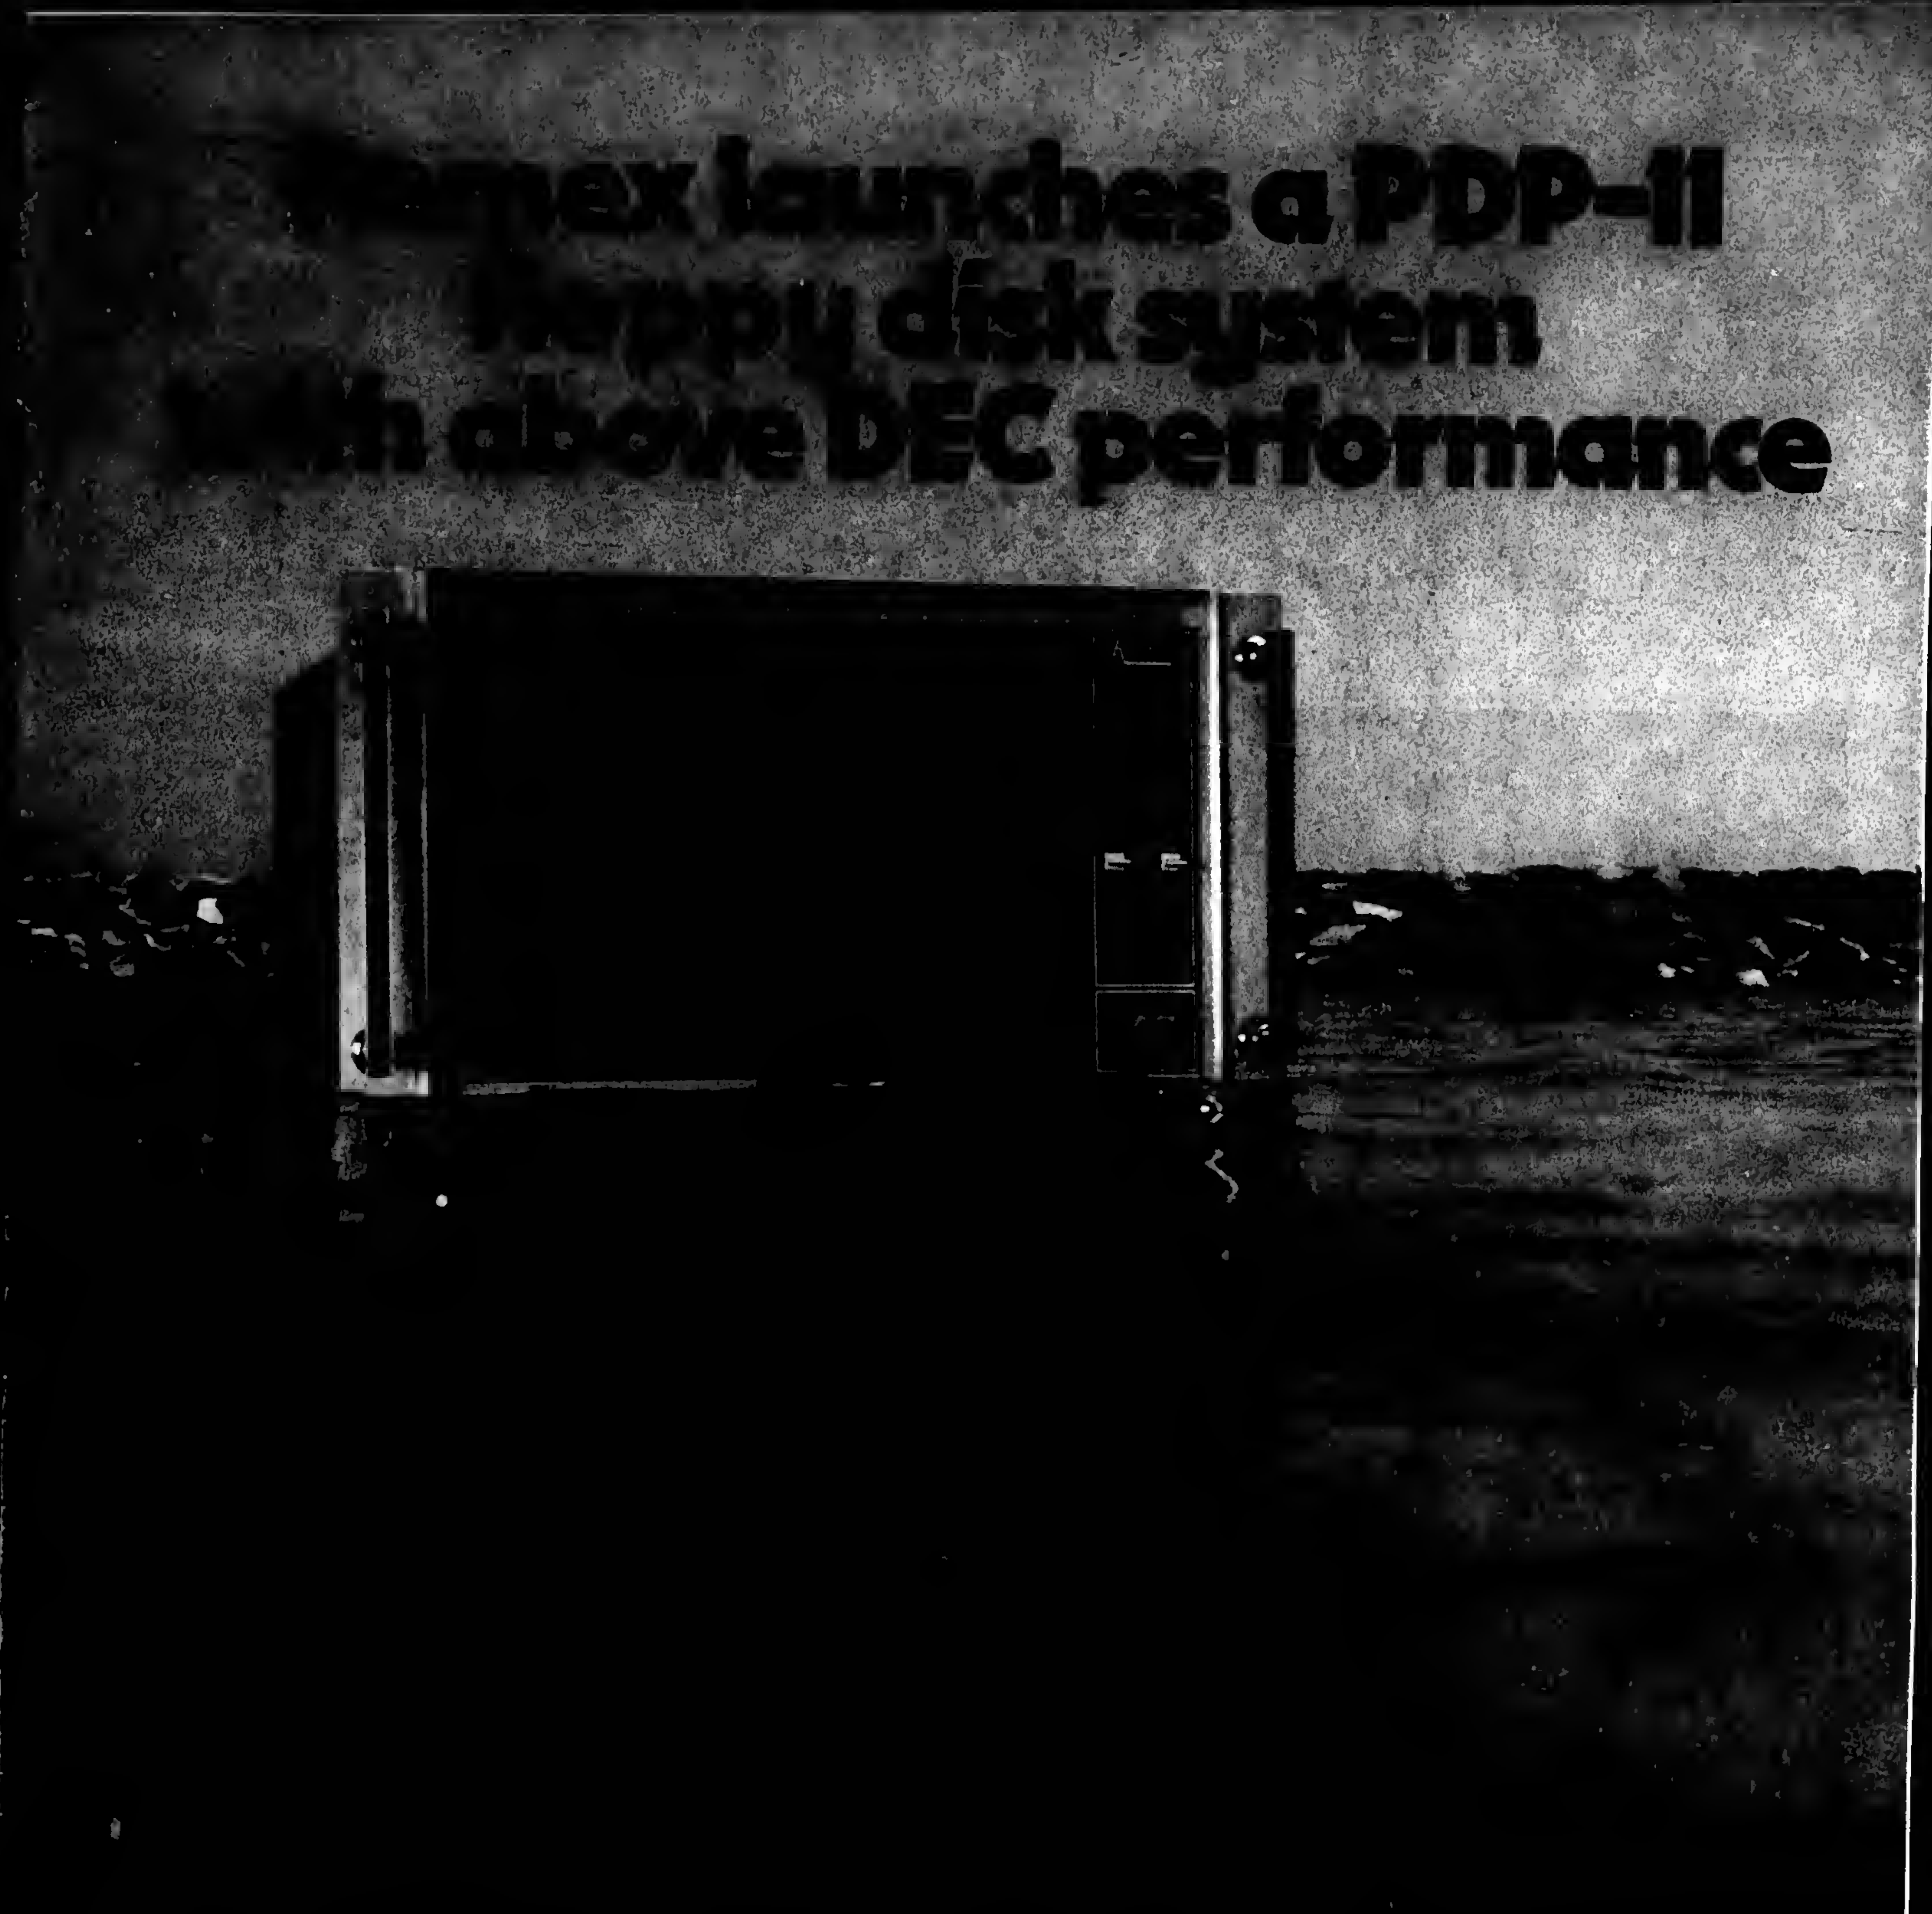
If the personal penalties for management violation of the Employee Retirement Income Security Act of 1974 have you worried, then take heart.

Wang has 360/370, Burroughs, Honeywell and Univac, ERISA software, designed, installed and running, coast to coast, safeguarding the pensions of more than one million workers and protecting the careers of their managers.

For more on ERISA, call Joe Nestor (617) 851-4111, Wang Laboratories, Lowell, MA 01851. In California, call Carl Tarascio (714) 631-0138.

WANG

Remex launches a PDP-11 floppy disk system with above DEC performance



It's an integrated hardware/software system so compatible with DEC's RT-11 operating system that we named it Remex-11.

It connects directly to the PDP-11 or LSI-11 bus, offers about 25 percent greater storage capacity than Digital's RX11 disk system, and it costs less.

In addition, the Remex-11 provides faster throughput than standard DEC configurations with more efficient sectoring, by far. A single command transfers up to 65K words.

A full array of switches and indicators makes operation easy.

If you're a PDP-11 user, set sail for Remex. High quality peripherals and their service are our only business. If you've bought any of our more than 100,000 punched tape and flexible disk units, you know what we mean.

Contact your nearest Remex Sales Office or the factory direct: P.O. Box C-19533, 1733 Alton St., Irvine, CA 92713. Phone: (714) 557-6860

'Centre-US' Data Base Positions 110,000 Places

ELMHURST, Ill. — The latest edition of Centre-US, a magnetic tape-oriented data base of geography for the U.S., contains coordinates and geocodes for 110,000 places in this country, according to Centre Mark Co., the vendor.

Each of the 126-character records contains fully spelled place name, latitude/longitude coordinates and, if assigned, postal Zip Code, Standard Point Location Code (SPLC) and the Dun & Bradstreet state-county-city geocode.

The county records also include square-mile area, bounding rectangle coordinates and Federal Information Processing Standards (Fips) and IBM state-county numeric codes, a spokesman noted.

The file provides geographic logic for many distribution, vehicle control, marketing and automatic mapping programs for a wide spectrum of users. It is updated semiannually so that information such as Zip Codes is reasonably current, he added.

Centre-US can be furnished in most standard tape formats.

The initial tape and the first semiannual update cost $5,000. The subscription service to keep the file up to date after the first year costs $500 annually, Centre Mark Co. noted from 296 Elm Ave., Elmhurst, Ill. 60126.

RCC Net Adds Trades Analysis

PALO ALTO, Calif. — The Trades Analysis feature of the Liquidity Management System (LMS) on the Remote Computing Corp. time-sharing network provides a way of comparing investments in a portfolio with investment opportunities currently on the market, a spokesman said.

In supporting institutional portfolio managers in their trade or purchase decisions, the feature uses a large data base of market prices to determine yields from the purchase of specific investments, including short-term instruments, bonds, GNMA passthroughs and Agency and Treasury issues, he added.

To obtain an analysis, the user specifies the type of instrument desired, the minimum acceptable profit on a trade, the maturity range of purchased investments and their price ranges. The analyses can cover trades between securities of the same type or between securities of different types, the spokesman continued.

Users can refine the definitions of what they want by adding a reinvestment rate for interest income, ineligible security types, pickup-giveup spreads and similar constraints, he said.

The results of the system's analysis are reported as the five "best trades" for any investment now in the portfolio or the five "best buys" with a given instrument type.

Remote Computing has regional offices in the New York City area and in Los Angeles. It is headquartered at 1076 East Meadow Circle, Palo Alto, Calif. 94303.

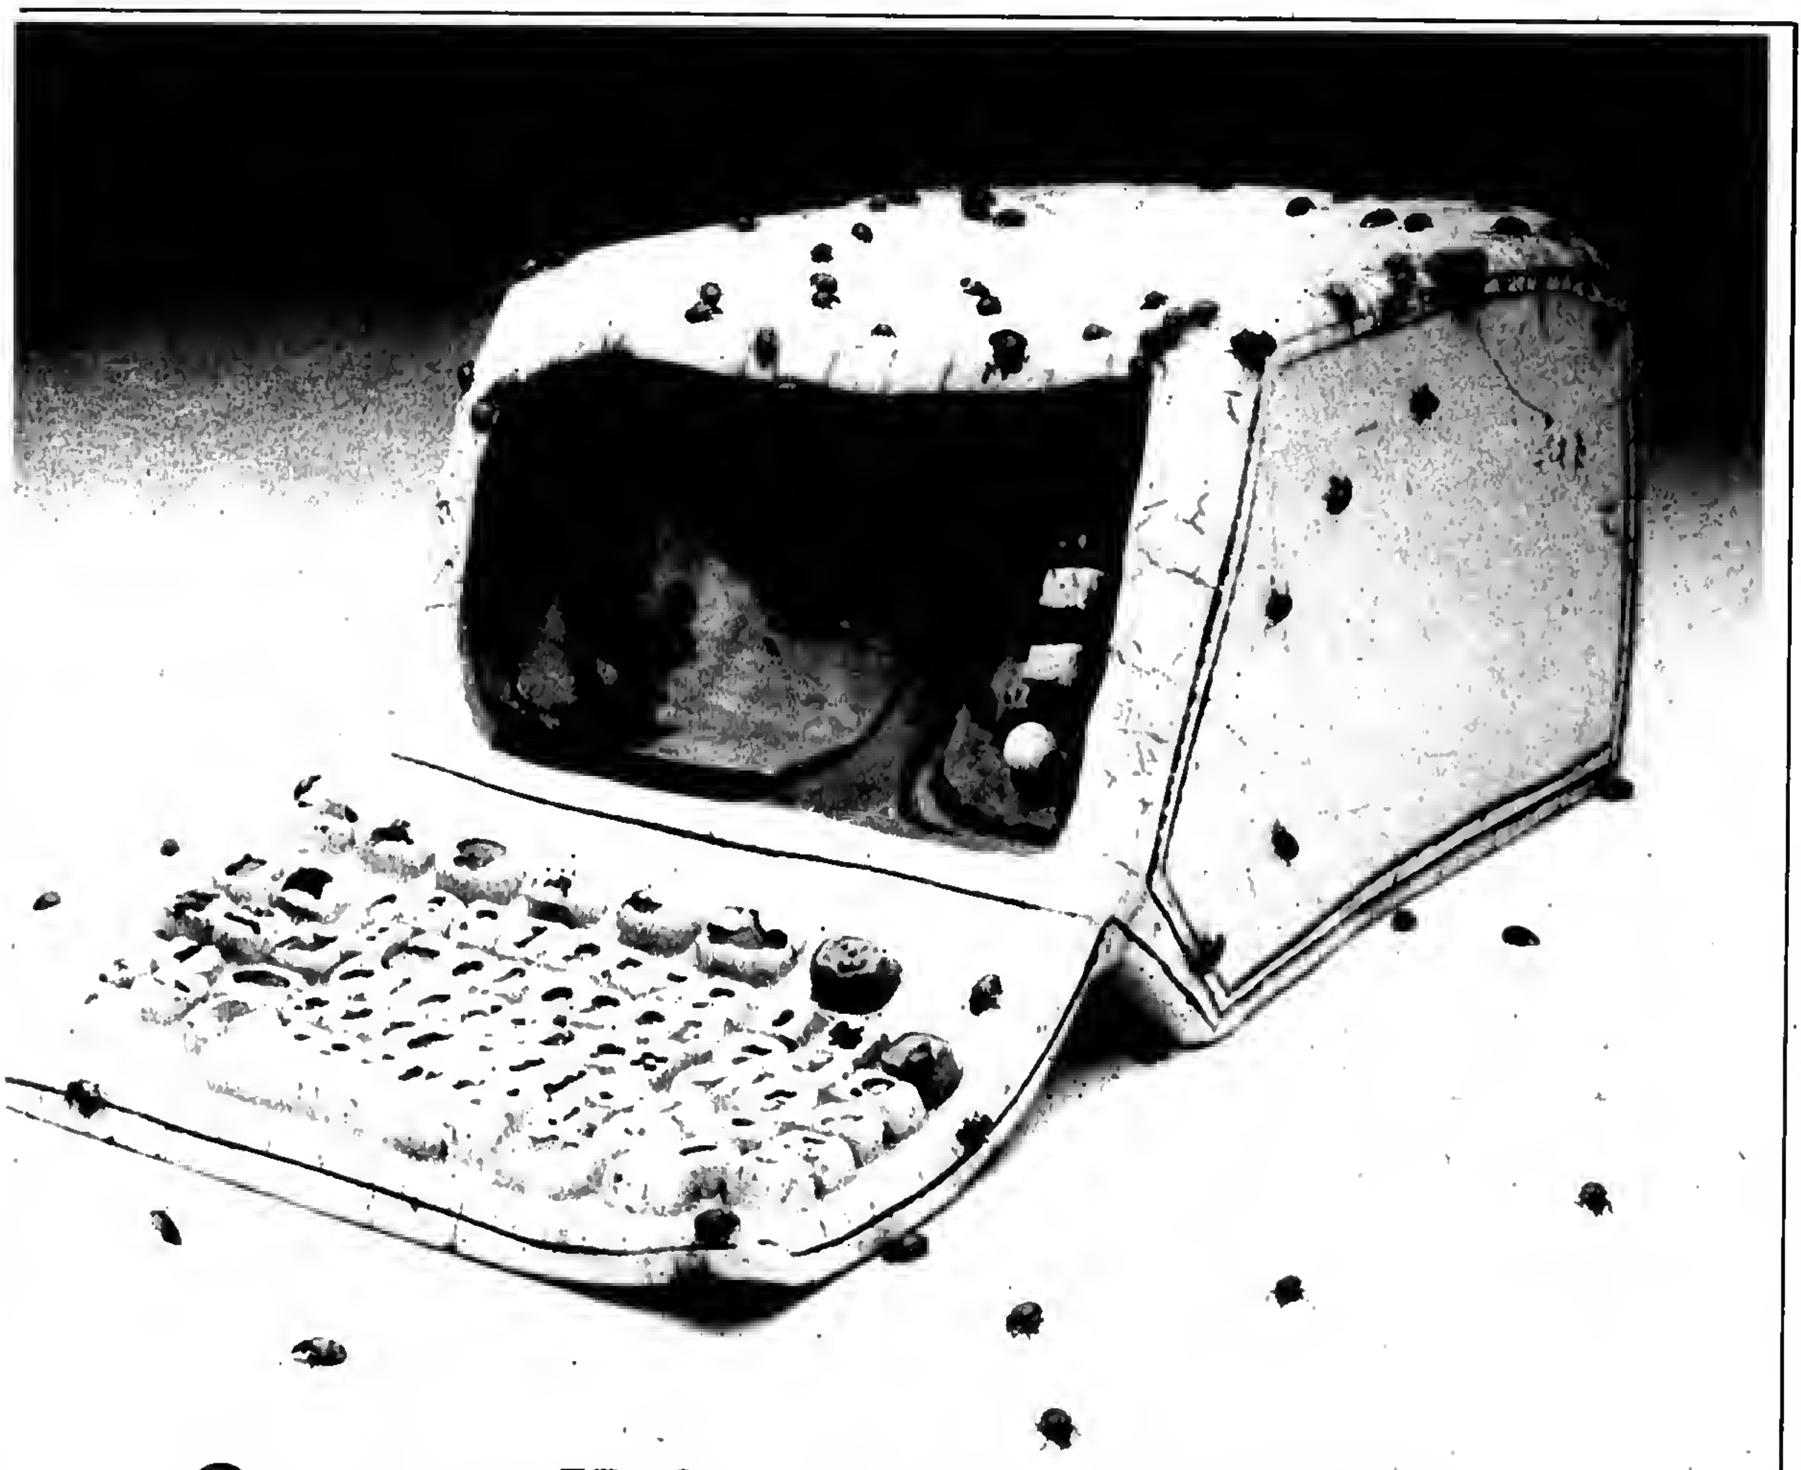
McAuto Service Runs MDs' Bills

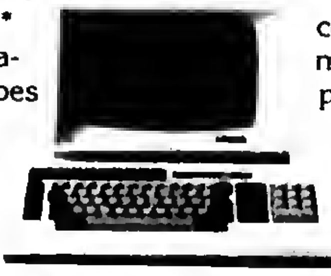
ST. LOUIS — McDonnell Douglas Automation Co. (McAuto) has extended the facilities available under its Hospital Services network to include Physician Data Services (PDS), an interactive financial system to handle accounts receivable and collections for medical groups and clinics.

PDS should help improve cash flows for these users, McAuto said from its headquarters here in St. Louis, Mo. 63166.

SEMINARS

Seminars on Production Planning Inventory Control Systems will be given by Management Technology Incorporated in Cincinnati, Ohio on Thursday, September 29 and in Grand Rapids, Michigan on Thursday October 6. Reservations are necessary. There is no charge to attend. For information contact Jerry Carter at (616) 531-5397 or write M.T.I., P.O. Box 8471, Kentwood, Michigan 49508.





Can your Uniscope debug itself? Our Harris 8210 can.

Our Harris* 8210 terminal emulates your Univac** Uniscope® at a very reasonable price. It also does things your Uniscope never dreamed of.

Like what? Like debugging. Instant problem diagnosis. Improving operator compatibility.

For instance, Harris terminals will let you pinpoint transmission problems between terminal and host computer.

Let you immediately display event codes describing line activities.

Let you make hard copy records to document intermittent problems.

Let you detect faulty network components, incorrect addressing, text inaccuracies.

Let you instantly diagnose any operational problem from text errors to addressing inaccuracies.

And Harris terminals are lightweight, compact. No glare, no heat, no noise. Result? Life's a lot pleasanter—and more productive—for your operators.

Service? Terminals are our only product. Naturally our service is good and fast.

Harris terminals. They could stop what's bugging you. Call or phone for details and a demonstration. **Harris Corporation, Data Communications Division, Daniel Webster Highway South, Nashua, NH 03060. 603-885-6685.**

Quick, which small computer has the fastest COBOL?

Wrong.

It's the Data General commercial ECLIPSE. By a wide margin. And you can quickly verify that fact by asking any other company to run benchmarks against our ECLIPSE COBOL. Then watch their expression.

ECLIPSE COBOL works with our commercial instruction set. Giving you the fastest execution speed of any small computer. And it's the only COBOL on a small computer that meets the ANSI '74 standard at the highest level. Which, in plain English, means you'll get more throughput.

Since our ECLIPSE computer can converse fluently with big computers, conversion is both fast and easy. The way we extend COBOL makes us look bigger than other small computers, too. INFOS, our extensive data management facility, is one example. It makes manipulation of data bases easy. And our debugger is interactive. It uses simple commands like "Compute" and "Display". Which gets programs up and through faster.

When it comes down to who has the small computers with the fastest COBOL, our commercial ECLIPSE systems speak for themselves. And since we give you a computer that talks fast, our people don't have to give you a lot of fast talk.

Write.

Mail to: Data General, Southboro, MA 01772

☐ Send me your manual, "Introduction to COBOL" and technical data sheets.

☐ Send me your brochure on the ECLIPSE computer systems with COBOL.

☐ Ask your sales representative to call.

Fortran Code Optimized For Vector, Array Processors

MARINA DEL REY, Calif. — The Vectorizer package from R&D Associates accepts standard Fortran programs and analyzes them to discover statements or sets of statements which can be rewritten to take advantage of vector or parallel architectures, according to a spokesman.

Developed by Massachusetts Computer Associates, the package appears to be useful in connection with either the 7600 or the Star systems from Control Data Corp., the Cray-1 from Cray Research, Inc. or the ASC from Texas Instruments.

The Vectorizer's analysis phase is "extremely machine-independent:' it looks for vectorization possibilities without regard for the architecture of the underlying machine," the spokesman said.

During code generation, however, the software "relies heavily" on the target machine's characteristics to produce optimized vector or array sequences, he noted.

Analyst Helps

Although the software produces improved code with no help from an analyst, it also produces diagnostics that enable an analyst to go further, making greater use of the vector or array processing capabilities of the target machine, he added.

In one benchmark that used a finite difference routine which made repeated passes over a large array, the same Fortran source code ran 2.1 times faster on the CDC 7600 and four times faster on the Cray-1 after vectorization than before, he claimed.

For the CDC 7600, the Vectorizer costs $95,000; for Cray-1, the cost is $105,000. Monthly rental agreements are also available from R&D Associates, which can be reached through P.O. Box 9695, Marina del Rey, Calif. 90291.

Package Eases PCB Graphics

BERKELEY, Calif. — PC50 from Second Source Industries is described as an interactive software package designed to run on the Tektronix 4051 graphics system to produce accurate, camera-ready layout art and documentation for printed circuit boards (PCB).

High-density double-sided or multilayer layouts, up to 30- by 40 in., are generated up to 10 times faster than is possible with common manual methods, a spokesman claimed.

Ground planes; solder mask and silk screen art; and drilling, fabrication and assembly drawings are also produced, he said.

The software works from a data base of PCB elements which can be customized to fit the designers' needs. These elements can be called, oriented, positioned with the system's joystick and displayed on the CRT.

Data is stored and later output to a Tektronix 4662 plotter at any user-specified scale. Editing facilities are said to simplify PCB revision; a special "draw-around" feature, for example, lets users capture and manipulate entire sections of a layout as a single entity, the spokesman noted.

PC50 runs on the Tektronix 4051 with 32K bytes of memory, a joystick and plotter, all of which is available from Second Source. The software itself costs $750 and can be ordered from the vendor at 735 Addison St., Berkeley, Calif. 94710.

Book Covers Documentation

ROCHELLE PARK, N.J. — *Organizing and Documenting Data Processing Information*, a 160-page book written by Thomas R. Gildersleeve, is available in paperback for $7.95.

The publisher is Hayden Book Co., 50 Essex St., Rochelle Park, N.J. 07662.

'PDMS' Runs Inquiries on Micro

BLACKSBURG, Va. — The interactive Personal Data Management System (PDMS) from Microwave Division of PBS Ltd. allows an Altair 8800B user to store, modify and retrieve information from floppy disks directly through a command language or through exits from Basic programs, according to a spokesman.

The data available to the user under PDMS can be a mixture of character fields or "tripleword" length integers, he said. Searches can be for specific information or for matches — or near-matches — of character strings, he added.

The commands available are in English; an operator with only secretarial skills can usually be trained in its use in less than an hour, the company claimed.

32K Memory

The current PDMS implementation is for the Altair 8800B with one or two floppy disks and a minimum 32K memory. Additional versions for cassette systems and for systems based on other microprocessors are under development.

Application packages utilizing PDMS as an access system are also being developed, Microwave said.

PDMS is available on an 8-in. floppy disk for $795. The package incudes a user's manual which contains a source listing of the program, Microwave said.

The company can be reached through P.O. Box 47, Blacksburg, Va. 24060.

Datapro Discusses DBMS

DELRAN, N.J. — "Data Base Management Systems: General Concepts and Planning Guidelines," a seminar for management personnel, data base administrators and systems planners, will be offered this fall by Datapro Research Corp.

The course will explain what data base management systems (DBMS) are all about and where their real economic advantages lie, a spokesman stated.

Costing $425 for Datapro subscribers and $475 for others, the seminars will be given in New York Sept. 28-30 and in late November; in Washington, D.C., on Oct. 12-14 and in December; in both Philadelphia and San Francisco Oct. 26-28; and in Chicago on Nov. 9-11.

Datapro is at 1805 Underwood Blvd., Delran, N.J. 08075.

'Isum,' Nova For Doctors

TRENTON, N.J. — A patient billing, accounting and payroll package for physicians' offices has been developed in Fortran by Isum for use of a 32K Data General Nova.

The facilities of the system are also available from Isum as a customized service, a spokesman added.

Hardware

The recommended hardware configuration includes a Micronova with 32K memory, 10M bytes of diskette storage, a Dasher printer and a CRT. Isum offers that system for $17,000 and the software for an additional $12,000.

Cost of the customized service, done here, is primarily a function of the volume of transactions, the spokesman explained from Isum's offices at 53 N. Post Road, RR1, Trenton, N.J. 08648.

DBMS Project Previewed

SCHILLER PARK, Ill. — A multimedia training package called "The Data Base System Project," now available from Deltak, Inc., is the first of a series of courses called "Developing Data Base Systems," a spokesman said.

The series includes the major steps involved in the design and development of a data base system up to, but not including, programming. The "Project" package can be used to train those responsible for starting and controlling a project, he said.

The first course in the package introduces the seven major steps in a data base project, and the second course shows how to carry out the planning phase.

The package is available for purchase or for rent under Deltak's Resource 12 library plan, he said from 9950 W. Lawrence Ave., Schiller Park, Ill. 60176.

'Tell-A-Graf' Eases Chart Chores

SAN DIEGO, Calif.— The Tell-A-Graf software from Integrated Software Systems Corp. (Issco) enables clerical, non-DP trained personnel to generate "publication quality" graphics on any vector-mode graphic device linked to an IBM 370 running under OS/-VS, the vendor said.

The package does this, a spokeswoman explained, by combining a high level language processor interpreting English-like commands with the company's current Disspla graphics system software. Tell-A-Graf simplifies the commands needed to generate the graph and includes editing capabilities, she noted.

Once the user has provided formatting instructions and the data to be graphed, the system creates legends, if desired, and scales axes to fit the data. It positions headings and axis labels without operator intervention, she said.

Although still in Beta-test operations at selected user sites, with general release "about six months away," Tell-A-Graf is now available on the National CSS, Inc. remote-computing network, based in Norwalk, Conn.

When it is ready for distribution, the package will cost $19,500, Issco said from Suite G, 4186 Sorrento Valley Blvd., San Diego, Calif. 92121.

Loader Ready For CA Syfas

IRVINE, Calif. — A downline software loading capability now available from Computer Automation, Inc. permits users of the company's Syfa systems to transmit application programs and system software throughout a distributed network from a central point, according to a spokesman.

The transmission support has several advantages, he said. Among them are faster distribution of software as it is developed, better backup in case of machine failure and program loss at remote sites and simplified handling of software at the central site as it is being prepared for shipment to the other locations, he claimed.

The new utility, which is free to any synchronous communications-equipped Syfa user, permits loading of either source or object programs at the remote sites. Transmission of source code requires availability of a compiler at the remote location if the program is to be made operational by the staff there.

Computer Automation is at 18651 Von Karman, Irvine, Calif. 92713.

Cassettes Teach BAL for IBM 3

BOWIE, Md. — "Basic Assembly Language Programming for the IBM System 3," a self-instructional package consisting of six audio cassettes and a workbook, requires no prior knowledge of BAL, according to the vendor, the Robert J. Brady Co.

Students are introduced to number systems and basic data concepts. Building on this foundation, the course includes laboratory sessions to be run on an IBM 3, sample printouts, an Ebcdic conversion chart, a hexadecimal addition table and a list of mnemonics, a spokesman said.

The course concludes with a section on subroutines and an appendix outlining a range of debugging tips. The complete package is available for $250 from Brady here in Bowie, Md. 20715.

All figures based on latest available Datapro survey.

Here's why our users rate DATACOM/DC so high:

"In terms of total satisfaction, DATACOM/DC measured up completely to what we wanted and gave us more than we expected."
—David Hughes, Manager of Systems and Programming, Mass. State Lottery.

"When we installed DATACOM/DC, we experienced a 30% increase in throughput; more important, we eliminated downtime."
—Gary Dyer, Data Processing Director, Blue Cross of Idaho.

"DATACOM/DC was extremely easy to install and we had no TP experience."
—David Harp, Director of Data Processing, New Castle County, Del.

"My programmers say DATACOM/DC is very easy to use; as simple as writing a COBOL program. The documentation also is very good. Technical enough for the technical people yet simple enough for management people to understand."
—Harvey Kennedy, Vice President and Director of Management Systems, Southern Baptist Annuity Board (Dallas).

"Vendor technical support is Insyte's largest shining star. The support people are unparalleled in the industry."
—Ben Driver, Data Base/Data Communications Software Manager, Brockman On-Line Systems (Houston).

Math Drill, Practice Uses HIS Level 66 CPU

WALTHAM, Mass. — Schools with Honeywell Information Systems, Inc. large-scale Series 6000 and Level 66 systems can help their math teachers through installation of the Individualized Mathematics Instruction (IMI/66) package from HIS.

The software consists of an integrated set of programs that function as an arithmetic drill and practice system and as an arithmetic test generator.

It also maintains student records dealing with individual and class achievement, enabling the instructor to provide more personal attention to each student, a spokesman said.

IMI/66 does not include any facilities with which an instructor could write any new examples for drill and practice. A "systems-type" person might be able to get into the code, however, and replace some of the current problems with new ones, he said.

The basic system provides a student with drill practice while he is at a terminal connected to the large-scale CPU. Problems can be displayed or printed for student response; the program compares the response with correct answers, replies to the student and presents another problem.

The interactive test-generation system produces tests covering the basic skills of arithmetic. Controlled by the instructor, this portion of the system can tailor tests for each student, building them of any combination of problems selected from 210 learning objectives, the spokesman said.

Written in Fortran, IMI/66 evolved from Model 1600 and Model 400 time-sharing systems. It requires 26K words of main memory and runs in time-sharing mode under HIS Gcos environment.

The math package is available in source and object code form on a fully paid-up license for $1,900, HIS added from its Inquiry Center, 200 Smith St., Waltham, Mass. 02154.

Micro Program System Includes Disk Hardware

SANTA CLARA, Calif. — A "universal" microprocessor development system that includes a dual-floppy disk drive, an interface circuit subsystem card, a read-only memory (ROM) card containing firmware and a disk operating system on a diskette, the IPC-16P/840 package is available from National Semiconductor Corp.

Initially designed for use with National Semi's Pace units, the system can be used with the company's SC/MP and other microprocessors as well, a spokesman noted.

The operating system includes a file management capability, support for assembly programs, editors, linking loaders, utility programs and diagnostic routines, he added.

It can be installed on any IPC-16P Pace development system with 12K words of random-access memory and heavy-duty power supply.

The interface card and the ROM card can be inserted in "any available slots" in the Pace system. The interface card provides protocol for the dual disk drive and an optional CRT: firmware, located on the card, operates the disk mechanisms, formats data and controls data transfers, he said.

A ROM-resident monitor provides the user wth control over system configuration and program execution. Single-word commands supply linkage to paper tape loader, card reader loader, diskettes and a debugging subsystem, the spokesman said.

The complete IPC-16P/840 package, including the disk drive, costs $4,500. Delivery is 30 days after receipt of order, National Semi's Microcomputer Systems Group said from 2900 Semiconductor Drive, Santa Clara, Calif. 95051.

T-bar's new flexibility for switching computer peripherals.

Available for all mainframe and minicomputers, including

Bank Installs Direct Link to 'Fed' CPU

By Stewart M. Shacter
Special to CW

ST. PAUL, Minn. — The First National Bank of St. Paul here has developed a processor-to-processor link between its minicomputers and the Federal Reserve Bank's communications switch in Minneapolis.

This link is between the bank's Digital Equipment Corp. PDP-11 processors and the "Fed's" IBM 370/145 with an IBM 3704 front end.

The direct communications link has increased the efficiency of transmitting financial data through the Federal Reserve System by allowing a greater transaction volume without an increase in staff size. For example, the bank has increased the daily number of transfers from 450 to 600, totaling an average of $600 million.

In addition to dropping the per-unit cost of each transfer through the Fed by 30%, the system has provided better service to St. Paul and its customers, permitted greater accuracy of data and, therefore, increased the security of the system.

Application System

The bank uses computer communications in its funds transfer operations, and the Federal Reserve Communication System (Fed Wire) is a major route for domestic money transfers.

Until recently, all electronic links between member banks and the Federal Reserve regional centers were terminal-oriented, with paper tape readers at member banks providing the fastest interface available.

To efficiently handle the increasing volumes of funds transfers, it became necessary to replace this terminal interface with higher speed processor links.

The First National Bank had previously developed a minicomputer-based Fed Write application system. Running a a PDP-11/45 RSTS system, the application programs provide for data entry, internal controls, management reports and an interface to the checking system.

This application system, installed in June 1975, greatly reduced the internal handling time for the processing of Fed Wires. The interface with the Fed was accomplished by having the system punch a paper tape that was input into a paper tape reader tied directly to the Federal Reserve Bank's equipment.

The automated application and the computer-assisted terminal link served the bank until the volume of transfers began to approach the functional capacity of the terminal. At that point, the bank began to study the feasability of a direct processor link to its Federal Reserve regional communications switch.

Linking the application processor directly to the Fed system was initially considered the best approach for establishing the link. However, it was quickly proven the time-sharing system could not efficiently handle both the application and communications.

Further, not only did the bank want an inexpensive system, but one which was versatile enough to be expanded for future needs. Commercially available message switching "front ends" which were studied were either too expensive or too inflexible.

User in Control

The bank decided to purchase a PDP-11/10 processor and write the communications software in-house. This software, which runs stand-alone on the processors, provides all the necessary functions normally associated with an operating system such as device handling, line protocol support and dynamic management of available memory.

As a front end for the PDP-11/45 RSTS application computer, the PDP-11/10 acts as a buffer, protecting the user-oriented RSTS system from the constant interrupts of external communications lines.

Since the RSTS system controls the communication line between itself and the front end, the movement of information between the PDP-11/45 and PDP/11/10 does not degrade the service given to terminal users of the time-sharing system.

Special features above the necessary communication facilities were included to allow for strict control over the communications lines. From the application terminals operators can "disable" communications, causing the front end to refuse all requests from outside networks.

Currently, the Fed Wire network is the only system to which the bank's frontend is linked. Other funds transfer networks are beginning to allow for processor-to-processor links, and the front end could be modified to handle them also.

Down-Line Loading

A significant savings was realized by down-line loading the communications software from the 11/45 to the 11/10. This means that the communications program is stored on disk on the 11/45.

(*Continued on Page 50*)

Serial Box Holds Alpha Bits

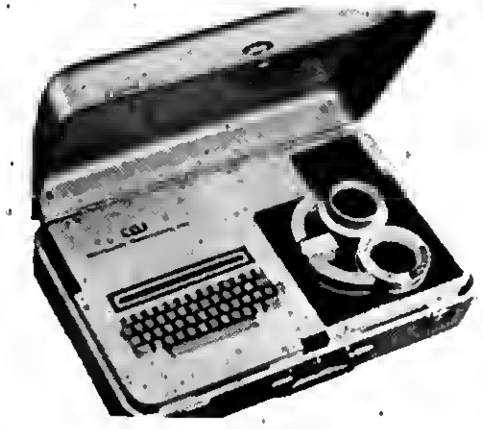
LANHAM, Md. — The Serial Box is a portable, interactive terminal capable of interfacing to mini- or microcomputers through its RS-232 or current-loop port, according to its vendor, Computer Operations, Inc.

The terminal comes in two versions: the CO-4410 and the CO-4420, both of which can transmit data at selectable speeds from 110- to 9,600 bit/sec.

The CO-4420 consists of a direct-access tape drive with a capacity of 1M byte, a full Ascii keyboard, 40-character plasma display, the RS-232 interface and a microprocessor controller, Computer Operations said.

The CO-4410 does not come with the display or keyboard. It was designed to add direct-access mass storage capability to any CRT or hard-copy terminal via a second RS-232 or current-loop port, the firm noted.

The Model 4420 was designed for noncomputer room enviroments and in applications such as data loading/logging in the field, oil exploration and medical and university environments.



Serial Box

Prices are $3,850 for the Model CO-4420 and $2,850 for the CO-4410. Computer Operations is at 9700-B Palmer Highway, Lanham, Md. 20801.

Correction

NCR Corp.'s Distributed Network Architecture (DNA) [CW, Aug. 22] is not based on the CCITT X.25 protocol recommendation, but will provide the means to derive links from public data networks based on X.25. In addition, NCR will make a commitment to be compatible with non-NCR communications and networks; the company will announce this month how the 721 communications processor, which "has been in existence for some time," will fit into the DNA concept.

BASF invented magnetic tape 40 years before Memorex broke their first glass.

Back in 1932, when Hoover was still president and radio was the big noise in home entertainment, BASF invented magnetic tape and the technology that made today's high-density data processing media possible. The state of the art has evolved considerably since then, and we're no longer alone in the magnetic media field. That's why, while we know we were first, we'd rather you know that we're the best. And we've put more effort into being the best than anyone else in the business. That's why we design and manufacture our own testing apparatus, and why we use up 75,000 miles of computer tape every year in our development department. Because at BASF, "good enough" just isn't good enough. We've been around for a long time . . . long enough to know that it's what we've done for you lately that counts. Ask our customers . . . most people who choose BASF make it their only choice. BASF Systems, Bedford, Massachusetts 01730.

BASF The Original.

Computer Tapes Disk Packs Flexydisks Word Processing Supplies

Harris 1600 Gets Floppies

DALLAS – Harris Corp. has added flexible disk storage for its 1600 family of remote batch terminals and distributed processing systems.

The 1600 diskettes can be advantageous in remote data collection store-and-forward applications employing IBM 3741 or equivalent technology, according to a spokesman for Harris' Data Communications Division here.

The diskettes can be used for mass storage autoload (initial program load); 3741-compatible read; and media conversion such as diskette-to-print, diskette-to-tape and diskette-to-cartridge disk, he said.

As many as three controllers and nine flexible disk drives can be used with larger 1600 systems to provide up to 2.2M bytes of flexible disk storage. Each diskette has a capacity of 1,898 128-char. records for a total of 242,944 char. per diskette, the spokesman noted.

The diskettes can operate under Harris' Communications Operating System (COS) or Extended Communications Operating System.

Either system can process single or multivolume diskettes. IBM 3741-compatible data sets may be processed and transferred without regard to multivolume indicators, volume sequence or end-of-file indicators, Harris claimed.

The Harris 1662 flexible disk controller and F662 flexible disk drives can be purchased for $2,200 each. A three-year lease for a single controller and drive, including maintenance, is $105/mo, the spokesman noted from 11262 Indian Trail, P.O. Box 44076, Dallas, Texas 75234.

Unit Allows Speed Upgrade

ROCKVILLE, Md. – Syntech Corp. has introduced the MPB-200C, a character-oriented converter/buffer said to allow most asynchronous communications systems to be upgraded to the higher speeds of synchronous operation.

The device can be used in terminal-to-terminal or computer-to-terminal applications operating on the dial-up network or on point-to-point and multipoint private lines, according to Syntech.

It will operate in full- or half-duplex modes as well as in a simplex mode on two- or four-wire lines as required by the attached modem, a spokesman noted.

In operation, the MPB-200C accepts machine- or hand-keyed data in an asynchronous character format at transmission speeds from 1,200- to 9,600 bit/sec. It accepts synchronous data from the modem receiver and delivers it to the terminal or CPU in the original format, but at the higher transmission rate, Syntech said.

The converter/buffer requires no adjustments except for the selection of the desired operating speed, according to the firm. It comes with an EIA cable and interface and costs $500, the spokesman said from 11810 Parklawn Drive, Rockville, Md. 20852.

Bank Links CPU Directly to Fed

(Continued from Page 47)

Whenever it is necessary to reload the system (because of testing or failure recovery), a new copy of the communications program is sent down the communications line to the 11/10, where it is loaded into memory through use of a down-line loading bootstrap.

Because this procedure is needed only rarely (perhaps twice per month), the four- to five-minute reload time is not a factor. However, because it eliminates the need for disk space on the front-end, the resulting system is cheaper and more reliable.

Finally, the ultimate point of interaction between the application system and the communication system had to allow both systems controlled access to the relevant information.

A program running in "detached" mode on the application computer continually monitors the application transaction files for outgoing messages and periodically polls the front end for incoming messages.

Outgoing messages are not transmitted until the users "release" them after performing application balancing procedures. Incoming messages are immediately put into the application transaction files, where they are available for review by the users.

For the systems now implemented, the Digital Data Communications Message Protocol (DDCMP) is used between the two in-house DEC computers, and the IBM 2740-2 protocol is implemented between the bank and the Federal Reserve district switch in Minneapolis.

The front end software is written in Macro, the assembler language of PDP-11 processors. The communications handler for the RSTS system is written in a high-level language developed by the bank to provide for facilities not available in the DEC Basic-Plus language. The code is translated into standard Basic-Plus for execution.

The PDP-11/45 RSTS mini supports a variety of applications including a securities trading and accounting system and a federal funds information system. It is anticipated that these current and other future systems will make use of the new communications facilities.

Implementation of the system has resulted in both cost savings and operational advantages.

Shacter is senior systems analyst at the First National Bank of St. Paul. He is responsible for the design and implementation of various financial systems, including the new front-end communications system.

The pioneer of small business computers now makes small business computers.

Actually, Basic/Four Corporation has been making its own central processing units since August, 1976. We now make our own terminals, too.

We wanted tighter rein on manufacturing and testing, choice of the latest components, total control of quality, production and delivery. So we could offer even more reliable, better products.

Now we do.

The Basic/Four® CPU's new semiconductor memory means 40% faster cycle time, down from 1 microsecond to 600 nanoseconds. New models make expansion even easier, accommodating one to 16 terminals. There are other improvements, too, with more to come.

And the Basic/Four systems we make have been running, bug-free. Just like before – only better. The best small business computers available.

All-around simplicity

We also made sure our system would be the easiest to install. And operate.

The software uses BUSINESS BASIC. And we have applications modules that are preplanned and packaged, including such eminently usable programs as CBS (Comprehensive Business System) and EASY, an exception analysis system. Plus a multitude of specialty packages. For hospitals, insurance, travel agencies, bond brokers, banking, the apparel industry, trucking, publishing – literally dozens, and more on the way.

Full time commitment

Our specialty is small business computers; it engages our full attention, dedication and effort. And, of course, as the pioneer, we've been at it longer. Long enough to have established through SORBUS INC., our sister MAI company, a national network of support and service, 24-hours a day, if needed.

All this leadtime and concentration keeps us ahead.

And now we make our own. So we *know* we're offering the best.

If you'd like to know more, call or write:
Basic/Four Corporation,
18552 MacArthur Blvd.,
Irvine, CA 92714

Look to the pioneer

Ever since we pioneered the field, our operating system has been acknowledged as the best of any small business computer. It had to be – because our systems were always interactive, even when others were batch.

Nowadays, everyone in the field is talking "transaction processing" – following our lead, some six years later!

Chip Controller Converts Data To SDLC, HDLC and ADCCP

HAUPPAUGE, N.Y.—Standard Microsystems Corp. (SMC) has introduced a programmable MOS/LSI chip controller that places data in IBM's Synchronoos Data Link Control (SDLC) and other high-level protocols.

The COM 5025 controller is a 40-pin monolithic integrated circuit utilizing an n-channel silicon gate process that can replace op to 300 integrated circuits and operate at speeds up to 2M bit/sec, SMC said.

The controller was designed for OEMs, but end users can utilize it in their systems' components with appropriate software changes or additions, according to a spokesman.

The device is a universal transmitter receiver for dedicated control and implementation of all major protocols including bit-oriented types such as SDLC, Higher Level Data Link Control (HDLC) and the Advanced Data Commonications Control Procedure (ADCCP), as well as byte-oriented protocols soch as Bisynch, SMC claimed.

The COM 5025 is the first programmable chip controller approved for these protocols and the only one that can process both SDLC and HDLC protocols, according to SMC.

Compatible with 8- or 16-bit processors, the TTL-compatible onit contains selectable protocols and a tristate I/O bus, SMC said.

Double Buffering

The data, statos and control registers are double boffered. Full- or half-duplex operation is provided by means of independent transmitter and receiver clocks, the spokesman added.

Data lengths are individually selectable for receiver and transmitter from 1- to 8 bits. Data, statos and control registers are linked to a master reset which reportedly initializes them to the SDLC protocol on power-up.

The controller of the device is responsible for all higher level decisions and interpretation of some fields within message frames, SMC stated.

For bit-oriented protocols such as SDLC, HDLC and ADCCP, the COM 5025 provides bit stuffing and stripping, automatic frame character detection and generation and residoe handling, SMC said.

Options for bit protocols include variable-length data (1- to 8-bit bytes), error checking — 16-bit polynomial cyclical redondancy character (CRC) or CCITT, primary or secondary station address mode, extendable address field to any nomber of bytes, extendable control field to 2 bytes and idle mode to transmit flag characters or mark the line.

For byte-oriented protocols, the COM 5025 featores automatic detection and generation of Sync characters. Options such as variable-length data, variable Sync characters (5-, 6-, 7- or 8 bits) and error checking (16-bit polynomial CRC or CCITT, as well as odd/even parity, deletion of leading Sync characters after synchronization and an idle mode to transmit Sync characters or to mark the line are also provided, SMC noted.

The multiprotocol controllers cost $94 each in single quantities and $62 each in qoantities of 250, the spokesman noted from SMC at 93 Marcus Blvd., Haoppaoge, N.Y. 11787.

Conference to Mull SNA

CAMBRIDGE, Mass.— A two-day conference on the impact of IBM's Systems Network Architecture (SNA) will be held Sept. 20-21 in New York by The Yankee Group.

Aimed at "osers who must make white-knuckle decisions over the next year" related to SNA, the conference will include discussions on such topics as the mainframe goals of SNA; growth in networking; transmission facilities to be offered by Satellite Business Systems; terminal trade-offs; and considerations of the large user.

Called "The IBM Grand Design: SNA, SDLC and SBS," the conference will be held at the Harvard Club in New York. Registration for the two-day meeting is $550. Further details are available from The Yankee Group, Box 43, Cambridge, Mass. 02138.

Yes, Art did develop Graphware® I: Specifically to improve the output from your electrostatic plotter.

A typical plot could take several minutes to produce on-line from your computer, because your computer uses a very rigid "compute-bound" method of changing a vector format to a raster format. Add to that the asynchronous nature of computer output — the stopping and starting — while the plotter waits for more data — and you've obviously been getting somewhat less than ideal plots, and wasting valuable CPU time.

Graphware I has changed all that. Vector-end-point data is converted into raster data — outside of the computer — in a nanosecond-speed, control-store microprocessor. Data is passed directly to Graphware where the conversion takes place. The computer moves to other tasks;

Graphware I processes the data for high-speed synchronous output to the plotter. The plots look perfect..And the whole process is accomplished two to five times faster.

The blackboard shows the old as well as new methods of plotting. As you can see, data transmission is cut to an absolute minimum with Graphware I. And, because Graphware is a dedicated combination of firmware and hardware, not just another computer with specialized software, it will improve the output of any electrostatic — yours, ours, theirs.

Simple? You bet. Efficient? There's no comparison. Available? Only from Art.

varian

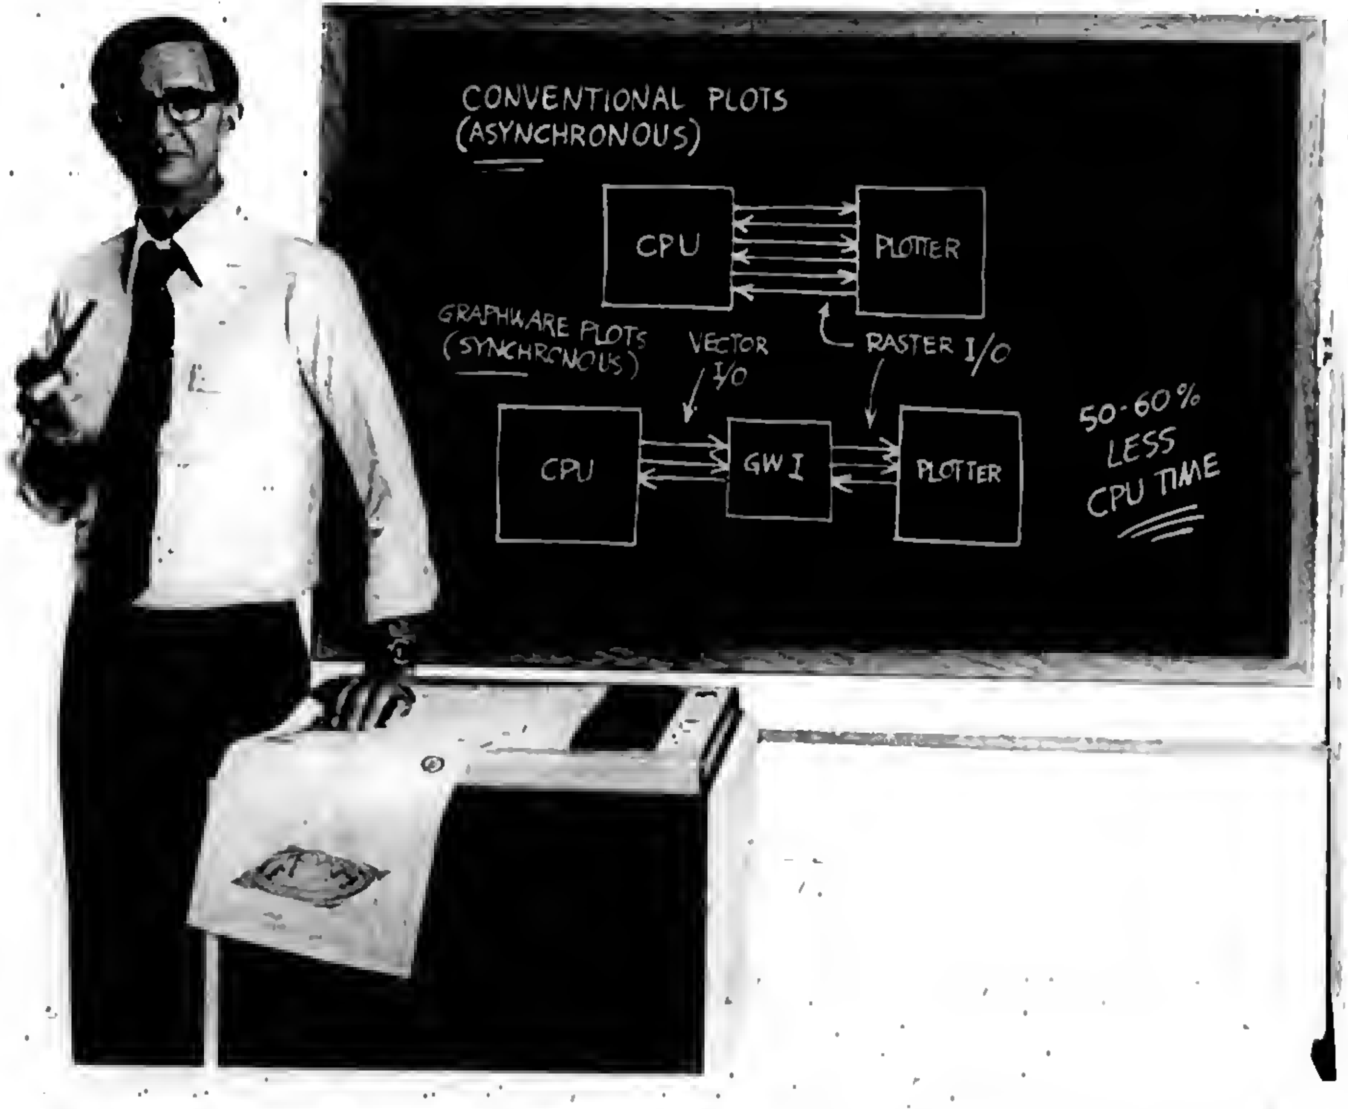
Palo Alto, CA 94303
(415) 494-3004

I'm Art Bliss.
I developed a hardware vector-to-raster converter for electrostatic plotters.
I call it HVR.
Marketing wants to call it "Graphware® I".
You'll call it about time.



Controller Eliminates TTYS

CHATSWORTH, Calif. — The Model 180 multichannel data logger from Micom Systems, Inc. is an intelligent terminal controller that reportedly permits up to eight pieces of test equipment, each producing a printed output log, to share a single teletypewriter (TTY).

The Model 180 is equally suited for use with computer systems, data concentrator systems, switching systems or any other type of intelligent asynchronous controller provided with a statistics output or operator's console interface, Micom said.

Each of the operator's console or test equipment log output interface is connected to one of eight ports on the Model 180; each of the ports is capable of receiving messages concurrently at up to 300 bit/sec, according to the firm.

The port connecting the terminal is switch-selectable to operate at 110-, 150-, 300- or 1,200 bit/sec.

The terminal used with the controller/logger can be attached remotely through modems, permitting a single terminal using one telephone line to monitor several remotely located pieces of equipment or intelligent controllers, Micom noted.

The device comes with serial asynchronous RS-232C channel interfaces; current loop interfaces are also available, a spokesman noted.

The Model 180 multichannel data logger costs $2,600 from Micom at 9551 Irondale Ave., Chatsworth, Calif. 91311.

Oscilloscope/Terminal Duo Processes Waveform Data

BEAVERTON, Ore. — Tektronix, Inc. has introduced a waveform processing system consisting of its digital processing oscilloscope and the Tektronix 4051 intelligent graphics terminal. The system provides waveform acquisition, digitizing, processing and display of the data.

Tektronix Waveform Processing System

The digital processing oscilloscope portion of the system is based on the 250 MHz Tektronix 7704A oscilloscope. Waveform digitizing and data storage facilities (512 data point/trace) for up to four traces are added to the basic oscilloscope, the company said.

The digitized waveform is displayed on the 7704A's CRT along with alphanumeric messages such as waveform scale factors.

Broad waveform acquisition capabilities are available by selecting from the 7000 series of amplifier time base, spectrum analyzer, digital multimeter and counter plug-ins, Tektronix noted.

Waveform calculations such as addition, multiplication, integration, differentiation, fast Fourier transform, inverse Fourier transform are performed on the 4051 intelligent terminal using the Plot 50 programming language.

Up to 32K bytes of working memory are available on the 4051 plus a 300K-byte cartridge tape unit. Other features include 20 user-definable functions, 10 line editor functions, a 128-character Ascii keyboard with upper and lower case, and IEEE 488 1975 interface, Tektronix stated.

Price of the system with the digital processing oscilloscope, 4051 intelligent graphics terminal and 32K bytes of memory is $28,505.

The 4631 hard-copy unit adds $4,295 and the data communications interface for the 4051 costs $1,500. The system has a 20-week delivery schedule from the firm, which can be reached through P.O. Box 500, Beaverton, Ore. 97077.

Qualterm Unit Portable

MOUNTAIN VIEW, Calif. — Qualterm Terminals has introduced two portable desktop versions of its daisy wheel-equipped 55 char./sec communications terminal for business data communications applications.

The keyboard/printer QT-P55 and the receive-only QT-R55 have been reduced in size and weight to less than 50 pounds, Qualterm said.

Transmission speed can be either 600- or 1,200 bit/sec.

The QT-P55 costs $4,450 and the QT-R55 costs $4,200; lease prices are $131/mo and $124/mo respectively on 27-month plans.

The firm is at 453 Ravendale Ave., Mountain View, Calif. 94043.

32-BIT PROFITABILITY

Profit from our 32-bit experience.

Scores of customers are taking advantage of our lead in 32-bit design right now, because we were there first . . . with the first mini with true 32-bit architecture. Hundreds of Interdata Megamini® computers have been working throughout the world since 1973.

Interdata's 8/32 computer processes data at one-half the speed of the IBM 370/158, for about one-tenth the cost. And the Model 7/32 offers even greater economies. With our Multiport Memory System, up to 14 processors can share a single memory bank, increasing throughput and processor-to-processor operation even further.

And, although they cost as little as the 16-bit DEC 11/70 or DG Eclipse, Interdata's Megaminis are the only low-priced computers with no constraint on program size. That's just one benefit of 32-bit architecture.

You also get 219 IBM-like standard instructions, and can create even more of your own with up to 512 words of Interdata Writable Control Store, raising throughput by a factor of five. And for still greater throughput, Interdata's exclusive Hardware Floating Point option improves the speed of scientific calculations ten times faster than software-bound minis.

Send me 1977 specs on your 7/32 and 8/32 Processors and field proven software.

"IDMS has the best vendor support"*

***say users in Datapro study**

In the fourth annual Datapro Research survey of software users, Cullinane IDMS was rated #1 among all Database Management Systems. #1 in Overall Satisfaction. #1 in Documentation. #1 in Ease of Use. #1 in Ease of Installation. #1 in Training. And #1 in Vendor Support.

Many of our users are literally running their businesses with IDMS. So when they want Vendor Support, they want it now, and often on site.

To us, Vendor Support isn't just having competent people answer the phone when you call. It's going the extra mile to be on-site, as soon as possible, if need be, And that includes weekends, holidays, Superbowl Sunday.

We do this with a dedicated team of computer trouble-shooting experts, headed by Ron McKinney. Most times the problem is not with IDMS. But like all our specialists, Ron and his group **care**. Care that your **whole** computer system works properly.

For the complete story – including technical literature on IDMS and a schedule of seminars for your area – send this coupon, or phone us at (617) 237-6600.

Think twice. You'll choose the database system users rate #1.

GDC Extends Line With Multiplexer, Modems

WILTON, Conn.— General Datacomm Industries, Inc. (GDC) has extended its communications product line with the introduction of a time-division multiplexer (TDM) and two modems.

The TDM-1253 multiplexer has the capacity for up to 12 data channels and can handle synchronous, asynchronous and isochronous data at channel speeds from 50 bit/sec to 72 bit/sec, according to GDC.

The multiplexer has local and remote system and channel alarms and diagnostics; it is said to accommodate high-speed lines from below 2,400 bit/sec up to 300 kbit/sec.

The unit can operate on voice-grade lines, wide-band circuits, satellite links and digital transmission networks including Bell's Digital Dataphone Service, GDC said.

Two optional circuit cards can be added to expand the capability of the TDM-1253: a plug-in test card to monitor and display the high-speed aggregate data stream error rate and, in systems where EIA controls are not required, a remote alarm and loopback card to provide remote alarm and test functions.

LSI Modems

In addition to the multiplexer, GDC also introduced two modems with LSI circuitry.

The GDC 2400 EP is a synchronous modem that can handle data transmitted at 2,400 bit/sec over two- or four-wire leased lines. It offers CCITT compatibility and has optional remote diagnostics for point-to-point and multipoint applications, signal loopback capabilities and a modem self-test function, according to the firm.

An optional synchronous remote control (SRC) plug-in module reportedly extends the remote diagnostic capability of the modem in multipoint applications.

GDC's 1200 EP modem functions asynchronously at speeds up to 1,200 bit/sec and synchronously at 600- or 1,200 bit/sec in half- or full-duplex modes over leased lines in point-to-point and multipoint applications.

Standard features of the 1200 EP include signal loopback diagnostics, selectable request-to-send/clear-to-send delays, selectable carrier detect levels and local and remote transmission speed control.

In synchronous applications, an optional SRC is available that is addressable from the central site to accept and decode diagnostic commands.

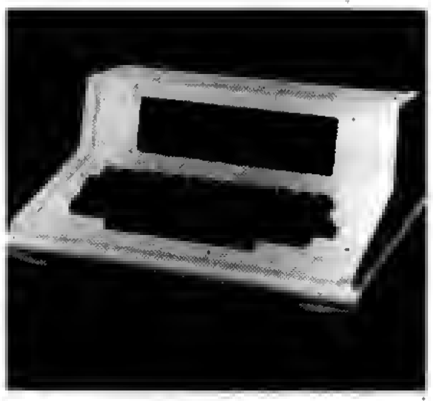
Both modems are available in stand-alone or rack-mounted configurations. The 2400 EP costs $1,072 and the 1200 EP costs $671. The SRC module for either modem costs $214.

The TDM-1253 multiplexer is priced at $1,950. GDC is at 131 Danbury Road, Wilton, Conn. 06897.

Transactor I Is CRT Alternative

GRANDVIEW, Mo. — Computerwise, Inc. has introduced a small alphanumeric display terminal designed as an alternative to a CRT.

The Transactor I consists of a single-line, 32-character gas discharge display with a 5 by 7 dot matrix and a 53-key teletypewriter-style keyboard.



Transactor I

It can be attached to computers with an RS-232 or 20mA current-loop interface.

Switches allow the user to select the operating mode including 110- to 9,600 bit/sec transmission; full or half duplex; even/odd or no parity; five to eight data bits; and one or two stop bits, Computerwise added.

Applications include retail sales, hospital patient accounting, general accounting, inventory control, computer programming, production control and instrument monitoring, according to the firm.

Price of standard Transactor I in quantity is $595. Computerwise is at 4006 E. 137th Terrace, Grandview, Mo. 64030.

New from Diablo:
1200 Baud/200 cps
Matrix Terminal.

4 to 5 times more productivity!

We're offering the most versatile 1200 Baud hardcopy terminal available. Our new Matrix Terminal prints 200 cps, has a 100% duty cycle 7 x 9 dot matrix head, that prints upper and lower case. We are microprocessor-controlled to provide incremental and "automatic" bidirectional printing, unique horizontal and vertical tabbing and extensive margin controls. We also offer program control multiple fonts, control code functions and versatile forms handling. We communicate in ASCII code, and are compatible with Bell 103A, 113A, 202 and 212 modems and other 110 to 1800 Baud asynchronous modems using the RS 232C interface, and we print an original and five or more legible copies of all 94 ASCII characters. A nice plus: our table-top terminal has the features and friendliness of an office typewriter. The rest comes from a demonstration! Call your Diablo representative or write Diablo Systems, Inc., 545 Oakmead Parkway, Sunnyvale, Ca. 94086, or Diablo Systems, S.A., Avenue de Fre, 263, 1180 Brussels, Belgium or Mitsui & Co., Ltd., 2-1 Ohtemachi 1-Chome, Chiyoda-ku, Tokyo.

292-Page Revision

Auberbach Updates Terminal Book

By John P. Hebert
CW Staff

PENNSAUKEN, N.J. — Because it is difficult to determine exactly what an intelligent terminal is, Auerbach Publishers, Inc. has updated its "Guide to Intelligent Terminals" to include "the genuinely intelligent terminals."

According to the 292-page guide, an intelligent terminal is one that can be programmed to perform certain functions that would otherwise require the services of the CPU to which it is attached.

After explaining what comprises an intelligent terminal, the publication considers terminal system procurement and describes qualities users should evaluate carefully.

It then devotes 251 pages to a description of each terminal chosen for the report, usually including an overview, the terminal's compatibility with host CPUs, its performance, user reaction, system design and peripheral equipment availability. It then usually describes data communications particulars, available software, maintenance and pricing for each vendor's intelligent terminal offering.

Some of the above categories are absent.

Overall, the publication would help users narrow the choices of available intelligent terminals.

It costs $24.95, Auerbach said from 6560 N. Park Drive, Pennsauken, N.J. 08109.

Tape Terminal Announced

CINCINNATI — LeBlond, Inc. has a punch tape communications terminal which it said can prepare, edit and duplicate numerical control program or machine tapes under microprocessor control.

The DPS-4000 can read, punch or convert EIA, Ascii or Binary codes. It can punch foil-laminated tape or other materials at a speed of 75 char./sec while providing tape verification with a read-after-punch feature, LeBlond claimed.

The terminal can communicate with time-sharing networks at 10-, 15- or 30 char./sec and can reduce time-sharing costs by performing editing and storage functions usually done by the time-sharing computer system, according to the firm.

A maintenance and training support program is offered by the company, including a library of hardware self-diagnostic routines, LeBlond noted.

Prices for the tape terminal start at $6,750, the company said from Madison at Edwards Road, Cincinnati, Ohio 45208.

IEE Has 14-Member Family Of Plasma Display Units

VAN NUYS, Calif. — Industrial Electronic Engineers, Inc. (IEE) has announced a 14-member family of alphanumeric plasma display subsystems called Argus.

The IEE-Argus display subsytsems utilize message panels to provide a display of characters in 5 by 7 dot-matrix format with standard underline and cursor capability, the company said.

The 14 subsystems make up two series — "mini" or "maxi" — that are distinguished primarily by different character sizes and consequent overall size, weight and power consumption.

Character sizes available are .21 in., .25 in. and .33 in. Models are available in character capacities of 32 (16x2), 64 (16x4), 128 (32x4) and 256 (32x8), IEE said.

All subsystems are available in either neon-orange or green. Synchronous, asynchronous and addressed-location loading modes reportedly promote versatility and straight-forward interfacing.

All signal inputs and the one output are TTL, and no intricate signals or critical timing is required, the company claimed.

Each system is compactly housed with multiple mounting methods provided. Optional accessories such as universal input power supplies, contrast enhancement filters, mating connector, cable assemblies and serial data converters are available.

Prices for the Argus family range from $80 to $900, IEE said from 7740 Lemona Ave., Van Nuys, Calif. 91405.

Voice-Response Terminals Suited for Pocket, Desk

ANN ARBOR, Mich. — Interface Systems, Inc.(ISI) has introduced a family of voice response Touch-Tone-type terminals.

The T-16 is a pocket-size 16-key numeric terminal and the T-48 is an alphanumeric desktop terminal which includes a volume control and a headset jack.

The T-48 uses a programmable read-only memory (Prom) for storing user-specifiable Touch-Tone codes, according to ISI.

Tone signaling is the standard "two of eight," which is said to be compatible with AT&T models 403 and 407 data sets.

Prices for the T-16 begin at $92. The T-48 with the volume control and headset jack costs $425. Without control or jack it costs $350, an ISI spokesman noted from 462 Jackson Plaza, Ann Arbor, Mich. 48103.

Compact CRT Bows

MAMARONECK, N.Y. — Teleram Communications Corp. has introduced the Model P-1881, a portable CRT terminal.

The P-1881 is a compact device able to fit under an airplane seat. It contains a 7-in. CRT, Ascii keyboard with upper- and lower-case alphanumerics and editing features.

Its 8,000-char. buffer memory can be preserved even when the machine is disconnected from line power.

Price for the basic P-1881 terminal is $3,995, Teleram said from 1032 Mamaroneck Ave., Mamaroneck, N.Y. 10543.

Ask Tab for a trial run.

Have Your Tab Rep Demonstrate Our Low-Cost 2-Part Decollators.

Seeing is believing! Let us prove our two new, easy to use, 2-part decollators will save you time and money!

Our economical 2422 table-top model zips through eight inch stacks of forms at 450 feet-per-minute. If your load is heavier, try out the 2424 floor-model two-part beauty. It's the fastest decollator for handling full boxes of forms at 450 feet-per-minute!

Your Tab representative will be glad to set up a local demonstration for you. Call him, or write us for more data. Tab Products Co., 2690 Hanover Street, Palo Alto, California 94304.

Modem for Terminet 30

CAMDEN, N.J. – The DE-100 TWX/DDD data set available from RCA allows utilization of the high-speed GE Terminet 30 teleprinter on the TWX network as well as in Bell Dataphone applications.

The unit automatically senses and adjusts printer speed to the incoming call – 30 char./sec for Dataphone, 10 char./sec for TWX – and meets Federal Communications Commission (FCC) certification requirements for direct-access arrangements, RCA said.

The DE-100 data set for a Terminet teleprinter costs $95/mo on a one-year lease, $70 to install and $40 to remove, according to an RCA spokeswoman.

The unit is also available on a purchase basis, she said from Dept. 2610, Bldg. 204-2, Camden, N.J. 08101.

Terminal Transactions

Processor Terminal Runs Alone Or as Remote Peripheral System

HOUSTON, Texas – TEI, Inc. has introduced the Model MCS-PT processor terminal, which can either be a remote peripheral device or a self-contained terminal system with CRT, disk storage, keyboard ~~and~~ a 12-slot motherboard.

Features of the processor terminal include a 15-in. reduced glare monitor, a full upper- and lower-case Ascii keyboard with eight user-defined function keys, and a 16-key numeric pad.

The 12-slot mainframe contains a CPU board that features an Intel Corp. 8080 processor and a special circuit that implements a start-up "jump to" routine to any user-selected byte address, TEI claimed.

The I/O board provides three parallel and three serial ports with selectable transmission rates from 75- to 19,200 bit/sec. Outputs are RS-232C or TTL, according to TEI.

Software provided includes CP/M DOS and Basic on disk. the processor terminal is priced at $3,495; and in kit form it is priced at $2,995, TEI stated. The unit is also available without the disk drive and controller for $2,495 assembled or $2,195 in kit form. The company is at 7231 Fondren Road, Houston, Texas 77036.

Control Unit For Teletype Cuts 'Junk'

WATERTOWN, Mass. – Digital Laboratories has brought out a "smart" motor control unit that reportedly allows a Teletype Corp. teletypewriter to print and punch paper tape without producing "junk" characters during an of/off cycle.

The Model TR20 is an external motor control with a six-character storage capability that provides a .6-sec delay for the teletypewriters motor to speed up and print, the company said. No programming changes or lead-in characters are required.

A bypass switch has been integrated in the Model TR20 to permit standard keyboard operation. An adjustable timer provides up to a 20-sec turn-off delay.

However, in the event of an unexpected delay between transmitted characters, there will be no data loss, it claimed.

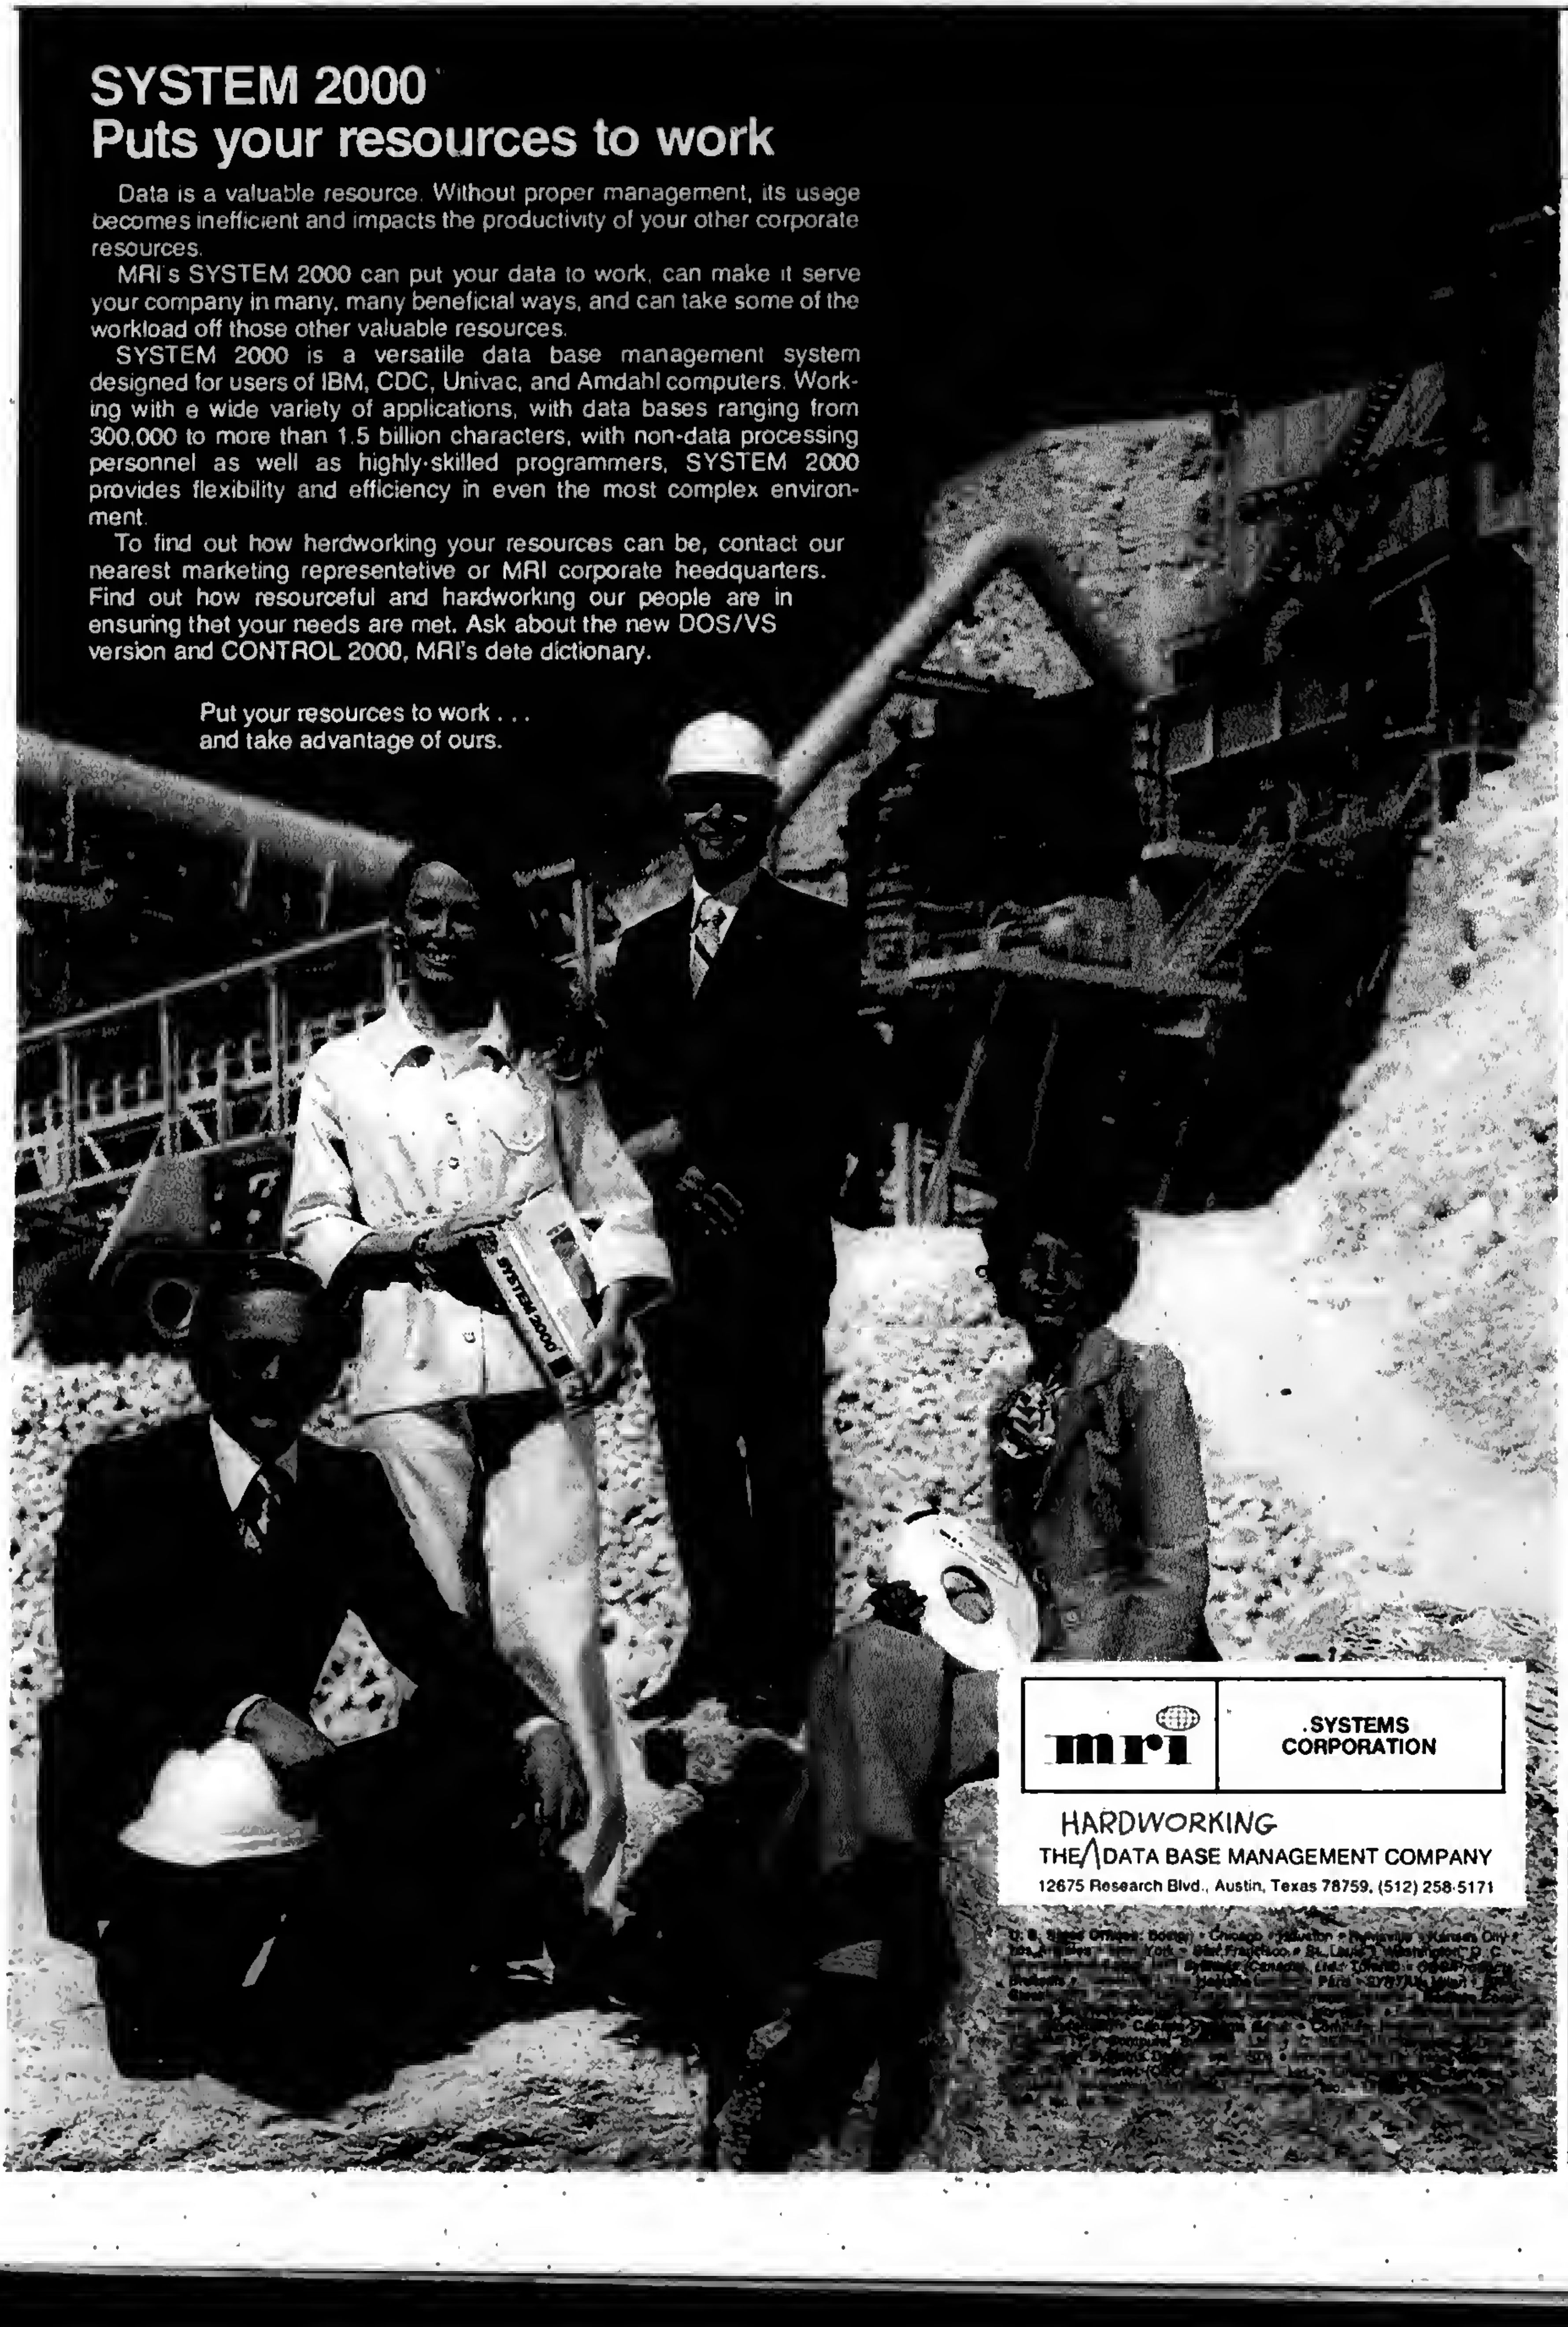
The unit sells for $175 from Digital Laboratories at 600 Pleasant St., Watertown, Mass. 02172.

Hazeltine CRTs Get Price Tags

GREENLAWN, N.Y. – Hazeltine Corp. recently released prices on its models 1510 and 1520 CRT terminals introduced last June at the National Computer Conference.

The 1510 costs $1,395 and the 1520 multiprocessor terminal system costs $1,650.

Hazeltine delayed divulging the prices of the terminals because of a "Guess the Price" contest held at NCC. Thomas W. Cook, senior engineer for Mobil Oil Corp., won the contest.



SYSTEM 2000
Puts your resources to work

Data is a valuable resource. Without proper management, its usege becomes inefficient and impacts the productivity of your other corporate resources.

MRI's SYSTEM 2000 can put your data to work, can make it serve your company in many, many beneficial ways, and can take some of the workload off those other valuable resources.

SYSTEM 2000 is a versatile data base management system designed for users of IBM, CDC, Univac, and Amdahl computers. Working with e wide variety of applications, with data bases ranging from 300,000 to more than 1.5 billion characters, with non-data processing personnel as well as highly-skilled programmers, SYSTEM 2000 provides flexibility and efficiency in even the most complex environment.

To find out how herdworking your resources can be, contact our nearest marketing representetive or MRI corporate heedquarters. Find out how resourceful and hardworking our people are in ensuring thet your needs are met. Ask about the new DOS/VS version and CONTROL 2000, MRI's dete dictionary.

Productivity Up 15%

Multimedia Data Entry Boosts Output

By Jeffry Beeler
CW Staff

KENILWORTH, N.J. — A service bureau here has boosted its overall productivity by an estimated 15% to 20% in the two years since the firm replaced its keypunch machines with a multimedia data entry system. And for some jobs, the equipment change has increased CMF Key Services' productivity by as much as 100%, according to Fred Beyer, the company's vice-presidnt and cofounder.

This jump in efficiency has raised the data entry service firm's average output of computerized records to 60,000 a day (or about 15 million to 20 million a year) and has boosted its revenues from $780,000 in 1975 to a projected $1.2 million this year.

Beyer partly attributed this higher productivity to the company's decreased use of punch cards. Before it installed the current data entry system, CMF supplied its customers with about 1:5 million punch cards a month at a cost of about $2,000 to $3,000.

He also credits the system with expanding the number of recording media the firm can accommodate in-house. With the keypunch machines it used previously, the company could make in-house data recordings on only one medium. If a customer required input on a medium other than punch cards, CMF had to send the data to an outside contractor for recording.

Expanded Service

Today, the firm can enter data in-house, not just on the traditional punch cards, but also on cartridge disks and 9-track magnetic

(Continued on Page 62)

DP Bureau Establishes 'Secure' Facility

By Lawrence A. Yaggi Jr.
Special to CW

SACRAMENTO, Calif. — "Given the choice, I'd specify a reinforced-concrete, windowless building within a reinforced-concrete windowless building, security systems on both and a secured perimeter with single-access control. I'd design, in other words, a building for computer use," according to Joe Pujals, assistant security oficer at the Stephen P. Teale Consolidated Data Center here.

Pujals recently commented on problems faced by Teale Data Center in securing the second floor of a conventional office building.

Teale Data Center is a state-operated computer service bureau serving 59 other state agencies for normal operational business. The facility occupies 10,000 square feet, of which 3,000 are devoted to storage of 43,000 data reels in the tape library. Total on-line storage capacity is 10.8 billion bytes of data.

Two loosely-coupled IBM 370/168 mainframes are used, operating under ASP SVS. Peripherals include 28 tape drives, 64 double-density disk drives, three 2,000-line/min printers and 31 remote job entry terminals in the field among the center's 59 clients. The installation employs 179 people, most of whom work in the computer room.

Subject to Hazards

Teale is subject to all the hazards peculiar to any major DP facility: stray electromagnetic radiation of some magnitude (e.g., from a welding machine); electronic theft; fire; the need for data privacy; and physical or electronic theft by a "disgruntled employee."

While security is always a concern, it is a more difficult problem if the site selected is a block-sized, multistoried, general office building, as in this case, according to Pujals. The building is conventionally windowed and lobbied, and the existing tenant (Teale's lessor) maintained security with guards (State Police Officers) patroling all entrances, the grounds and the parking lot. In this instance, the lessor also occupied a smaller building across the street.

Coordination Necessary

As a new tenant, Teale Data Center had to coordinate its own security arrangements with those of the lessor for mutual access and total security for both buildings. This had to be done "reasonably," yet with total control of access and identification.

Since security considerations were not part of the original architectural plan, there was no practical way to seal off the second floor, which could be reached from the lobby by both escalators and elevators. Yet the lessor, whose service allows public access to all floors during daylight hours, also maintained a DP facility on the floor Teale would occupy.

When the site was selected, many security needs were recognized. An immediate problem was access to the computer room.

This was met with one mantrap entry-exit booth at the entrance to the computer room. One of-

(Continued on Page 60)

On-Line Microfiche Unit Interfaces to 360, 370 CPUs

NEW YORK — Datagraphix, Inc. has introduced an on-line Autocom microfiche recorder/processor that interfaces to an IBM 360/25 or larger or to any 370, the firm said here.

The unit connects to the IBM byte multiplexer, block multiplexer or selector channels and can operate up to 150 feet from the CPU, depending upon the host system, a spokeswoman said.

Converts Data

The Autocom unit converts data from the IBM mainframe into 4 in. by 6 in. microfiche, each containing the equivalent of up to 270 pages, she said.

For certain repetitive jobs, no operator intervention is needed. After the recording command is queued in directly from the CPU, the Autocom automatically receives the data and produces the cut, dry microfiche, she added.

The on-line unit utilizes a 16,000-byte buffer memory and offers 42x or 48x reduction, standard or optional full-reversal film processing, up to 12,000 line/min recording speed and an optional 1,600/6,250 bit/in. tape drive for on-line or off-line operations.

The Autocom sells for $61,000 and deliveries will begin in February 1978. The tape drive costs $39,000 and will be available at the same time from the firm at P.O. Box 82449, San Diego, Calif. 92138.

In 24 University Departments

TS System Helps Students Learn, Recall More

NEWARK, Del. – Classrooms at the University of Delaware here are online to a time-sharing system in Arden Hills, Minn., and teachers are using the system to help students learn such diverse subjects as agriculture, biology, home economics, art and music.

The students are enjoying it immensely, according to Dr. Fred Hofstetter, music professor. He noted that with the aid of the time-sharing system his students are increasing their music sensitivities, spending less time completing course requirements and making higher grades.

"Most importantly, many of the students are experiencing the fun of learning for the first time," he said.

It all began two years ago when the university installed one terminal for faculty experimentation. That experiment drew such enthusiastic response that today the university has a network of 32 terminals that deliver educational materials in the form of text, drawings and animated graphics for 24 different academic departments. Nearly 100 faculty members are involved in developing instructional materials for the system.

The system, Control Data Corp.'s Plato, is based upon a CDC Cyber 70 Model 73-28. The dual CPU system has 131K bytes of memory with 2 million words of extended core storage and 12 double-density Model 844 disk drives.

Plato delivers instructional materials in whatever form the author of the lesson designates. Students communicate with the lesson through the terminal's keyboard or by merely touching the screen with a fingertip. Through these two methods of communication, they answer questions, make choices, change the displayed materials or ask for help.

Instructors use the same terminals to develop and update lesson materials and also to check on student performance and time at the terminal, which the system records and processes into whatever reporting format the teacher wants.

Hofstetter, who is director of the university's Plato project, spearheaded the introduction of computer-based education on the campus through the development of several music courses which he then demonstrated to his colleagues. The courses took advantage of the system's speed, animated graphics and touch-sensitive display screen.

He even attached a random-access audio unit and a four-voice synthesizer to the terminal for an ear-training course called Guido. Musical notes displayed on the screen correspond with the sound to help students master the complexities of reading music so they can recognize and correct errors in musical performance.

For drill and practice in music intervals, students merely touch one of the interval names displayed on the Plato CRT screen and it is played by the CPU-controlled synthesizer.

Or, in a reverse exercise, the synthesizer will play a musical interval, and the students can identify it by touching its name in the list displayed on the screen. The system immediately flashes a responding message: "That's right," or "Wrong, try again,"

"When drill and practice is done in a self-paced environment such as this, learning is more efficient," Hofstetter said.

"Precious class time formerly devoted to drills can be spent in concept development and more creative aspects said.

Idea Spread

What Hofstetter experienced in computer-based music instruction was soon shared by instructors in agriculture, art, education, home economics, nursing, physical education and even drama, as they implemented Plato in their courses.

In the College of Agriculture, students use Plato for study in plant science, animal science, agriculture engineering and entomology. Courses in genetics and veterinary science use Plato to multiply fruit flies and study animal anatomy. This reduces time-consuming field and laboratory projects, according to Dr. Donald Fieldhouse, professor of agriculture.

For example, in a plant science lesson, students are asked to select the proper chemical treatment for a drooping, ailing plant that is displayed on the screen. If the student selects the proper chemical, the plant immediately straightens into a healthy-looking specimen. If the wrong chemical is prescribed, the plant withers and dies – on the screen. But it can be redisplayed in its former state for another remedial treatment.

Aid to Memory

"This type of instruction is not only entertaining, but students tell me it helps them remember data better than if they read it from a textbook or chart," Fieldhouse said.

In the art department, students are using the graphics and touch capabilties of Plato to study design, type faces and lettering techniques. For example, letters in a particular type style are displayed on the screen for

This computer delivers more than 600K bytes of storage for $3,650.*

DTC's use-proven MICROFILE—ideal for system software houses, OEM system builders and individual users.

MICROFILE includes an 8080A microprocessor, two or four flexible disks with storage of 300K characters per disk, 7K ROM memory (plus 1K reserve), 8K of RAM memory expandable in 16K increments to 56K, and two RS-232 ports with additional wire-wrap boards available for special hardware interfaces.

The rugged, reliable MICROFILE comes fully documented. It requires no special technical skills, no program loading or bootstrapping, no additional engineering or assembly. Simply plug it in and turn it on.

Use our software, or write your own.

Standard MICROFILE software includes a disk operating and file management system, powerful text editor, data communications routines, and an automatic letter writer.

Optional software designed to speed up your own program writing efforts includes an 8080 Assembler, disk oriented Extended BASIC with full Sequential and Random Access file features, and document processor. The system has internal safeguards to protect proprietary programs.

Every MICROFILE backed by a national sales and service organization.

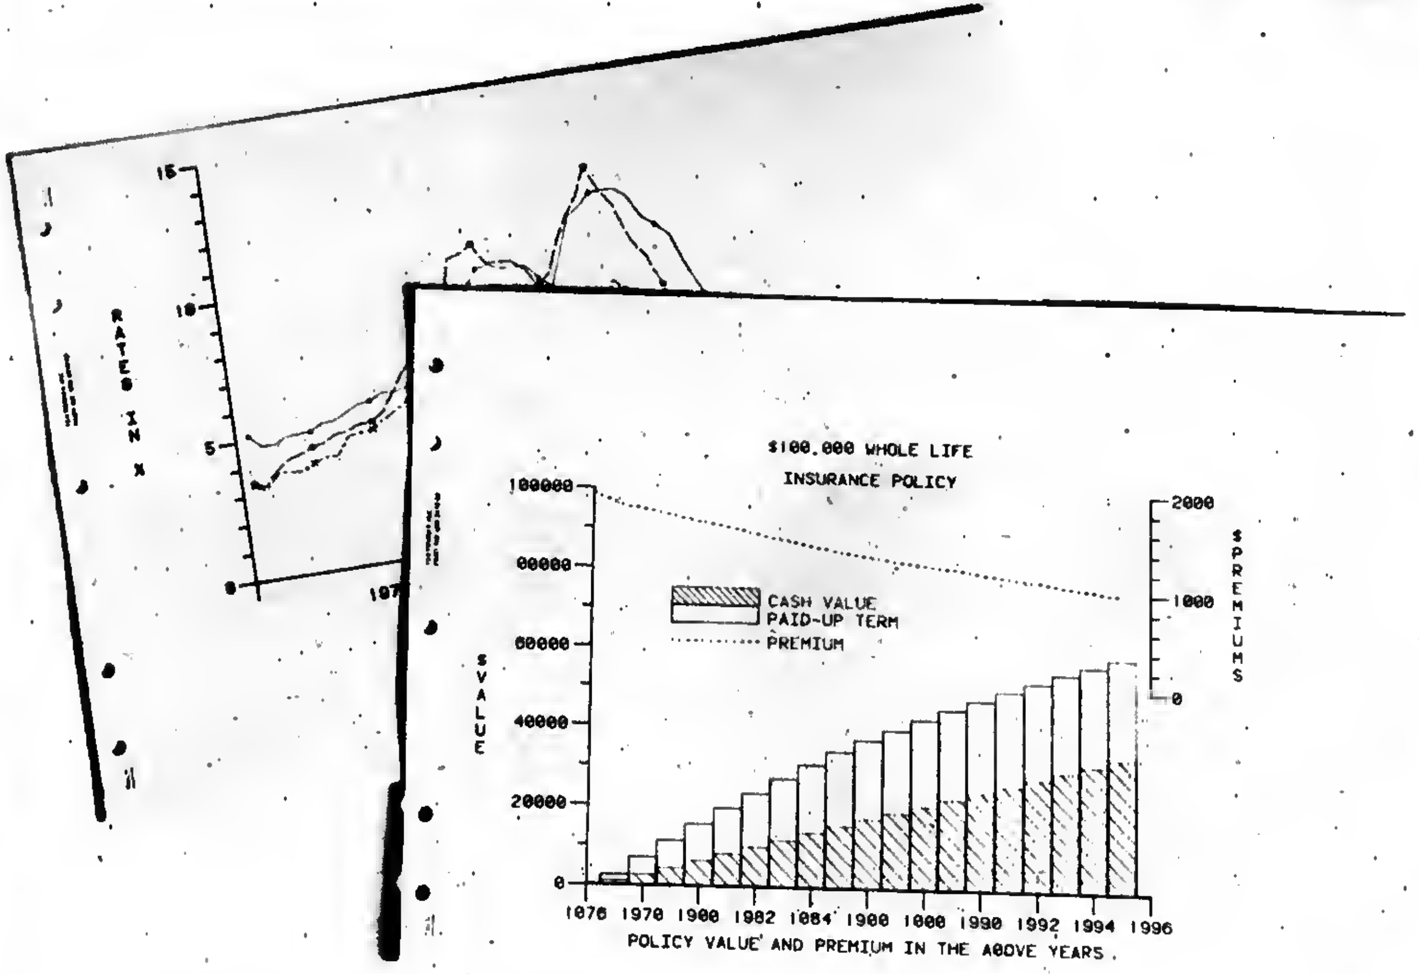
HELPING PEOPLE SEE RESULTS **TEKTRONIX 4662**

"There's no plotter like it. My terminal easily commands any graphics."



Problem: You'd like computer graphics, but not at the price of adding more terminals. So you continue to use paid personnel to hand-plot charts, graphs and diagrams.

Solution: Tektronix 4662 Interactive Digital Plotter. Plugs into most terminals for precise, multi-colored graphics. The 4662 plugs into almost all RS232-C or GPIB-compatible terminals. Use the 4662 to prepare graphics on paper or Mylar® polyester film for sales meetings, program presentations. With computer accuracy and unexpected economy. Plus multiple colors from felt tip or wet ink pens.

Easy interface to timeshare environments. Thanks to its built-in microprocessor, Tektronix modems, and Plot 10 software, operation is simple, accurate, and faster than any other plotter at the 4662's low price.

Don't ask your people to do a plotter's job. Get a graphics specialist that pays for itself. Because the 4662 is from Tektronix, the worldwide graphics leader, you're assured of exceptional reliability and fast service wherever you are. Talk to your local Tektronix Sales Engineer now, or call toll free, (800) 547-1880.

State DP Service Bureau Creates Secure Facility

(Continued from Page 57)

ficer controlled passage through the booth, which consisted of two locked doors separated by a short passageway.

Simple access control of the computer room entrance sufficed for six months while a number of options were explored among generally accepted systems: key, code, key/code and others.

The key and code systems were rejected for their one obvious flaw: they allow multiple ingress ("tailgating") once the door has been opened by a key carrier. Other systems were rejected as not adaptable to Teale's physical requirements, including the need to coordinate with the lessor's access needs in both buildings on a 24-hour-day basis.

The system chosen and installed offers remote personnel identification and access control, based on a two-zone plan. The computer/data storage area lies within an inner zone, surrounded by a fully secured outer-zone perimeter — a "room within a room" — plus unsecured office space. The inner zone also includes the lessor's computer room, with a separate access point, plus a code-locked door between the two facilities.

The core of the system at Teale Data Center is the control room, located in a protected area within the perimeter, adjacent to the principal computer-room entry-exit point. Heavy glass panels allow visual inspection of the "man-trap" booth leading into the computer room.

Within the control room, which is always locked, one security officer sits at a conrol console that includes three split-screen Videoguard monitor/-control units and 18 additional video monitors. The units are manufactured by Mardix, Inc. of Mountain View, Calif. One split-screen unit controls entry-exit and identification through the outer perimeter; the others control auxiliary entrances into the computer rooms.

Identification control of the man-trap passageway is visual. Two additional split-screen units are used for after-hours control of both building entrances. For emergency use there is a two-way radio and telephone communication link with outside State Police units.

The 18 monitors provide surveillance of the entire perimeter hallway on the "sterile" area principle: Scanning is intended not to obseve personnel movement as such, but to note uncommon items left in the hallways such as briefcases, packages and boxes. Aside from personnel, hallways are requried to be vacant.

Each entry-exit point is an 8 by 8 ft Videoguard booth with two locked, opposed doors and a wall-mounted identification console. Concealed in the console are two CCTV cameras which present full-face and badge views to the split-screen unit in the control room. A third camera in the booth ceiling provides a wide-angle view of the entire booth to ensure occupancy by only one person.

The controller can switch from split-screen face/badge monitoring to full-screen overhead view at his discretion, and may initiate two-way voice communication. Doors can only be unlocked from the control room, and relock automatically on closing.

Cable Transmission

All signal transmission for the electronic surveillance system is by cable which was installed through the building's existing conduits. One cable extends under the street to the access booth at the entrance to the second building.

When Teale went into operation, normal security required one officer per shift at the man-trap entrance to the computer room, plus the outside patrol of building entrances and grounds provided by the lessor. To Teale, this represented a total of five man-years on a 24-hour, seven-day basis.

This system continued through Teale's first six months' tenancy while the remote equipment was selected and installed.

With the Videoguard system one man per shift controls all access to and identification for the building as well as for the computer room. This frees two officers for patrol who would otherwise have to be available to permit entry to the building.

The two officers are then able to complete two additional patrols of the ground and buildings per night. Since both Teale and the lessor share the cost of the system, the net effect has been to reduce the security force by one and double the efficiency of two others, with a net manpower savings of $60,000 per year.

The cost of system hardware and installation amoritzed itself within 18 months, according to Pujals, on savings achieved by using fewer officers. "If we can project a national inflation rate of approximately 5% per year, we'll see even more savings in time," he said.

And there are other, not-so-apparent savings: less casual foot traffic and less need for janitorial service.

According to Pujals, Teale Data Center was the first California State agency to install remote personnnel-identification and access control. Now, two and one-half years later, other state agencies who inspected it have installed 26 remote access units essentially the same as those installed at Teale Data Center.

Yaggi is president of Mardix, Inc.

We knew it from the beginning. And, so did our customers. We were convinced from the start that static RAM technology was the way to go on our 370 add-on memories. Static is faster. More reliahle. And, totally compatible with IBM.

Now, we see an interesting thing happening. Our competitors, long-time proponents of dynamic technology, have suddenly changed their tunes. They're now planning to jump on the static handwagon. But, they have a long way to go. We spent two years to develop our static technology before we started delivering it in 1975. We were the first with an NMOS static chip. The first with a 4K chip. And, our new 4K chip is the fastest, static or dynamic. All from EMM's own semiconductor facility in Phoenix.

Evidently, recent IBM enhancements have left some of our competitors holding the bag. We knew from the beginning that complete IBM compatibility requires static technology. We've kept right up with IBM. And that's how our customers are always going to be up-to-date with future IBM enhancements.

When you need add-on memories, check with EMM. We've got the best total all-around add-on-memory package going. We'll see to it that your memory stays IBM compatihle.

GRAHAM MAGNETICS ■ EPOCH 4
GRAHAM MAGNETICS

There are times when there's too much at stake for mistakes.

That's how it is running high-density drives, too.

With today's high-density equipment, you need to know what you're up against when using marginal computer tape.

For one thing, you're up against a potential for write/skips that can eat up available tape space fast. That, plus the loss of valuable data and resulting re-creation costs, can make a bargain tape get expensive fast. Then there are the things that are occurring but being masked by the GCR format. Ask your Graham product technology man about that.

If you're developing a smaller library, now you can afford a better library, too.

To get a better cost/results ratio, get Epoch 4.

Firm Boosts Output With Multimedia System

(Continued from Page 57)

tape (probably the most popular recording medium among CMF's customers), Beyer said. And when the company attaches another communications line to the data entry system in October, CMF will also be able to accommodte IBM-compatible floppy disks for the first time.

This expanded service capabiity has opened previously unavailable markets for CMF and has freed the company from reliance on its sometimes undependable outside contractors, Beyer explained.

CMF began operations six years ago with a small battery of IBM 026 and 029 keypunch machines before upgrading two-and-a-half years later to 35 IBM 129 units. Six months after starting the business, company officials concluded that the IBM equipment, though adequate for the job it had been required to do, had increased their punch-card costs to as much s $2 to $3 per thousand, an unacceptable expense, Beyer recalled.

Company officials also concluded that the IBM machines had unduly tied the firm to punch cards and in so doing, had hampered its competitiveness in the increasingly promising magnetic tape market.

They also complained the keypunch units had limited the company's control over its internal operations. If one of its outside contractors experienced a serious equipment breakdown, for example, CMF could do little to correct the problem except try to explain to an unsympathetic client why the data entry firm would be unable to meet its production deadline.

To alleviate these problems, Beyer and his colleagues decided three years ago to replace their keypunch machines with a more up-to-date and versatile data enty system. In their search, they evaluated equipment from seven hardware vendors, including Inforex, Inc.; Entrex, Inc.; General Computer Systems, Inc.; IBM (which offered a floppy-disk-based system); Lockheed Electronics Co.; Four-Phase Systems, Inc.; and CMC, a Los Angeles-based division of Pertec Computer Corp.

Opted for CMC

CMF eventually opted for the CMC equipment, a Model 5 system with 16 keystations. That configuration in turn gave way two years ago to a more advanced CMC 1800 system that today incorporates 32 Model 108 keystations and leases for $4,600 a month.

Beyer and his associates picked their current data entry system over the other configuration they considered primarily because they were impressed with CMC's service and with the performance of the demonstration models they observed, the company vice-president explained.

Besides the CMC 108 keystations, CMF's data-entry system incorporates a Decision Data Computer Corp. 8010 cardpunch unit, a Centronics Data Computer Corp. 102 printer and a CMC 1116 CRT terminal. Athough the system has no computer, it uses Cobol programs to verify data and RPG-II programs to control inventory, internal billing and invoice preparation.

CMF plans to soon increase the system's array of keystations to 40, Beyer added.

Ampex Expands DEC Memory

EL SEGUNDO, Calif. — Ampex Corp. reports that it has expanded its ARM-10L memory for Digital Equipment Corp. Decsystem 10-KL and KI models to 512K word capacity in a single cabinet.

The 512K-word ARM-10L memory, which is based on 32K by 18-bit modules, is equipped with two- or four-way internal interleaving capabilities. The memory unit requires 7.5 ft of floor space, the firm said.

Earlier the 128K-word and 256K-word versions are field upgradable to the full 512K-word capacity. All three capacities can be equipped with eight ports, in two port increments, a spokesman said.

The system panel provides controls and indicators for power, port priority, port activity status, sector address, sector status, two- or four-way interleave control, address status, data status, parity error status, last module selected, memory hang indicator and hang reset-control, he said.

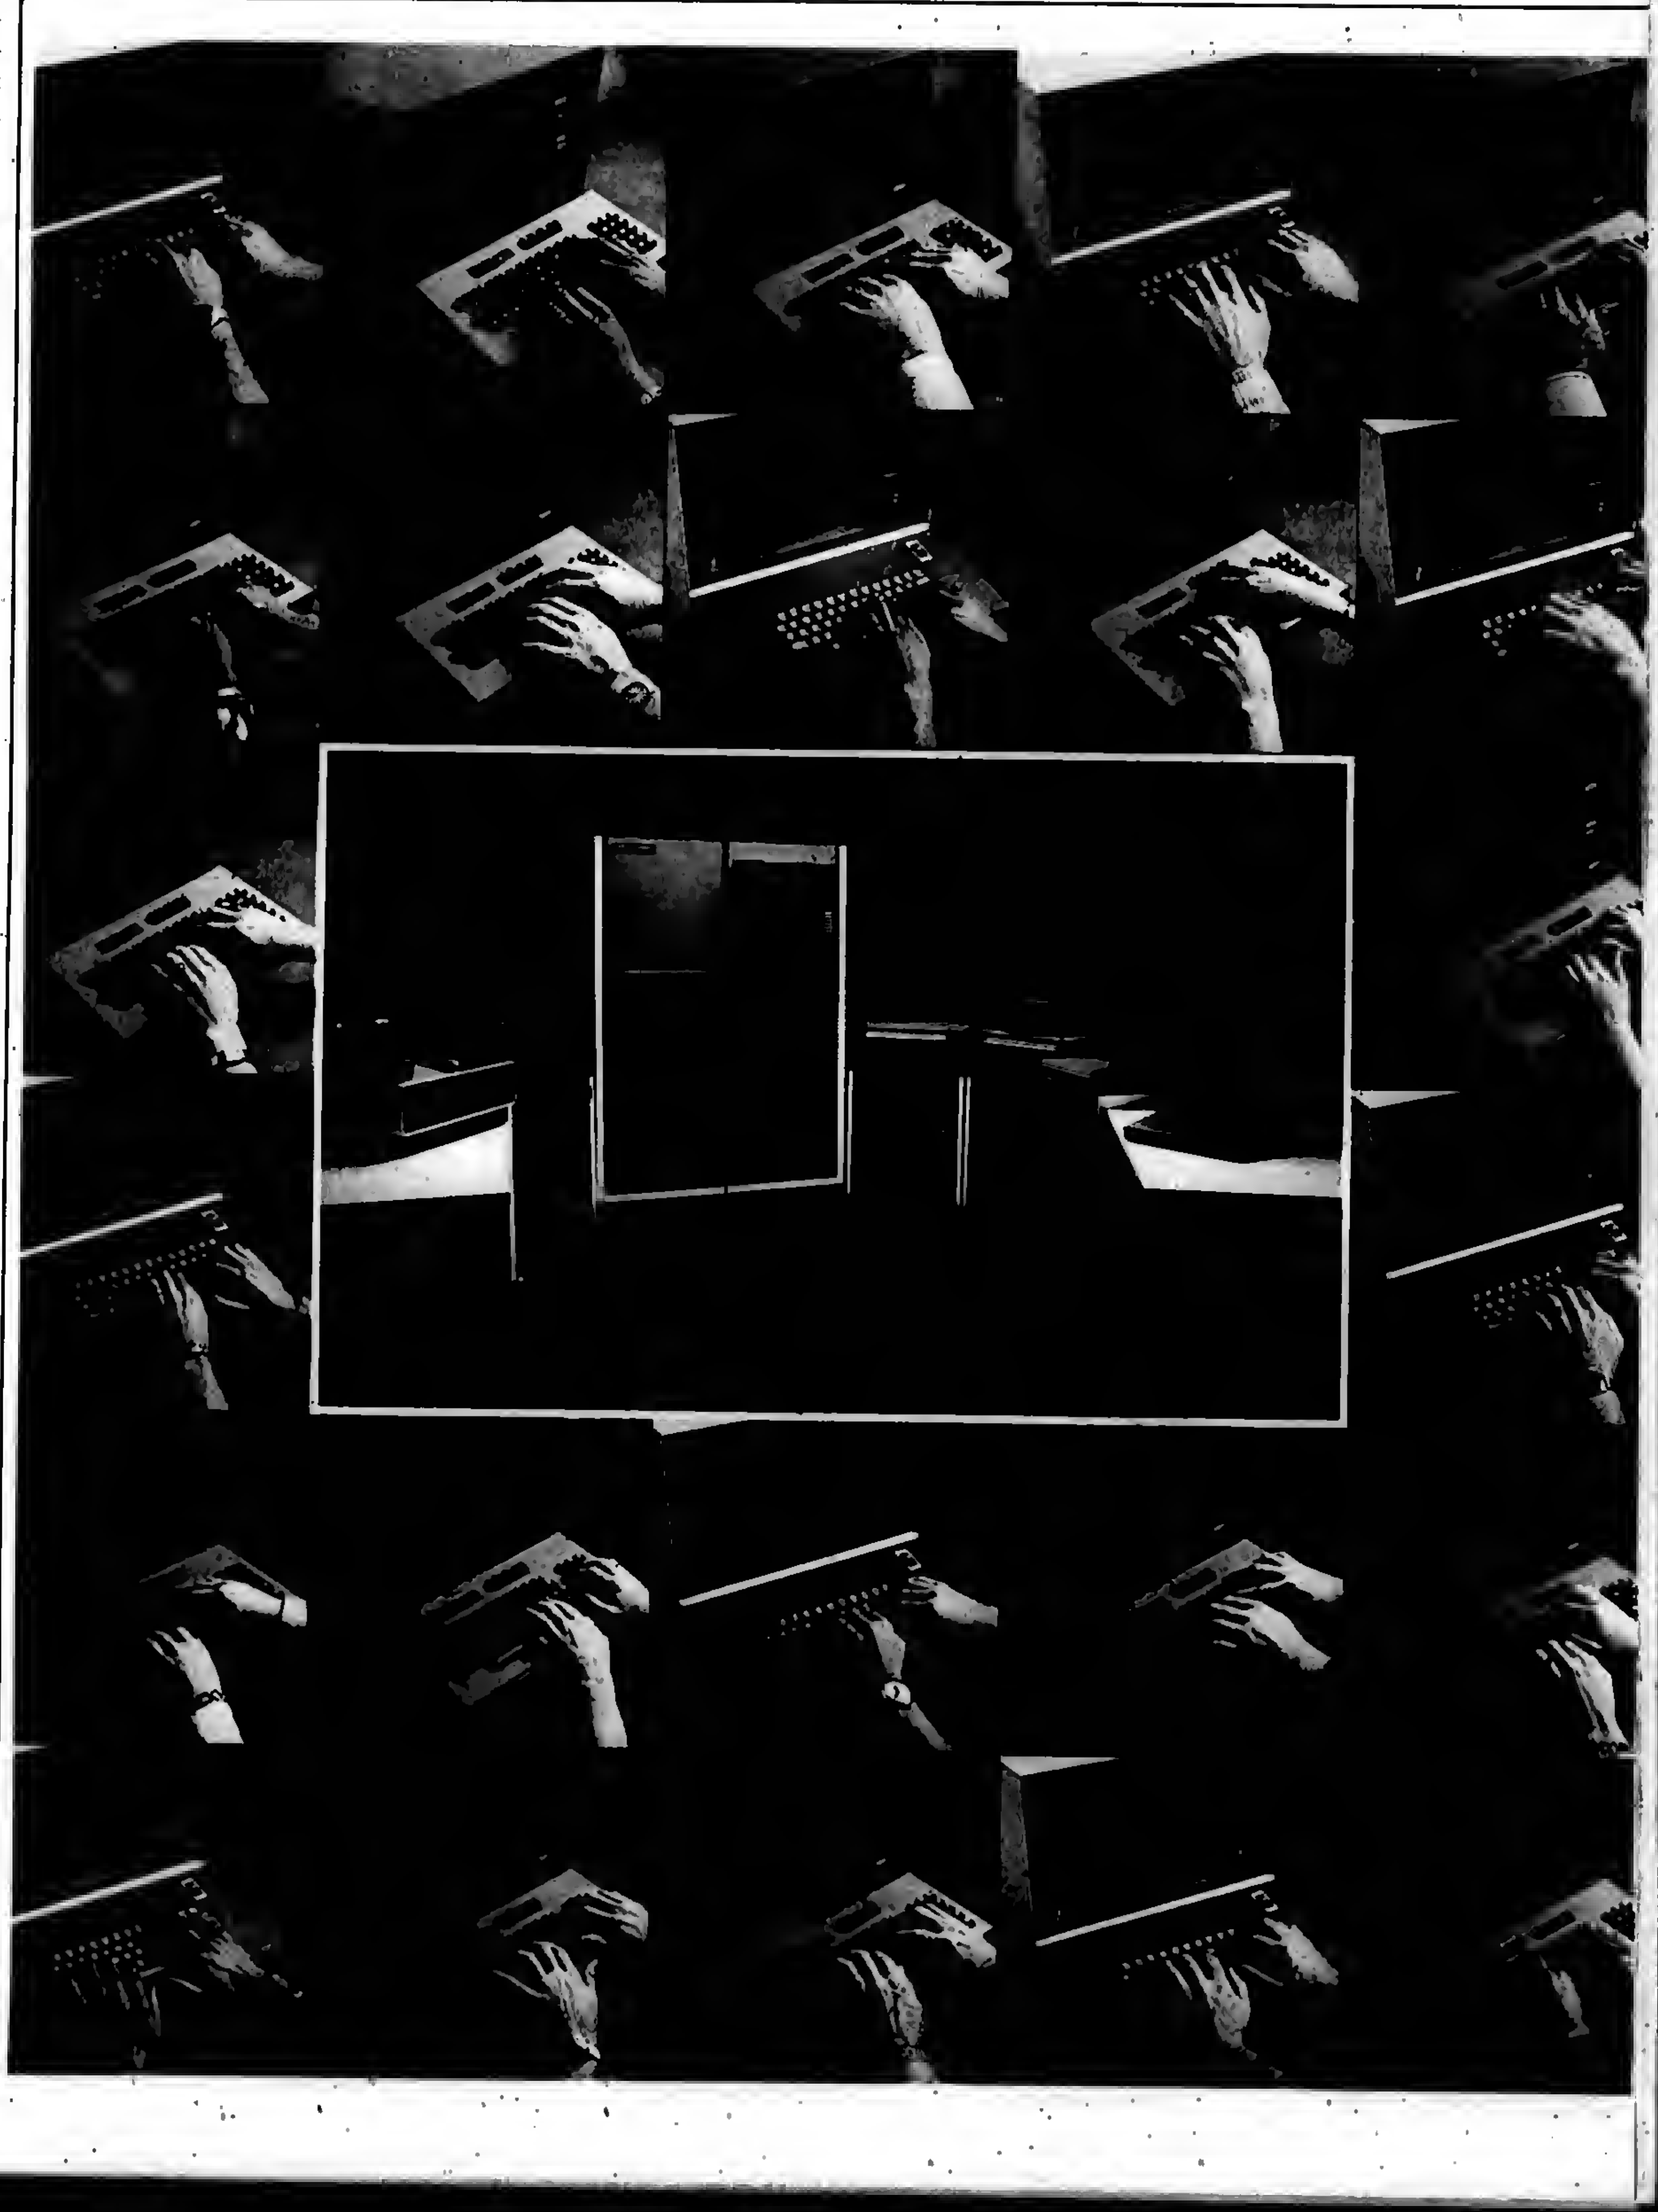
Typical access time is 500 nsec with a maximum of 520 nsec. Cycle time is typically 750 nsec with a 770 nsec maximum, the spokesman claimed. The 512K-word ARM-10L costs $175,000 and delivery is 30 days from the firm at 200 N. Nash St., El Segundo, Calif. 90245.

Magstripe Verifier Displays ABA Data

TORRANCE, Calif. — American Magnetics Corp. has introduced a magstripe verifier for instant reading of encoded American Bankers Association (ABA) data on magnetic stripe cards.

The verififer has a 38-digit LED display. The user simply passes a magnetic strip card through the reader and the encoded data is displayed on the screen, the company said.

The reader costs $1,495, it added from 2424 Carson St., Torrance, Calif. 90501.



Replaces Key-to-Tape

Dow Increases DP Efficiency With RJE System

ELIZABETHTOWN, Ky. — Dow Corning Corp. has increased its data entry productivity with a 25% reduction in keystrokes and one third less verification time since the installation of a key-to-disk remote job entry (RJE) system.

Dow Corning installed a Data 100 Corp. Keybatch system for the plant here in April 1976, replacing a key-to-tape system for batch data entry of financial and administrative data. The plant manufactures a variety of silicone elastomers and adhesives.

The company wanted both better productivity from its key operators and on-line communications with the host CPU, an IBM 370/158 at the corporate site in Midland, Mich., according to Michael Mallicoat, data center supervisor. With the off-line key-to-tape system, data was transmitted from the plant here to an identical system in Midland where it was manually loaded into the mainframe.

"With our limited operator productivity and mechanical problems tht are normally associated with off-line tape handling, we had a very inefficient operation," Mallicoat said.

In searching for a replacement, the Elizabethtown department evaluated the IBM 3270, which is in use at various other company locations. The study showed that even key-to-tape was more efficient than the 3270 for a number of reasons: The 3270 had no programmable keyboard entry, allowed only sight verification and had no off-line storage. In addition, a benchmark study showed total keying and verifying time was 65% more than tape, and accuracy decreased from 99.6% to 98%.

"Since we were already working at nearly full capacity, it was obvious we could not even maintain, much less increase, our productivity with the 3270," Mallicoat said.

After looking at several other alternatives, the company chose the Data 100 Keybatch system. "It provided state-of-the-art in key-to-disk entry, allowing concurrent off-line storage and on-line communications to the mainframe. The programming interface to the mainframe was minimal. The Keybatch easily emulates the IBM 2780 and 3780, all at comparable cost to the key tape," Mallicoat said.

System Configuration

The current system in the Elizabethtown data center consists of a Keybatch control unit, a synchronous communications adapter, a 215 line/-min printer and controller, a line printer adapter, three local key stations and a 2.5M-byte disk drive.

The major data entry applications include accounts payable, production, usage, inventory, shipments, materials requirements planning, purchase orders, accounting formulations and production planning. Since installation of the Keybatch system with its concurrent data entry/RJE capability, other new applications have been installed, including detailed delinquent analyses, production variances, master file for sample orders and work orders.

New software is being developed for warehouse inventory applications and there are currently about 80 application programs on the master file.

Dow Corning uses the RJE capability to key programs onto disk for transmission to the mainframe. Programs submitted in RJE mode include various routines for retrieval, library maintenance and some program development. The number of batches submitted per day in the data entry function is about 20 to 25, with approximately 10 to 15 in the RJE mode.

"The Keybatch system permits up to 999 programs, which can be used concurrently on-line," Mallicoat said. "The same program can be used by several operators at the same time. Program maintenance for data entry supervisors is much simpler than before."

The Keybatch system provides the operators with a larger, more flexible repertoire of data entry functions. When beginning data entry, the operator enters his operator number into the system for tracking operator statistics. He then selects an option — entry, re-entry, verification, search or audit.

The format number is selected by keying a three-digit master format number available from a master format list. The operator then names the batch of data to be entered via an alphanumeric character field. The first four digits of that character field are used for today's date. This enables printout of all batches with corresponding format numbers at the end of the day for transmission purposes.

Production reports are created on the mainframe overnight and sent back to the Keybatch terminal, which is set up in an auto-answer mode and 3780 emulation. The number of output reports has increased to about 35 reports per day, about double the previous output, according to Mallicoat.

The Keybatch system contains many features which have simplified and streamlined the data entry operation. Among these are table look-up, check digit verification and arithmetic computation. A compare and branch feature allows branching forward and

All at once, it's Harris.

Harris now delivers the most cost/performance effective multi-use computer system in the industry.

Our new family of high performance systems—S115, S125 and S135—together with our powerful VULCAN Virtual Memory Operating System supports more than 50 terminals. Simultaneously.

This is a whole new line of medium-scale, multi-use systems with increased reliability and new state-of-the-art technology. You get greater I/O throughput. MOS memory with error correction. Powerful micro processor based CPU. Broad selection of highly reliable peripherals. And all operate with ANSI 74 COBOL, FORTRAN, RPG II, FORGO, SNOBOL, and extended BASIC.

The Harris S100 systems take on many different jobs all at the same time. Multi-stream batch processing. Multiple concurrent RJE's, both host and remote. Multiple interactive time sharing. Real-time processing. And this new generation of high performance computer systems from Harris delivers these all to you, *concurrently.*

If your need is distributed processing, time sharing, data base management, or any type of concurrent multi-use application, *benchmark our new computer system against any other system in the industry.*

HARRIS
COMMUNICATIONS AND INFORMATION HANDLING

TS System Helps College Students Learn More

(Continued from Page 58)

students to experiment in spacing them.

By merely pressing a directive key, a student can make the space between two letters become narrower or wider. This eliminates the need to hand draw letters and then carefully arrange them to study the effects of spacing..

Another computer-based art lesson allows students to produce on the Plato terminal screen their own designs and then rotate them to any desired degree for observation. One of the major advantages of computer-based design is that students can easily redo a portion of the unit at any stage.

According to one student: "I spent more time redoing what I'd already done just to insert one change. Now I can include new ideas in a few seconds.".

Other principles of design — such as form, line, light, movement, balance and rhythm — are also rapidly available for display on the Plato screen. Students experiment with these elements by adding their own concepts through the keyboard or by touching the materials they want to change or move.

In the home economics department, students are trading the traditional dressmaker form for a computer terminal to determine proper fit of the garments they make in textiles and clothing classes. They are enthused about the new fitting technique as well as about a lesson on how to analyze and correct fitting problems, according to Frances W. Mayhew, a department professor.

"A certain amount of dressmaking for the beginner was trial and error with lots of disappointments and wasted materials," Mayhew said. "Now students are able to simulate design and construction plans on the terminal and they see the results before they cut into material."

As a result of its success with Plato, the home economics department is organizing a national consortium for the development, evaluation and distribution of computer-based home economics lesson materials.

"By sharing efforts and expertise, home economics instructors will be able to expand computer-based instruction into other areas of the curriculum and generally enrich course offerings," Mayhew said.

Highly Organized Support

Central to the university's rapid implementation of computer-based education is a highly organized support and resource program. This was created when just one terminal was installed and consisted of a coordinating committee composed of 17 teachers. Within three months the number of faculty involved had grown to 55, and now more than 100 are engaged in course development.

Each academic area involved with Plato is assigned a programming specialist who helps the faculty members develop courses.

"Our experience with Plato shows it is capable of sustaining the motivation of faculty members. They did not receive released time or incentives of any kind other than the improvement of instruction at the University of Delaware," Hofstetter noted.

Hofstetter believes computer-based education is the next revolution in education and predicted that within 10 years there will be broad-based implementation of it in universities."

"It is inevitable," he said. "There is no stopping it and really no reason to do so."

Chemical Firm Uses RJE To Increase Productivity

(Continued from Page 63)

backward within a format automatically.

The output reformatting feature allows the operator to arrange a format in the order the data appears on the input document without regard to how the computer will handle it. The system automatically rearranges the data into a computer-usable format before transmission.

This, Mallicoat said, is a time-saving feature for the operator. Accumulators enable saving data that has been entered for later reinsertion into a record, thus eliminating operator rekeying.

Activity Log

The activity log feature enables the system to keep track of each supervisory transaction on all batches. If a question arises concerning whether or not a batch has been transmitted, it is a simple matter to check the log.

Accuracy has been improved through features like range checks, which ensure data validity. Data entered must agree with preselected values and range tables or the system will reject the data.

The operator can now selectively verify fields within a record and edit and check the data at the same time it is entered. Previously, it was impossible to verify all records on a key tape in an eight-hour working day, without overtime.

Reduced Keystrokes

The net result has been a significant reduction in keystrokes and verification. Production has increased without the need to add data center personnel. Operator performance is now monitored through the Keybatch statistics feature which keeps track of keystrokes and verification errors.

Reliability, Mallicoat said, has improved considerably over that of the key-to-tape system. As far as vendor support goes, "We get excellent response. The service personnel are really top-notch," he said.

Dow Corning will soon be installing the Keybatch software Version 3.1, which will enable sending data from the communications line directly to disk, he said. It will also implement a feature called Index Sequential Table Retrieval (ISTR) to speed up response time during table look-ups.

The current Keybatch system provides an excellent foundation for expanding into distributed processing with some local processing capability, he concluded.

Recorder Notes Line Noises

ESCONDIDO, Calif.— Micro Instrument Co. has announced a digital power line transient disturbance recorder and analyzer.

The Model 5229 portable sag/surge recorder prints out on an integrated alphanumeric printer all power line disturbances over the entire DC current range, according to the firm.

The instrument is said to operate on-line 100% of the time and will miss no electrical disturbances, giving priority to higher-amplitude transients, regardless of when they occur.

It costs $3,495, a company spokesman noted. from 2250 Micro Place, Escondido, Calif. 92025.

Publisher Benchmarks Minis for DDP

By Esther Surden
CW Staff

BOSTON — Houghton Mifflin Publishing Co. just completed an in-depth analysis and benchmarking of three minicomputer systems for a distributed data processing (DDP) application.

The system finally chosen outperformed its nearest competitor by nearly a two-to-one margin, according to Jim Burns, corporate director of data services.

The publishing company decided to go the distributed processing route as part of an overhaul of DP activities, Burns explained. Right now the six locations involved have a "mixed bag" of DP capabilities, with three of the branches using key-to-tape equipment and two others using Honeywell Information Systems equipment. The central DP department in Burlington, Mass., has a host IBM 370/148 mainframe.

"The easiest approach that we could see was to take and bite off pieces" of the system, Burns noted. "We decided to go out into the field and update the general user community," bringing them up to an automated state so they can dispense with manual procedures. Streamlining operations in the user locations will hopefully give the end users a competitive edge in the industry, Burns added.

Finding systems capable of performing a distributed processing application was no easy task, Burns noted. "We went to a number of different sources" to determine who had the machines that could do the job. "We came up with 11 potentials," among which was the IBM 3790.

The company sent out its specifications to the 11 prospective manufacturers and they "came back and told us what they could do and could not do." After a technical evaluation of the respondees the DP department the field down to three finalists, according to Burns.

"We told the other eight that we would concentrate our attention on the three that we felt could do the job," he said. Those who fell out were rejected because of limited storage capacities, unavailability of software to support the firm's processing needs or other problems, he added.

The three finalists were Digital Equipment Corp. with its PDP-11/70, Hewlett-Packard Co. with the 300 II and Computer Automation, Inc. with its Syfa system.

(Continued on Page 71)

More Survey Results Show

Users Satisfied With Maintenance

By Esther Surden
CW Staff

NEWTON, Mass. — Minicomputer users responding to a recent CW survey called hardware maintenance of their systems either "good" or "excellent" in a vast majority of cases.

Only 23 of the over 220 users responding to the survey rated their maintenance as poor [CW, Aug. 29].

Those who said hardware maintenance was good, however, did give suggestions as to how it could be improved. As one user said, although "response time is good, the service representatives are not always competent."

Another user noted that the service department his vendor offered was not large enough, while yet another said "although there is rapid response time," he has trouble getting parts.

One Hewlett-Packard user in the U.S. government said the vendor "can usually diagnose and supply a positive fix on the hardware," but "vendor's customer engineers are hardware-oriented, not backed by software support personnel."

Some of Digital Equipment Corp.'s technicians are "rotten" and some are "excellent," another user at a medical center noted, pointing out the problem of spotty hardware maintenance.

'Adequate Talent'

A Burroughs Corp. B1716 user rated his vendor's hardware maintenance as good and said that Burroughs has "adequate talent that sometimes lacks depth and quick response." Another Burroughs user, of a B1705, also called hardware maintenance "good" but said "there was only one customer engineer for too large an area."

"Quality of the repairmen" was "uneven," another user of nine minis from DEC, Interdata, HP and Data General Corp. said, while another user of Burroughs and HP equipment called his service excellent "with average response time two hours and downtime from 2% to 5%."

A user of a Texas Instruments, Inc. TI 960 minicomputer rated TI's maintenance as "fast and effective . . . the thing gets fixed.", A very satisifed Microdata Corp. Reality user called the vendor's hardware maintenance excellent "because of remote diagnostic capabilities" and pointed out that the "system's expandability is almost infinite."

A DG Eclipse and Nova "have given us excellent service for a minimum investment," a municipal DP manager commented. However, the parts inventory kept by the vendor was "insufficient," this user stated.

'Excellent' Rating

Rating the maintenance of an IBM 3/12 as "excellent," one user indicated the yendor features "excellent response, turnaround" and "downtime is almost zero."

In another case, a life insurance company that uses DEC equipment said DEC's hardware service was "poor" because of "slow response.

"They sent too many trainees" and were "low on parts."

A DG840 user at a junior college said his vendor's "engineers are prompt in arrival and their

(Continued on Page 71)

Datapro: User Beware In Buying Small System

DELRAN, N.J. — "The watchword in selecting a small business computer is 'buyer beware,' " Datapro Research Corp. warned readers of its most recent "All About Small Business Computers" report.

"All too often the buyers of this class of equipment have little or no understanding of DP principles and are likely to buy the wares of the salesman who arrives first or sells hardest," the report continued.

"No company should *ever* buy a computer from the first salesman who comes through the door. It's always wiser to check out the offerings of at least a few of the other major suppliers, and you shouldn't hesitate to play one vendor against the other in an effort to get the most for your money," Datapro advised first-time users.

Promises of extra software, technical support and other concessions should be specifically included in the final contract, the report added.

Before considering any system, users should demand detailed specifications for hardware and software from the vendor. A full-scale demonstration of one of the user's principal applications is also helpful, although a demonstration program "whose functions are similar enough to your own needs so that you can draw realistic conclusions about the system's processing speed and ease of programing or operation" will do, the report stated.

The 62-page report features 50 pages of comparison charts covering specification of 249 current systems from 87 vendors. Also included is a chart that summarizes the experience of about 750 respondents with a total of nearly 1,800 minis and small business systems.

The report costs $12 per copy from the company at 1805 Underwood Blvd., Delran, N.J. 08075.

HEY, BERT! WHO'S GOT THE BEST PRICES AND FASTEST DELIVERY ON DEC & LSI TERMINALS?
OH BOY! WE HAVE, DUMMY. WERE MTI... OF COURSE, OF COURSE... AND WE HAVE EVERY TERMINAL ON SALE, LEASE OR RENTAL.

Magazine Distributors Get System

BALA CYNWYD, Pa. — An in-house DP system designed to meet the needs of magazine, book and newspaper distributors is available from Sonco, Inc.

The system handles allotments, receiving, distribution, invoicing, returns, statements, bulk records and sales analyses, a spokesman noted.

Called MDS,. the system guides the operator through all job steps by continuous prompting and provides for verification of input data and error correction.

The hardware configurations supplied by Sonco consist of Digital Equipment Corp. components. All MDS applications software is written in Dibol and runs under the DEC CTS-300 operating system. Hardware maintenance is available to MDS users from DEC, the company reported.

The basic MDS hardware configuration available from Sonco includes a DEC PDP-11, a two-drive disk subsystem with 7.5M bytes of storage, a Decscope keyboard-CRT display unit and a 180 char./sec printer. Special interfaces to Universal Product Code (UPC) scanners are available, as are 300, 600, 900 and 1,200 line/min printers.

Purchase price for a basic MDS hardware-software system is $54,00. It may also be leased for $1,600 per month, including maintenance, under a five-year term agreement. Delivery is 45 days after receipt of the order, a spokesman noted from Sonco, Inc. at 211 Rock Hill Road, Bala Cynwyd, Pa. 19004.

Sonco MDS System

DeAnza Has Digitizer

SANTA CLARA, Calif. — DeAnza Systems, Inc. has unveiled a video camera digitizer and image storage system that will digitize an RS-170 or RS-343 signal and store it in digital refresh memory for computer analysis and enhancement.

The Model CD5506 can hold an image in a 64-level gray scale with 512 by 512 pixel resolution in one TV frame, according to the firm.

The digitizing system is said to be suited for use with microscopic images, photo analysis and telescopic images. The device will digitize the captured image to 256 gray levels, DeAnza added.

The system is designed to interface to a Digital Equipment Corp. PDP-11 Unibus, although other "popular" minicomputer interfaces are optionally available, the company stated.

Prices for the CD5506 digitizer, not incuding the camera or CRT monitor, start at $15,300, according to DeAnza at 3444 De La Cruz Blvd., Santa Clara, Calif. 95050.

TP-50 Lab System Based on LSI-11

OAK RIDGE, Tenn. — The TP-50 from Tennecomp Systems, Inc. is a laboratory system based on the Digital Equipment Corp. LSI-11.

Designed for use in pulse height analysis, instrument control and general computation, the system has a large display, keyboard and numeric keypad as well as a minifloppy disk drive. A 40-column impact printer is optional.

Users can add any standard LSI-11 or PDP-11-compatible peripherals, the firm claimed.

The unit costs $15,400 for the base configuration from the company at 785 Oak Ridge Tpke., Oak Ridge, Tenn. 37830.

Why do we sign our name with these words?

ltifunction data processin

Gemini Has Turnkey

TONAWANDA, N.Y. — A turnkey minicomputer designed specifically for medium-sized businesses' on-line operations is available from Gemini Data Systems, Inc.

The system is based on Data General Corp. hardware and Automated Quill, Inc. software, a spokesman noted. The standard software incudes a business application utility subroutine library, open-item accounts receivable, inventory control, billing, open-item accounts payable, financial reporting and payroll.

Basic hardware for the system includes a 32K-word Nova, one CRT, 10 million bytes of disk and a matrix printer.

The basic configuration costs $38,250 from the company at 2638 Sheridan Drive, Dept. 378, Tonawanda, N.Y. 14150.

Mini Suits Business, Science

PROVO, Utah — Billings Computer Corp. is offering users a business and scientific minicomputer called the Data-Byte System 1.

The basic system includes a Billings CPU, dual floppy disks, a B-100 terminal and a bidirectional line printer. Operating software and relocatable Fortran IV are included as a standard part of the system, a spokesman said.

Hardware options available for the system include higher speed printers, X-Y plotters, analog-to-digital and digital-to-analog converters, acoustic couplers and application software as well as 50M- to 300M-byte hard disks.

The basic system costs less than $18,000, the spokesman added from Billings Computer Corp., P.O. Box 555, 2000 E. Billings Ave., Provo, Utah 84601.

PDP-11 Board Bows

SANTA ANA, Calif. — Able Computer Technology (ACT) is offering its QuadrAsync/C interface board to Digital Equipment Corp. PDP-11 users.

The unit gives users four asynchronous communications channels but presents only one load to the system's Unibus, a spokesman stated. Called a 20ma current loop alternative to the DL-11C, the unit is software compatible with the DEC PDP-11, according to ACT.

Contained on one quad board with four DEC-compatible connectors, the unit operates in full- or half-duplex mode.

The unit costs $1,600 with quantity discounts available from the firm at 1616 S. Lyon St., Santa Ana, Calif. 92705.

Interdata Users Get Array Device

NEWTON, Mass. — Computer Design and Applications, Inc. has an array signal processor designed for use in Interdata 8/32 and 7/32 minicomputers.

Occupying a single plug-in board, the system is designed for such applications as image enhancement, voice processing and analysis of seismic data, a spokesman said.

The board derives its power from the host computer, the company noted, and is said to be able to perform array calculations from 10 to 50 times faster than minicomputers used for that purpose.

The unit costs $19,500 with quantity discounts available, a spokesman said from 375 Eliot St., Newton, Mass. 02164.

Drafting System For Wang Units

SAN ANTONIO, Texas — The EDP-11/75 flatbed drafting system can now be interfaced to Wang Laboratories 2200 minicomputers, according to the vendor, H. Dell Foster Co.

The microprocessor-controlled stand-alone system offers users a resolution of .001 inch, the firm noted, and is tiltable to 55 degrees. It features a three-position universal drafting head.

The plotter, plotter interface and software driver to convert existing Wang applications programs cost $18,700 without a vacuum hold-down feature and $19,950 for a version with vacuum hold-down. The Wang 2200 interface must be added for $450, a spokesman said from the company at 14703 Jones Maltsberger Road, P.O. Box 32581, San Antonio, Texas 78216.

Because they sum up the basic concept behind our products.

Products that offer the user up to four functions in one system. Remote job entry. Key-to-disk data entry. On-line file management. And stand-alone processing. All configured to meet application requirements.

It's a concept that offers our customers a unique blend of stability, growth and economy. A concept we also offer to you.

We protect your past and present.

Multifunction data processing developed from a major commitment we made when Data 100 came into being.

To protect the user's time and resource investment in system procedures and software, by providing continuity between every product in the Data 100 line.

Our first product was a remote batch terminal with remote job entry.

Today, we offer remote job entry, remote data entry, on-line file management and stand-alone processing.

In the meantime, we have protected the time and resource investments of our customers.

Software and system procedures used in early Data 100 products still operate with today's expanded multifunction systems.

We provide for your future.

Data 100 products are designed for multiple tasks.

That's the beauty of multifunction data processing.

For example, you can buy a remote job entry product now, then add key-to-disk data entry later.

As your needs grow, you can add on-line file management; and still later, stand-alone processing.

And you don't obsolete your system as you grow.

We help you save money.

Multifunction data processing systems can do four jobs, at nowhere near the cost of four systems.

That's economy. Real dollar savings.

Whether you buy a single function system now and add functions later, or buy a single system to do four functions, Data 100 can help you save money.

Multifunction data processing.

We sign our name with these words, because they tell you what Data 100 is all about.

Unequaled . . .

NEW Extended TSO Capabilities

Features and capabilities not available anywhere else.

This package is named Video Programming Tools (VIP). VIP offers a broad array of TSO commands and sub-commands providing a generalized on-line update and inquiry system for its user. An associated data dictionary facility is provided to allow users to define specific field definitions for files being accessed. Fixed or variable length records are handled for ISAM, BDAM and sequential datasets. Data, at your option, may be displayed in hex, bit, packed or character format. Multiple formats may be assigned to one field. VIP is also very handy for creating complicated test files for program debugging.

Included in the VIP package is an OS JCL Flow-charter. All JCL including PROCS is flowcharted on 8½ x 11 printed output picturing each job step on a separate page.

Job Organization Language (JOL)

Completely unique—has a high level language that no one else has.

- Program job schedules
- Reduce hardware/software dependency
- Increase throughput

Run your 360/370 IBM computer without writing another OS JCL statement. JOL is to JCL what PL/I and COBOL are to BAL. You write all of your job streams in a high-level easy to understand language. You then submit this language to the operating system via the card reader or other media instead of JCL. JOL will have the same effect on your data processing environment that COBOL and PL/I had when they were introduced. By simplifying the development of OS jobstreams JOL will result in increased programmer productivity, optimized state of the art JCL creation and reduced job failure. JOL is easily installed and becomes an integral part of your operating system environment. It should also be noted that both JOL and regular JCL jobs can be run at the same time.

NEW LIBMAN The intelligent tape library management system.

The only on-line system that uses TSO.

LIBMAN is a Tape Library Management System designed to give you:

- Maximum file protection
- Automatic scratch tape forecast and release for production
- Flexible tape retention by number of GDG's, file name, JCL or System Generated Defaults
- On-line inquiry and update
- Nine Management Reports
- Dedicated or non-dedicated slot library
- Customized SYSGEN
- Notifys you when tapes need cleaning
- No operating system "Hooks"
- No extra tape label data

The system runs on an IBM 370 computer under VS2 with TSO and SMF. You may use LIBMAN under a perpetual lease or monthly rental plan.

Conversion Packages

RPG/RPG II To COBOL Translator

This package accepts all types of RPG and produces ANS COBOL. The resulting COBOL program is modular in design (main driver perform sub-routine) and follows the basic RPG process cycle: Read, Process, Write. RPG data and procedure names are used without exception unless they are COBOL received words. Several client service options are available: Perpetual Lease, Conversion only, Clean Compile and full implementation including production JCL, test and installation.

MAP To COBOL Translator

Honeywell MAP source code is the input and IBM ANS COBOL is the output. Originally, MAP was programming language for the earlier General Electric 400 Series Computers now referred to as Honeywell 400 Series Computers. The Translator runs under IBM's OS/VS operating systems and will work on either 360 or 370 hardware. The resulting COBOL procedure division uses section-level code to accommodate the translation of MAP internal sorts having I/O procedures. A common print routine is inserted into each report writing program to convert MAP carriage controls to those supported by IBM. Various warning messages are provided as part of the translator output to highlight potential problem areas within the translated program.

COBOL To COBOL

System—3 COBOL is the input and 360/370 OS ANS COBOL is the output. This package is designed to save your programmers the boredom of changing 5000 select and FD statements the same way every day until your conversion project is done. Also specific differences such as COMP—4 (Binary), missing value clauses, UPSI switches, etc. are handled. Since the System—3 used no printer carriage control character in front of the print line all print commands are replaced with a perform of a common print sub-routine which inserts the correct carriage control for 360/370 printing.

Utility Software

SIMBA

SIMBA is a blocker/deblocker interface between your applications programs and relative block BDAM datasets. By allowing you to handle relative block BDAM as though it were relative record BDAM you save a considerable amount of disk space for dataset allocation as well as realize an improved program processing efficiency. SIMBA is very valuable when converting from hardware environments where relative record accessing was heavily used to an IBM 360/370 enivronment where BDAM is not oriented toward blocked records. SIMBA will run on any OS/VS IBM 360/370 hardware.

DASDCMP

This is a Generalized File Utility designed to expedite programmer productivity during major conversion projects, parallel testing or regression testing where large data files must be compared to verify new program accuracy. The compare and print function, when a difference is sensed between two files, prints the file one record followed by just the differences for the file two record. Errors are quickly spotted. Control card parameters are accepted so you can compare specific parts of a record or ignore specific differences. Also file merging, match compare and print and print only functions are available. Records are printed in alpha and hex.

Boeing Division Installing Mini-Based Control System

By Robert C. Gamrath
And Fred M. Stewart
Special to CW

SEATTLE — While the Fabrication Division of Boeing Commercial Airplane Co. here can do little about an environment indigenous to a machine shop, it is removing from the floor two major causes of downtime — tape readers and spoolers — and replacing them with a minicomputer-based online distributed numerical control system. By the end of 1979, 80 machine tools are planned to be assimilated into the system.

Presently, our Distributed Numerical Control (DNC) process, developed by Allen-Bradley Co. of Cleveland, Ohio, is operating 25 tools.

Its base is comprised of two Allen-Bradley Bulletin 1795 systems, each incorporating an Interdata 7/32 minicomputer that transmits instructions from a remote location directly to the machine tools. Enclosed in a room above the machine shop floor, the minis are removed from the severe elements and are therefore unaffected by the environment below.

Though our system is still many months away from full implementation, its present phase is far and away superior to past methods. Like most machine shops with numerical control tools, we had — and still have in many instances — photo electric tape readers and electromechanical spoolers on the floor.

Mylar tapes to control the tools were brought to the floor where they were run through readers.

Programs were read in blocks, the tapes starting and stopping after every one to two inches. Thus, in a 500-foot reel of tape operating at 400 char./sec, the reader started and stopped 12,000 times.

Besides such heavy-duty operation, the readers and spoolers were exposed to hydraulic and lubricating oil, coolant, metal chips and a mist that hangs over the shop. All of this contributed to numerous failures and an ongoing program of maintenance.

As conceived in diagram form, our system will resemble a pyramid with part programming computers at the apex servicing two modules that will operate a total of 80 machine tools.

A module consists of two systems. Each Bulletin 1795 is designed to operate 20 machine tools. It may be linked to machine control units, which in turn operate the machine, or machine terminal units connected to machine control units.

When the system is complete, our parts program will rest in a data base library, also resembling a pyramid. At the apex will be an "active" library of stored parts programs, which can be accessed for transmission to a tool-operating terminal.

The "ready" library in the middle is for parts programs scheduled for near-term use, but not currently in demand by a terminal. Speed is less important but still must provide for suitable response.

The "archives" are exactly that — every parts program in our library.

When the system is totally operational, the manufacturing engineering group responsible for developing parts programs would store the data in the archives. The parts programmers will have sole responsibility for management information in the archives.

Programmers will be able to revise the status of programs or purge them from the archives. Using a CRT, a programmer will be able to track a parts program to a particular library level and put an immediate hold on it for change or purge. If the program is already in the "active" stage, we will allow the part to be cut before recalling it.

Gamrath is Director of Facilities and Stewart is manager of Mechanical Equipment Engineering at the Fabrication Division of Boeing Commercial Airplane Co., Seattle, Wash.

Operator mounts punched tape onto system at Boeing Commercial Airplane Co.'s Fabrication Division.

Schedules Closed Faster

Auto Metal Fabricator Keeps Growth Rolling

AKRON, Ohio — A metal fabricator for the auto industry is keeping its business rolling with the installation of a small business system.

In order to meet production schedules, Falls Stamping and Welding Co. must stock huge inventories of steel and other raw materials. Combined with a weekly payroll of over 150 employees, inventory control became an extremely complicated job.

Records had previously been kept by hand, but the complexity of Falls Stamping's payroll dictated the need for an automated system.

Initially, Falls Stamping contracted with a local service bureau for computer assistance. It didn't work, according to D.A. Stoneman, controller. It took up to four working days for information from the center to reach the company, he said.

The relationship became even more difficult during severe weather conditions. The service bureau failed several times to deliver payroll checks on time and union officials were understandably concerned, he noted.

After switching to a different service bureau, the situation improved. But a similar problem soon developed, forcing the company to prepare payroll checks by hand to avoid a union confrontation; Stoneman said. On one occasion it took two employees one full day to prepare and distribute checks, he added.

"Service bureaus," according to Stoneman, "were charging us $1,800 per month for hourly payroll which was approximately 80% of their work for us. The other 20% was for miscellaneous reports," When it came to nonprogrammed requests, it meant an additional delay due to programming time.

"What we wanted to do," Stoneman said, "was to get away from the problems with service bureaus and have our own small business computer system."

Narrow the Field

After reviewing and evaluating findings in a Datapro computer research report together with competitive product literature, the field was narrowed to 12 computer manufacturers. A letter was sent to each manufacturer requesting a quote on a 16K system, 6M bytes of disk with a printer and CRT.

"We developed our own questionnaire," Stoneman said, "which was sent to each finalist. Based on responses and personal interviews, the Microdata Corp. Reality system was eventually selected.".

The company needed a system that was easy to operate. "All the way from the secretaries to the company president, we needed a computer anyone could communicate with," he said.

The system installed has 16K bytes of memory, 10M bytes of disk, two CRTs and a printer.

Almost immediately after the system was in operation, Falls Stamping began to realize a return on its investment, Stoneman said. The monthly cost for owning the system was about half what the service bureaus had been charging, he added.

One of the most important features was the programmability and retrieval of information in Microdata's English. "It was hard to comprehend how fantastic English really was. Now that we have it, it's remarkable. What a powerful tool it has turned out to be," Stoneman said.

The system handles scheduling, weekly payroll and inventory. It inputs daily invoices and updates receivables simultaneously. Payroll now goes out on schedule without concern over violating union contracts. "There are many other areas where the system can help improve our operations," Stoneman said, "that we never thought of before."

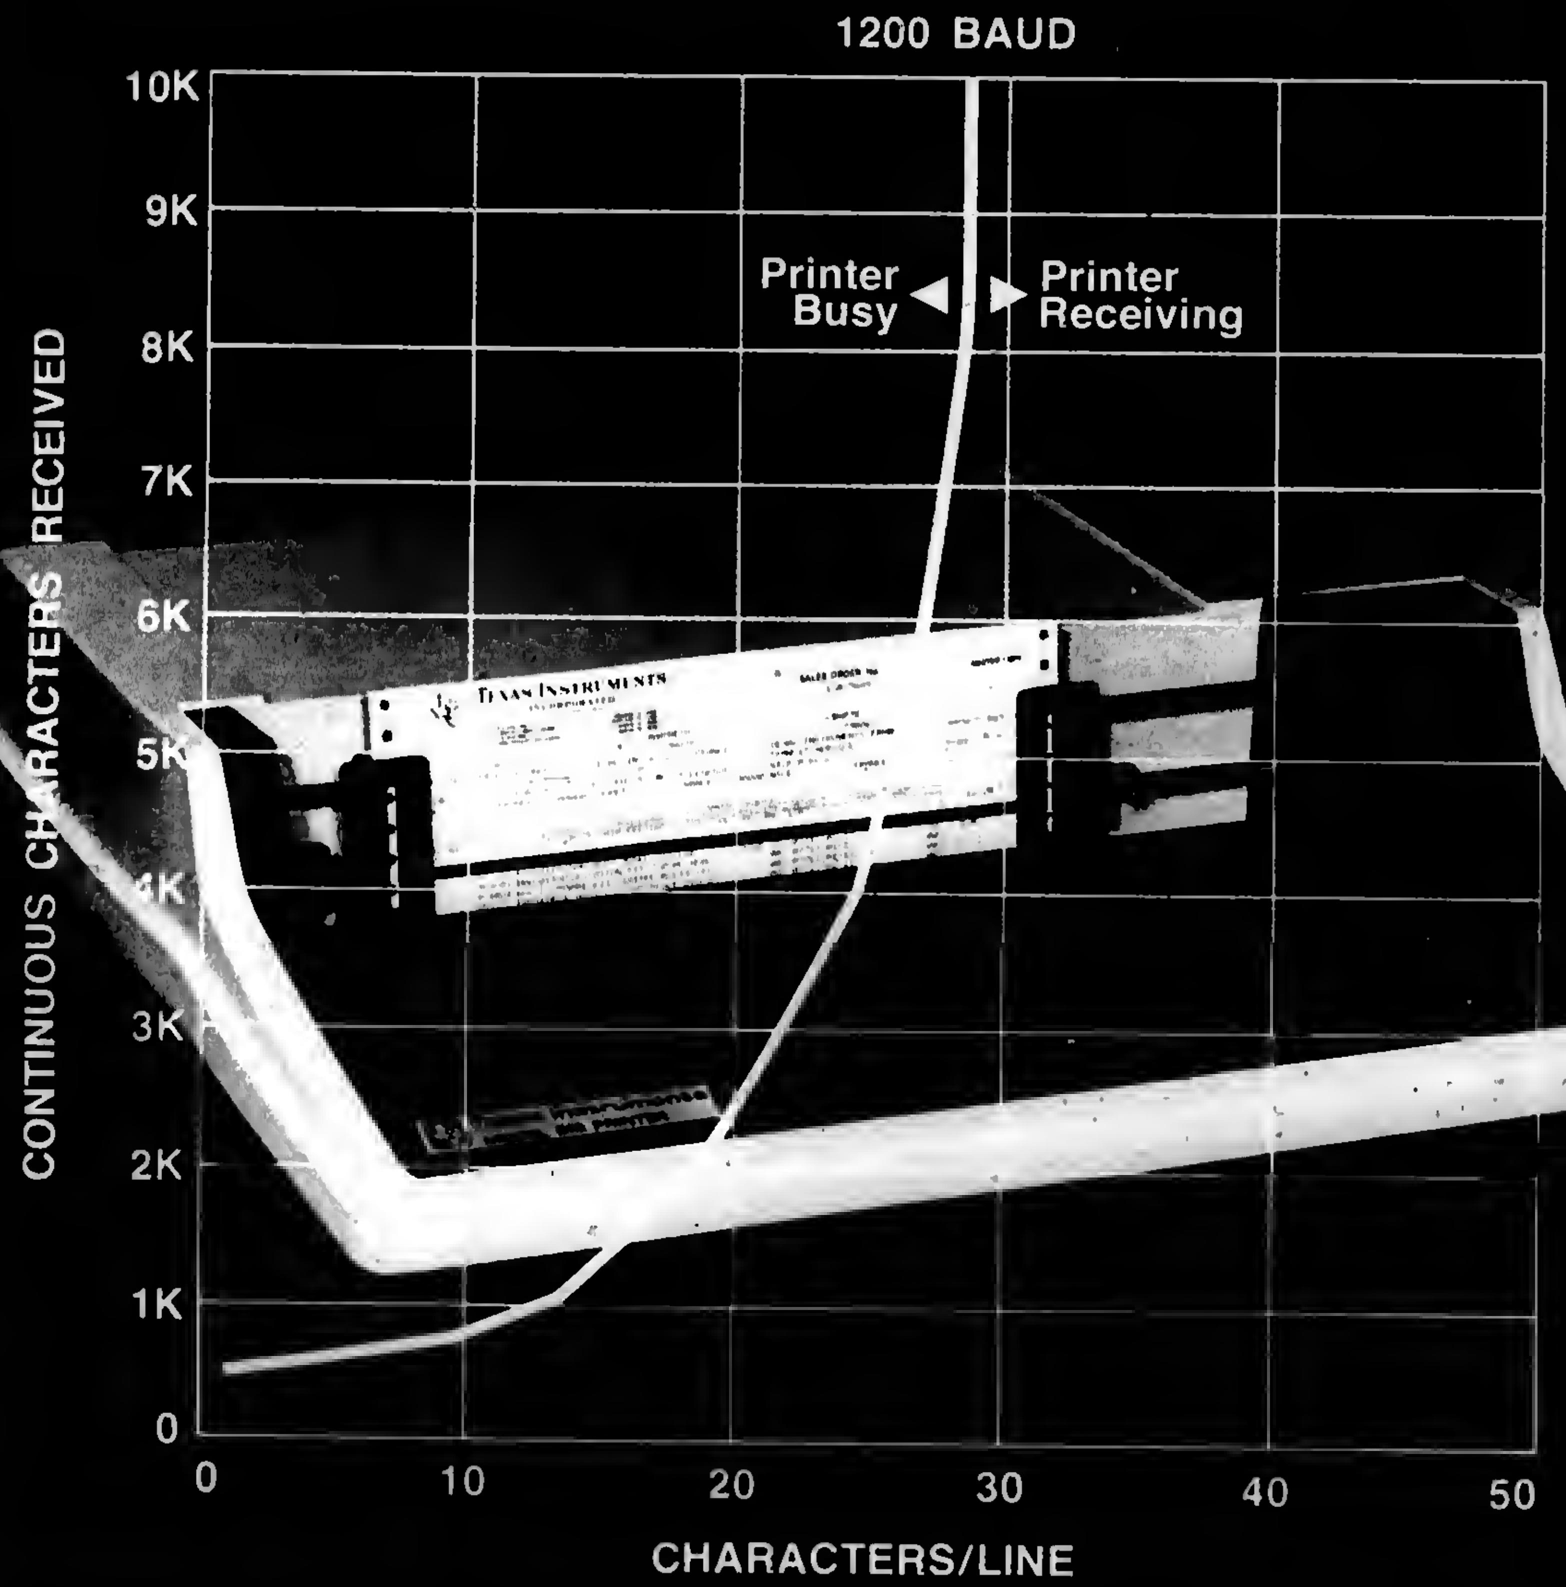
Alternate Jobs

A typical example of how the system has enabled Falls Stamping to react quickly to changing situations was when

(Continued on Page 71)

New from TI.

Plot the performance of the Model 810 Printer against any other printer on the market.



With average line lengths of more than 28 characters, the 810 Printer can accept continuous data at 1200 bits/sec. with no "printer busy" interruptions for carriage return.

Auto Metal Fabricator Keeps Growth Rolling

(Continued from Page 70)

a major auto manufacturer suddenly shut down six plants. The computer immediately provided alternate routings for materials, personnel and press loads. It listed run times for alternate jobs and noted orders that could be scheduled in place of the jobs that were being held. It even told Falls Stamping if sufficient materials were on hand to complete alternate jobs. If not, it notified purchasing to make the buy.

What has the addition of the computer meant to Falls Stamping? Profit, according to Stoneman. Schedules are closed as much as five days faster every month. Jobcosting is more precise than ever before and available in a number of formats. Response to customer demands is faster and more accurate, he said.

On the management side, department heads can have a status report on any job or materials-on-hand by pressing a few buttons on the terminal. Management response time to any problem area is shortened by three days or more, he stated.

"We've more than paid for the system already in increased efficiency," Stoneman said, "and we expect it to have a major positive impact on our profits from now on."

As far as planning and projecting, the mini permits Falls Stamping to plan for the future as well as the present. Cash flow has been improved tremendously through production efficiency, making it possible for meaningful financial planning for the future, he said.

Publisher Plans DDP

(Continued from Page 65)

A test bed of 8,700 typical transactions was created for the benchmark testing, Burns explained. "The transactions would be different going into a CRT against the current method, so we really had to create" the data base, he added:

Among the formalized tests were multi-keyed access; generic search — partial key retrieval; significant word access; and multitasking capabilities. Also included were record updating via key; high-volume throughput and high-speed access to disk; and random, sequential and indexed access on the same file.

The department ran the 8,700 transactions through multiple CRTs and timed the first and last terminals to complete the transactions. "The last CRT to finish up all 8,700 transactions" did so in slightly less than three and a half hours — the Syfa system. The average time was about two and a half hours, he said.

HP was the next closest competitor, with the last CRT run finishing in under six and a half hours and the average CRT time in about five hours.

In DEC's case, "its last CRT didn't wrap up for almost nine and a half hours" and its average time was about six and a half hours.

Although price comparisons of the three systems "didn't carry an enormous amount of weight," the Syfa system was about $100,000 cheaper than the nearest competitor.

The first Syfa system is already installed in the firm's DP department for system development. The largest branch, in Geneva, Ill., will get its mini in April.

Upkeep OK: User Survey

(Continued from Page 65)

repairs."

A user of 34 NCR minicomputers said the maintenance service he received from the manufacturer was excellent, but another NCR user, of a single Century 101 system said the vendor's maintenance was poor "because customer engineer knowledge was lacking."

'One-Day Response'

"One-day response with a maintenance contract and excellent repair parts availability locally" rated HP an excellent mark from a user in Maryland. "Very little downtime; 99% up' said a Four-Phase Systems, Inc. user, rating the system "excellent."

And you'll find our impact is exceptional.

TEXAS INSTRUMENTS.

Compare the new Model 810 Printer with any other printer you are using or considering. We believe you'll find that the 810's reliable, microprocessor-controlled printing results in the highest throughput per dollar and lowest cost of ownership.

The 810 is ideal not only for OEM's but as a peripheral printer for the TI model 770 Intelligent Terminal and the 990 Mini/Micro Computer Family.

Plot our standard features.
The 810 printer has exceptional standard features too. Like bi-directional printing at 150 cps. No paper tape programming. Adjustable tractors for a variety of form widths. A 9 X 7 wire matrix character font for high-quality printing of an original and 5 copies. Bottom and rear paper loading. Speeds from 110 to 9600 baud. And 6 or 8 vertical lines per inch. Add to these the 810's tested reliability and the result is *performance*.

Add a full line of options.
With Vertical Forms Control, you get non-volatile storage of up to 8 different vertical forms. And with Forms Length Control, you can have 11 switch-selectable stored form lengths, from 3 to 14 inches plus 1 programmable form. The compressed printing option lets you print 132 columns in 8½ inch width. And foreign character sets are available as well as interfaces for most applications.

A company you can rely on.
A valuable feature of any Texas Instruments product is after-sale support. When you purchase your 810 Printer, you're getting support from a worldwide network of factory-trained personnel. And contracts are available for up to 24-hour, seven-days-per-week service.

With the Model 810, you can be sure your total cost of ownership is the lowest possible. And printer performance the highest. For a demonstration of the Model 810, or more information, just mail the coupon. Or call your nearest TI sales office, or (713)494-5115, ext.2124.

You'll like the 810's impact.

Yes! I am interested in the new Model 810 Printer. 9-9-CW

Diskette Datashare-

The Breakthrough Your DP Budget's Been Waiting For.

And waiting for: An inexpensive, multi-user system that increases your data processing capability without depleting your pocketbook.

Datapoint announces Diskette DATASHARE® — a new combination of hardware and software that features the power of our DATASHARE Business Timesharing System and the economy of a diskette-based processor.

With Diskette DATASHARE, you can implement a timesharing system with up to four concurrent users on individual 3600 Datastations. Based on the 48K Datapoint 1170 Dispersed Processor, the system uses advanced disk buffer management techniques to produce an astounding 32,000 bytes of virtual memory for each user. Data is stored on convenient diskettes using any of Datapoint's file access techniques, such as random-access or indexed-sequential. A total of one million bytes of on-line storage is provided.

What's more, Diskette DATASHARE contains the same versatile capabilities for external communications as the larger DATASHARE systems. Like DSNET,™ for remote disk file processing, and MULTILINK,™ for real-time telecommunications to a mainframe computer. So your Diskette DATASHARE system can become a node in a dispersed network as you grow.

And because all the members of Datapoint's family of hardware and software products are compatible, you can later upgrade your system without costly software revisions and retraining.

But the best news is the price. Now you can install a full, four-station DATASHARE capability for under $27,000, or $830 a month on a three-year lease (metro-area maintenance included, printer optional). That's right — your DP budget can finally breathe easy. While your operations run more efficiently than ever.

Find out more about Diskette DATASHARE. Contact the Datapoint sales office nearest you, or write:

Mini Speeds Flight Data to Airline Passengers

LOS ANGELES — The nearly 750,000 passengers who pass through the Hughes Airwest Terminal at Los Angeles International Airport each year receive updated information about aircraft arrivals and departures from displays controlled by a minicomputer.

Similar systems are also operating at Hughes Terminals in Las Vegas, San Francisco, Phoenix and Salt Lake City.

The mini is the heart of a new airline Intelligent Flight Information Display system designed and developed by the Systems-West Division of Conrac Corp., Duarte, Calif.

Under the control of a Computer Automation (CA) Naked Mini, the system provides information on arrivals, departures, gates and planes as well as new flights or cancellations. It handles as many as 16 flights simultaneously and displays information on 23-inch television monitors located throughout the terminal.

"Under the old system, information was disseminated by telephone from the operations office to check-in counters and boarding gate personnel, who in turn would update manual flight boards," according to Bud Donohoe, director of ground communications and reservation systems for Hughes Airwest in San Francisco.

"In many instances, though, phone calls weren't made or employees were away from their phone and didn't receive the information," Donohoe noted.

At other times, especially on busy days, changes would come so thick and fast passenger agents had no time to update the boards. "When this happened, the agents would be continually interrupted by questions by passengers," he said.

Flights Updated

Now operations agents update flight information using the computer terminal, which is then used to transmit the data to the display monitors.

"It eliminates the time needed to make phone calls and change manual flight boards and reduces the time employes are distracted from their other duties," Donohoe said.

The system also enables Hughes Aircraft to keep employees up to date on continually changing operations information. "Several internal channels are used to disseminate operations data such as aircraft number, gate assignment, fuel load, passenger transfer and cargo data. This information is displayed on 9-inch monitors located below ticket counters and boarding gate areas, in maintenance areas, in hangars and in management offices," according to Ralph Sellars, station manager for Hughes Airwest in Los Angeles.

In operation since July, the system links large television displays in public arrival and departure areas and 9-inch internal monitors in operations areas with the Naked Mini.

The flight schedule for an entire week is stored in the minicomputer's memory in chronological order of flight activity — along with gates, times and other remarks. Each flight is coded for the days of the week it is scheduled.

Daily Setup

When setting up for the day's operation, the operations agent presses a button on his control-edit terminal and the day's first 16 flights appear on the control monitor screen. If no temporary changes are required, the agent punches another button that causes the minicomputer to separate the arrivals from departures and transmit them to the appropriate public display screens.

"All of the television monitors are activated by signals received from the Naked Mini. The operations agent depresses a button labeled 'roll-up' and the top line of the display rolls off. All other lines roll up and the next flight is pulled from the minicomputer's memory and appears on the screen at the bottom of the line. The agent then depresses the transmit key and 'execute' button and data is transmitted to all public display screens," Donohoe said.

"From data in its memory, the mini even knows when to automatically omit flights that do not operate on particular days," he added. "For example, if a flight departs only on Tuesday and Thursday, the computer brings it up to the screen on these days and no others.

"The entire updating operation takes approximately seven seconds," he noted.

IBM Users: Dearborn's DOS/RS™ is all the software you'll ever need, no matter what your core size...128K to ∞

At last...growth potential for your S/360 or S/370 with the latest version of Dearborn's Operating System/Real Storage.

DOS/RS is the single, fully-integrated system with total capabilities written into it—from the outset—to let you improve throughput beginning with the most modest core size right up the scale to 1 Mg...and beyond.

DOS/RS is the major enhancement of DOS Releases 26 and 27 that improves, extends and helps evaluate itself...without combining several different systems...without adding or modifying an existing system...without maintenance problems...without added costs.

DOS/RS improves 360/370 performance without installation and conversion problems. Installation is quickly accomplished in an orderly manner since all standard DOS functions are supported. What's more, many DOS/RS features will begin operating automatically. Then, as your core size and requirements increase, DOS/RS permits a gradual, phase-by-phase conversion to total DOS/RS capacity.

VISAM—a direct replacement for ISAM

Dearborn's new Variable-Length Indexed Sequential Access Method can be added to improve processing throughput and utilize disk storage more efficiently.

For detailed information on the all new DOS/RS and VISAM, call the nearest Dearborn office or write:

Money-Saving Packages Gaining Acceptance

By T. Schindler
Special to CW

NEW YORK — Packaged applications software makes good business sense for small businesses because it can save money, it can save a great deal of executive time and it offers the user the possibility of knowing exactly what is being provided.

A custom system design may or may not be complete and may not become reality as specified, so users should have a close look before succumbing to the "not invented here" syndrome.

The rise in acceptance of packaged applications software by the smaller user has resulted from a variety of phenomena.

Hardware price/performance in small systems has advanced rapidly, making the benefits of on-site computer mechanization available to smaller and smaller businesses and other enterprises.

The service bureau, either time-sharing or traditional, of necessity burdened with substantial skilled personnel overhead, has not been able to pass on hardware economies because of an off-setting rise in other costs. The economics of in-house processing have thus improved. Service bureaus like the laundromat and freezer center to the home owner, are less essential since many traditional users can now afford their own systems.

Complexity

At the same time, business complexity, largely due to increasing governmental reporting requirements, has virtually forced mechanization of data gathering and reporting procedures for many businesses.

Improved communication and DP education within the business world, even at very low levels, has made increasingly clear that the end result of an accounting system is virtually the same for every business. Procedures differ, of course, but the emotion attached to "my way" is disappearing, partly because of the need for economies and partly because of rising mobility, which is making the long-term employee cadre less common.

Programming costs were always a major consideration, however, they were a relatively obscure, difficult-to-identify segment of the overall mechanization program. Today, the compounded situation of declining need for in-house technical expertise and the rising direct and indirect costs of systems professionals has cleared the way for much compromise by users.

It is fine to be "different" and require a custom designed and programmed system, but how much is it worth? Is it worth $7,000 to $8,000 per man-year? Perhaps. What about $20,000 to $30,000 per man-year? Perhaps not. At least alternatives are worth considering carefully.

'Used' Packages

Combined hardware/software vendors are also interested in reducing the number of developmental software personnel on board by offering once-developed packages installed by less expensive (and easier to find) field programmers.

As usual, economics, communications, education, technology and government are leading the way toward defined peformance standards. Standards are growing out of common basic requirements and benefitting from the input of users, vendors and consulting professionals.

Experience is undoubtedly improving in terms of general package systems performance as well as user satisfaction.

Early development attempts were, predictably, limited by the exposure of the developer whose know-how tended to be single-sourced and thus not necessarily broadly usable. Also, in-house staff of early user organizations tended toward strong "not invented here" attitudes and, while not necessarily openly hostile toward packages, often did less than the maximum in trying to make the package work.

The idea, however, of packaged applications software was and is both logical and economically smart. Vendors continued to try and improve upon past efforts with some startling results.

Today, the mere thought of specially designing and programming a general accounting system is absurd.

Furthermore, advances in design and programming methods allow for system flexibility permitting, at reasonable cost, a reasonable degree of package "customization." The clever vendor today seems to offer both the economics of standard packages and the "nuance" of custom development.

Caveat Emptor

Nevertheless, in spite of tremendous package improvements in recent years, the potential user must be careful. Here are a few initial items to consider when contemplating purchase of a package.

First consider who the vendor is. While size is not necessarily important it does suggest some past success and stability. Growth based upon nonperformance is exceedingly difficult in the systems business.

The vendor may be a recognized hardware supplier with an important market position and reputation to protect. This is probably the best situation in terms of guaranteed support, although not necessarily a guarantee of getting the best package. Remember, such vendors must work within the boundaries of their proprietary hardware capabilities — a reality which may not be in the best interests of the user.

A software house has primarily its package products to live on, but often suffers from thin capitalization and thus a need to install systems with payment taking priority over package performance and support.

If buying software from another user, the risk can be minimized by checking with other users regarding system suitability and vendor support. Questions to be asked include: Is training adequate? Is user documentation adequate? Have any systems errors been detected and how did the vendor react?

Users also need to know what hardware is offered and from how many different OEM suppliers. How well established is the software house/OEM supplier relationship?

Rapid component shifting can mean incompatibility from one package generation to the next. This can lead to obsolescence and an unforeseen major expense when an upgrade or enhancement is called for in the future.

Take Protective Measures

After thoroughly checking out the package vendor, users can take some other protective measures. For example, be sure that the system features are clearly defined in official documentation and that such documentation is referred to in a contract.

In dealing with a large vendor with a substantial user base, there is not much else the buyer can do.

The small software house with little or no user base must be dealt with differently. Policy is often nonexistent and there is often dire need for cash. If in doubt about the package, design a payment schedule that ensures the vendor's interest in the installation until it is certain there are no basic problems and that all claimed features are indeed included.

Schindler is executive consultant at Advanced Computer Techniques Corp., New York, N.Y.

Shows Draw Hobbyists, Novices, Press

Boston

By Frank Vaughan
CW Staff

BOSTON — Computermania opened here recently amid massive publicity by the show sponsor that microcomputers have come of age.

But despite claims of 14,111 total attendance, the opening day crowd gave the appearance of falling quite short of the expected overflow crowds predicted by the show sponsors, *Kilobaud* magazine of Peterborough, N.H. The show did, however, draw visitors from most parts of the U.S. It also drew much of the international press corps, with the British Broadcasting Corp. and several Asian publications represented.

The Radio Shack Co. TRS-80 was one of the stars of the show as the under-$600 microcomputer system made its New

(Continued on Page 78)

Music enthusiasts found plenty to play with at PC '77.

Atlantic City

By Frank Vaughan
CW Staff

ATLANTIC CITY, N.J. — For the second straight year, the microcomputing people came to the Shelburne Hotel here for a computing show. Personal Computing '77 (PC '77) despite a competing show in Boston, was termed by most attendees and exhibitors an unparalleled success.

Estimated attendance for the two-day show ranged from lows of 8,000 to a high of 12,000. Exhibitors indicated that few of the show's visitors came "just out of curiosity."

Instead, they were generally people with a knowledge of microcomputing interested in seeing the latest state of the art.

The Heath Co. chose PC '77 to make the first public display of its kits line. At times it was virtually impossible to squeeze past the

(Continued on Page 77)

SFS WALLETSIZE
Trekkies and spaceship landing games gave the Boardwalk the look of a spacewalk.

Atlantic City saw no age barrier for microcomputing enthusiasts as young and old came to look, buy and play.

Exhibit Deceived Businessmen: Monosson

BOSTON — "The devastating deception for a businessman is a surface illusion that he can solve all of his business problems for $595 with a simple little computer . . . but he can't," Adolf G. (Sonny) Monosson, president of American Used Computer Corp., said after several hours of discussions with attendees at the recent Computermania show here.

The discussions caused him to realize that businessmen are being seriously misled by "the rising wave of personal computing," Monosson said.

The typical question the businessman asks is where he can get the $595 computer to do his job. He went around the show floor and didn't see it, Monosson said.

The computers demonstrated at the hobby show produced no printout for the businessman, they had inadequate memory systems for business and there was no software support, which meant the microcomputers couldn't be used in business without substantial software expense, he contended.

What the businessman saw were computers developed for the personal computer user — the technician, Monosson claimed.

Monosson challenged the idea that the microprocessor systems will be the salvation of the small businessman. "Digital Equipment Corp. was one of the first to introduce a microprocessor in its LSI-11 and never heralded it as a savior for anyone. People say that Digital didn't realize what it had, but maybe it did and maybe it realized the peripherals and software are far more expensive than the CPU," he said.

Monosson also claimed to have the only real business computer at the show, the Olivetti P-6060. He noted that it was not in the $400 price range, but priced at $8,950.

Because it was designed for the small businessman, the P-6060 has the capabilities the $400 systems lack, he said.

The small businessman must decide if he wants a $400 to $600 system that may or may not work with software; that he will have to bring in to a shop for repairs; that will not have adequate storage for records; and that either doesn't print or does so too slowly to be of real use, he added.

What users are seeing at microcomputing shows is a collection of technical ideas put together in a hodgepodge manner in their early stages of growth. This is of prime attraction to the technical person who has the capacity of fixing the system himself if it goes down or to the game player who sits at a console all day long and plays Star Trek, 21 or Tic Tac Toe.

These microcomputers have limited memory, which is fine for these limited tasks, Monosson said.

Monosson was upset with the description of microcomputers as "business computers." "It puts us on the defensive," he explained. "Many people would come to us and tell us they were very resentful. They came to the show and they looked for business computers and found nothing under $3,000 to $4,000 with software which could be maintained or supported to do the jobs they had heard could be done for $400, $500 or $600.

(Continued on Page 77)

Canadian Show Rescheduled

TORONTO — The Canadian Computer Show scheduled for the International Center of Commerce here Nov. 8-10 will introduce Canada's first Personal Computing Showplace.

Industrial and Trade Shows of Canada made the decision to stage the event on the same days as the Canadian Computer Show, rather than at a different time as had been planned, according to Robert Gowdy, general manager.

"Our original plan to overlap by only one day was adjusted in light of the fact that another consumer show of a different type was booked for the International Centre on the additional dates we had planned on using. We felt this might create traffic difficulties for our visitors and we have therefore rescheduled the Personal Computing Show to the same dates as the Canadian Computer Show," Gowdy said.

Gowdy stressed that the Canadian Computer Show will remain exclusively a trade show and that the general public will not be admitted to the exhibits. Visitors to the Canadian Computer Show will be admitted free to the Personal Computing Showplace, but the reverse will not be allowed, he explained.

Public admission to the Personal Computing Showplace will cost $5. Gowdy can be contacted through the Industrial and Trade Shows of Canada, 481 University Ave., Toronto, Ont. M5W 1A7, Canada.

RCA Micro Kit Features OS in 4K Bits of ROM

ATLANTIC CITY, N.J. — An expandable hobbyist microcomputer kit called Cosmac VIP (Video Interface Processor) is available from RCA's Solid State Division. It was shown at PC '77 here.

The VIP is a complete microcomputer, offering an operating system in 4K bits of read-only memory, a spokesman claimed. VIP's output directly interfaces with a CRT or, when used with an FCC-approved modulator, a television receiver. Programs can be generated and then stored in an audio cassette tape recorder for later retrieval and use, he said.

Features 1802 MPU

The heart of the VIP is RCA's CDP1802 microprocessor unit (MPU). The MPU board comes with 2K bytes of random-access memory (RAM) using 4K-bit static RAMs, single-chip graphic video display interface, built-in hexadecimal keyboard, 100 byte/sec audio cassette tape interface and power supply.

The Chip-8 interpretive programming language has 31 instructions in a 2-byte format, the spokesman explained. The 512-byte operating system reportedly simplifies loading programs into RAM via the keyboard, recording RAM contents on cassette tapes and transferring tape-recorded programs into RAM. It also facilitates displaying memory bytes in a hexadecimal format on a CRT, stepping through RAM contents and examining the contents of the MPU registers, the spokesman said.

The VIP is expandable both on the printed circuit (PC) board and through connectors. RAM capacity can be doubled on the card to 4K bytes by adding four 4K-bit devices and can be expanded to a total of 32K bytes by adding further memory capacity through a 44-pin connector socket in the card. Parallel I/O expansion to 19 lines can be achieved on the PC card for use in music synthesizers, relays, printers or Ascii keyboards.

The hobbyist manual contains information on kit assembly, operating procedures, Chip-8 programming techniques, machine language programming, logic description, test programs and troubleshooting guides and system expansion instructions. The manual also includes instructions on using the hexadecimal keyboard.

The VIP is selling for $275 from RCA Cosmac VIP, New Holland Pike, Lancaster, Penn. 17604.

Group Forming in N.J.

ATLANTIC CITY, N.J. — A hobbyist group is forming in the Camden County, N.J., area. The group is open to any computer hobbyist and is not limited to computer owners. Information may be obtained by calling Gene Bomgardner at (609) 541-8296.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:

Scheduled Micro Shows Stretch Across Nation

Trying to figure out how to schedule vacation time and money to take in a hobby computer show or two can be a trying affair. And it often seens like everyone else knows about the big shows, but the information never passes your way.

As a reader service, *Computerworld* will publish a regular listing of known microcomputer shows. Included in the listing will be the name of the show, date, location and the name and address to contact for further information.

Sept.17-18, Houston — **Houston Personal Computing Faire.** Contact: Foundation for Personal Computing, P.O. Box 22486, Houston, Texas 77027.

Oct. 5-7, Niagara Falls, N.Y. — **Micro-10.** Guideon Frieder, Department of Computer Science, State University of New York, Buffalo, Amherst, N.Y. 14226.

Oct. 7-10, New York — **The Great American Do-It-Yourself Exposition.** Contact: National Expositions Co., Inc., 14 W. 40th St., New York, N.Y. 10018

Oct. 11-12, Laurel, Md. — **Microprocessor Peripherals.** Contact: Applied Physical Laboratory, John Hopkins University, Laurel, Md.

Oct. 27-29, Chicago — **'77 Midwest Personal Computing Show.** Contact: Louise Garcia, Personal Computing Magazine, 401 Louisiana, Suite G, Albuquerque, N.M. 87108.

Oct. 28-30, New York — **Personal Computing Exposition.** Contact: Ralph Ianuzzi, H.A. Bruna & Associates, 78 E. 56th St., New York, N.Y. 10022.

Nov. 8-10, Toronto — **Personal Computing Showplace.** Contact: Derek A. Kidd, Industrial & Trade Shows of Canada, 481 University Ave., Toronto, Ontario M5W 1A7, Canada.

Nov. 28, Gaithersburg, Md. — **Personal Computing.** Contact: National Bureau of Standards, Gaithersburg, Md.

1978 Shows

April 28-30, Long Beach, Calif. — **Percomp '78.** Contact: James H. Lindwedel, Royal Exposition Management, No. 108, 1833 E. 17th, Santa Ana, Calif. 92701.

June 5-8, Anaheim, Calif.— **National Computer Conference & Computer Festival.** Contact: Steve Miller, Stanford Research Institute, 333 Ravenswood, Menlo Park, Calif. 94025.

July 23-25, Detroit — **Macc Computerfest '78.** Contact: Jim Rarus, Semco, Box 9578 North End Station, Detroit, Mich. 48201.

Aug. 25-27, Atlantic City — **Personal Computing '78.** Contact: John Dilks, Rt. 1, Box 242, Mays Landing, N.J.

PC Held for Second Year

(Continued from Page 75)

Heath booth as the number of its visitors never seemed to let up.

Another exhibitor experiencing a large draw was Radio Shack with its TRS-80 display. The company reported that it sold "a lot" of kits during the two days and is "very pleased" with sales.

The popularity of the two exhibits was partially a result of the excitement generated by the two companies' entry into the microcomputer field.

Another exhibit with overflowing crowds was 2005 AD's exhibit. The people manning the booth were costumed in Star Trek attire and the main attraction in the display was a mockup of the controls for an unnamed type of spacecraft.

Visitors could, after a long wait in line, play a version of "Lander" on the large CRT screen in the mockup. "The people came here looking for a show, so we decided that we would give them one," one of the "Trekkies" explained.

Show organizer John Dilks, who works full-time for the telephone company and gave birth to the idea of the Atlantic City show a little over two years ago, seemed pleased with the show's success. "I was concerned for the success of the show, especially with the conflict in Boston, but the turnout here has been fantastic," Dilks said.

"We've outgrown the Shelburne and next year it will be in the convention center," Dilks added as he went from exhibit to exhibit with a massive blueprint in hand, selling space for next year's show.

Gary Coleman, president of the Midwest Affiliation of Computer Clubs (Macc), was named hobbyist of the year during the show banquet. Coleman, a Euclid, Ohio, resident, was cited for his role as prime organizer of the first and second Macc Computerfests in Cleveland.

All of the exhibits here were related to computing in one way or another. When the doors opened, only two booths were vacant, in stark contrast to the Boston show.

Visitors who attended both shows made note of the difference in exhibitor attendance and Dilks reported receiving several calls from exhibitors in Boston seeking booth space at his show. In fact, it was not unusual to see exhibitors sharing booth space.

The willingness to share booth space, coupled with the general excitement over the show, tended to give the exhibit place almost a carnival-type atmosphere. Despite the crowds and lines which stretched from the Shelburne out onto the boardwalk, few complaints could be heard — other than the occasional attendee lamenting the fact that his budget could not be stretched enough to buy all of the "goodies" on the show floor.

Dealer Hits Boston Show

(Continued from Page 75)

"What this show does is show that the personal computer is still at the level of the individual person, attracting the computer afficionado who wants to play, build and do his own thing — and there is nothing wrong with this, and the prices are becoming lower so that he can have one of these units to play with.

Programming

"This does not mean he can transfer it and use it in his business — not unless he invests a lot more money and does not care about outside support and programming," Monosson said.

"What this show has done is to point out — very, very bluntly — that the low-cost computer for the businessman has not arrived on the scene as yet. And what this show has done, more than anything, has hurt the potential buyer of small business machines who has visited this show [because] he has been disillusioned and misled in one form or another as to the fact that computers are not here for his needs," Monosson charged.

Monosson concluded his remarks with the warning that the businessman looking toward the inexpensive type of system to solve his problems should beware.

West Coast Faires Slated

PALO ALTO, Calif. — The dates for the second and third West Coast Computer Faire have been set.

The second Faire will be held in the San Jose, Calif. Convention Center March 3-5, 1978, which is immediately following the Compcon show in San Francisco. The third Faire is set to take place in the Los Angeles Convention Center on Oct. 27-30, 1978.

In conjunction with the date announcements, Faire officials issued a general call for papers for both shows. The deadline for submissions is Jan. 2 for the second Faire and Aug. 28 for the third Faire.

Prospective authors are urged to contact Faire representatives before those dates to obtain format and topic information.

In a separate announcement, it was noted that the proceedings of the first Faire have been published and are selling for $12 a copy.

Faire proceedings, as well as information on past and future Faires, is available from Computer Faire, Box 1579, Palo Alto, Calif. 94302.

Why spend $150,000 or more for a firmware system when our's can give you the same End results for less than $300/mo. (60/mo lease plan). Remember ust We're that "FREE SOFTWARE" company that provides you with thousands of dollars of software for just a little more than the cost of the paper its' printed on. NOW we are going to virtually give away our "Firmware System" at mere fractions of everyone else's prices. How can we do it? Well — Just like we did with our software: by providing a quality product at very nominal prices and relying on volume for our profit instead of making it off you! Unlike some of the other advertised systems we offer a TOTAL system package with mass memory, video display, line printer, operating system, plus a full Application Software Library. Software packages available with the system include: Payroll, Inventory, General Ledger, Medical Record Keeping, Word Processing and more. Entire package includes everything above plus system tutorial, more than 600K Bytes of formatted disk storage and over 65K Bytes of RAM. Assembled and ready to use. Complete Unit price $8999 plus shipping. Leasing plans and national service available from any of our 134 dealers.

CRT Expands to 16K Bytes

SUNNYVALE, Calif. — Video Terminal Technology, Inc. (VTT) has introduced its VT-4800 CRT featuring 4K bytes of installed random-access memory (RAM) that can be expanded to 16K bytes, according to a spokesman.

VTT's terminal also offers complete cursor control, cursor addressing by either keyboard or software, scroll up and down, five clearing functions, page increment and decrement, video inversion on any character, RS-232 serial I/O, user-strappable I/O codes and both composite and separate video outputs, according to the spokesman.

The VT-4800 printed circuit board, assembled and tested, costs $650. A kit version of the CRT sells for $1,195 and the assembled version costs $1,295 from the firm at P.O. Box 60485, Sunnyvale, Calif. 94088.

Exhibits Vacant in Boston

(Continued from Page 75)

England debut. Much of the show's local media blitz was based upon the Radio Shack entry, so the long lines at the triple booth surprised few of the visitors, who often had to squeeze past radio and television crews recording the action.

When the doors opened at 1 p.m., almost 40 booths were vacant with no indication as to the whereabouts of the vendors. One-fourth of these exhibitors arrived later in the day; by late afternoon the number of empty booths dropped to 30. Among the noticeably missing exhibitors listed on the program were IBM, Wang, 3M Co. and Texas Instruments.

The hobbyist entering the show floor with a thick wallet and a microcomputing shopping list could easily find almost every conceivable product. Chips, boards, tools, components, kits, interfaces and books stretched aisle to aisle. The person with money to spend could easily walk in empty handed and walk out with everything needed to build, operate and program the microcomputer of his choice.

The user could even be enlisted in the military — the Air Force, Army and Coast Guard manned recruiting booths. The Army even boasted a direct telephone connection to the largest job data bank in the world. The lines weren't too long at the recruiting booths, however.

The microcomputer hobbyist was not in the direct spotlight of the show. Instead, the small businessman with little or no computer knowledge was one of the prime targets. Many of the computer stores displayed systems that aimed at the small businessman — rather than Star Trek, backgammon and chess, accounts receivable, payroll and inventory programs seemed to be on most of the CRTs that adorned the hall.

Other significant exhibits included Imsai Manufacturing Corp., with a booth that dominated the show entranceway. The kit manufacturer displayed its line of micros and peripherals, including its 8085-based systems.

The Computer Warehouse had a large display which, in addition to retail hardware offerings, had artist Tom Huston showing his line of computer art, stationery, jewelery and T-shirts.

Seals Electronics, Inc. showed its line of custom and assembled boards. Jade Electronics had the largest components display, with a retail booth surrounded by uncountable packets of tiny parts and stacks of technical books. A Jade representative noted that many of the visitors had been at the Jade booth in other cities.

Some products that made their way onto the show floor seemed strangely out of place. These included digital automobile clocks with LED readout, police radar detectors and digital clocks.

And, of course, there was the inevitable microprocessor playing music from a great movie out of the past.

Nobody turns COM data into sound business decisions the way 3M can.

Only 3M Beta System offers programmable COM with the big plus of business graphics—to make your COM output more useful to your company's decision makers!

With 3M Beta COM, you make data easier to interpret, decisions easier to make in either of two ways:

Highlight the data. The 3M Beta System gives you underlines, italics, bold face, 8 different character sizes through simple operator-entered instructions. No host computer modification needed!

Graph the data. Reduce complicated numbers to easy-to-scan pie charts, graphs, tables. The 3M Beta System includes the software needed for graphic presentation of data.

But making business decisions easier is only the first step. Beta System makes your job easier, too. From software innovations to installation and operator training programs to field and home base service nobody offers you the unique total system support approach 3M can.

So whether you're interested in business graphics or want to move up to programmable COM, move COM in-house or expand your operation, let 3M show you the way. Call your local 3M Business Products Center or write Microfilm Products Division, 3M Company, St. Paul, MN 55101.

BETA Systems

For entry-level COM, let 3M show you "LBR"—the only **totally dry COM** and the most convenient way to record computer data on 105mm microfiche.

Reflections On the Report Of the Privacy Commission

By Arthur A. Bushkin

At 9:15 a.m. on Tuesday, July 12, 1977, the members and staff of the Privacy Protection Study Commission met with President Carter in the Cabinet room of the White House to present him with the commission's final report, "Personal Privacy in an Information Society." Sitting there, listening to the President express his gratitude for our work and his commitment to these issues — he said that he would personally disseminate and discuss the summary of our report at the next Cabinet meeting — I was struck by the thought of how far we have come.

Just a decade ago a group of computer scientists, in response to the growing concern that all uses of computers could not be predicted or controlled, let alone deemed desirable, formed the Defense Science Board (DSB) Task Force on Computer Security. The group was headed by Dr. Willis Ware, who was later to become chairman of the Health, Education and Welfare (HEW) Secretary's Advisory Committee on Automated Personal Data Systems and then vice-chairman of the Privacy Protection Study Commission.

As a 24-year old graduate student, I became the secretary of the DSB Task Force, having "volunteered," as the junior member of the group, to keep the minutes. Now, 10 short years later, we were meeting with the President of the United States. To borrow a phrase, "we've come a long way, baby."

In 1967, two principal groups were concerned with the impact of computers on society: social and political scientists without a technical orientation and computer scientists and technologists. The proposal for a National Data Center had just been defeated in the public forum of the Congress, and this was one of the first significant examples of a formal public policy debate regarding the effects of computing on individuals.

Computer scientists who followed this issue were motivated, perhaps a bit unknowingly, by two main themes.

First, there was the realization that, without adequate safeguards, "wrong things" could happen to, or as a consequence of, the use of computers.

Second, and probably more important, the issue of a national policy on the use of personal information was only delayed, not resolved, as a result of the withdrawal of the National Data Center proposal. In a piece of little-noticed testimony, Dr. Paul Baran told a congressional committee that, in the future, there would be networks of interconnected computers. As more and more data bases of consequence were automated, the effect of such networks would be the same as a national data center, although there would be no centralized form of control.

In short, as any computer scientist knew, future technological developments were certain to raise the same issues again. It was just a matter of time.

Admittedly, our perception of the problem in the late 1960s was somewhat limited. The "undesirable social consequences of computing" was too vague a subject area to address, whereas "misuse of computers by technologically sophisticated penetrators" was not only possible, it was also an area of immediate concern and funding, and hence, subject to investigation.

Thus, for the next five years, the field of computer security focused on the detection and prevention of the misuse of computers by individuals who were presumed to be as technically sophisticated as the computer security specialists themselves.

By the early 1970s, however, the intellectual boundaries of the computer security field began to expand. The technologically unsophisticated, but dishonest, user of the computer system came to be perceived as a threat at least as serious as the technologically sophisticated penetrator.

While the latter might still be tempted to crack systems in order to steal national defense secrets, tales of accountants, clerks, bank tellers and managers misusing computers for their own personal gain began to abound. The field of computer security now had a cousin: computer abuse.

The release of the HEW Advisory Committee report in 1973 also firmly planted the seed of another idea, namely, that there were right and wrong ways to use computers, even when there was no thought or indication of premeditated abuse or misuse. The Code of Fair Information Practice which was presented in that report not only received widespread attention but, a year later, became the intellectual underpinning of the Privacy Act of 1974.

The field of privacy, or personal information policy, was officially born and, fittingly, the Privacy Act also established a federal commission to study the problem. Now, with the report of the Privacy Protection Study Commission being made public — there are still several appendices yet to be released — it is important to take stock, not only of where we have been but also of where we are going.

Use of computers through the 1960s was mainly confined to the automation of previously manual recordkeeping practices. By the mid-1970s, however, the broad availability and low cost of computer and telecommunications technologies provided both the impetus and the means to perform new recordkeeping functions. Indeed, countless recordkeeping practices have arisen that would not have been possible without computers and telecommunications.

The problem is, however, that *information policy has not kept pace with information technology*. Questions of the impact of computers on society have hardly been raised, let alone adequately debated and resolved.

Whenever topics like technology and society or the social responsibility of scientists arise, however, the mind usually leaps to images of graduate seminars or conference panels; one does not generally think of these areas as the grist for daily endeavor. Likewise, the government regulation of scientific development — as, for example, in the areas of nuclear engineering or genetic research — is not something generally associated with the computer field, except perhaps in the area of telecommunications.

Unfortunately, the Privacy Commission's experience documents the extent to which consideration of the social impact is a missing ingredient in information system development.

The issue of accurate information is perhaps the best example of an area in which information system design and development and their subsequent impact on people have not always meshed as well as they could or should have. Ever since I could first program a computer, friends and acquaintances would regale me with stories of "computer errors" — incorrect bills and the like. I would patiently point out that the computer only did what it was told — after all, what else was there to say?

(Continued on Page 80)

In Depth: Privacy

The Privacy Commission Meets

(Continued from Page 79)

Unfortunately, the "information explosion" of the past few decades, coupled with the dramatic developments in computer and telecommunications technology, has brought us to the point where recorded information now commonly substitutes for direct contact between individuals and organizations. And whereas erroneous information used to be a mild inconvenience, it is now becoming an increasing source of unfairness to individuals.

Throughout the commission's recommendations, there are a number of recurrent themes regarding accuracy, some of which are (1) that individuals should have a right to see and obtain a copy of a record maintained about them; (2) that individuals should have a right to correct or amend a record about them, including the right to file a statement of explanation or disagreement; and (3) that recordkeeping organizations should bear an affirmative responsibility to transmit corrections of erroneous information, regardless of whether the correction was initiated by the organization or the individual, to both sources and prior recipients of that erroneous information.

While the commission recommended varying methods and degrees of implementation of these concepts, the basic thrust remained constant: that the designers and managers of information systems have a responsibility to ensure the recorded information does not itself become a source of unfairness to the individual, and that the individual has a right to participate in the recordkeeping process.

And who could disagree? No one favors unfairness; no one supports the maintenance of inaccurate information. Indeed, one would expect that information systems are already designed with fairness and accuracy in mind.

Yet organizations frequently make no provisions for verifying the accuracy of the data they maintain, particularly when that data has been obtained from another organization rather than from the subject of the record. Instead, there is often a general presumption of accuracy, timeliness and completeness with respect to the information in the record.

Similarly, organizations rarely transmit corrections (which they discover) of erroneous information back to the sources and forward to the prior recipients of that information. Partially as a result, the commission's recommendations contain a number of affirmative requirements in this regard.

Missing the Point

An equally important issue, though, is that of redress of grievances, of due process with respect to information systems and recordkeeping organizations. An aggrieved individual must have some means for righting the wrongs that have happened to him, not just as a result of inaccurate information but as a consequence of any aspect of the recordkeeping process. Interestingly, the issue of computer security will not only serve as an illustrative example, but it will also demonstrate how far public policy in this whole area has come.

The commission found that the federal agency response to the Privacy Act's provision requiring adequate safeguards for personal information ranged from no response at all to, in the case of some automated systems, "technological overkill." At computer conferences this is also probably the most cited provision of the act, usually in some context that implies that, with passage of the Privacy Act, safeguards or security are now mandated.

Curiously enough, this interpretation misses the essential point of the Privacy Act's safeguard provision.

Without delving deeply into the legislative history of the Act, it still can be confidently asserted that the safeguard provision of the act was not intended to mandate a change from an agency's existing practice, simply because there is a presumption that most agencies are already employing adequate safeguards. Rather, the provision provides the foundation for a "cause of action" — the legal term for the basis upon which a suit is brought — for an aggrieved individual in those cases in which he believes that agency practices are not adequate or have caused him some harm or injury.

In other words, the safeguard provision (particularly as it would be technically amended by the commission's recommendations) is premised upon the assumption that most agencies are already using good information management practices. What is new, though, is that an individual now has a basis upon which to bring suit against the federal government — the government consents to be sued by waiving sovereign immunity — if he

HOW WE HELP SOLVE THE 1403-N1 USER'S TWO BIG PROBLEMS:

TOO MUCH SPEED. AND NOT ENOUGH.

The IBM 1403-N1 is a great printer. Trouble is, 1100 lpm is an awkward speed for lots of systems.

Either it's too slow for your 360/370's high-speed needs, and you can't afford the jump to 2000 lpm.

Or you're paying for speed you don't need, but it sure beats trying to live with 600 lpm.

Well, we offer two more *logical* printers to fit your needs: one substantially faster, the other slightly slower than 1100 lpm. Both can save you money. (Also floor space and power.)

For instance, for less than you're now paying for the 1403-N1, you can get our 1500 lpm printer. And up your speed by 400 lines per minute.

Or, for a whopping $500 per month less than you're now paying for that 1403-N1, you can have our 900 lpm model.

At only a slight reduction in speed.

In fact, you can mix and match our 300, 450, 600, 900, and 1500 lpm printers to meet all kinds of performance needs. And economy ones. Same goes for our complete line of card peripherals, too.

Just talk to us.

We're already saving money and improving performance for over 6,000 IBM customers. With over 13,000 add-ons, plug-ins, and auxiliary units installed: Including hundreds and hundreds of printer installations.

And better yet, we don't sell, and then send you off in search of service. We service, too. Wherever. Whenever. From 70 key-city locations. Call us. Toll-free: 800-523-5948. Or write.

Get Smart.

ADDS Regent · Smart for the price of Dumb.

Time was, if a man bought a Dumb terminal, he was considered pretty smart. Times change.

ADDS Regent family of Smart terminals is making Dumb look dumb.

For under $1000 our Regent 100 has features no smart man can resist.*

You get cursor controls for operational simplicity and extensive remote commands that make it easy to control the Regent from the computer. Optional function keys customize Regent to your specific application.

You get a Status Line that provides current information on the terminal's operating status. And, you get visual highlights such as blinking, zero intensity, half intensity, underline and reverse video.

You also get self diagnostics.

In other words, you get Smart. Or Smarter: Our Regent 200 has everything our 100 has plus buffered transmission, auxiliary port and editing options.

You can't get a whole lot more.

Get Smart. Get ADDS.

Quality, Reliability and Integrity. It all adds up to ADDS.

*In moderate quantity.

(Continued from Page 80)

believes that an agency is not implementing the provision properly.

Thus, the impact of the safeguard provision, which most computer scientists instinctively view as a technical provision, is actually predominantly in the legal domain, in the sense that it is not intended to impose new practices on an agency.

But it is the more mundane provisions, like the one that requires an agency to propagate corrections of erroneous information, that are intended to levy new requirements on recordkeeping organizations. It is precisely these provisions, which have profound technical implications, that are most often ignored by computer scientists. Little attention has been paid, for example, to the requirements for descriptor and routing data in data base management systems.

There is an interesting circle here. The initial response of the computer community to the social issues of computing was in the area of computer security, and the response was largely technical. Now, however, there is a safeguard provision in the Privacy Act with essentially legal implications.

On the other hand, the simple process of collecting, maintaining, and disseminating accurate information has not been adequately implemented over the past decade, with the result that we are now seeing laws (as well as commission recommendations) that essentially tell the recordkeepers, and the computer scientists, to do a better job.

Privacy may be a social issue, but its most significant technical implication will be, in my judgment, not in the area of safeguards or security, but in the simple requirement to develop systems, techniques and procedures for keeping information about people accurate, timely and complete.

No Retreat

My own sense of the situation is that we are now at a turning point. Both public policymakers and computer scientists will have an important responsibility in the next few years, and to ignore this responsibility would be to turn our backs on the "fallout" from the information explosion.

Policymakers will have to grapple with the subtle and illusive issues of information policy. As the commission rightly observes, we live, inescapably, in an "information society." Few of us have the option of avoiding relationships with recordkeeping organizations. Each of us acts out the events and transitions of our lives with organizations as attentive partners, and each of our countless interactions with these organizations leaves its trail in the records they maintain about us.

There is no turning back, no retreat, from the information society that we have become. We must address the issues of information policy candidly, fairly and quickly.

Public policy is, however, an inherently general statement of a social goal. Legislation, as a reflection of public policy, is also inherently general in nature. In its suggestions for revising the Privacy Act of 1974, for example, the commission concentrated specifically on policy objectives rather than on the particulars of implementation.

The commission's goal in this regard was simple: to allow for changing information technology and diversity of organizational information needs and uses, as well as to foster the constructive creativity that is frequently inhibited by overly restrictive requirements.

But computer scientists, system designers and technologists are accustomed to dealing with precise specifications, with functional requirements, and not with generalities. It will be their responsibility, however, to translate these broad statements of public policy into the details necessary for information system design and development. No one else will; or should, do it for them.

It is my hope that technologists and computer scientists will view this responsibility as a challenge. I find it somewhat disconcerting that so few computer scientists are familiar with the HEW Code of Fair Information Practice and that so many speeches are still being given equating privacy with security while no mention is made of the data base management aspects of privacy.

The impact of computer technology on society is no longer some vague abstraction suited only for the classroom or the conference; it is now part and parcel of our daily lives, and my sense is that the computer community is up to the challenge.

Arthur A. Bushkin has been in the computer field since 1962 specializing in protection of data, privacy and information policy.

He was staff technical advisor for the Privacy Protection Study Commission, where he was manager of the Privacy Act Assessment Project as well as manager of the Technology Assessment Project.

He is also co-author of The Privacy Act of 1974: A Reference Manual for Compliance, *published by Systems Development Corp. (SDC). While at SDC Bushkin was one of several senior technical staff members on a computer security contract for the Department of Defense's Worldwide Military Command and Control System.*

Swapping a 360/370 for a DEC can be a good deal. Hanging on to the IBM 1403's will make it a better deal.

Moving to a DEC System can make good economic sense. But if you're about to do it, just one word of caution. When you're evaluating your peripherals, be sure to hang on to your IBM 1403 printer. You know from your own experience that the 1403 gives you remarkable print quality. It's a proven performer that others have used to improve DEC System printing.

With the Grumman printer controller it's a simple matter to interface the IBM 1403 to your DEC system. Or, for that matter, to any other computer you might be considering. You'll not only retain the superior printing you're accustomed to, but continue to enjoy the extremely high reliability of the 1403. Best of all, the economics are right.

Remember, whether you buy, rent or lease our printer controller, we can provide efficient maintenance.

For complete information, contact your Grumman Data Systems representative. Or write or call Joe McDonough, Grumman Data Systems Corporation, 45 Crossways Park Drive, Woodbury, NY 11797, (516) 575-3034.

The Waves of Change

By Charles P. Lecht

Users are not the only ones confused by the current proliferation of microcomputers and minicomputers — manufacturers are, too. "The degrees, dimensions and deployment of systems distribution are the key confusion factors," Lecht contends in the latest excerpt from his soon-to-be-published book.

CHAPTER IX

In Chapter I, we noted that today's waves of technological change have obscured our earlier, well-packaged, nicely defined concept of a computer system. Thus it should come as no surprise that there are no universally accepted definitions of the terms "microcomputer" and "minicomputer."

Therefore, it would be well to preface our discussion of the impact of such devices by establishing some working definitions which, while they may not satisfy all readers, can at least serve to indicate "boundaries" for each of these product classes. These boundaries, like so many others struggling to maintain their integrity in today's fluid DP environment, will certainly change by the end of this decade — caveat lector.

- *Microcomputer* — includes one or more microprocessors which perform logical and arithmetic functions under program control (firmware and/or software), and usually consists of one or more LSI (≥ 100 active gates) chips; also included is some read-only memory (ROM) and/or random-access memory (RAM). Today, many microcomputers are limited to 65K or less words of 4-, 8-, 12- or 16-bit size. They provide some I/O interface logic and a limited complement of I/O devices.

"Typical" prices for microcomputer chip sets *without* I/O devices or power supplies range from under $100 to over $1,000 each, depending on functional capability and memory size characteristics. Examples include the widely accepted Intel 8080 chip, the Texas Instruments TMS 1000 and the Motorola 2901.

- *Minicomputer* — includes a miniprocessor (and may, in addition, incorporate one or more microprocessors). It performs logical, arithmetic and I/O functions under program control at speeds typically five to 10 times faster than microprocessors. The mini memory address range is usually wider than found in microprocessors, with sizes extending from 65K to over 262K words.

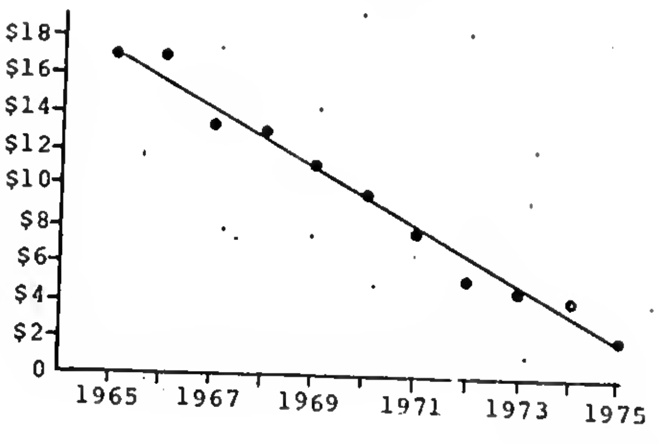
The minicomputer price range varies considerably, depending on features included. From a low-end figure of about $10,000, the cost may rise to something considerably in excess of $100,000 for the processor with some ROM/RAM storage and I/O interfaces (but excluding I/O subsystems). In general, the mini price will be under $50,000.

Model Designation:	8	8/S	8/I	8/L	8/E	8/F	8/A
First Delivery	5/65	9/65	3/68	9/68	3/71	11/72	10/75
Min. CPU Price ($ Thous.)	18.0	10.0	13.5	10.0	5.0	4.0	2.5
Cycle Time (Microseconds)	1.5	1.5	1.5	1.6	1.2	1.2	1.2
Total Installed (July 1974)	2,350		6,900		14,950		-

Figure IX-1. DEC PDP-8 PRODUCT HISTORY (12-bit word)

Figure IX-2. AVERAGE YEARLY PRICE POP-8 WITH 4K MEMORY

(In Thousands)



SOURCE: Bache, Halsey, Stuart, Inc.

The performance ranges of some minicomputers can overlap those normally thought of as falling in the domain of "large" mainframes, such as the IBM 370/158. In this context, "mini" and "large" assume additional meaning as qualifiers, since the former may match the capabilities of the latter — at much lower prices (in terms of raw Mips [millions of instructions per second] — a somewhat controversial measure).

The market for minicomputers (and microcomputers/microprocessors) has been highly price-elastic. Rapid shipment growth over the past decade has been spurred by an average price decline of 22% since the Digital Equipment Corp. PDP-8 was first shipped in 1965 (Figure IX-1). Technological innovations have enabled minicomputer and microcomputer designers to make processing power cheaper, penetrating markets highly sensitive to price/performance.

By designing more power and functional capability into their units while maintaining price levels characteristic of those belonging to preceding generations, DEC, Data General, Interdata and other minicomputer vendors have been able to penetrate markets for more advanced applications.

Major new micro/minicomputer products have been introduced at (more or less) 15-month intervals over the past few years. Average processor and memory prices for these products have declined at about a 20% (or greater) annual rate. However, processor and memory cost constitutes an ever-*decreasing* part of the total computer systems cost while micro/mini peripherals and software/services costs represent an ever-*increasing* portion of the total cost pie.

For example, the software (utilities, compilers, applications, et al) required by the typical buyer of today's $50,000 minicomputer can involve large multiples of the basic hardware price. In addition, the trend toward more complex systems has nearly offset the price declines of low-end systems, flattening the declining trend in average unit prices (see Figure IX-2).

The fact that market expansion has continued despite the trend toward average unit price stablization suggests the importance of functional elasticity as an additional factor in the demand equation.

Rapid expansion has also resulted in market fragmentation, with each emerging segment characterized by its own set of multidimensional criteria (industry, function, customer sophistication, etc.). We use the word "characterized" more in the hypothetical than in the practical sense, since a well-defined industrial and/or functional marketplace segmentation which provides a clear basis for product definition continues to elude product planners.

Minicomputer companies have developed families of general-purpose processors which were originally targeted for process control-like ap-

(Continued from Page 83)

plications. Moving these into the business arena to do payroll, accounts receivable, etc., hasn't been an easy task. Their entry, at the very onset, represented a horizontal, shotgun approach to the marketplace.

The readiness of end users in the early 1970s to purchase mini/-microprocessors is more properly traceable to the economic conditions prevailing at the time (conditions that persuaded end users to "make do" with lower priced, "cheapie" processors) than it is to the perceived sufficiency of those processors to meet more exacting user needs, already provided for by better accoutred, "classic" products.

As time passed, the market/product mappings improved, causing mini/-microprocessors to account for a larger share of the business systems marketplace. Furthermore, the shotgun has now been replaced by the rifle, allowing for vertical penetration increases (Figure IX-3).

Vertical Integration

Partly as a consequence of the trends mentioned above, some of the major mini vendors have launched integration of the manufacture of their own peripherals, terminals, memories and other electronics at a pace well ahead of their competitors. The principal advantages to be gained by this approach include the following:

- Increasing complexity of system configurations (mentioned earlier) means that a greater share of overall system value is represented by peripherals, memory and software (Figure IX-4). In Figure IX-5, note the lower share of system value represented by the Digital Equipment Corp. CPU in the increasingly popular higher value systems (PDP-11/40 and 11/45) vs. the traditional PDP-11/05 OEM configuration.
- In-house peripheral and integrated circuit manufacture allows the larger manufacturers to capture a greater share of the total system value-added, a consideration of special importance to their business in Europe (where independent miniperipheral manufacturers remain relatively noncompetitive).
- Improving technology and lower prices have turned low-end CPU manufacture into a low-margin commodity business, with reduced opportunities for product differentiation and premium pricing. Peripherals, memory, software and services have held up eroding profits on low-end products, which are often priced as entry vehicles for capturing subsequent higher margin upgrade businesses.
- A comprehensive line of standard CPU, peripheral and memory components gives some mini vendors the flexibility to construct system packages which more directly address the needs of vertical markets.

In order to successfully carry out the product strategy suggested above, the mini/micro companies need to achieve economies of scale in all product lines through volume shipments. Thus, one or more of the following strategies suggest themselves:

1. Retain and preserve experienced employees while improving productive capacity thorugh inventory building.
2. Form a special components group to help build volume on processors, peripherals and other electronics.
3. Control price concessions and liberal credit terms to lock in higher volume, recurring OEM business. Incidentally, OEM sales by the mini vendors accounted for the lion's share of their revenues in the past; this trend is now being reversed (see Figure IX-3).

With lower costs should come the ability of some manufacturers to sustain market leadership through pricing flexibility and development of additional standard components and configurations. (see Figure IX-6). Further cost benefits for higher volume include:

- Economies of distribution and maintenance, made possible by higher geographic installation and shipment densities.
- Additional units over which to spread the fixed expense of developing sophisticated software systems, as well as additional R&D funds to develop applications software for penetrating new markets.

Mini Market Shares

Market shares of the major suppliers are shown in figures IX-6 and IX-7.

(Continued on Page 85)

In Depth: The Waves of Change

(Continued from Page 84)

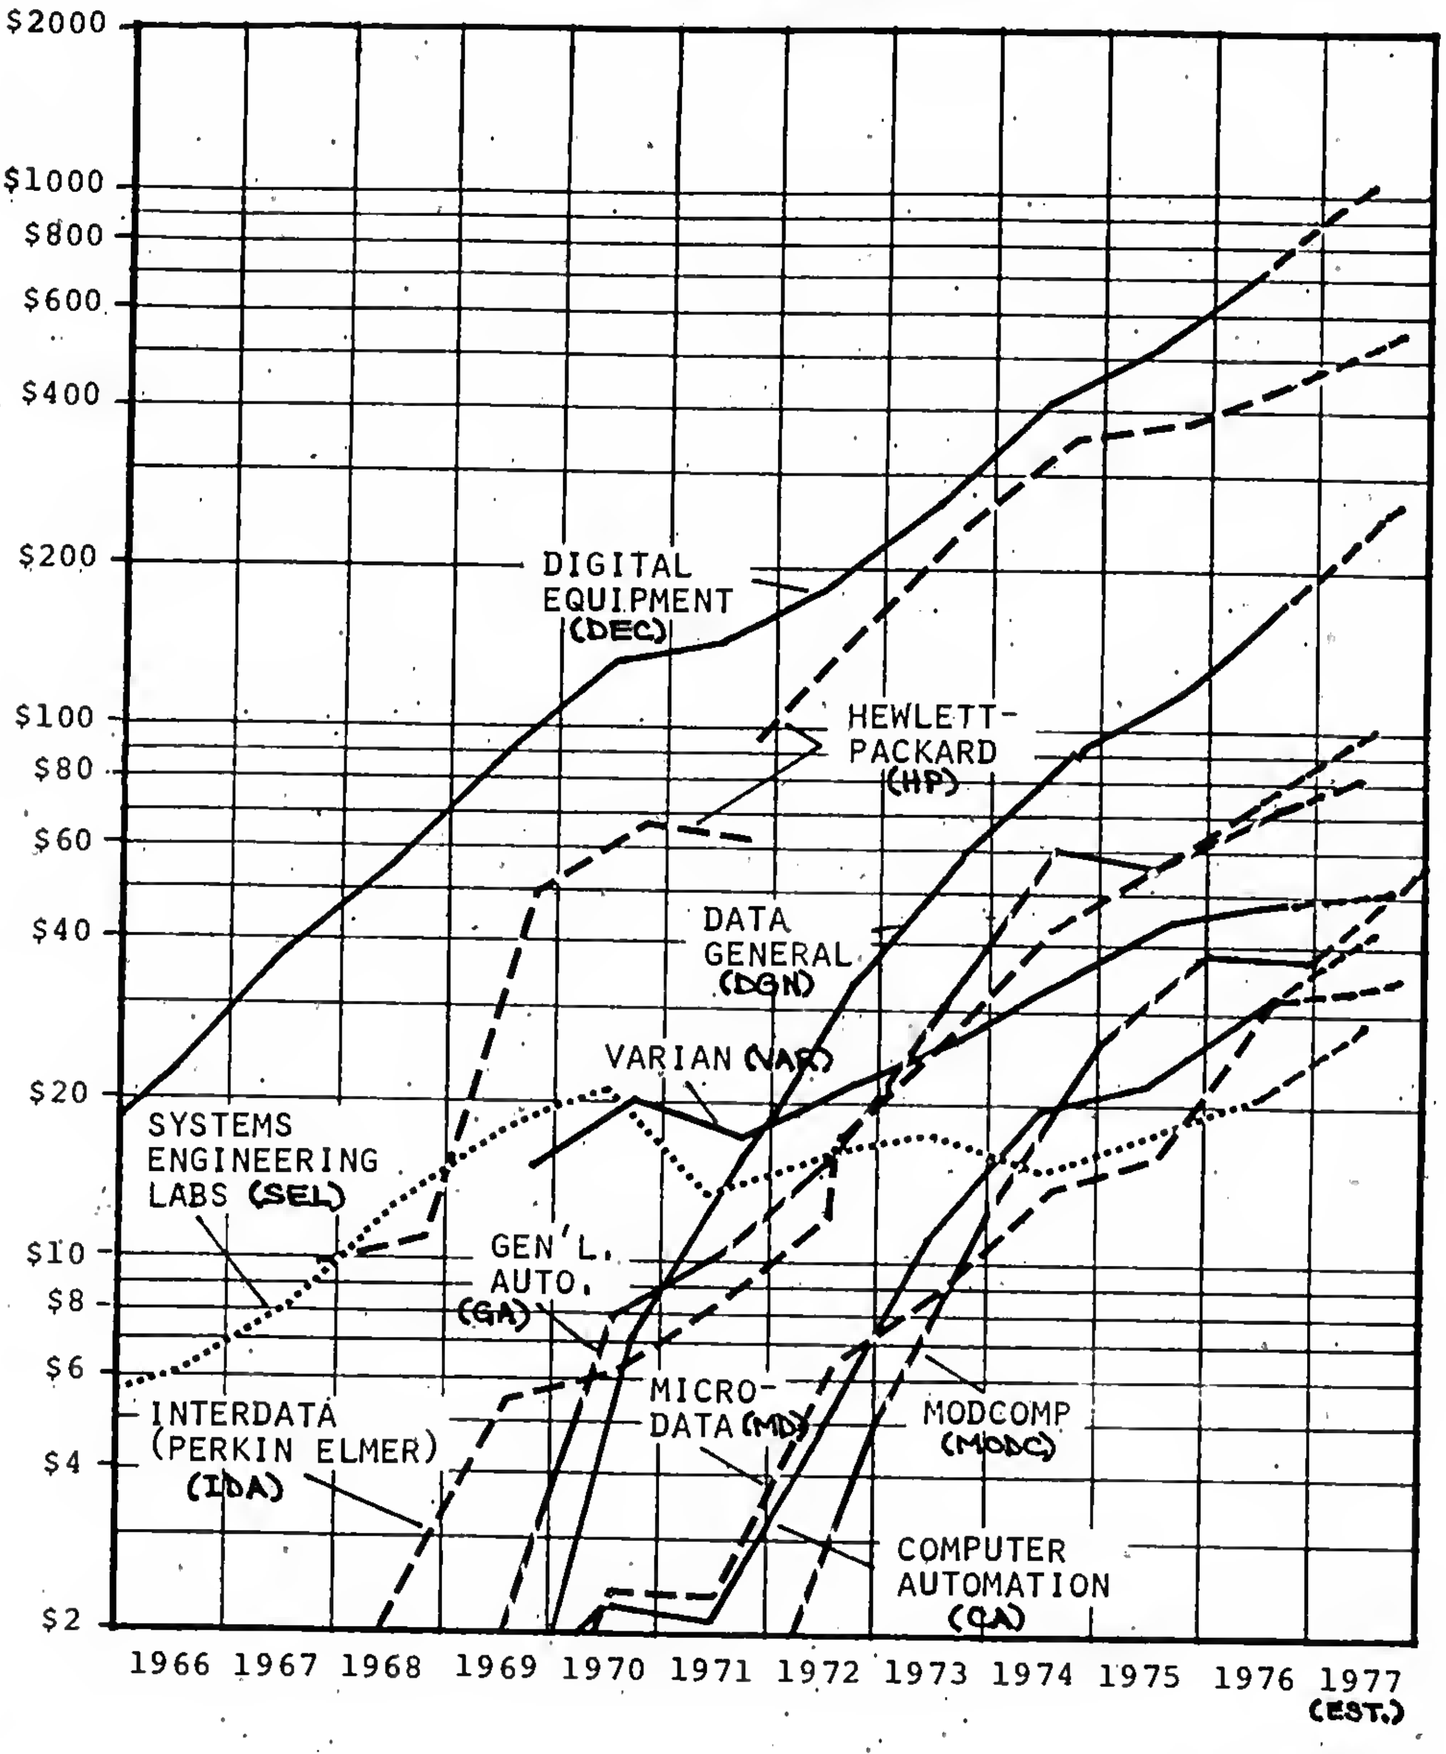
According to Bache, Halsey, Stuart, Inc., a respected Wall Street investment brokerage and market analysis firm, "Digital ranks first and will maintain that position indefinitely. Hewlett is currently in second place, with prime emphasis on larger systems aimed at time-sharing use and for sophisticated industrial automation applications.

"IBM's apparent strong showing is the result of its overpriced and aging System/7, sold into three or four specific narrow markets where massive IBM support can be used to justify the prices.

"Data General's seemingly distant fourth place is deceptive. Data General is the fastest growing mini supplier of size and is following a strategy similar to Digital's in placing as many systems as possible, laying the groundwork for future larger volume sales.

"General Automation has been growing rapidly, but a series of problems impacted growth in the past year. Honeywell emerges from relative obscurity with its new mini line, which has been quite successful in Honeywell mainframe accounts.".

Figure IX-6. MINICOMPUTER REVENUES OF SELECTED COMPANIES (IN MILLIONS)



SOURCE: Bache, Halsey, Stuart, Inc., updated by ACT

The years shown along the horizontal axis represent the fiscal or calendar basis of financial reporting used by each of the indicated companies, depending on their individual practice. All 1977 figures are estimates based upon ACT's sources of information. In millions they are (from top to bottom): DEC, 1050; HP, 575 (figures include minicomputers and scientific calculators, and have been reclassified from 1971 onward); DGN (including Digital Computer Control results as pooled), 260; IDA, 100; GA, 81; MODC, 56; VAR (revenues of data products group, now part of UNIVAC operations), 51; CA, 43; MD, 36.5; SEL,28.

However difficult it is to track the market shares of the larger mainframers (IBM, Honeywell, Burroughs, Sperry Univac, NCR, Control Data Corp., etc,), it is substantially more complex a task to establish the minicomputer market positions with any degree of accuracy. However, it is clear that DEC is, effectively, the "IBM of the minicomputer market" and that, together with IBM, Hewlett-Packard and Data General, it forms the top tier of that market.

Honeywell, General Automation, CDC and others represent the second tier market, although it should be noted that the gap in market shares that separates the two tiers is of formidable width.

Reaons for Demand

According to C. Casle, a Bache, Halsey, Stuart, Inc., vice-president, there are five major factors stimulating minicomputer demand:

1. "Continual declines in semiconductor costs are passed along in minicomputer pricing, expanding existing market opportunities and opening new ones. This trend appears unlikely to change for several years.".

2. "Manufacturing processes, office practices and regulatory compliance are increasing in complexity. Apart from other considerations, these spur automation simply to cope with the burdens additional complexity causes. The minicomputer is a primary automation tool independent of process."

3. "Labor costs continue to rise, minicomputer costs continue to fall. Each increment of change adds to the number of situations where automation becomes financially attractive." Consider, in this context, the cost of a given mini as compared with the average cost (in salary alone) to the employing U.S. company of a single clerk — $8,000 to $10,000.

4. "Semiconductor performance gains are being passed on by minicomputer makers as improved access to automation and computation. Each increment widens the number of people that can access computers and reduces the complexities of use. This trend appears to be continuing."

5. "Electronic arbitrage. Mini makers sell cheap what mainframe vendors rent dear. Some leading edge users, such as Citibank, Hartford Insurance and others, are taking advantage of hardware price discrepancies. This trend is in the formative stages since the level of sophistication required to successfully play the arbitrageur role is very high."

Impact on Mainframes

The mini/microcomputer or component suppliers will *not*, in my judgment, severely impact the major mainframes for the following reasons:

- When the *system* purchase price exceeds roughly $100,000, the cus-

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development and testing of APL, BASIC, FORTRAN, COBOL, RPG, Compilers.

OPERATING SYSTEMS

Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER

Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK...

(Continued from Page 85)

tomers generally become more concerned about software, support, maintenance and vendor viability (not raw hardware price/performance).

- The price war between the mini/-micro and component suppliers will continue to force the price down, and the resulting profit margin erosion will force many smaller firms out of business.
- As minicomputers attempt to penetrate the medium to large-scale general-purpose markets (IBM 135 and up class, although the definitions of medium to large are rapidly changing), the quality and selection of I/O devices are increasingly important.
- Future customers (1980s) will be more and more interested in security, flexibility, adaptability, operational human factors, application development and maintenance capability — not "raw" CPU power or bits and bytes. Besides, many low-end computer systems are I/O or peripheral limited anyway.

Furthermore, *all* of the major mainframers or systems competitors are gradually replacing hard-wired logic modules with microprocessors. In so doing, they are attempting to enhance or expand their current system performance, improve reliability, accessibility and serviceability, reduce size and power requirements and lower costs.

Figure IX-8 clearly shows the current and projected high annual growth rate for microcomputers (40%). However, this significant growth is from a relatively low shipment base of about $200 million last year. Minicomputers also enjoy a growth rate (25%), which is presently estimated to be more than twice mainframe shipments (12%).

However, mainframe shipments may pick up in 1977-78 as the IBM 138/148/3033 machines begin to be delivered in volume). Moreover, since large minicomputers tend to overlap so-called mainframes, one must not depend on the absolute values. Figure IX-8 only shows a relative trend over time.

At least a dozen important applications for microprocessors in traditional medium to large-scale systems can currently be identified:

- Front-end communications processors.
- Remote concentrators/multiplexors.
- Maintenance processors.
- Disk controllers.
- Magnetic tape controllers.
- Hierarchical storage controllers.
- Memory access controllers.
- Nodal processors (in a network).
- Terminal controllers.
- I/O processors (replacement for channels).
- Intelligent terminals.
- Encode/decode devices.
- Office automation.

Collectively, the above list represents

a very substantial portion of the system's "added value" and revenue. It is important to realize that only two or three microprocessor performance levels are required to handle the above dozen or so functions and that many systems will require multiple usage of the same type processor(s) (see Figure IX-9) for fail-soft operation.

Price/Performance Factors

The potential performance capability of a microprocessor or miniprocessor depends on many interrelated and interdependent factors:

- Processor speed is determined by CPU cycle time, instruction set size, efficiency and "richness" and efficient memory (ROM/RAM) utilization.
- Input/output capability depends on the number of I/O channels or ports, the channel band-pass or width, etc.
- Memory speed and range (ROM/-RAM) can be critical if multiple applications are planned, and speed or capacity range will often represent a key limiting factor in the overall performance equation.

Price represents the most important criterion for many users, especially at the low end of the microprocessor spectrum (e.g., single-chip 4- or 8-bit products such as the Mostek 3870, Intel 8748, Texas Instruments 9940, TMS1100, etc.). However, wherever practical, price must be evaluated on the basis of the answers to a wide range of critical questions.

For example, how much ROM/RAM is included? Are additional supporting circuits required (for I/O functions or power supplies, etc.)? Are second sources available? What is the current track record of the vendor in terms of credibility, financial stability, availability of supporting software (tools)?

Summary of Trends

Looking ahead to the near term (1977-80), there will be:

- Greater competition between IC vendors and mini/microcomputer suppliers.
- Greater competition between mini/microcomputer suppliers and general-purpose mainframe manufacturers.
- Increasing consolidation/mergers of IC/mini/micro, miniperipheral and mainframer companies to obtain economy of scale and more added value (vertical integration).
- Far more emphasis placed on software and end-user support services.
- More cost-effective, larger word size machines (32 bits) and memory ranges.
- Substantially increased usage of mini/microcomputers in distributed systems networks as "nodal" processors or terminal processors.
- Use of 64K-bit memory chip in products by 1979 (Figure IX-10).

Today's industrywide preoccupation with distributed systems is heavily influencing product planning in the mini/micro arena. If users are confused with the power and scope of current systems offerings, it appears that the manufacturers are too. The degrees, dimensions and deployment of systems distribution are the key confusion factors. These issues (and others) will no doubt be clarified in the future.

Meanwhile, users are confronted with the dilemma of choosing between multiple mini/micro vs. maxi power. Can several midgets successfully compete with one tall basketball star?

It depends on the court.

Lecht is the author of four previous books on computer-related matters: The Programmer's Fortran II and IV, The Programmer's Algol, The Programmer's PL/I *and* The Management of Computer Programming Projects.

He is president of Advanced Computer Techniques Corp., which he founded in 1962, and has lectured widely for such groups as the Association for Computing Machinery, American Management Association, American Society for Information Science and the Data Processing Management Association.

Intel delivers more semiconductor memory than anyone. Even IBM.

When you select a computer, it often makes sense to choose IBM. Because of their size, industry acceptance, installed base and technological leadership in computers.

But when it's time to select a memory supplier for your IBM computer, it always makes sense to choose Intel.

For the same reasons.

Intel is the world's largest supplier of semiconductor memory. Over 53 billion bits shipped in 1976 alone. That's more than IBM has shipped domestically during the life of System 370.

We became number one in semiconductor memory by applying marketing strength to technological leadership. Technological leadership is what you expect from the company that invented the world's first microprocessor. And marketing strength is what you expect from the world's largest supplier of microprocessors and semiconductor memory.

Intel's financial strength and security take the risk out of selecting an alternative to IBM. We're over a quarter billion dollars strong.

And we've built an organization to equal—and often surpass—the sales, service, support and confidence you expect from IBM. Intel has over 600 IBM 370 series memories installed at companies like yours.

We could not have made it to number one if we didn't offer you more than IBM. Our memories deliver significant cost savings when compared to IBM memory prices. And we're the only independent supplier to offer a complete line of 370 memories—from System 125 through System 168.

Our memories go beyond compatibility with all IBM features and configurations. Enhancements—such as our unique microprocessor-controlled maintenance and diagnostic features—give you operating flexibility and reliability second to none.

Intel is your logical choice for System 370 memory. So whether you're planning a new 370 installation or upgrading existing capability, talk to Intel. Phone us at (408) 734-8102. Or write: Intel Memory Systems, 1302 N. Mathilda Ave., Sunnyvale, CA 94086.

intel delivers.

HIS SYSTEM CRASHED

Hours of intense programming effort, all arranged perfectly, were just ready for compile when blip, the system crashed. No record of the changes. And no way to recover, without . . . doing it again.

Pansophic has done away with disappearing code for the terminal programmer with PANVALET / ON-LINE, a technological advance in online programming. Working in transactional modes through CICS, all work occurs in a change file. If the system crashes, the change file remains and a warm restart allows you to pick up where you left off. Other PANVALET / ON-LINE features such as hard copy audit trail of library changes, query of job queues and library system security make PANVALET / ON-LINE unique, while doing away with frustrations involved with other online and TP systems.

If you have CICS, OS or DOS, contact us about PANVALET / ON-LINE. Pansophic is the leading systems software company dedicated to solving your software problems. Call or write today for further information on our complete line of proven software products.

Low-Speed Printers Holding Their Own

WALTHAM, Mass. — Despite the allure of inkjet technology, lasers and the 45,000 line/min speeds offered by the much-touted high-speed printers, low-speed printers are holding their own.

In fact the value of the installed base for printers that operate below 3,000 line/-min is expected to grow from $3 billion in 1976 to over $6 billion in 1981, according to *EDP/Industry Report* (EDP/IR), a newsletter published by International Data Corp. (IDC) here.

EDP/IR highlighted several trends which will be apparent throughout the rest of the decade:

- "The technology at the slower speeds is evolving. Matrix printers are taking over from fully formed character printers; bank technology is invading line printers; nonimpact devices are blossoming."
- "Major OEM acccounts are going in-house with printer production, hoping to add to the reliability of their products while trimming costs . . . and meanwhile keeping the OEM market in flux."
- "Microprocessors are adding function to output devices as variable fonts, increased print control and error detection find their way into the industry's new products."

Printers with speeds over 3,000 line/min will lead the overall market, growing from 2% of dollar value in 1975 to 15% of value in 1981, but the low end of the market — printers with speeds from 10- to 30 char./sec to 600 line/min — will nonetheless experience an annual growth of about 20%, the report noted.

Line printer shipments will grow from 60,000 units this year to almost 75,000 units by 1981, a year in which OEM revenues could well amount to over $250 million, EDP/IR projected.

While slow-speed line printers have traditionally found their niche at general computer sites, by 1981 installations at small business computer sites should be a rival, the newsletter proposed.

"Growth will come from the large base of matrix printer users in the small site and minicomputer base as users fleet up to the faster devices as their output needs increase," it stated.

By 1981, the U.S. installed base of character printers should be about one million units, equal to abut 75% of all printers used with general-purpose computers, minicomputers, terminals and shared-logic word processors.

IBM Trial 'Non-Event': Stock Analysts

By Molly Upton
CW Staff

As the U.S. vs. IBM trial drones into its third year and nears the changing of the guard from the government offense to IBM's first display of its defense tactics, several stock market analysts discount any near-term effect of the trial on stock market activity.

However, one analyst said he sees a slightly higher probability of a consent decree.

The Justice trial is a "non-event" as far as the market is concerned, according to John McManus, vice-president of Kuhn Loeb & Co.

Another New York analyst indicated the trial is not expected to be a real factor in investment considerations over the next year or so.

Other cases can have more of a psychologically damaging impact to investors' views of IBM than the Justice Department's action, he continued.

Gideon Gartner, a vice-president at Oppenheimer & Co., believes the probability of a consent decree is higher than it has been in the past.

If the Justice Department asks Judge David N. Edelstein to grant interim relief on certain items, logically it could then take those conditions to IBM as the basis for a consent decree, he said.

However, this thought is probably too optimistic because the chances of Justice being granted relief are slim, according to Gartner. Justice would have to prove that the public is being irreparably damaged and that the terms of the relief would not irreparably harm IBM, he said.

But, he continued, "it's about time someone came to their senses." The trail's duration is not doing the Justice antitrust staff, IBM or the competitors any good.

James Blair, first vice-president of White Weld & Co., said the only effect of the trial on IBM stock would be if something significant happened in terms of a settlement. That doesn't look like it's in the offing, he added.

Whereas two or three years ago analysts' commentaries were full of speculations over terms of a consent decree, analysts have now come to accept the fact that no premature ending is on the horizon, Blair said. They are thinking this litigation is going to drag on forever, he pointed out.

"I think this is in large part the result of IBM's successes in court. You could hardly call Greyhound a setback for IBM — it's basically just reopened another item of litigation. But IBM has not been penalized for litigating other than the management time and expense associated with it."

"I don't think there appears to be any great incentive for IBM to accelerate settlement here, and thus I don't think we're going to

(Continued on Page 92)

SSA Revises RFP for OCR Gear As Result of Vendor Protest

By Edlth Holmes
CW Staff . .

WASHINGTON, D.C. —. The Social Security Administration (SSA) is amending its specifications for optical character recognition (OCR) equipment as the result of a protest made by a small California-based firm, Information International, Inc.

The SSA request for proposals (RFP), issued in August for what is expected to be the largest purchase ever of OCR equipment by the federal government, was designed to accommodate the agency's present scanning devices, according to Dr. F.N. Karmatz, an Information International consultant.

Those devices are largely of IBM and Recognition Equipment, Inc. (REI) manufacture, Karmatz noted.

The SSA failed to ask for "an overall — equipment and labor — solution" to the problem it faces in complying with a congressional directive that the agency share Social Security information with the Internal Revenue Service (IRS), he said.

Under the legislative changes aimed at eliminating duplication of effort by the SSA and the IRS, the agencies will both be reading new W-2, W-2P (pension) and W-3 (summary) forms. Public Law 94-202 eliminates the need for almost five million employers to file quarterly 941 reports to the SSA.

The SSA must now handle 158 million earnings items or about 70 million documents filed by these same employers, however.

"Conservative estimates" indicate that these documents, prepared on a great variety of computer printers, typewriters and accounting machines, will translate into 32 billion characters of information that have to

SSA Amends OCR RFP After Vendor Protest

(Continued from Page 91)

be correctly processed by the SSA by 1979, Information International stated in a "white paper" on the project.

The California firm charged that "the technicians who prepared the RFP have taken a narrow and 'safe' approach by limiting their procurement to types of equipment they are already familiar with — paper scanners which [the SSA] has used for the past eight years. SSA has asked for a device rather than a system."

Information International believes it has a system, a microfilm reader-OCR system, that will more than satisfy the SSA requirement that its new equipment be able to scan 94% of alphabetic characters and 96% of numeric characters.

The firm's Grafix I system microfilms raw documents at up to 20,000/hour; its OCR equipment then reads the film, having generated a permanent record of the documents.

The British Health and Social Security Department is currently employing Information International's system with a 99.1% eficiency rate, and the system has literally paid for itself in savings over 14 months of use, the company claimed.

The U.S. Navy is also using the Grafix I system for handling data records.

Ability Demonstrated

On June 16, Information International demonstrated its capability to read the new W-2 and related forms for an SSA team and proved its system could outperform the agency's RFP requirements by a margin of three to two in the area of rejected forms and by a margin of nine to one in the area of substitution corrections.

The agency would need a minimum of 7,300 people to process the rejects and make corrections if it is to fulfill the RFP scanning requirements with the kind of equipment it has now. No more than 635 people would be required to achieve the same results, however, if the Grafix I were used, Information International said.

"The RFP is also written to procure the least expensive machine that will meet its specifications. It ignores the fact that it will take additional equipment and human effort to read the great volume of incoming data which the low-cost scanner does not read, and it ignores the much larger labor cost that is required to correct the errors introduced by the scaning devices themselves," the company added.

Admittedly, a Grafix I system costs several times more than a single paper scanner, Information International noted, and the system reads microfilm instead of scanning paper.

But because the SSA already microfilms all its forms for its record depository, the Grafix I would use this source at no additional cost to SSA.

Had the RFP gone unamended, the agency would have locked itself into "a self-bankrupting system that would cost taxpayers an extra $1 billion to $1.5 billion over a five-year span, the expected life of the new system," Information International said.

Following the firm's protest, the SSA sent a letter to interested vendors advising them that it would amend its RFP to include nonpaper-reading scanners. The agency also promised to revise its cost projections for the procurement and extended the reply date for the RFP from Sept. 8 to Sept. 29.

At press time, Information International was waiting to receive the new technical SSA specifications.

The agency's final decision will be made on the basis of total cost to the government, not just the initial hardware price tag, an SSA spokesman said.

Analysts Show Apathy to Trial

(Continued from Page 91)

see anything evolve in the near term. That's what stock prices are all pretty much assuming," he commented.

Looking at the litigation IBM faces now and in the future, Blair said he tends to think the more significant trial in the near term might be the Memorex case. That action is tentatively scheduled to begin in January.

Extrapolating from the performance of the Memorex executives on the witness stand for the Justice Department, Blair said he would be more concerned about IBM's outcome in that case.

"Probably the only thing that has come out of the Justice effort is the forerunner to what might evolve out of the other cases," he added.

But Gartner, said he's not sure investors have discounted the Justice trial as a factor. They're saying it on the one hand, but the price does not necessarily indicate that, he said.

There was some disagreement over the impact of the Greyhound decision ordering the case back to trial. One analyst indicated that since IBM's stock is so closely balanced between buyers and sellers, the decision might have an impact on portfolio managers who remember the days of the Telex decisions and the 100-point drop in stock within a year.

They may prefer to postpone any buying action for a while, he said.

But McManus said the Greyhound decision should have no effect on IBM stock. Although it is a setback, one must remember that IBM has yet to show its defense and "I think it can defend its position," he said.

NOW AVAILABLE!
LOW COST MEDIA PROTECTION FOR SMALL SYSTEMS USERS!

ON-SITE FIRE PROTECTION FOR CRITICAL RECORDS.

Even the smallest data processing department needs to protect critical records from fire. Judge your company's records on their "after-the-fire" importance. Accounts receivable, payroll records, inventory data, and customer lists will be needed to validate claims, collect on insurence coverage, continue business operations, collect outstanding accounts, and comply with government requirements.

FireGuard

FireGuard is on-site fire protection for a company's most important asset . . . its vital records.

FIREGUARD MAKES OTHER MEDIA SECURITY SYSTEMS OBSOLETE.

Until now, most small systems users have relied on backup, off-site files for protection of vital company records . . . with the need for costly, time-consuming updating and inherent "information lag". Others have relied on "false security" measures such as fireproof rooms or buildings (which contain many combustible furnishings and supplies plus ducts which permit rapid heat transfer to the computer room), sprinkler systems (which can ruin EDP equipment if activated), or gas extinguishing systems (which are costly and may not activate before heat reaches destructive levels).

NEW FIREGUARD EDP SAFE IS SPECIFICALLY DESIGNED FOR THE SMALL SYSTEMS USER.

Although specially designed EDP media safes have been available for some time, the sizes and capacities available have been much too large (and expensive) for the small systems user.

FireGuard is a compact 41⅛"H x 30¾"W x 31⅛"D and fits neatly under a counter top. And yet because of a patented insulation system, you'll find more room inside FireGuard than in any other comparably sized EDP safe. FireGuard's lighter weight means less floor load and easier mobility. Attractive styling blends nicely with other computer room furniture.

FIRE PROTECTION IS CERTIFIED BY UNDERWRITER'S LABORATORIES.

Data processing managers know that EDP media are damaged beyond use by temperatures above 150° or by a combination of temperature above 120° and humidity in excess of 85%.

FireGuard bears the Underwriter's Laboratories Class 150-1 hour label for fire endurance. Actual tests confirmed that inside temperatures remained below 150° and humidity remained below 85% when the safe was exposed in a furnace to temperatures reaching 1700° in one hour. Other certification includes U.L.'s Relocking Device label and the Safe Manufacturers National Association label for fire endurance, impact, and explosion hazards.

To Approach $3 Billion

Rigid Disk Drive Revenues Seen Peaking in '79

By Toni Wiseman
CW Staff

MOUNTAIN VIEW, Calif. — The moving head rigid disk drive industry sold an estimated $1.87 billion in disk drives worldwide in 1976, and 91% of this volume was shipped by U.S. manufacturers.

Based on existing or announced products, the industry can anticipate a peak in revenues in 1979 at $2.95 billion, with a slight decline in 1980 to $2.91 billion, according to a report by James N. Porter, a management consultant.

Worldwide revenues for U.S. manufacturers should reach $2.66 billion in 1979 and $2.81 billion in 1980, according to Porter's *1977 Disk/Trend Report.*

"It is considered likely that new products not yet announced will prevent any decline in actual sales at the end of the decade," the report stated. "The forecasted average annual growth rate (AAGR) of 12% through 1980, representing the effects of old age in the product life of several of today's products, will be exceeded if significant new products are introduced at rates similar to past experience.

"A reasonable estimate of AAGR on this basis is 18% to 20%, which would place 1980 total revenues at $3.6 billion to $3.9 billion," it said.

Moving head rigid disk drives are produced by 23 U.S. manufacturers, plus 11 in Japan and Western Europe.

About 70% of all drive revenues represents captive prodution, and the remainder are produced by the plug-compatible manufacturers (PCM) and OEM market, the report stated.

'Confusing' Industry

"The industry structure can be confusing, even to industry participants, but follows most of the classic rules for free-market industries: Noncaptive manufacturers sell drives, alone or with related hardware, directly to every type of industry participant.

"Questions of technical capability, manufacturing facilities and quantity requirements control whether various industry levels buy directly from the drive manufacturer or through a reseller," *Disk/Trend* noted.

The report pointed out that vertical integration has been a strong trend in the industry, noting that with the exception of IBM, all the U.S. captive drive producers used to be OEM drive customers for all or part of their requirements.

IBM holds about 40% of the drive market, compared with its 70% share of the mainframe market. The PCM programs of several drive manufacturers, which displace potential IBM revenues, and the disk drive requirement of the minicomputer segment, which IBM has only recently addressed, account for the difference in market shares, the report stated.

"The short-term loser in market share is the PCM business, which held 14% in 1976, but will drop to 9% and stabilize at that proportion, as independent manufacturers hurry their 3350 drives to the market to replace lost 3330 shipments," *Disk/Trend* predicted.

The report forecast fixed disk drives will account for more than half of all drive revenues by 1980. Worldwide shipments of fixed disk drives up to 12M byte will grow from $87.7 million in 1976 to $340.1 million in 1980, while drives with over 200M byte will grow from $219.5 million to $849.7 million.

Decreases are expected in most disk cartridge and disk pack drives as well as in data module drives.

Disk cartridge drives up to 12M byte will drop from 23.5% of shipments in 1976 to 12.5% by 1980, pack drives of 29M byte to 58M byte will show a similar decline from 7.2% of shipments to 3.3% while those with more than 100M byte will drop from 35.% to 11.6%, the report predicted.

Data module drives' market share will also drop, from 13.7% to 1.2%.

Disk cartridge drives of 12M byte to 55M byte, on the other hand, will see an increase in market share, from 1.1% in 1976 to 5.6% in 1980. Storage module drives of 25M byte to 80M byte will also see an increase, from 2.7% of total shipments to 11.5%, the report stated.

Competing Techiques

No competing technology is likely to have a significant impact on the market for moving head rigid disk drives prior to 1980, *Disk/Trend* stated. "Several emerging technologies will, however, find specialized segments of the data processing market responsive to the new capabilities offered, even at comparatively high prices.

"The production programs thus initiated will lead to future cost reductions which probably will have a greater effect on disk drives later in the 1980s," the report said, noting that so, the one feature offered by disk memories not under attack by competing technologies is removability.

For further information on the *1977 Disk/Trend Report*, contact James N. Porter, 1224 Arbor Court, Mountain View, Calif. 94040.

Choose the right on-line approach for your bank's exclusive needs:

INCOTERM®

For banks and thrift institutions, the INCOTERM Series 7000 Retail Banking System represents new freedom of choice: you choose the right degree of automation for your current plans; what you specify today can be expanded or extended as requirements evolve, grow or change.

Backed by INCOTERM's user proven technology, the modular Series 7000 supports all the traditional retail banking functions — Checking. Savings. Installment loans. Mortgages. Club accounts. Lines of credit. Bank credit cards. CIF reference.

Series 7000 is a line of highly flexible hardware supported by a broad spectrum of software. It is the most capable and versatile equipment available — a new generation designed in direct response to bankers' design objectives. The series includes teller station equipment, administrative platform equipment, back room equipment and automated teller machines, operating under the direction of the branch Intelligent Transaction Controller.

All at very favorable prices.

The entire Series 7000 line is ready now to go on line — from teller inquiry applications to comprehensive cash control networks. Whatever your approach to bank automation, you can be sure that INCOTERM lets you do it your way. If you'd like more information, write or call.

More power to your terminal.

Chances Slim for Penetration of Soviet Market

By **Bohdan Szuprowicz**
Special to CW

Is there a Soviet market for Western computers?

At first glance the answer would appear to be yes, since several spectacular sales of large Western computer systems to the Soviet Union have been widely publicized. But whether a worthwhile market share can be realized in the Soviet market by any Western computer manufacturer is another question altogether.

Yet that should be the main objective when attempting to penetrate this potentially huge but centrally controlled market with Western equipment, which is much more advanced than domestically manufactured Soviet computers.

International News

This basic issue, although completely overshadowed by strategic technology transfer considerations, has resurfaced once again with the controversy over the export license for Control Data Corp.'s Cyber 76, which was sold to the Soviet Hydro-Meterological Institute two years ago.

The Cyber 76 is one of the fastest Western computers on the market with processing speeds in the order of 10 million to 12 million instructions per second, while the top Soviet machine at present is still the venerable BESM-6 which is rated at 0.8 million to 1 million operations per second. The top Soviet Riad computer, the EC-1060 that was finally reported to have been put into production in June 1976, is still rated at 1.5 million operations per second, well below its original design speed.

Thus it is argued by some that shipment of a Cyber 76 to the Soviets would be tantamount to giving the Russians computer technology that would allow them to increase by a whole magnitude their state of the art in large computer manufacture. This is particularly relevant because since 1974 the Soviet Academy of Sciences made no secret of the fact that it is building a prototype BESM-X, now to be known as BESM-10, which it hopes will reach speeds in the 15 million operations per second category.

But the market for such big number-crunchers is limited and academician Dorodnitsyn, director of the computer center of the Soviet Academy of Sciences, stated in 1974 that probably no more than 100 to 150 such large systems will be installed ultimately in the whole Soviet economy, as well as exported to major institutes in East European countries to replace their BESM-6 machines.

So far the Russians have not announced their BESM-10 prototype, which was supposed to go on the air during 1977. Since they obviously have a significant investment in that program already, it is very difficult to believe that they would not want to get some helpful ideas from the Cyber 76 once it is installed in their territory.

Aside from any possibility of diversion of the Cyber 76 for strategic use, the issue is basically one of a fair market share for Western manufacturers in return for such an advance in the state of the art.

So far chances are that once the Russians get their BESM-10 on the air, Control Data or anyone else is unlikely to make another sale of a Cyber 76 in the USSR, Eastern Europe or even India.

A look at the history of Western computer exports to the USSR during the last 1970-1975 Five Year Plan may prove illuminating.

About 200 Western computers have been sold during that period, of which about 50 are relatively large machines such as ICL 4-70, ICL 1906, IBM 360/50, IBM 370/155, Univac 1106, HIS 612, Siemens 4004, CDC 6200, Burroughs 6700, Iris 80 and similar models in great variety.

The other computers consist of small machines and minicomputers such as the HP 2000 series, DEC PDP-11, Mitra 16, Varian 627, Logabax, IBM System 3, Ferranti Argus 700 and a few other models, many of which were shipped as integral parts of various plants sold to the Soviet Union on a turnkey basis often in return for a fair price or even raw materials.

But what is interesting to note about the imports of single Western computer installations is the fact that most represent different computer models from different Western manufacturers, except in a few cases where the nature of the application required a dual system for reliability.

It appears as if someone behind the scenes orchestrated the importation of representative models of the latest obtainable and most advanced Western computers. When offers of large numbers of used IBM 360 computers and later IBM 2314 and 2319 disk drives comparable to Soviet Riad equipment only now being manufactured were made at very attractive prices, these have been consistently rejected.

The total value of all those Western computers exported to the Soviet Union in the last Five Year Plan period is in the order of $150 million realized over five years by at least 20 manufacturers from the UK, France, Germany, Sweden, Japan and the U.S. This just about averages at $1.5 million per year per manufacturer, which is less than what some salesmen are selling within a single block of Manhattan.

Commerce Foresees Minis Boosting Dutch Imports

THE HAGUE, The Netherlands — The economic recession reduced imports of computers and related equipment by The Netherlands during 1975, and available information for early 1976 indicated that little if any, improvement should be expected.

After 1976, however, economic recovery should lead to renewed growth, according to a U.S. Department of Commerce report.

Minicomputers will open up a completely new market here and contribute substantially to the improvement of the total import figures, Commerce added.

In 1973, The Netherlands imported computers and related equipment valued at $153.9 million, of which $45.4 million were U.S. imports. By 1975, total imports grew to $229.8 million with U.S. equipment claiming $63.64 million.

In addition, for the first four months of 1976, U.S. imports accounted for $20.9 million of total imports of $72.7 million, according to Commerce figures.

"U.S. suppliers hold a dominant position in The Netherlands' computers and computer related equipment market," the report indicated.

"Domestic production is mainly in the hands of U.S. subsidiaries, except for Philips, the Dutch multinational, which produces some minicomputers and peripheral equipment with a special attraction in the Dutch market."

Commerce noted that while the U.S. position in the mainframe sector is secure, strong European competition is being encountered in the peripheral area.

Foreign Orders & Installations

Ontario Hydro has ordered a Univac 1100/42 system to be installed at its System Control Center in suburban Toronto.

South African Coal, Oil and Gas Corp., Ltd. has ordered Honeywell instrumentation equipment worth $11.5 million to monitor the world's largest oil-from-coal complex.

Shell Canada Ltd. has ordered a Flic system from Metromatication International, Inc. to be installed in its research facilities at Oakville, Ont.

Prestil Eclair, a zipper manufacturer in Rouen, France, has ordered a Model 7110 system with six terminals for order entry applications from Inforex, Inc.

Six European banks have ordered IBM 370/158 and 370/168 add-on memories from Electronic Memories and Magnetics Corp.

D. Stempel AG, West Germany, has ordered a high-speed, multihead large-format graphics scanner from Optronics International, Inc.

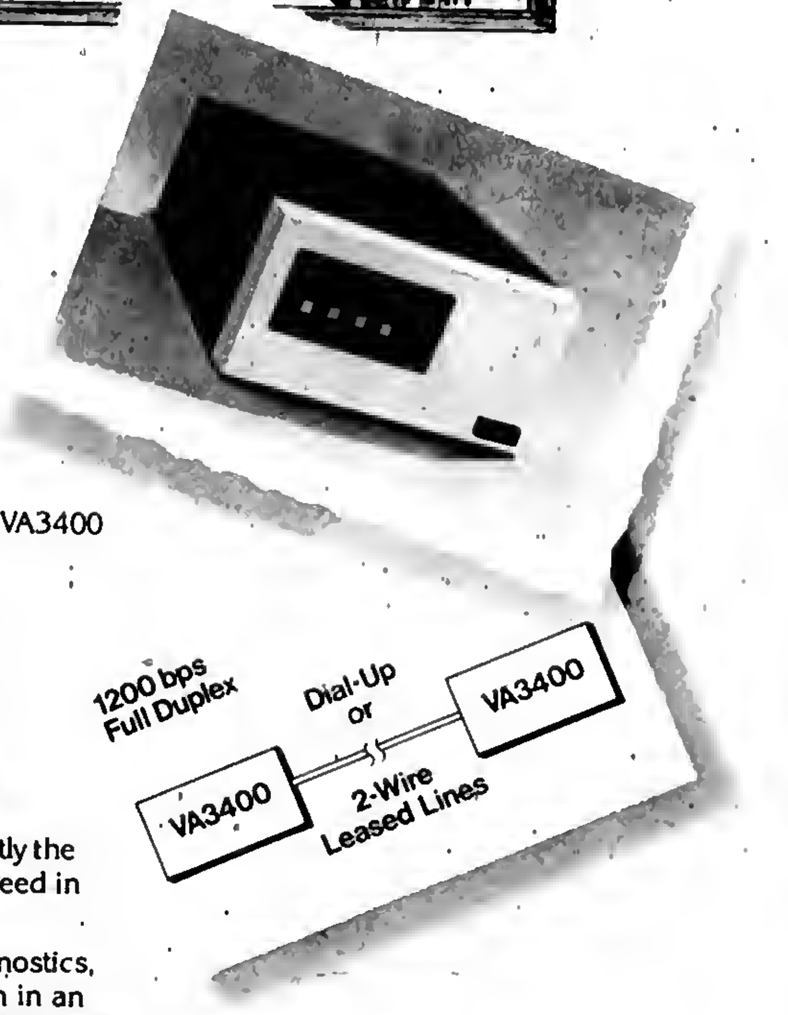
Dear Ma:
While you've been playing games, Vadic has shipped over ten thousand 1200 bps full-duplex 2-wire modems.



Did you know, Ma, that Vadic has delivered over ten thousand VA3400 modems?

That's right, Ma. To more than 1,000 different customers. You see, Vadic was able to invent a full duplex 1200 bps modem that operates beautifully on either dial-up or 2-wire leased lines because they're modem specialists. And Ma, they did this almost four years ago!

With Vadic's VA3400, any 120 cps terminal can operate at full speed. Users no longer have to plod along at 300 bps or live with Inefficient half-duplex operation. And since Vadic's VA3400 uses exactly the same line discipline as your 103, they can change computer port speed in just minutes.

These field proven VA3400's have powerful displays and diagnostics, too. Using them, operators can pinpoint just about any malfunction in an entire data network. More big news, Ma. General Electric now leases, Installs and services Vadic modems at over 50 locations nationwide. And Vadic backs them up with five regional on-line diagnostic centers.

When it comes to industry "firsts", Ma, Vadic sure hasn't been playing games.

Your Independent thinking son,

Alexander Graham Jr.

PS: Vadic has shipped over 125,000 modems to date.

SBS to Start Satellite Experiment This Fall

McLEAN, Va.— A communications experiment known as Project Prelude will be conducted this fall by Satellite Business Systems (SBS) in association with Comsat Laboratories and other companies.

The Project Prelude experiment will use the National Aeronautics and Space Administration's (Nasa) Communications Technology Satellite (CTS) to test emerging concepts for intracompany communications, including high-speed data transmissions, teleconferencing and facsimile, according to an SBS spokesman.

The experimental transmission of high-speed digitized communications will be at the higher frequencies of the 12-and 14-GHz bands, at which CTS operates.

These communication transmissions will be a prelude to advanced commercial communications to be available in the 1980s to meet intracompany needs of large organizations, the SBS spokesman explained.

Three business organizations will participate in the satellite experiment: Rockwell International Corp., Texaco, Inc. and Montgomery Ward and Co., Inc.

SBS is making arrangements with leading communications equipment manufacturers to supply terminal equipment at each site for the experiment.

Project Prelude will provide an opportunity to plan and develop equipment for high-speed and high-quality transmission capabilities required for future satellite systems, according to the spokesman.

The capabilities and performance of the manufacturers' advanced prototype equipment will be evaluated in a realistic business environment, he said.

The six participating manufacturers are: Advent Corp.; Arvin Echo Corp.; Dacom, Inc.; Harris Satellite Communications Division of Harris Corp., which will supply a multi-data rate, high-speed modem employing QPSK modulation; Hewlett-Packard Co. which will supply a computer systems network; and NEC America, Inc.

The experiments will employ two small transportable earth stations, built by Comsat Laboratories. Each of the participating business organizations, in turn, will have the pair of earth stations installed at their selected sites for several weeks, the spokesman noted.

During the experiment, data will be gathered on user acceptance, economic impact and equipment performance. An evaluation will be published in a report to Nasa and the Federal Communications Commission (FCC), he said.

The experiment is under the overall direction of SBS, which is a partnership formed by wholly owned subsidiaries of Comsat General Corp., IBM and The Aetna Casualty and Surety Co.

SBS has been authorized by the FCC to establish an all-digital, 12/14 GHz satellite system to serve businesses, government agencies and other large communications users.

AIIE Planning Conference On Federal DP Procurement

WASHINGTON, D.C. — A government-industry computer conference on "Federal ADP Procurement: 1978 — The Year of Transition" is being presented by the American Institute of Industrial Engineers (AIIE) in cooperation with key military and civilian agencies.

The conference will be held Nov. 14-16 at the Twin Bridges Marriott Hotel here.

The conference will focus on federal ADP procurement issues from two perspectives: policy agencies, represented by the Office of Management and Budget, the General Services Administration and the National Bureau of Standards; and user agencies, represented by the Department of Defense, military and major civilian agencies.

The first day of the conference will offer a status report on major issues given by executives in organizations with governmentwide responsibilities for ADP policy and implementation.

The second day will consist of a series of parallel sessions, stressing agency experience with ADP procurement practices and addressing key issues that affect internal agency procedures. Sessions include: "Teleprocessing Services Program (TSP)", "Developing the Request for Proposal (RFP)," "Management Session: Department of Defense," and "The Post RFP Process."

The third day will feature a panel discussion on proposal evaluation.

Further information is available from Dept. PR, AIIE Seminars, P.O. Box 3727, Santa Monica, Calif. 90403.

Amdahl Announces Key Appointments

SUNNYVALE, Calif. — Amdahl Corp. has announced a series of key management appointments representing the executionary phase of a management enhancement plan previously approved by its board of directors.

Eugene R. White, Amdahl president since 1974, has been appointed deputy chairman.

John C. Lewis, formerly group president of Xerox Business Systems, will succeed White as president, while William F. O'Connell, formerly director of IBM World Trade large systems marketing, has been named senior vice-president, corporate marketing.

Other Changes

- Joseph A. Orlando has been elected executive vice-president of Technicon Corp.
- Daniel A. Hosage has been named vice-president and general manager, communications management products for Datapoint Corp.
- William A. Clarke has been selected as vice-president, business development for On-Line Business Systems, Inc.
- Irwin J. Kusel has been named vice-president of systems and consulting at Cogna Systems Corp.
- James S. Conners has been named vice-president and area manager of National Sharedata Corp., the Western Union Teleprocessing division.
- James Peacock has been named vice-president of International Data Corp. (IDC).
- Philip Schneider has been named vice-president of Advanced Westar for the Western Union Telegraph Co.
- John F. Graham has been named director of Honeywell Information Systems' Industrial Design and Human Factors Department.
- Allan T. DeVault has joined Digital Development Corp. as director of marketing.
- William D. Jobe has been named vice-president for North American sales for Data General Corp.

Think about the world's most popular video terminal. Chances are you're thinking about the Dumb Terminal.™

Because with a 24-line screen, and 1920 bright, easy-to-read characters as standard equipment, it would be difficult to come in second best. Especially at a price of $895. (Even for the Dumb Terminal.™)

In fact, the more you look at it, the smarter it is to think Dumb.

Wema to Study Drop in Investment Capital

By Edith Holmes
CW Staff

PALO ALTO, Calif. — The dramatic decline in the capital available to start and support the growth of young electronics companies in the U.S. has prompted Wema to form a special task force of industry executives to study and help solve the problem.

Wema, formerly known as the Western Electronics Manufacturers Association, attributed the current lack of investment monies to the continuing increase in the federal and state capital gains taxes over the last eight years. Capital gains taxes have nearly doubled since 1969, stifling any incentive people have to invest their money in businesses — and particularly in small, high technology companies.

These firms require a great deal of capital and their chance of failure is high, according to Edwin V.W. Zschau, chairman of Systems Industries, who will head the task force.

"The situation has become so bad that many would-be companies don't get started and those that do either fail or grow slowly because of capital starvation," Zschau said. "Recently, several have obtained capital from foreign investors, often selling part of their technology in the process," he added.

A 1976 Department of Commerce study underscored the problem, Zschau noted. The study reported that in 1969, when increases in capital gains taxes began to take place, more than 200 young, high technology firms were able to raise $349 million in new invested capital in the U.S.

By 1975, however, the investment climate had deteriorated so much that not a single small, high technology company raised a dollar of new capital in public markets during the first six months of the year, the Commerce study said.

"This is particularly unfortunate since small, high technology firms create jobs at a rate nearly 70 times greater than large, mature companies," Zschau said, adding that "small, fast growing companies have a constant need for infusions of new capital for expansion."

The Wema task force chairman argued that the statistics show that had people in the U.S. been encouraged to invest today at the same rate they did in 1969, the unemployment rate in this country could be more like 3-1/2% rather than 7% or 8%.

Zschau is optimistic that the task force will be able to educate lawmakers with this information, helping them realize "that a vote for increase in capital gains taxes is actually a vote for greater unemployment and inflation."

Wema Opens Eastern Office

PALO ALTO, Calif. — Wema has opened an Eastern U.S. office to provide services to the more than 50 Wema companies in the East.

The new office, located in Amherst, N.H., will be headed by Kenneth J. Ritchie.

"The hiring of a full-time professional and opening of an Eastern office was prompted by Wema's steadily growing membership, which now includes 870 electronics companies in 33 states," Kenneth Oshman, chairman of Wema's board of directors, said.

Expansions

Datacom, Inc. has moved its manufacturing facilities to a 110,000 sq-ft plant on Old Berwick Road, Berwick, Pa.

Monolithic Systems Corp. has added 4,000 sq-ft to its corporate headquarters and production facilities at 14 Inverness Drive East, Englewood, Colo.

Computerland Corp. of San Leandro, Calif., has opened its fourth personal computing retail store in Tustin, Calif.

Digital Equipment Corp. has purchased a building and additional land in order to expand its factory operations at Maynard, Mass.

Analog Devices, Inc. will begin building a larger semiconductor division plant in Wilmington, Mass., this summer.

Computer Power Systems Corp. has moved into larger quarters in Long Beach, Calif.

Hamilton Digital Controls has purchased a building adjacent to its present location on Beachgrove Place, Utica, N.Y.

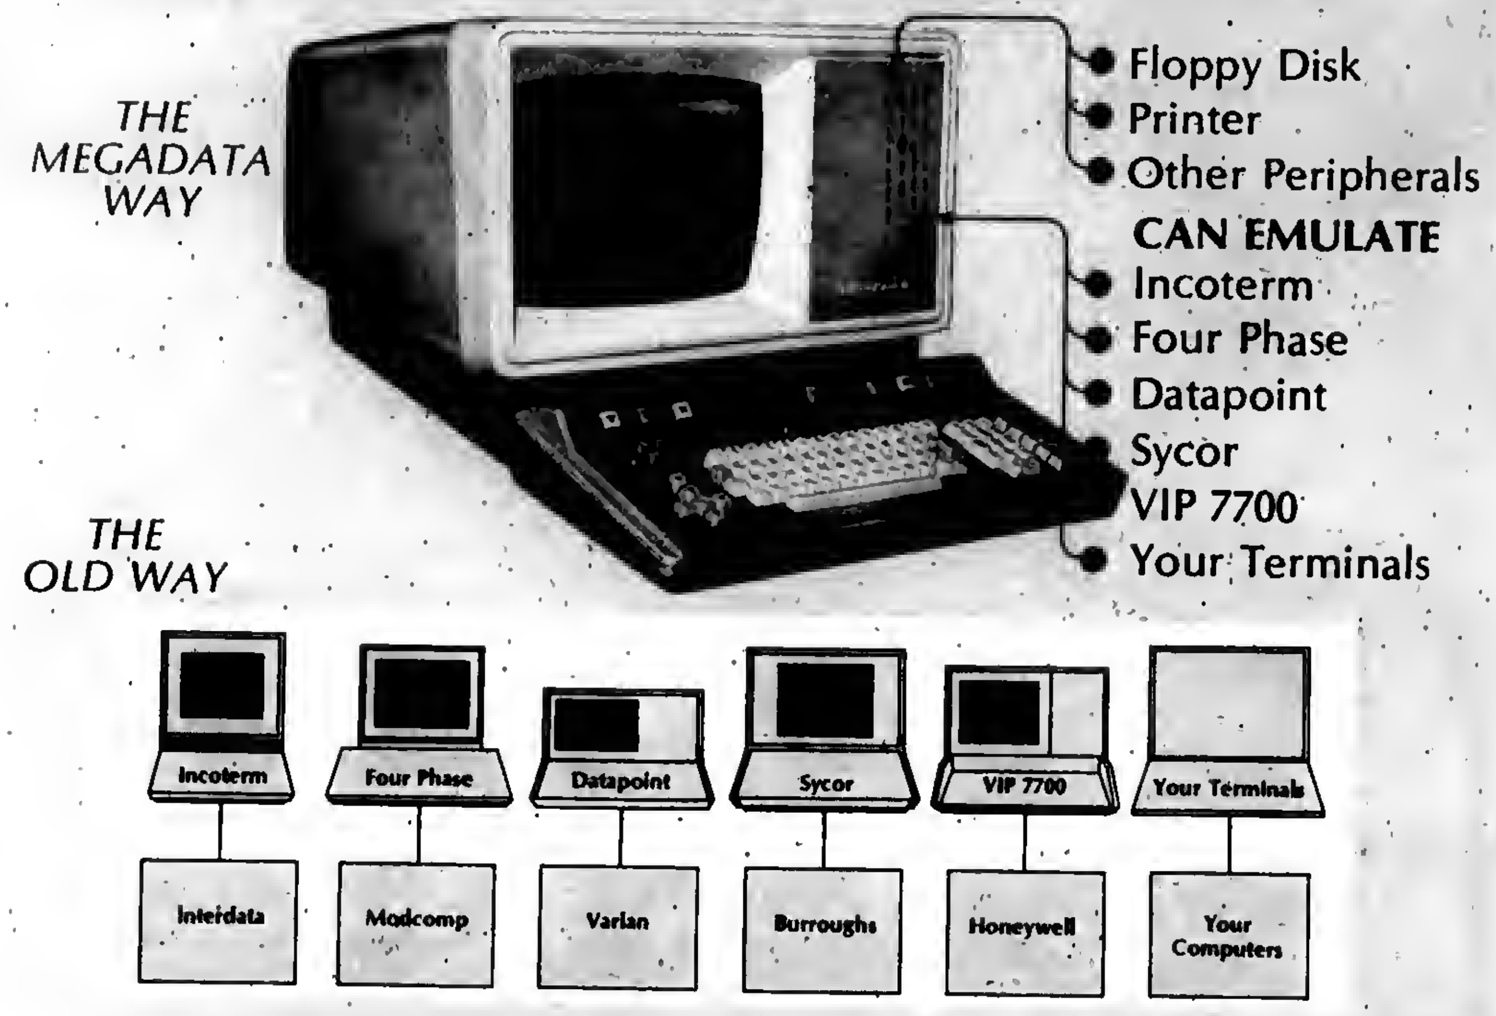
Microkit, Inc. has moved its general offices and plant to larger quarters at 11205 La Cienega Blvd. in Los Angeles.

Jacquard Systems has moved to larger quarters for manufacturing research and office work. They are located at 1639 Eleventh St., Santa Monica, Calif.

Interstate Electronics Corp. has added a 131,000 sq-ft plant to its Anaheim, Calif. facility.

Computer Sciences Corp. has completed construction of a computer center in Beltsville, Md., to be used in the company's international time-sharing service, Infonet.

MEGADATA's Model 700/UETS
Universal Emulating Terminal System



If you are a *multiple* computer user and your network includes many *different types* of terminals, the new and powerful MEGADATA UETS system is your key to vastly improved system utilization and operations....A SINGLE UETS terminal can interface with a multitude of host computers, and it emulates any number of different terminal devices. It thus provides very significant advantages to the user.

- *APPLICATIONS ORIENTED*—readily configured for your specific application
- *VAST REDUCTION IN EQUIPMENT*—a SINGLE UETS can replace any number of different types of terminals
- *UNIFORM OPERATING PROCEDURE*—ONE basic operating procedure on ONE machine; no changing from unit-to-unit and procedure-to-procedure
- *REDUCED MAINTENANCE COMPLEXITY*—ONE serviceman from ONE company, with all spares supplied by ONE source

To provide all the required interfaces and emulations, the UETS has been developed as a most powerful piece of hardware. It contains a 12-bit MPU, a 15-inch diagonal display, a memory up to 73 K, and a 126-station keyboard with up to 71 function keys.

To find out more about our UNIVERSAL EMULATING system and the many other applications oriented MEGADATA terminals, call or write *TODAY*.

THINK

And discover how to improve 3270 performance.

Think first. And weigh all the pros and cons before you make a decision on new equipment. Particularly for the 3270. We figure you'll want Genesis One® field-proven, plug compatible Display Terminals and Printers. Especially when you:

Think availability. You don't have to wait for stretched-out delivery.

Think low cost. Dollar for dollar, Genesis One units are your best buy. You realize direct significant savings. Now!

Think compatibility. We're plug compatible with the IBM 3270 displays and printers. Genesis One units are direct replacements for IBM 3277 Mod 2 displays; 3284 and 3286 printers on 360's, 370's, Systems/3's and 3790's.

Think features. Like two LSI memories for a steady image, home and repeat keys, automatic visual indication, blinking cursor, true upper and lower case, and more on our G77™ Information Display Terminal. Our G-Series Printer boasts four models (60, 88, 120, 165 cps). Vertical forms control. Adjustable forms tractors. Audible alarm. Automatic motor control.

If you think all this adds up to a good deal, you're right. Shouldn't you know more about our products? Call your regional Genesis One office in New York, Chicago, Dallas or Los Angeles. Or contact us at (212) 557-8414. You'll be glad you did. We think.

Possible Shortages Predicted in Hobbyist Mart

WOODLAND HILLS, Calif. — Those types of computers that are sold through retail stores may be in short supply during September and October, according to Pertec Computer Corp. (PCC).

"The phenomenon of inexpensive computers, sold in retail outlets for less than $400 in kit form to as much as $15,000 for an assembled small business system, is about to experience its first burst of growth and national attention," according to J. David Callan, divisional vice-president and general manager of PCC's Microsystems Division.

About two weeks ago, PCC announced a series of manufacturing economies and some significant price reductions in its Altair line of microbased personal computing systems.

"Awareness of this type of equipment is causing a rush to open new stores. PCC, for example, currently sells through more than 50 personal computing retail stores and 30 retail outlets that specialize primarily in very small business systems, and it plans to open 50 to 100 outlets by year end. But we have more than 800 requests for store locations," Callan said.

Just the number of systems necessary to stock new stores may result in a supply-demand imbalance, he explained.

"Further, and most significant, is the lack of comparative data on our customer base. We are assuming that only a minute portion of the market has bought a system at this point.

"With the flood of national publicity and recent articles in *Business Week*, the *Los Angeles Times*, the *New York Times* and other media, a lot of people have suddenly become aware of the types of systems that are available for small business and the things they can do with them. How quickly will this market begin to purchase? That is something we have not been able to project," Callan said.

"Another element that might create shortages in certain geographic areas is also the result of the immaturity of the market," he explained. "In a mature situation, such as the automotive industry, dealers will let each other "borrow" a product: But right now the Altair computer store network is still in a formative stage.

"Stores are located too far from each other to be of more immediate assistance. And, dealers are still learning to balance their own inventories and cashflow," Callan added.

Many of the individuals who operate retail computer stores were hobbyists themselves only a year or so ago. But the store owners are now reaching the point where they can visualize a computer industry that has many parallels with the office equipment business — including its ultimate size, Callan noted.

Semi Conference To Cover Sales To East Europe

BOSTON — A day-long conference focusing on the market potential for and the problems associated with the sale of semiconductor capital equipment to the USSR and the other socialist countries of Eastern Europe has been scheduled for Sept. 16. at the Colonnade Hotel here.

The conference is designed to present facts and basic information on U.S. export control policies and programs and is being sponsored by the Semiconductor Equipment and Materials Institute (Semi).

A number of ranking government officials are scheduled to participate in the program including recently appointed Deputy Secretary of Commerce Stanley Marcuss; Dr. Maurice Mountain, director of the Office of Strategic Trade and Disclosure in the Department: of Defense; Arthur Reichenbach, compliance affairs officer in the Department of State and Joseph Dytrt, director of the Capital Goods and Production Materials Division in the Commerce Department. Roger Majak, staff consultant to the House Subcommittee on International Economic Policy, will analyze the congressional role in export control.

Industry executives participating in the sessions will include Hugh Donaghue, vice-president of Control Data Corp.; Frederick Van Veen, assistant to the president of Teradyne; William Barton, president of International Business Government Counsellors, Inc.; and Aubrey Tobey, director of marketing, GCA.

For further information contact Semi, Suite 212, 625 Ellis St., Mountain View, Calif. 94043.

DP Tools Seen Vital To Emerging Nations

TAMPA, Fla.— Education and training are the essential ingredients for developing countries to obtain long-term benefits from computerization, in the estimation of American Software and Computer Services, Inc. (ASCS).

"Only if computers are made to be tools placed directly in the hands of the developing country's people can meaningful benefits be gained," Peter Fingar of the ASCS staff said.

ASCS plans to channel a major portion of its efforts toward developing nations, Fingar said, as a result of those countries' increased awareness that computers are vital to the orderly process of advancement and industrialization.

Telxon puts a family of data terminals in the palm of your hand!

If the successful operation of your business requires the fast movement of data from remote locations to your computer facilities—Telxon can help you:

The Telxon data terminal system offers telecommunication Accuracy, Speed, Convenience, Ease of Operation all at your fingertips.

TELXON 919 is recognized in the distribution industry as the finest cassette source data terminal available, particularly where large volumes of data must be collected and stored before transmission. 919 brings you:

- Proven Reliability.
- Permanent Data Record
- Large Data Storage — 150,000 characters
- Wand Scanning
- Many Additional, Attractive Optional Features

TELXON WAND — Tells it all, does it all. Simply hold it like a pencil and you are ready to scan. Your Wand unit offers Telxon, UPC and Codabar scanning capabilities.

If you are now a Telxon equipment user you may upgrade to Wand scanning with a simple field modification.

TELXON 717 is a production and field proven solid state expandable memory data terminal. Check these solid reasons for adding Telxon's 717 to your data communications equipment family.

- Low Cost
- Solid State Reliability
- Ease of Operation
- Minimum Training Time
- Designed for wide range of applications, large or small

Upgrading your present data order entry system? Specify Telxon! This sophisticated family also speaks other existing data terminal languages, eliminating costly modifications. Let us show you how Telxon data terminals will easily fit into your present data communication facilities. Call or write Telxon; a representative is ready to show you, by demonstration in your location, how well this family of data terminals can help solve your data accumulation and transmission problems.

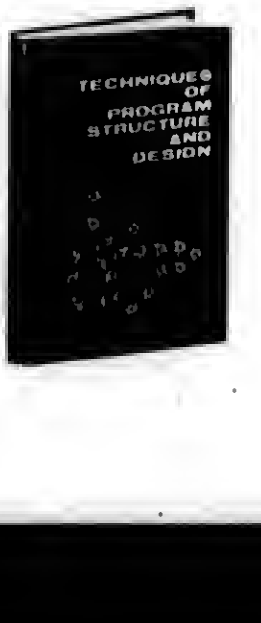
TOP-DOWN STRUCTURED PROGRAMMING TECHNIQUES
Clement L. McGowan and John R. Kelly



54450. THE IBM 5100 PORTABLE COMPUTER: A Comprehensive Guide for Users and Programmers. *Harry Katzan, Jr.* Includes BASIC and APL programs for payroll/inventory control applications. **$19.95**

84385. TOP-DOWN STRUCTURED PROGRAMMING TECHNIQUES. *Clement McGowan and John R. Kelly.* Practical solutions in actual code serve to introduce this revolutionary new concept. **$14.95**

35450. AUTOMATIC DATA PROCESSING HANDBOOK. *The Diebold Group.* Auxiliary memory, peripherals, systems design, consultant services, software packages. *Counts as 2 of your 3 books.* **$29.50**

58810. THE LOGICAL CONSTRUCTION OF PROGRAMS. *Jean Dominique Warnier.* Provides a wide array of specific techniques and information. **$14.95**

70190. PRINCIPLES OF OPERATIONS RESEARCH. *Harvey M. Wagner.* Based on the author's twenty years of experience applying operations research to a wide variety of problems, this 1009-page book offers a complete overview of all the fundamental concepts involved in operations research. **$21.50**

56255. INTRODUCTION TO COMPUTABILITY. *Frederick Hennie.* Fundamental study of the limits of digital computation, the power of programming languages, basic differences between functions and algorithms, more. *Counts as 2 of your 3 books.* **$20.95**

52900. HIGH LEVEL COBOL PROGRAMMING. *Gerald M. Weinberg, Stephen E. Wright, Richard Kauffman, and Martin A. Goetz.* An advanced guide to proper and efficient COBOL usage. Introduces "sheltered programming" concepts, stresses modular design and maintainability of code. A sound approach to more efficient program design. **$16.95**

83400. THEORY AND DESIGN OF SWITCHING CIRCUITS. *Arthur D. Friedman and Premachandran R. Menon.* Covers practical solutions to optimization problems for large-scale systems, plus flip-flop memory elements, mathematical models. **$19.95**

52215. HANDBOOK OF DATA PROCESSING ADMINISTRATION, OPERATIONS, AND PROCEDURES. *S. R. Mixon.* Offers a future- and user-oriented system for designing, documenting, and controlling computer center projects. Plus a wealth of practical information on systems and programming techniques, project management methods, documentation standards, COBOL language standards, and staff training. *Counts as 2 of your 3 books.* **$24.95**

55920. INTERACTIVE DECISION ORIENTED DATA BASE SYSTEMS. *Edited by William C. House.* An extensive user's guide to the state-of-the-art in data base and management information systems (MIS) concepts. A skillful blend of management planning with technology. **$19.95**

88000. WRITTEN COMMUNICATION FOR DATA PROCESSING. *Randi Sigmund Smith.* Guidelines to help prevent the leading cause of data processing catastrophes—ambiguous specifications. **$12.95**

53795. HOW TO MANAGE STRUCTURED PROGRAMMING. *Edward Yourdon.* Based on the author's highly popular seminar series, this offers a detailed step-by-step presentation of just what programmer productivity techniques (PPT) can do for the DP manager. **$19.95**

62620. MICROCOMPUTER HANDBOOK. *Charles J. Sippl.* Detailed reference to the technology and applications of microprocessors. Covers software to the effect of micro technology on mainframe users. **$19.95**

55415. INFORMATION AND DATA IN SYSTEMS. *Borje Langefors and Kjell Samuelson.* Covers basic retrieval functions, processing techniques, design methodology, more. **$14.95**

58085. LEARNING TO PROGRAM IN STRUCTURED COBOL. *Edward Yourdon.* Treats COBOL as a foreign language, and offers several dramatic, easy techniques to help you learn the basics of structured programming—process, decision, loop, CASE. **$17.95**

39970. COMPUTER ARCHITECTURE. *Caxton C. Foster.* Covers microprogramming, switching circuitry, memory speed increases in mainframes. **$16.95**

MEMBERSHIP BENEFITS • In addition to getting three books all for $4.95 when you join, you keep saving substantially on the books you buy. • If you continue your membership past the trial period, you will be eligible for our Bonus Book Plan, with savings of at least 70% off publishers' prices. At 3-4 week intervals (15 times per year) you will receive the Book Club **News**, describing the coming Main Selection and Alternate Selections, together with a dated reply card. In addition, up to 4 times a year, you may receive offers of special selections, always at substantial discounts. • If you want the Main Selection, do nothing and it will be sent to you automatically. • If you prefer another selection, or no book at all, simply indicate your choice on the card, and return it by the date specified. • You will have at least 10 days to decide. If, because of late mail delivery of the **News**, you should receive a book you do not want, we guarantee return postage.

82560. TECHNIQUES OF PROGRAM STRUCTURE AND DESIGN. *Edward Yourdon.* Over 300 illustrative problems, 90 valuable references, and four demonstration projects. **$16.95**

44900. ENCYCLOPEDIA OF COMPUTER SCIENCE. *Edited by Anthony Ralston and Chester L. Meek.* The latest accurate information on hardware, software, systems, theory, economic, social and professional issues. *Counts as 3 of your 3 books* **$60.00**

59920. MANAGEMENT: Tasks, Responsibilities, Practices. *Peter F. Drucker.* A brilliant task-focused handbook of the skills, techniques and tools a good executive needs to stay effective in modern management. **$17.50**

66010. OPERATING SYSTEMS: A Systematic View. *William S. Davis.* Covers everything from cpu's to number systems. **$13.95**

The Library of Computer and Information Sciences 7-2AK
Riverside, New Jersey 08075

Please accept my application for membership and send me the three volumes indicated, billing me only $4.95. I agree to purchase at least three additional Selections or Alternates during the first 12 months I am a member, under the membership plan described in this ad. Savings range up to 30% and occasionally even more. My membership is cancelable any time after I buy these three books. A shipping and handling charge is added to all shipments.

3 books for $4.95

Indicate by number the 3 books you want.

A few expensive books (noted in book descriptions) count as 2 or 3 choices.

Try One Trivex With Your 3270s Instead Of Biting The Bullet.

You'd like to replace your IBM 3270s with more versatile terminals. It'd make you a hero. But the first step is like biting the bullet because things could blow up in your face.

That's why Trivex invented the free 30-day Mix and Match Plan. It gets rid of the risk of obsoleting your system, or hurting your user service reputation.

Here's how it works: We'll give you one of our Trivex Plus 70 terminals (or a system if you want) to try for 30 days. Free. Just plug it in. There's nothing else to do because it's *completely* compatible with IBM 3270 units.

The same goes for our controllers and printers. So you can mix and match our equipment with IBM's any way you want to.

Then sit back and see how well it works. Our terminals not only cost less than IBM's, you'll find they give you more. Like in-line, on-line and off-line diagnostic capability. Local display-to-print capability. OCR Wand. High-resolution, non-glare CRT. Prompting line. Cursor position indicator. Statistical package. And 10-key numeric pad. Features you won't get from IBM for years. If ever. And all Trivex 3270-compatible devices are microprocessor controlled. They're software-modifiable to future changes in network requirements.

When your 30 days are up, either unplug our Plus 70 System and send it back or keep it. It's a painless decision.

To try our high-calibre terminals, call the number below or write us on your letterhead. Our salesman will bring you information on our free 30-day Mix and Match Plan along with an Executive Decision-Making Kit complete with operating instructions and a real bullet. It's one offer you should bite on.

Free Thirty Day Mix & Match Plan.
The Alternative

Don't Replace Your 3270s Without Sending For Our Kit.

Two Interchangeable Versions

Intel Designs 'Slaves' for 8-Bit Machines

SANTA CLARA, Calif. — The Microcomputer Division of Intel Corp. has introduced single-chip "slave" microcomputers designed to boost the processing power and control flexibility of 8-bit microprocessors such as the 8080A, 8085 and 8048.

The UPI-41 Universal Peripheral Interface (UPI) components are the first microcomputers with the architecture required to operate as a microprocessor's "intelligent slaves," Intel claimed.

They will be used primarily to interface and control printers, keyboards, displays, cassettes, analog-to-digital converters, serial data communications channels and other peripheral equipment, a spokesman said.

Intel is offering a basic UPI-41 microcomputer in two interchangeable versions, along with an input-output expander for either microcomputer. The Intel customized Model 8041 contains a mask-programmed read-only memory (ROM) for program storage.

The Model 8741 UPI was designed to expedite system development and costs $250 in single quantities. It contains an erasable programmable read-only memory (Eprom) in place of the 8041's ROM. Each 8243 I/O expander unit contains 16 I/O lines and costs $8.

The UPI-41s can store entire control algorithms that would normally consume much of the master processor's execution time and main memory space and execute them in parallel with the main program, Intel said.

Microcosm

In addition to interfacing and control functions, the UPI-41 slaves can also handle data buffering and local DP tasks such as totalizing printed lists, linearizing analog inputs, concentrating data and executing diagnostic routines, the spokesman noted.

With slaves in the system, the 8080A and 8048 single-chip microcomputer or other master can issue commands, transfer data at its convenience and continue executing its main programs, the firm added.

Software development will be simplified since control and overhead routines ordinarily interlaced with main programs can be isolated to UPI-41 modules, according to Intel.

Unlike previous intelligent peripheral chips, the UPI-41 components are fully user-programmable instead of being software-adaptable to particular kinds of applications, Intel said.

Each single-chip slave contains a complete microprocessor to communicate asynchronously with multiple slaves, the firm said from 3065 Bowers Ave., Santa Clara, Calif. 95051.

Analyzer Debuts

SCOTTSDALE, Ariz. — Yucca International, Inc.'s Yuccalyzer Model YA-20 is a real-time, noninterfering microprocessor logic analyzer that costs $875.

The YA-20 is structured to debug systems using 8-bit data bus structures such as the Motorola 6800 and Intel 8080-type micros.

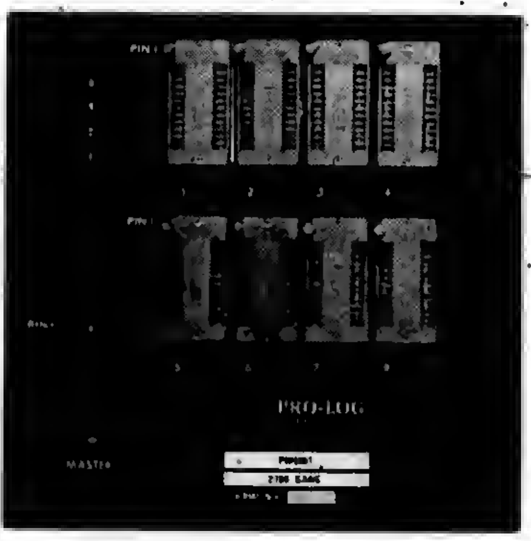
Up to 128 30-bit data words can be trapped and stored at any address in the program, Yucca said. Instructions can be read a data word at a time on hexadecimal LED displays; user inputs and MPU status are reported by LED indicators.

Probes are provided for either the 6800 or 8080 at no cost; others are available on order.

Yucca International is at 14415 N. Scottsdale Road, Scottsdale, Ariz. 85260.

Pro-Log Has Unit For 2708 Types

MONTEREY, Calif. — Pro-Log Corp. is offering a gang personality module it said is able to program up to eight 2708-type 8K MOS erasable programmable read-only memories (Eprom) simultaneously in less than three minutes.



PM 9051 Gang Module

The PM 9051 can program, duplicate, list and verify 2708-type Eproms from Advanced Micro Devices, Electronic Arrays, Intel, Intersil, Motorola, National Semiconductor, Signetics and Texas Instruments, according to Pro-Log.

The PM 9051 gang module works with both Pro-Log's Series 90 programmable read-only memory (Prom) Programmer and Series 92 Prom programmer/duplicator control units.

With the PM 9051 priced at $895, users can do gang programming with a Series 90 for $2,695 and gang duplicating with a Series 92 for $1,890, Pro-Log said.

The PM 9051 modules are available off-the-shelf from the firm at 2411 Garden Road, Monterey, Calif. 93940.

No one has more 11/03 systems and microNOVA's available off-the-shelf than we do. Not even DEC and Data General.

If you're developing a prototype system and need components fast, give us a call. The same goes if you need a large order pronto.

We've got all the DEC 11/03 hardware, firmware, and software you'll ever need — from processor boards to full systems. Available now. Off-the-shelf.

We've also got Data General microNOVA processors, computers, and full development systems. Available now. Off-the-shelf.

Plus a distributed processing communications module that lets one computer talk to another (including IBM) over any phone line. Available now. Off-the-shelf.

Data Systems Marketing can ship you all these products — plus printers, terminals, and accessories — the minute you need them.

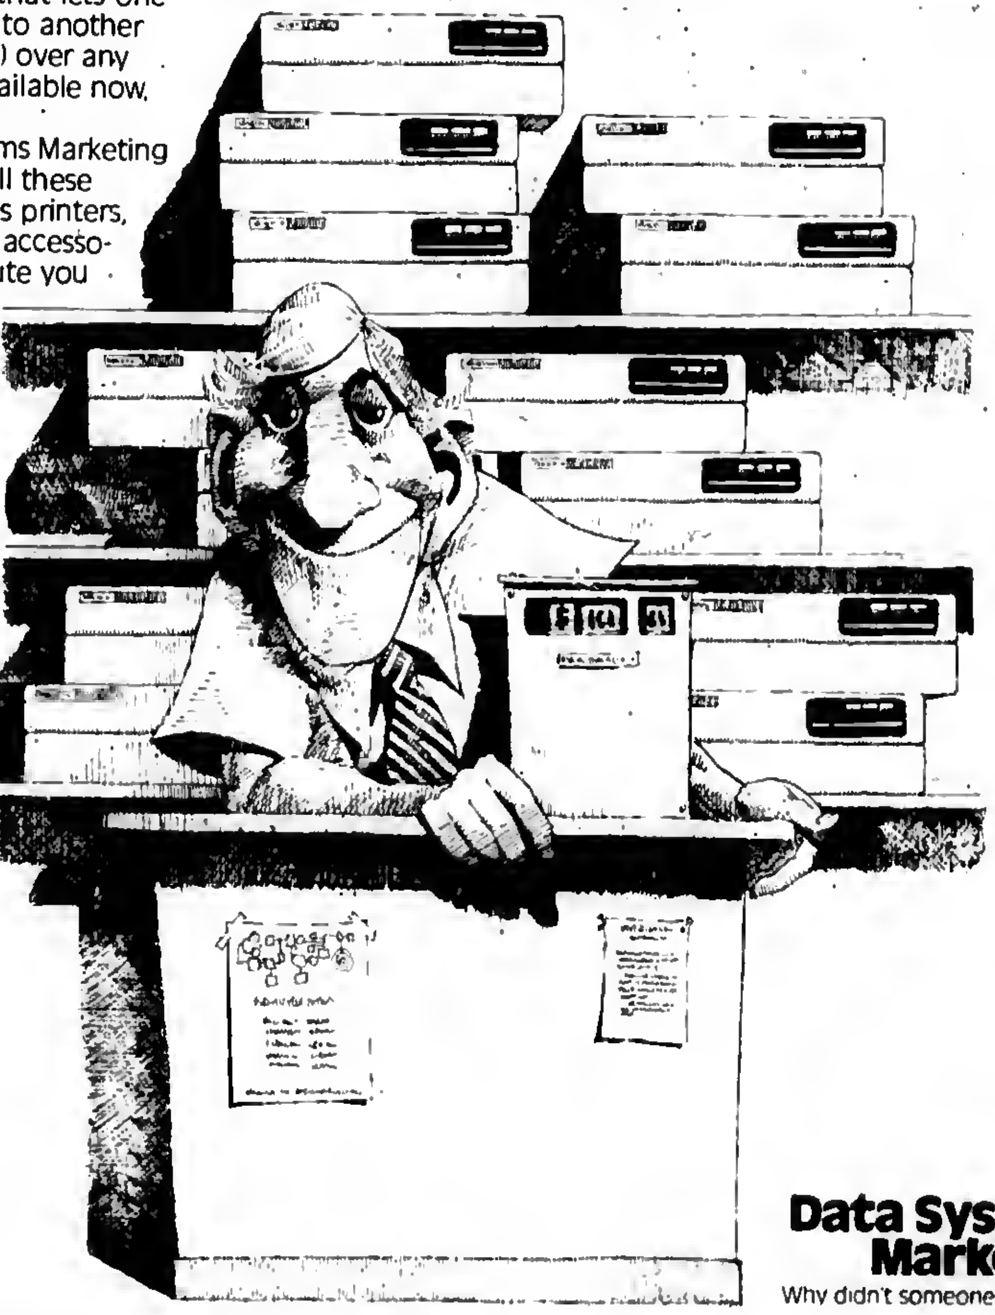
We've got super low prices. Convenient leasing plans. And an experienced sales staff to answer all your questions.

Data Systems Marketing. It's a whole new concept in computer sales. A chain of showrooms fully-stocked with a wide selection of microcomputer related products.

It's a place where you can see them. Play with them. And buy them.

Off-the-shelf.

And that's on the level.



Data Systems Marketing
Why didn't someone think of this before?

Fujitsu Unveils Two Disk Drives

SANTA CLARA, Calif. — Fujitsu America, Inc. has unveiled two disk drives, the M2201 with a dual-disk removable cartridge and the M2251, which features Winchester technology.

Prices for the M2201 are $3,900 in quantities of 100 and $215 for the cartridge. The M2251 in capacities of 12.5M- to 50M bytes costs $2,650 to $3,540 in quantities of 100. Deliveries are scheduled for early 1978.

The drives can be intermixed under the same controller, Fujitsu said.

The M2201 is a front-loading drive with two disks within the removable cartridge which contain up to 50M bytes unformatted and 40M bytes formatted.

The removable disk contains four times as much data as other single-disk methods and requires no nonremovable media, the firm claimed.

Access times are 6 msec track-to-track and 30 msec average for the M2201, Fujitsu said. The M2201 uses a track following servo system.

The M2251's access times are 10 msec track-to-track and 40 msec average, the firm said from 2945 Oakmead Village Court, Santa Clara, Calif. 95051.

OEM Products

40-Pin Controller Out

PALO ALTO, Calif. — Cybernetic Micro Systems has introduced a 40-pin LSI universal printer controller, the Model CY 480, which it said will control and interface any standard 5 by 7 dot matrix printer having a print speed up to 200 char./sec.

The controller operates from a single +5V power supply, according to a spokesman. It will interface a printer with any microcomputer or minicomputer system through standard 8-bit ports and accept either RS-232C or parallel Ascii input from the host system's data channel, he said.

Features include a 5 by 7 dot matrix character generator a full upper/lower case Ascii 96-character and font.

In lots of one to 49, the CY 480 is priced at $92. In quantities of 5,000 and up, it costs $30 from 2460 Embarcadero Way, Palo Alto, Calif. 94303.

Raycorder Introduced

MIDDLETOWN, Conn. — Raymond Engineering, Inc.'s Raycorder Model 6413 was designed for use with 1/4-in. data cartridges.

The unit is fully Ansi-Ecma-compatible; modular packaging provides a variety of configurations for OEM requirements, the firm said.

Standard electronics provide automatic search to load point on command and external program capability for drive select codes when up to four drives are operated from a single controller, according to a spokesman.

Data format is serial NRZ at 48 kbit/sec. Block detection allows block count/search operation.

In single quantities, the unit costs $1,250 with a serial interface and $1,400 with a parallel interface from 217 Smith St., Middletown, Conn. 06457.

Printer Gets Controller

SHELTON, Conn. — Practical Automation, Inc. has added an integral microprocessor controller to its 80- to 96-column text/data printer, which prints on adding machine rolls, impact-sensitive paper or fanfold forms and labels, the firm said.

The DMPT-6 printer controller provides selectable interface functions; parallel Ascii, RS-232-1-Loop and switchable transmission rates from 110- to 1,200 bit/sec.

All needle drivers, character generation and required diagnostic routines are also provided by the microprocessor controller, it added.

The needle printer forms 7 by 5 dot matrix characters over the Ascii 63-character set. Printing speeds range up to 110 char./sec and the price is $472 in single quantities.

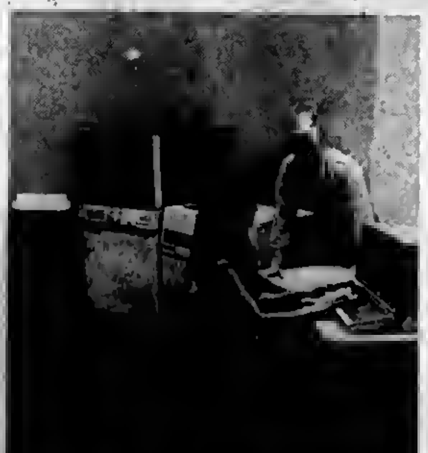
Practical Automation is at Trap Falls Road, Shelton, Conn. 06484.

SYSTEM 3300

Inforex 1300 and 1301 offer highly cost effective data entry capability for smaller installations (4 to 8 keystations) or remote locations where you can take advantage of our communications capabilities.

The 1303 provides medium range data entry capacity, with about triple the disc capacity of the 1301. It supports up to 16 keystations and the addition of edits, table look-ups, range checks and cross-footing. The 1303 also offers communications capabilities such as *spooling*, *HASP* and *RJE*.

With the 1330, you can consolidate remote job entry and batch data entry applications without compromising either function. The system features expandable disc storage (up to four – 10 Mb. drives) foreground and background editing and bisync communications.



The Inforex 3300 is a powerful pre-processing system that allows you to edit data at the point of entry, enabling you to offload your mainframe. Its sophisticated editing capabilities can also handle many of those applications which you haven't had time to put on your present mainframe.

Univac Integrating MCO

BLUE BELL, Pa. — Univac plans to integrate its new Minicomputer Operations (MCO) into the company organization with a program designed to give "optimum continuity in the acquired operation as well as focus attention on this fast-growth sector of the computer industry."

Univac recently acquired Varian Data Systems. Manufacturing and development of additional hardware and software products will continue to be centered in Irvine, Calif., according to Jerome J. Meyer, vice-president and general manager of Univac MCO.

Meyer noted that expanded development, marketing, production and support plans are being implemented to serve both the traditional mini applications and Univac distributed DP applications.

Meyer pointed out that the development of the MCO product bases — in particular the Series V77 — will be especially directed toward industry sectors with applications in small to large system environments.

T-Bar Head Warns

Communications in Danger

NEW YORK — "The rapid expansion of data communications offers many pontential benefits for our society and almost as many serious problems. In fact, one senses the similarities betwen the present energy crisis and the coming communications crisis," A. Henry Morgan, president of T-Bar, Inc. recently told members of the New York Society of Security Analysts.

"Unfortunately, whereas some people recognized the onset of the current energy crisis as long as 20 years ago," Morgan said, "an awareness of an imminent communications crisis is only seven or eight years old."

In many ways, sustaining uninterrupted data communications has become as vital as sustaining the availability of electrical energy. In one way, it is even more critical, for in data communications "the content of the transfer has its own importance, unlike the substance transferred in an electrical energy system," he noted.

The importance of this data is society's ever-increasing dependence on the computer that provides the services which have become virtual necessities for business and individuals, Morgan said.

Without uninterrupted data communications and data processing, "we would not have available to us the facilities that help us to control disease, disseminate aids, increase agricultural productivity, help control floods or to make provision for world wide credit cards, instantaneous hotel, airline and car reservations or the ready transfer of funds through banks, stock exchanges or other financial institutions," he said.

"Future developments in communications, made possible by increased use of newer technolgies, are expected to even transform the way Americans conduct their lives, at the same time perhaps raising serious problems.

"These transformations will effect how they send and receive messages, pay their bills, talk to their politicians, get their pay, obtain medical care and receive entertainment, news and even their education.

"There is, as well, the possibility of invasion of privacy should the federal government opt for a single clearinghouse for financial transactions. And consider the government's increasing reliance on these technologies for making evaluations that affect defense, taxes, welfare, aid to cities — virtually every area of our lives," Morgan pointed out.

Orders & Installations

Utah County has installed a Burroughs B1726 system and an on-line terminal network of TU 1700 terminals and TD 830 systems in the county building in Provo, Utah.

J.E. Sirrine, engineers and architects, has ordered a Honeywell Model 66/05 large-scale system valued at $800,000.

The Southeast Banking Corp., Miami has ordered a network for credit card and check cashing authorization services from National Data Corp.

The State Bank of Apopka, Fla. has installed an on-line inquiry system from Florida Software Services.

The Revenue Department of the Commonwealth of Pennsylvania has ordered eight Key-Edit 1000 systems, including 190 data terminals, from Consolidated Computer International, Inc.

Lotspeich Co., a Miami-based construction and building supply company, has installed a Geigel & Williams Systems, Inc. turnkey system, including an on-line distribution inventory system.

The Computer Co. of Richmond, Va., has installed a 1.5M-byte 370/Stor 155 add-on memory system from Cambridge Memories, Inc.

The Sumitomo Bank of California has ordered 100 NCR Corp. 279 financial teller terminals for use in the bank's on-line financial system network.

The Wells Fargo Bank of San Francisco has ordered Incoterm Corp. Series 7700 automated teller machines, supporting equipment and software.

The Commodities Exchange Center of New York has installed Trans-Lux Corp. ticker terminals as hard-copy, last-sale tickers for its news and quotation reporting system.

Clay Bernard Systems International of Tulsa has ordered three systems from Tandem Computers, Inc. for distributive process control applications.

Dallas County Community College District has installed the first of 147 APL CRT terminals from Hewlett-Packard.

The National Bank of South Carolina, headquartered in Sumter, has ordered a NCR Corp. Criterion 8550 system and on-line teller terminals.

Demand Data, Inc. a Lakeland, Fla., DP firm has ordered a Data General Corp. C-330 Eclipse System.

Pepperdine University of Malibu, Calif., has installed a Univac 90/60 to process all administrative and academic DP applications for the university.

Rite-Aid Corp., a national retail drug chain, has ordered 600 electronic cash registers worth approximately $1 million from Data Terminal System, Inc.

National Airlines, Inc. of Miami has ordered a Dual CC-80 programmable front-end processor system from Computer Communications, Inc.

Adams Millis Corp. of High Point, N.C., has ordered a System 7000 from Inforex, Inc. to handle its inventory requirements. Adams Millis is a producer of hosiery products.

St. Joseph's Hospital of Parkersburg, W. Va., has ordered a NCR Corp. Medical Information and Communications System.

Hofstra University, Hempstead, N.Y., has installed a Univac 90/60 system, replacing its Univac 70/7 system.

The *Morning News* of Dallas has ordered a Digital Equipment Corp. TMS-11 text management system to be used in the newsroom for automatic capture of wire copy, remote bureau input and local newswriting and editing.

Boston College has ordered a Digital Equipment Corp. PDP-11/70 system to support academic and research programs.

United Feature Syndicate, Inc. of New York has ordered a minimum of 2,500 microcomputer systems from EDC Corp.

INFOREX: THE SIMPLEST SOLUTION TO ALL YOUR DATA ENTRY PROBLEMS.

The simplest and best solution to all your data entry problems is right here: the Inforex data entry family.

Simplest because we design them for ease of use and speed of throughput.

Best because we've been a leader in the innovation and development of key-to-disc data entry products and capabilities right from the start.

Which is why our family's got it all. From the basic keypunch replacement System 1300 to the tremendously powerful maxi-editing System 3300.

So whatever your needs — modest, middling, or immense — the growing Inforex data entry family will meet them.

You don't have to settle for a compromise system. You don't have to sweat out an unsatisfactory price/performance choice. All you have to do is choose the system that's best for you.

And that's where an Inforex Support Team comes in. They'll help you select just what you need. They'll provide expert installation. And they'll give you the benefit of their years of experience in other installations.

But even after all that, you won't be left high and dry. Whenever and wherever you need help, an Inforex Support Team will be available with the support you need.

The Inforex data entry family. You shouldn't settle for anything less.

I would like more information on the following:
☐ Key-to-disc data entry ☐ Distributed processing
☐ Computerized records management
☐ I would like to talk with an Inforex Sales Representative

'New' Company Has Advantage: Experience

ESCONDIDO, Calif. — There's a "new" company here that has an unusual advantage over the typical start-up firm: it has been building its product, a computer data terminal, for half a dozen years.

In fact, the company has shipped more than 1,000 terminals. To the outside world, however, the identity of Design 100 Corp. has been obscured by the fact the company was a captive manufacturing facility for other firms who sold the product under their own names.

More recently, Design 100 has been "reborn" with a new family of terminals that incorporate advanced technology in microelectronics, printing mechanisms, software and packaging. With a highly competitive product and an infusion of private capital, the company is now plunging into marketing and sales, with primary focus on distributors who sell to managers of computer communications and word processing systems.

"Our approach is exceptionally simple," according to Carl Anderson, president of Design 100 Corp. "We will emphasize the strengths of our products to sophisticated customers that understand the advantages of our Cleantype terminals."

In naming the new product line Cleantype, the company is emphasizing one of its features — an easy-to-read, high-quality printout, he said.

"This is a long-standing sore point with computer users who might spend a million dollars or more for a computer system that produces copy which is difficult to ready by any than a practiced eye," Anderson explained.

Design 100 products incorporate the bidirectional daisywheel printer mechanism manufactured by Qume Corp.

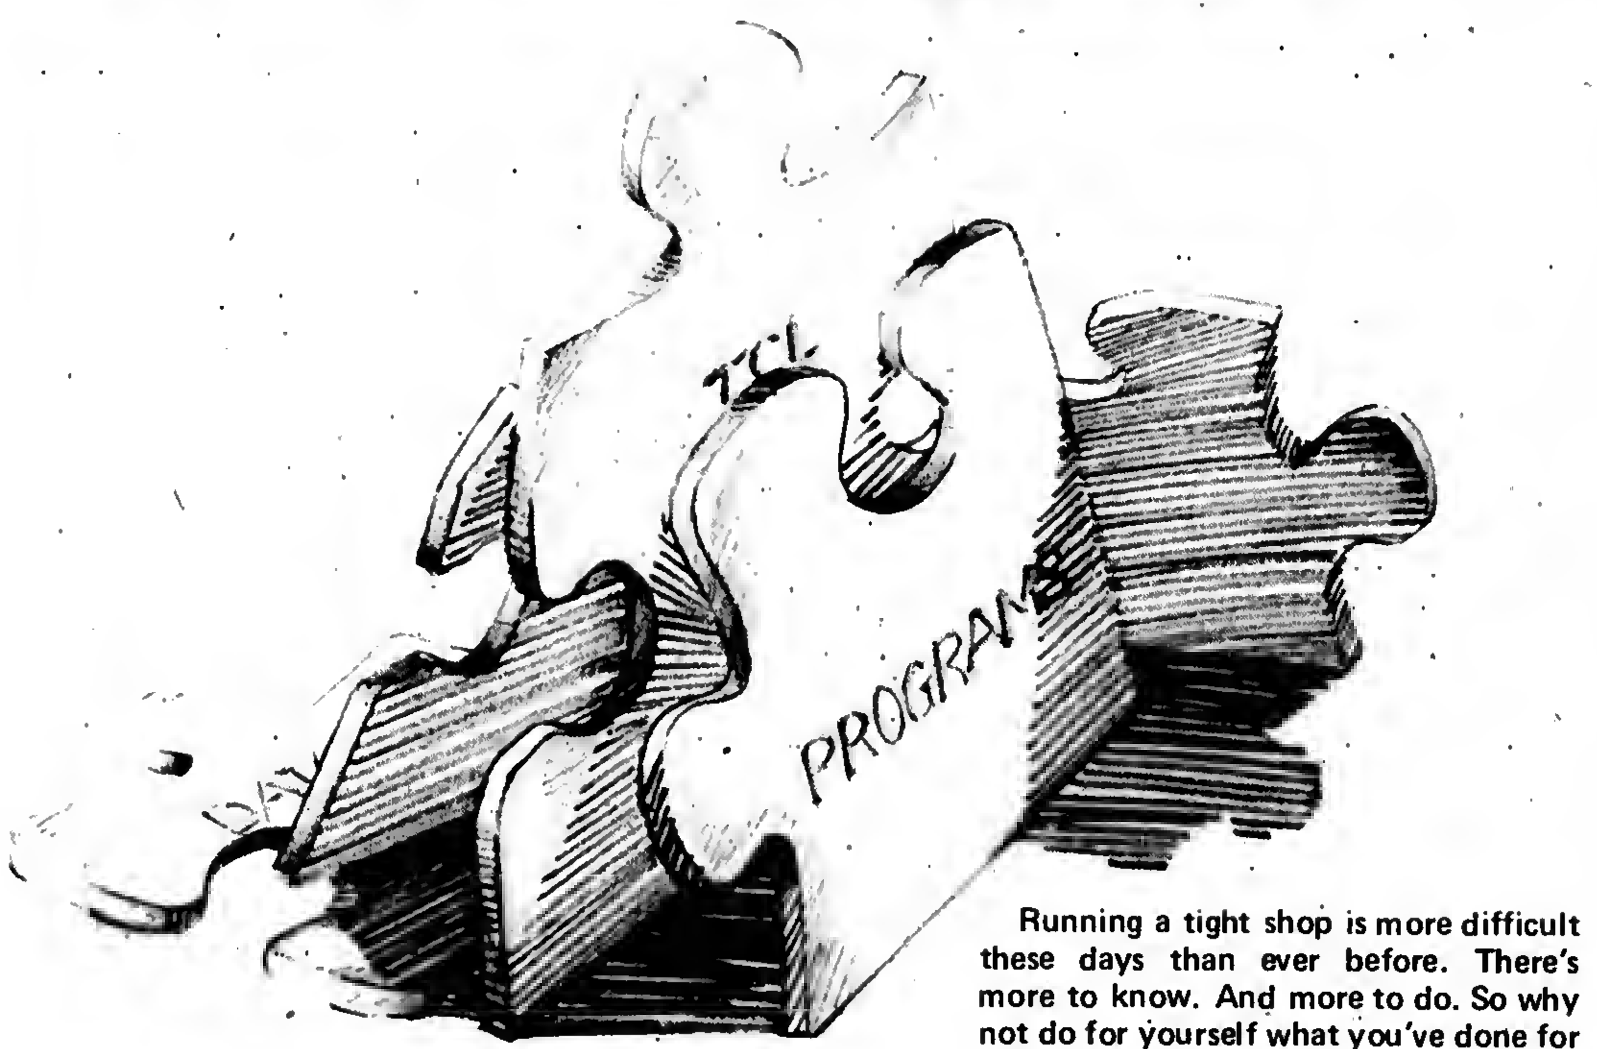
The quality of printing is but one competitive feature, according to David Crellen, vice-president of engineering.

"We will be selling versatility in today's multiuse business environment," he said. "All products in the Cleantype series are desktop communications consoles (up to 1,200 bit/sec), with programmable microprocessor, choice of communication codes, interchangeable type fonts, selectable pitch, plotting capability (5,760 points per square inch) and a 256-character print buffer."

A Cleantype terminal can be used for local data entry and editing, as an interactive terminal, as an electronic typewriter in word processing systems and as a plotter for producing graphic exhibits. Design 100 will also offer custom software development services for customers with nonstandard application requirements, he said.

At present, three standard models are being produced, Crellen noted, with differences based on print speeds and type of printer wheel. The Cleantype 45 has a 96-character plastic wheel that prints at 45 char./sec, the Model 55 has the same wheel, but prints at 55 char./sec and the Model 40X features an 88-character metal wheel that prints at 40 char./sec.

Get It All Together...



Running a tight shop is more difficult these days than ever before. There's more to know. And more to do. So why not do for yourself what you've done for your users?

With JOBDOC, you build a data base of everything you need to know about running your jobs. And then let JOBDOC go to work:

- **Controlling Costs**
- **Monitoring File Relationships**
- **Generating Complete Job Requirements**
- **Cross Referencing All Job Related Information**
- **Providing Operating Statistics**
- **Giving You A Better Audit Trail Than You Ever Thought Was Possible.**

JOBDOC: When you want an easier way to do a tougher job.

Merrill Lynch, NCSS Offering Business Service

NEW YORK — Merrill Lynch Economics, Inc. and National CSS, Inc. (NCSS) have announced the availability of economic forecasting and modeling services — a joint effort based upon the Merrill Lynch Economics Macro-Econometric Model and implemented through NCSS' computer services.

"We have been working for a long time to develop a large-scale econometric model of the U.S. that was detailed enough — at the industry level — to provide our clients with a practical analytical tool," according to Dr. Albert H. Cox Jr., chief economist and president of Merrill Lynch Economics.

"Today we have such a model," Cox continued, "a practical tool, tied to the activity in 81 different industries, for forecasting the national economy and its sectors. An example is the automobile component of final demand which is built up from a detailed 80-equation model of the automobile industry."

At a joint news conference, Robert E. Weissman, NCSS president, added, "It's our job to make this important new approach to business forecasting information available in the right places, at the right time. To do this, National CSS provides data communications designed to accept and deliver forecasting information at any location.

"We also supply the applications software to translate the data and deliver solutions in a form that makes business sense. And we provide the computers which deliver the power to drive the entire system."

The core of the Macro-Econometric Model's real sector comprises 53 indexes of industrial production. The model generates forecasts of employee compensation in 11 business and government categories.

In the pricing sector, nearly 50 wholesale price indexes are modeled. These, in turn, become the cost base for nearly 30 consumer price indexes.

According to Cox and Weissman, the industry detail of this econometric forecasting system signals a major step forward in the provision of information for businesses across the country.

COMPU SEARCH®
Division of Management Recruiters

SOLID STATE TECHNOLOGY RESEARCH PLANNING

A major east coast computer manufacturer is searching for an individual with a Ph.D. and research background in one or more areas of solid state technology, and with several years experience in device and chip design and fabrication of computer related circuits, to fill a key management level staff position in a growing research organization.

Major responsibilities will be to identify research needs in the area of solid-state technology related to commercial mainframe computer systems, and create, initiate and monitor multi-year research programs which will provide new technologies for use in developing future computer systems. Will also help define in-house integrated circuit production needs and facilities requirements.

Candidates for this position will have a solid commitment to the need for well planned, innovative research, and will be ready to assume full responsibility for the planning and monitoring of research in this critical area of computer technology.

Interested candidates, send resume, in confidence, including salary requirements to

Equal Opportunity Employer m/f

SOFTWARE ENGINEER

Numerical Analyst

Intel, whose many products have become industry standards, has a ground floor opportunity in our fast-growing Microcmomputer division.

You can become involved in the following:

- Specify, design and implement and document systems software including compilers, assemblers and operating systems for a family of microcomputers.
- Participate in the planning and design of microcomputer systems.
- Specify, design and implement and document mathematical and statistical software for microcomputers.
- Participate in architectural reviews of math systems.

To qualify you should have a MS or PhD in Computer Science, Electrical Engineering, or a related field with two or more years of experience working in state-of-the-art design of Programming languages, systems, and mathematical/statistical software. You should also be experienced in design and implementation of systems and/or numerical software, preferably with translators and operating systems on mini or microcomputers plus have worked both in high level and assembly languages.

If you are a self-starter and desire responsibility of large tasks and project leadership, please send your resume to Jerry Hukee, Intel Corporation, 3065 Bowers Avenue, Santa Clara, CA 95051, or call (408) 246-7501, ext. 2670. We are an equal opportunity employer m/f.

Plan to Attend
Source Edp's
Special—**

Atlantic Coast Computer Career Conference!

$15-$50,000+

When: Wednesday Through Saturday, September 28-October 1, 1977.

Where: Boston, Hartford, Stamford, Union NJ, New York City, Philadelphia, Washington DC and Atlanta.

How: Call your nearest Source Edp office today.

Do you really know if you're in the very best position? Are others getting better exposure? Are you being paid what you're worth? Are you gaining the solid foundation needed to move into management? Where will you fit in your present company's plans a year from now? What about in three years? Will you continue to grow or have you peaked out?

In today's dynamic computer field it's almost impossible to stay abreast of what others are doing and whether you are keeping pace. The special Source Edp Atlantic Coast Computer Career Conference has been conceived to help computer professionals, like you, analyze and evaluate the current job market and find out where they stand. Key information systems executives from leading Atlantic Coast based organizations will be assembled at the Conference to explain their long-range plans—and where you might fit in. These firms represent the broadest possible cross-section of computer users, computer consulting/services firms and hardware manufacturers. They are diverse in industry, location, size and type of position currently available. Each has something special to offer that might better utilize and broaden your skills and potential. Compensation levels are outstanding. The Atlantic Coast Computer Career Conference is a simple and easy way for you to investigate a wide variety of career paths rapidly while maintaining complete confidence. Over 1,000 specific position openings currently exist within the Conference participants at compensation levels ranging from $15,000 to over $50,000 per year.

Should you attend the Computer Career Conference?
If you have at least one year of experience in programming, software, systems development, computer marketing or marketing support and live (or would like to live) along the Atlantic Coast, the Computer Career Conference has been specifically designed for you. In a matter of hours, you'll be able to thoroughly evaluate the broadest possible base of currently available positions at responsibility levels ranging from individual contributor to senior manager. You may pick and choose from some of the most sophisticated and advanced organizations in the nation. You'll be able to select the types of exposure and training you need to accelerate your career. You'll learn not only the specifics of current challenges but also where each will lead you in the long term. In short, the Computer Career Conference has been designed for computer professionals seeking to maximize their career potential.

Meet your Source Edp Atlantic Coast Conference Directors.

Richard E. Gardner is Director of the Boston office. Rich, who holds a B.S. degree in Mechanical Engineering from Newark College of Engineering, has been in the computer field since 1968. Prior to joining Source Edp, he was associated with IBM for eight years in a variety of marketing and account management positions.

Martin Grolnic is Director of the Washington, D.C. office. Marty, who holds a B.S. degree from Temple University, has been involved in computing since 1959. Prior to joining Source Edp, he was District Manager for ASI; Marketing Director for Digidata Inc. and Regional Manager for Leasco Response, Inc. Earlier experience includes six years with RCA Corporation in systems development, systems management and product planning.

Steven M. Joffe is Director of the Union office. Steve, who holds a B.S. from Queens College and an M.S. in Management Science from Stevens Institute, has been active in data processing since 1965. Prior to joining Source Edp, he was Project Administrator and Senior Staff member with Dun & Bradstreet, Inc. for nearly four years. Earlier positions were Senior Analyst with Joseph E. Seagram & Sons, Senior Programmer with Allied Chemical, Operations Research Analyst with General Foods and Systems Analyst with Prentice-Hall.

Thomas C. Johnston is Director of the Hartford office. Tom, who holds a B.S. degree in Business Administration from Western Michigan University, has been in data processing since 1967. Prior to joining Source Edp, he served as a Marketing Account Manager for Honeywell Information Systems and Systems Analyst and Sales Representative for Sperry Univac.

Daniel S. Mickel is Director of the Stamford office. Dan, who holds a B.A. degree from the University of Rochester, has been associated with computing since 1957. Prior to joining Source Edp, he served as Director of MIS for the City of New York. Earlier, he was associated with Mutual of New York in various positions including Assistant Director of Data Processing, Director of Electronics, and Systems Associate.

William R. Penberthy is Director of the Philadelphia office. Bill, who majored in Electrical Engineering, has been associated with data processing since 1957. Prior to joining Source Edp, he was involved in his own computer consulting firm for nearly two years. Earlier positions included Data Processing Manager for the city of Flint, Michigan and Montgomery Ward. He also worked as a Systems Engineer for NCR and IBM.

Michael D. Taylor is Director of the Atlanta office. Mike, who holds B.S.E.E. and M.S.E.E. degrees from the University of Texas, has been involved in computing and electronics since 1968. Prior to joining Source Edp, he was employed as a Systems Engineer for Electronic Data Systems for nearly two years. Earlier experience was as a Development Engineer with Schlumberger Well Services and with Radiation Incorporated.

Gary L. Weiss is Director of the Wellesley office. Gary, who holds a B.S. degree in Marketing from the University of Arizona, has been involved in the computing field since 1968. Prior to joining Source Edp, Gary was Boston Branch Manager for Periphonics. His initial experience was gained at IBM for six years as an Account Representative and National Account Team Leader.

Here's how you can take advantage of the Computer Career Conference
Call your nearest Source Edp office today. One of our professional staff will give you a detailed rundown on the specific organizations involved in the Conference in the city of your choice, where you might fit in and at what salary level. We will then arrange for you to meet privately with those organizations of interest at your convenience during the Computer Career Conference week of September 28 through October 1, 1977. (Please note that evening and weekend interviews may be conveniently arranged.) There is no charge to you whatsoever to participate in the Conference—and your confidence will be rigidly protected. **You have nothing to lose and everything to gain. Be sure to call today.**

SENIOR CUSTOMER SERVICE ENGINEER:

We Have the Best
So
We Need the Best

We have quality workmanship and services, and by hiring only the best employees we intend to keep it. We don't need board sweppers - we do need craftsmen with pride in their ability to work with both hardware and customers.

To qualify for this excellent Field Service opportunity you'll need 3 yrs. of solid experience in systems-oriented computer maintenance. The position also requires strong peripheral experience and preferably some exposure to software.

Our offer includes a competitive salary and benefits package, good advancement potential, and the security of being affiliated with our major parent corporation, Perkin-Elmer. For immediate and confidential consideration, please send your resume and salary history and a list of peripherals showing manufacturer's names with which you are familiar. Or call our toll free 24-hour answering service:

SR. SYSTEMS ANALYST

ARE YOU READY TO STEP UP TO NCR'S ADVANCED SYSTEMS DEVELOPMENT GROUP?

NCR's Communication Systems Divison, specializing in development and manufacturing of data communications products and systems, is currently expanding its Advanced Systems Development group.

This unique department provides early definition and design of future microcomputer and communications products, along with initiation, early program management, and startup development of new programs. The group is characterized by working in state-of-the-art software/hardware environment, with opportunities for individual contributions in a systems level scope of design from the conceptual stage to the finished product.

We are currently seeking Senior Analysts with a minimum of 5 years experience in software, but knowledgeable in hardware, who desire work and have experience in any one of the following areas:

- Microcomputer Design
- Communications Products Design
- Communications Network Architecture
- Systems Modeling
- Performance Measurement and Analysis

All our positions are in our beautiful, sunny South Carolina location, close to the seashores and mountains. Columbia offers a lifestyle that includes both city and country living with excellent recreational facilities for tennis, gold, fishing, boating and swimming. The area also offers excellent housing opportunities, low taxes, and it is the home of the University of South Carolina and other fine educational institutions.

If you are seeking a challenging career with a leader in the indutry, need a new lifestyle and have the above experience, we'd like to speak with you.

A degree in Engineering, Math or Computer Science is required. For consideration, please send your resume and salary requirements in complete confidence to:

NCR

Ken Uhlig, Dept. ASD
Industrial Relations
Communications Systems Div.
NCR Corporation
3325 Platt Springs Road
West Columbia, S.C. 29169

An Equal Opportunity Employer

Microprocessor Software Engineering

If you're a senior-level software engineer experienced in software development for microprocessor applications or tools, Digital has many exciting positions at all levels of responsibility currently available. These positions offer highly visible, challenging opportunities for growth in Digital's dynamic environment and vary in degree of responsibility from programmer to senior technical consultant.

They include tasks such as:

- designing and developing microprocessor firmware
- developing and supporting software tools for microprocessors such as assemblers, compilers and debugging utilities
- providing expert microprocessor software consulting services for engineering groups in Digital
- developing and promoting standards and guidelines for microprocessor software and its systematic development

If you are interested in the above positions and have a BS in CS or EE, or equivalent experience, at least 1-2 years direct work or school laboratory experience in the development of software for microprocessors, and can exchange ideas effectively with hardware engineers, we would like to hear from you. Naturally, with additional years of experience in programming or engineering you will qualify for more senior positions.

Please forward your resume outlining salary requirements to Joe Hart, Digital Equipment Corporation, Dept. B912, 162 Main Street, Maynard, Massachusetts 01754.

We're the company looking for people.

PROGRAMMER/ ANALYSTS

The continuing expansion of our Data Processing department has created several new openings for experienced programmer/analysts. Come join our team of professionals where you can use and expand on your expertise.

We offer the opportunity to work on both batch and teleprocessing medical, financial and academic applications.

Qualified applicants will have PL1 or COBOL IBM experience. Send resume in confidence including salary requirements or call to:

Maxine Yuen, Employment Manager
(312) 531-3242

LOYOLA UNIVERSITY MEDICAL CENTER
2160 South First Ave., Maywood, ILL 60153
equal opportunity employer m/f

SOFTWARE SYSTEMS POSITIONS

Multi billion dollar Mid Atlantic bank is seeking Data Processing professional for its rapidly expanding Data Processing Division. You will join the movement toward a large scale on-line system integrated into a total data base with the accent on state-of-the-art equipment and systems

MANAGER SOFTWARE SYSTEM DEPARTMENT

The successful candidate will have responsibility for the planning and maintenance of operating systems for a multiple CPU environment including an IBM 370/158 and an AMDAHL 470/V5 At least 2 years of software systems managerial experience necessary with virtual systems experience essential

TELECOMMUNICATIONS ANALYST

The individual will be responsible for installing and maintaining communications networks and the coordination with carriers, equipment vendors and user departments, software analysts, and computer operations for installation and network maintenance

Even if you are satisfied with your present position, we encourage you to spend a few minutes with us and review our exciting plans for the future These positions provide an excellent salary and benefits package Please submit a resume or brief letter of inquiry to:

CW Box 3160

Programmers

(Southern California)

Northrop Data Processing Center in Hawthorne, California, has openings for qualified programmers in the following areas:

Applications Programmers

Will write new COBOL programs for development projects and modify programs for ongoing batch and IMS Data Base Systems, including coding of PSB, DBD, and MFS control blocks. Support application in material, manufacturing and financial function. 4 year degree plus 2-5 years' experience in COBOL with emphasis in analysis, programming and documentation.

Systems Programmers-IMS

Duties to include IMS sysgens control block generations and maintenance and use of IMS related utility programs. Must have degree and at least 2 years' experience in the IMS support area.

Senior Financial Analysts

Will develop, coordinate and issue foresight procedures and documentation standards as well as plan, develop and coordinate foresight user meetings. Requires 3 years' financial, general ledger and cost accounting experience, plus a degree in Business Administration or Accounting. Strong user oriented background essential as this position is the nucleus of dissemination of foresight technical user information.

Please send resume to:

Technical Employment Office
3901 West Broadway
Hawthorne, California 90250

NORTHROP

An Equal Opportunity Employer M/F

Data Processing Professionals

Opportunities with Levi Strauss & Co. in San Francisco

The Corporate offices of Levi Strauss & Co., a world leader in the apparel industry, is seeking Data Processing Professionals interested in careers within our Data Processing Group.

Programmer/Analysts

Responsibilities include systems analysis and programming, user interface and systems enhancements in commercial applications. Requires 2-3 years of programming experience including 1 year of ALC and/or 2 years of COBOL plus working knowledge of 370 OS, JCL and Utilities.

Previous experience with sales/marketing, manufacturing and/or financial applications, TSO and PANVALET desirable.

Systems Programmers

Responsibilities include systems generation and maintenance of OS/VS2, IMS, HASP, software and hardware consulting and implementation planning; assist programmers in developing installation standards, tuning systems, and procuring software packages.

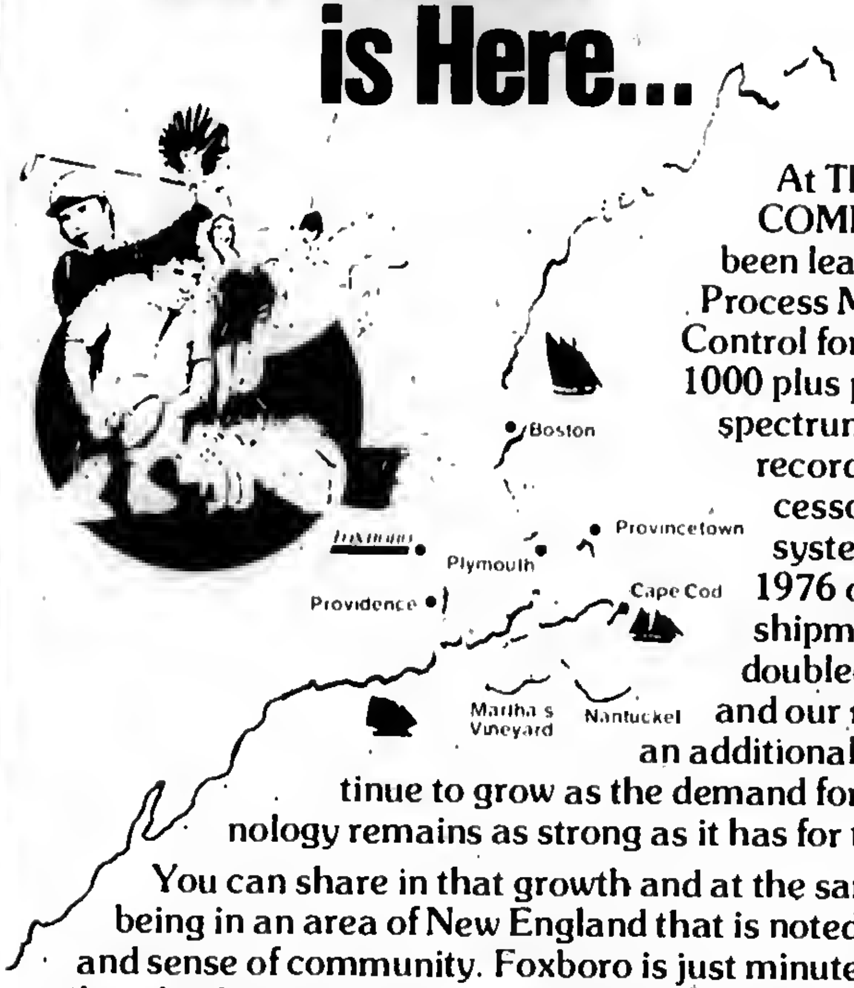
Seeking 2-3 years systems programming experience in OS/VS2, IMS HASP, and JCL.

Successful candidates will enjoy a professional environment, competitive salaries, excellent benefits and working conditions.

If you are interested and meet the above qualifications, please forward your resume and salary requirements to: Professional Employment Department, PM-5, Two Embarcadero Center, San Francisco, CA 94106. We are proud to be an equal opportunity employer.

Levi's®

Your Career is Here...



At THE FOXBORO COMPANY we have been leading the way in Process Management and Control for 70 years. Our 1000 plus products cover the spectrum from mechanical recorders to microprocessor based digital systems. From 1972 to 1976 our annual dollar shipments more than doubled to $328 million and our net income rose by an additional 5.4%. We will continue to grow as the demand for advanced technology remains as strong as it has for the last 70 years.

You can share in that growth and at the same time enjoy being in an area of New England that is noted for its friendliness and sense of community. Foxboro is just minutes away from the cultural, educational and entertainment centers of Boston and Providence and the limitless recreational opportunities on Cape Cod and the Islands.

...in Real Time Software

Senior Software Development Engineer

Will program software implementable functions on dedicated instrument devices. These devices typically require programming of a commercial microprocessor. Programs may reside in either ROM or RAM. This person to be involved from conceptual system design through to a finished product. Requires at least 4 years' experience programming small computer systems (micro experience helpful).

Senior Software Design Engineer

Will be responsible for supervision of programmers engaged in the design and implementation of software for microprocessor based control products. Will participate in project definition, feasibility studies, design reviews. Requires at least 5 years' mini and micro programming experience with real time control systems.

Senior Software Design Engineer

Key person responsible for the design and implementation of software for a microprocessor based digital control system. Will participate in project definition, feasibility studies, design reviews, trade-off studies, etc. Most programming done in assembly language. Degree with at least 3 years' experience required.

Senior Software Design Engineer

Will be project programmer for general purpose microprocessor based man-machine interface. Will participate in evaluation of functions, integration with other products, and will do detailed design and implementation of MMI Firmware programs. Degree with at least 3 years' experience required.

Scientific Programmer

You will assist the Systems engineer in the estimation, design and implementation of application software and work as project programmer on applied systems. BS in Engineering, the sciences or equivalent and at least 2 years' experience in real time application programming with Fortran experience required.

Simulation Software Engineer

Will be responsible for simulation involving one or more of the following areas: computer system simulation, continuous simulation of process control systems, discrete simulation of manufacturing processes.

Degree required and at least 1 year simulation and analysis of complex systems experience. Familiarity with GPSS or one or more of the major simulation languages and CSMP and FORTRAN programming experience. Knowledge of process control theory desirable.

Please send resume, including salary history, to Mike Boyd, Dept. 129-CW, The Foxboro Company, 38 Neponset Avenue, Foxboro, MA 02035. Foxboro is an equal opportunity employer, M/F.

FOXBORO

EUROPE

SENIOR COMPUTER SYSTEMS DESIGNERS

HOWARD ORGANIZATION INTERNATIONAL LTD., a leading European **E.D.P. SERVICE ORGANIZATION**, has immediate openings for senior systems designers with specialist experience in real-time communications (ideally in packet switching).

Successful applicants will be assigned to Belgium for a period of 2 to 5 years and will be initially involved in a packet switching network for the dutch market.

By European standards incomes will be very attractive including overseas allowances. Our preference is for designer with E.E.C. passport status and interviews will take place during September.

Please send your resume and income expectations to:
E. Ryan, Overseas Recruitment Consultant

Hertfordshire, WD6 1LE England

SYSTEMS PROGRAMMERS

Technical Services at Indiana University/Purdue University at Indianapolis has challenging career opportunities at all levels for systems programmers with experience on DEC-10's and/or 370's.

IBM 370 SYSTEMS PROGRAMMERS

Positions exist in two areas:

Operating and Telecommunications Systems — B.S. and at least one year experience with TOPS-10. Knowledge of operating system internals a must. Familiarity with performance measurement and schedulers highly desirable.

Systems Software — B.S. and at least one year experience with editors, loaders, compilers, and other systems programs. This position will also support similar requirements on a CDC 6600 and Cyber 172.

DEC-10 SYSTEMS PROGRAMMERS

A challenging position as lead systems programmer is open to the right individual with at least two years' experience with 360 or 370 operating systems, at least one year of which must be in DOS/VS or OS/VS. This individual will have full responsibility fpr operating system software on a 360/44 running DOS and on a 370/125. The 370/125 will be used for academic instruction in operating system theory and construction and will run DOS/VS, OS/VS1, and VM. It will also act as an RJE station to the DEC 1090 and a 370/158 running MVS. This position thus offers considerable opportunity for growth and technical challenge.

IUPUI has a student enrollment of 22,000 and combines the strengths of the curricula of two BIG TEN SCHOOLS and the largest school of medicine in the country. Computer equipment on campus supported by Technical Services includes IBM 360/44 and 370/125 systems and a DEC 1090. In addition, the group provides support and has access to a 370/158, CDC 6600, and CYBER 172 at our Bloomington campus, as well as a large number of minis in use for research at Indianapolis.

Fringe benefits are excellent. Salary is commensurate with experience.

Please submit resume to: Bill Schilk, Personnel Division, Indiana University/Purdue University at Indianapolis, 1100 W. Michigan St., Indianapolis, IN 46202, An Equal Opportunity Employer.

CIRCULATION DEPARTMENT

Manufacturers' Rep

Experienced computer-terminal sales representatives wanted by small but expanding systems house that engineers and manufacturers patented brailling devices, printers and terminals. The fast-growing market for these devices in education, industry and government, both here and abroad, provides an excellent opportunity. Educational "mainstreaming" of handicapped students, as well as affirmative action programs, are stimulating demand for these devices. Generous commission arrangement. For more information, call Lee Brown, collect, at (813) 879-4452.

DALLAS

SOFTWARE ENGINEERING PROFESSIONALS

Upgrade your future...
Now...new opportunities are opening up for software engineering professionals at E-Systems, GARLAND DIVISION.

OPPORTUNITIES...for real time software engineers with ALC experience on large scale computers.

OPPORTUNITIES...for real time software engineers with 16-bit mini-computer experience.

OPPORTUNITIES...to work on a team of professionals to generate new data processing concepts and carry them through to implementation.

OPPORTUNITIES...to enjoy an attractive salary and fringe benefits offered by E-Systems.

OPPORTUNITIES...to participate in developing and producing state-of-the-art electronic systems for data management, digital communications and highly complex data processing systems.

OPPORTUNITIES...to participate in a formalized in-plant upgrading/on-the-job software training program.

To qualify, you need a degree in Math, Engineering or Computer Science disciplines and an interest in being involved in state-of-the-art Electronic Systems Engineering.

Make a good living where the living is good. There's no question – living is good in the Dallas area. Our public school systems have earned national recognition for excellence. We're one of the fastest growing areas in the nation, yet our housing dollar still buys considerably more home in Dallas than it would in most other metropolitan areas. We're surrounded by lakes, and blessed by beautiful weather year 'round. We back professional, university, and high school athletic teams, and we support our symphony, theaters, the civic opera and several museums. But, best of all, most of us are down home friendly people.

E-SYSTEMS

SOLID STATE TECHNOLOGY RESEARCH PLANNING

A major east coast computer manufacturer is searching for an individual with a Ph.D. and research background in one or more areas of solid state technology, and with several years experience in device and chip design and fabrication of computer related circuits, to fill a key management level staff position in a growing research organization.

Major responsibilities will be to identify research needs in the area of solid-state technology related to commercial mainframe computer systems, and create, initiate and monitor multi-year research programs which will provide new technologies for use in developing future computer systems. Will also help define in-house integrated circuit production needs and facilities requirements.

Candidates for this position will have a solid commitment to the need for well planned, innovative research, and will be ready to assume full responsibility for the planning and monitoring of research in this critical area of computer technology.

Interested candidates, send resume, in confidence, including salary requirements to

CW Box 3154
797 Washington St.
Newton, Mass. 02160
Equal Opportunity Employer m/f

Digital's Field Headquarters Organization was the answer for Peter, Collins, Sue, and Bob...

and it could be the answer for you.

If your career growth isn't progressing as rapidly as you'd expected and you're beginning to find that your projects aren't as exciting as they once were, consider the experiences of Peter, Collins, Sue, and Bob.

They reacted to similar points in their own careers by critically re-evaluating their goals and where they could achieve them. And what Peter, Collins, Sue, and Bob all discovered were the opportunities for growth, advancement, and responsibility, within Digital's Field Headquarters Organization.

Their standards were very high when they searched for a place where they could have a more meaningful, productive, and rewarding career. They chose our Field Headquarters Organization. Like many other talented and ambitious professionals, Peter, Collins, Sue and Bob found our environment encourages initiative, increased responsibility and advancement while working at the vanguard of computer technology.

Corporate Field Service is responsible for all customer support services, giving you a unique opportunity for exploration and involvement across the entire spectrum of our technical operations. You'll have a chance to be right on top of state-of-the-art developments in a variety of hardware/software support areas (Memory, Peripherals, Power Supplies, and Communications) as well as the design, maintenance and installation of small, medium and large scale operating systems.

You can also utilize your communications skills and knowledge of operating systems and compilers. Or you could help develop A/V courses and instruct hardware/software courses for new systems and products. And because your contributions impact on a corporate level, you'll have unusually high visibility within one of the world's leaders in computer development and manufacture.

Our various groups within the Field Headquarters Organization — Product Support, Software Service, Field Service Logistics/Operations Development, Educational Services and Technical Documentation — offer you a wide range of virtually unlimited opportunities.

Product Support

Our organization is interested in pursuing exceptional candidates with a strong desire to grow and ability to be creative. We are looking for people with a combination of technical computer background, business skills and some experience in dealing with hardward oriented field related problems. Several positions are currently available for hardware professionals including Project Managers with good technical and business skills and Support Engineers with experience in disc, mag tape, data communications, terminals, etc.

Contact: Jon Zion

Software Service

At Digital, service is a major business. Commitment to providing excellent service makes this a key group. They provide highly qualified technical expertise to back up the Field Software Service Organization in the solution of both product oriented and customer oriented software problems.

You can be a Software Specialist if you have done one of the following: customer or vendor software support, if you are a good Systems Programmer with a solid knowledge of operating systems, compilers or device drivers, have installed, tested or started-up software packages, or if you have distributive processing or networking experience.

If you would like the visibility of a Headquarters position, we can offer you a managerial or technical dual-path career opportunity.

Contact: Dale Welch.

Field Service: Logistics/Operations Development

Responsible for monitoring inventory to over 150 Digital offices throughout the United States and Canada, this group is seeking Clerks and Planners. It is supported by an EDP Business Group, which has several positions available for Programmers, Programmer Analysts with a background in Financial Applications and Principle Systems Analysts with COBOL experience. Exposure to DEC-systems 10 and/or 11 desired.

Contact: Pete Rojcewicz.

Technical Writers

Digital is seeking talented, experienced Technical Writers who can research, organize and communicate. You'll be on a par with Engineers and have the potential to advance to Project Management. If you're experienced in generating technical descriptions and servicing information associated with both processors and peripheral devices, we're looking for you.

Contact: Pete Rojcewicz.

Sales Training

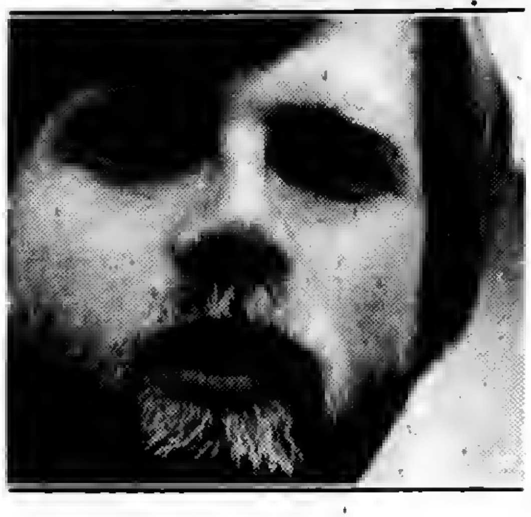
The Sales Training Group is responsible for keeping Digital's sales force informed on new products and new trends in computer sales and the computer business. To provide this service, the group needs qualified Technical Sales Trainers and Program Developers. Our primary needs at this time are for Program Developers who are responsible for putting together course materials for class presentations, as well as Program Developers for self-paced programs on Digital's products and services. Ideally, you will have hardware and software experience and be familiar with course development.

Contact: Bill Mersch.

In-House Field Service

This group is responsible for the installation and maintenance of all computer systems within our Corporate headquarters. We currently need in-house Technicians and Field Service Engineers to work on state-of-the-art hardware in this high visibility environment.

Contact: Jeff Bull.



Educational Services

Responsible for providing technical training to Digital customers and employees, this group is seeking professionals with a solid technical knowledge and a desire to teach or to become involved in course development work. Opportunities are available in both the hardware and software areas, and a field service, maintenance, or applications programming background would be desirable. If you're looking to broaden your career horizons, the wide exposure, technical challenge, and excellent growth potential of one of the largest training organizations in the computer industry is for you!

Contact: Mary Ann Joyce.

Peter

Educational Services

After he had worked his way up to Project Manager with another company, Peter was ready for new challenges. He came to our Educational Services division as an Instructor and is now Commercial Systems Manager with responsibility for teaching all commercial products developed and assessing the need for educational services. Peter's growth to managerial responsibilities was what he was looking for, and he calls Digital "a dynamic company — very people-oriented with good opportunities."

Collins

Field Service: Logistics/Operations Development

Collins brought his considerable expertise in a wide range of applications areas from another major company to here because of "limitless opportunities for advancement." A highly regarded Principle Systems Analyst, Collins is very impressed with Digital's "people-oriented" environment and positive attitude toward our employees. The opportunity he found here to be an individual and "do a little dreaming about future systems" was the answer Collins was looking for.

Sue

Corporate Operations

Sue was attracted to Digital because of our flexibility. "Of course you have policies, but they serve as guidelines. When it comes right down to it, the individual defines his or her own job." Sue, now a Senior Product Support Analyst, works closely with all other areas of the company to help us as we enter new markets. "People here are so responsive and responsible," she says, "very high-quality people."

Bob

Product Support

Digital gave Bob the opportunity to utilize his military training (US Army Defense School, 1969) in creating a successful civilian career. His technical expertise and reputation as a person who could skillfully handle a critical customer situation — both of which he credits to his military training — have resulted in steady promotions. Currently Bob is a Project Manager in our New Products — Mass Storage group and certain that he found the answer to his career questions at Digital.

The Field Headquarters Organization is located in our Corporate headquarters in Maynard, Massachusetts, approximately 25 miles west of Boston. In Maynard and its surrounding communities you and your family will find excellent school systems, contemporary or colonial homes on large parcels of land, equestrian and hiking trails, camping, and all of the things that make life in New England unique. In addition, we're just minutes from some of the nation's premier educational, cultural, and recreational resources.

In Massachusetts, you'll find what are unquestionably some of the finest lifestyles in the country. At Digital's Field Headquarters Organization, you'll find a dynamic and challenging environment to pursue some of the most exciting projects in the industry . . . and the opportunity for the career you've been looking for. If you would like to find out if the answer Peter, Collins, Sue, and Bob found is also the answer for you, please send your resume, indicating salary history and the areas you would like to explore to the appropriate person, Digital Equipment Corporation, Dept. K912, PK3-1/A41, 162 Main Street, Maynard, Massachusetts 01754. We are an equal opportunity employer m/f

We're the company looking for people.

Programmers... HELP!

Now that we have your attention, we need several programmers and analysts with backgrounds in COBOL, CICS and Data Base and are willing to pay for them! We offer competitive salaries and a full range of company-paid fringe benefits.

We are currently utilizing an IBM 370/148 OS, but may be changing to a larger system due to increased applications in the areas of Manufacturing and Financial Systems. The Manufacturing team is developing MRP, procurement systems, shop floor control and bill of materials systems. The Financial team is presently working on A/R, A/P, payroll, general ledger, and personnel reporting. In both areas, we provide our people with state-of-the-art tools with which to do their jobs including on-line editing, no cards, and test time. If you have experience and are a "get the job done" individual, we would like to talk with you about joining our Systems Group.

Now that we have told you a few things about us, why don't you tell us a few things about you by sending a resume or calling **BILL LEE, Manager Systems at (213) 390-4451, extension 6288.**

Teleprocessing and Systems Support Programmers

The technical support division of the United States Fidelity & Guaranty Company is currently recruiting for the following openings:

- **Teleprocessing Programmer:** Individual will assist in the implementation of a nationwide telecommunications network of IBM 3790's in a leased line VTAM/NCP environment. Future plans for further sophistication include interactive and distributed data base applications. Those individuals who qualify will be trained to support this leading edge application. We will consider individuals having two years' of OS ALC experience with background in SMP.
- **Systems Support Programmer:** Individual will be maintaining current and new versions of the many software products now being installed. Some of these products are CA-SORT, OS/VS COBOL, FDR/DSF, and UCC ONE & TWO. Experience is necessary in SMP and SUPERZAP. Good working knowledge of debugging, JCL and utilities is also needed.

Excellent opportunity for career minded individual who looks forward to eventually expanding abilities into other areas of system support or teleprocessing.

Salary commensurate with experience and abilities. All relocation costs paid by company, liberal benefits package along with comfortable work environment in our modern data processing department.

UNIVERSITY OF ILLINOIS
COMPUTING SERVICES OFFICE
URBANA CAMPUS

THE FOLLOWING POSITIONS ARE OPEN WITH THE COMPUTING SERVICES OFFICE:

Computing Documentation Writer

This full time position involves the writing/editing and maintenance of a large scale user document for the services offered on a CDC CYBER 175 and an IBM 360/75. A knowledge of computer programming, experience with time-sharing systems, a university degree with a background in communication arts and experience in composing and/or editing computing documentation are required. The position offers avenues for imaginative expression and initiative. Initial salary: $11,000 to $13,000.

Statistical Computer Consultant

This full time position for a statistical computing consultant involves the research, development and maintenance of statistical software on the CDC CYBER 175 and IBM 360/75 computers. The ability to help computer users with statistical computing is of prime importance. This individual should also have the following qualifications:

- General statistical knowledge a must, while experience with statistical software (SPSS, SOUPAC, SAS, BMD, etc.) desirable.
- Programmer/analyst experience with FORTRAN a must, while knowledge of CDC NOS and IBM OS operating systems desirable.

All applicants should have at least one year of experience in the areas described above, and have a university degree with a background in statistics and computer science or closely related fields. Initial salary: $11,000 to $15,000.

Research Programmer—Senior Research Programmer

This full time position is for an individual with demonstrated skills and achievements in at least one of the following areas:

- CYBER 175 NOS systems programming, development, and performance analysis.
- IBM 360 HASP-OS/MVT systems programming performance analysis and maintenance.
- DEC PDP-11 systems programming and hardware development, with an accent on on-line applications.
- Systems measurement and quantitative performance analysis.
- Synchronous and Asynchronous data communications measurement, analysis and development. Knowledge of CDC 2550 desirable.
- Development and implementation of large storage hierarchies.

All applicants should have at least two years experience as a systems programmer, and have at least a bachelor's degree with a strong mathematical basis. Initial salary: $12,000 to $18,000.

CAREER OPPORTUNITIES AT DATAPOINT CORPORATION
for
Telecommunications Systems Professionals

Make Your Future with the Leader

The rapidly growing and profitable Communications Management Products Division of Datapoint Corporation is seeking selected individuals to design, develop and support the INFOSWITCH™ product line and expansions into other telecommunications systems areas.

Senior Systems Programmer

Datapoint Corporation is seeking a senior systems programmer with a track record of successful real-time telecommunications systems design and implementation experience. An advanced degree in Electrical Engineering and/or Computer Science plus a minimum of five years design of operating systems software for EPABX, ESS, ACD, least-cost routing, or passive line monitoring telephone products is desired. As a senior professional member of the Communications Management Products Division, you will assume a key role in the creation of innovative new telecommunications systems. This opportunity affords long term career advancement and compensation either as an individual technical contributor or through management responsibility.

Systems Programmer

Individuals with two to five years experience in minicomputer systems programming of telecommunications applications will find a refreshing, fast-moving, results-oriented environment to expand career goals in the Communications Management Products Division of Datapoint Corporation. An opportunity to carry software projects from definition through design, coding, testing and customer delivery is afforded with typical project cycles lasting from 3 to 8 months. You will be creating user-oriented turn-key software products in Datapoint minicomputer assembly language for one of the most rapidly expanding product market areas today — telecommunications management. Practical hands-on background in message switching, data or voice communications control, or teleprocessing systems is appropriate.

Software Support Programmer

Datapoint Corporation is seeking programmers experienced in the support of minicomputer assembly language telecommunication products. This position affords the opportunity to perform all facets of software support for the end-user turnkey program packages of the rapidly expanding Communications Management Products Division. Coordinating between the software development team and direct customer contact with 10-20% travel provides a stimulating environment for professional growth.

* * *

All career openings are within the Communications Management Products Division of Datapoint Corporation in San Antonio, Texas. Datapoint offers successful applicants career development, rapid advancement and a long term association with a company that has added pertinent new dimensions to the business world of computing. Compensation commensurate with experience.

Send your resume in confidence to **Datapoint Corporation, attention: Mr. Charles Zeleny, Manager of Employee Relations, Dept. CW, 9735 Datapoint Drive, San Antonio, Texas 78284.**

San Diego opportunity in advanced-technology
EDP SYSTEMS DEVELOPMENT

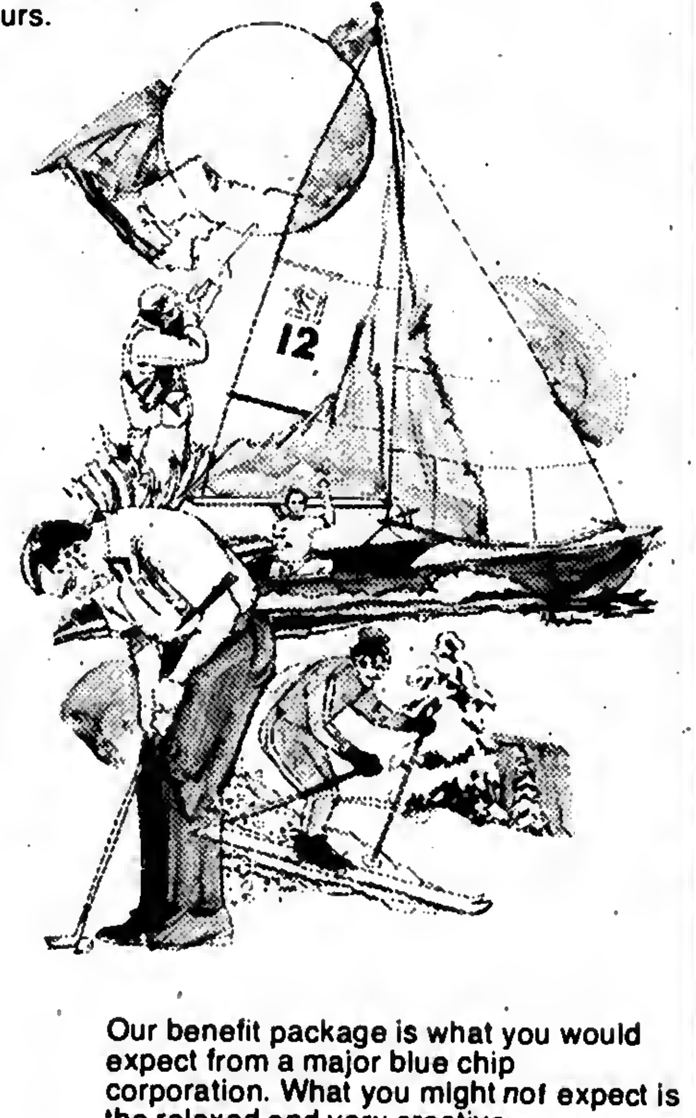
Want to combine the ideal career opportunity with your favorite lifestyle? NCR Special Systems Division needs your help now in developing advanced, high-technology EDP systems for customers around the world. You'll be doing important work in our Sorrento Valley facility, just three miles from the ocean and only minutes from Torrey Pines, La Jolla and downtown San Diego. You can live in the setting of your choice—beach, valley, mountain, country, small-town or urban—and still be only a short drive from work. Spend your leisure hours golfing, swimming, hiking, getting advanced degrees from major universities, attending theatrical, music, art and sports events, or soaking up the year-round sun. Pick your climate, too—from mild coast to dry desert. San Diego is a place of extraordinary choices—and right now the choice is yours.

COMPUTER PROFESSIONALS

The Special Systems Division has opportunities for software professionals in a broad range of disciplines and in all experience levels. Our current and firm future programs require top people with experience in any of the following areas:

- TELECOMMUNICATIONS SOFTWARE
- FILE PROCESSING
- NETWORK DEVELOPMENT
- LARGE MAINFRAME, MINI and MICRO PROCESSOR
- OPERATING SYSTEMS
- COBOL APPLICATIONS
- ASSEMBLY LANGUAGE

Assignments will include the development and implementation of various EDP systems for specific customers as well as the development of future NCR total systems; both requiring state-of-the-art knowledge.



Our benefit package is what you would expect from a major blue chip corporation. What you might *not* expect is the relaxed and very creative environment of this small, highly specialized division. The facilities are modern, comfortable, designed to provide an atmosphere in which every employee can achieve an uncommon degree of personal and professional satisfaction. May I offer you the opportunity to judge for yourself? Please send your resume (with salary history) to me,

Thom Harris, Employment Specialist

NCR

SPECIAL SYSTEMS DIVISION
4046 Sorrento Valley Blvd.
San Diego, Calif. 92121
We are an equal opportunity employer

We can give you 3 good reasons to call Robert Half for data processing positions:

1. Robert Half has been in business for about 30 years. Can you name an EDP personnel service that's been around longer?

2. Robert Half specializes. We've been an integral part of the data processing community through all its generations.

3. Robert Half's offices are staffed by experts in the EDP field.

and if 3 reasons aren't enough, we can give you 55 more:

55 offices..Robert Half is a network throughout the U.S., Canada and Great Britain. One call and you've searched the local market....or the world.

and if 58 reasons aren't enough, we can give you Half a reason more:

Robert Half. Where integrity is a lot more than just HALF.

ROBERT HALF PERSONNEL AGENCIES

Look in the white pages.

INSTALLATION CONSULTANT

Analytical, affable person needed as consultant for broadcasting stations installing O.P. systems. Generaral BA or BS degree required. Must have 4 years experience in broadcasting and 2 years in O.P. 25% travel, basic 40 hrs/wk, $1300/month. Exc. benefits and working conditions. Apply to nearest Colorado Job Service for referral. Columbine Systems, Inc.

DS

The VS1 and MVT* formula for TP success

COM-PLETE= TSO+CICS-OVERHEAD

Com-plete provides the interactive program development functions of TSO and the conversational transaction processing functions of CICS. All this with less overhead than either one.

For example: over 30 terminals in 130K and over 250 terminals in 300K...which includes user program areas.

And there's much more. Call or write for details.

*SVS and MVS in the near future.

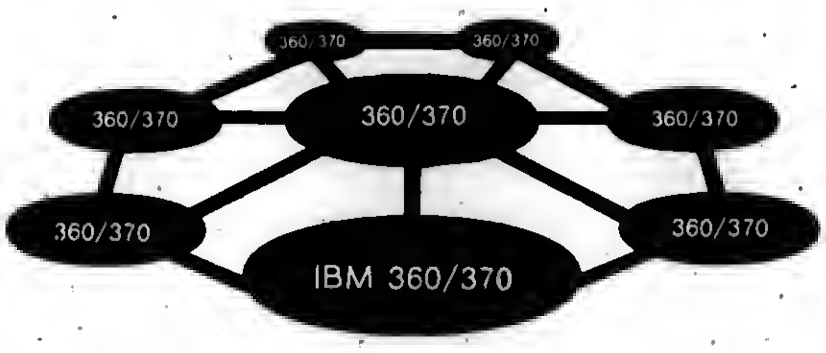
Meet FLEXICOM, the only distributed processing system based on IBM 360/370 architecture.

Flexicom is an entirely new approach to building multi-processor networks. Flexicom is the only distributed processing system that uses IBM's 360/370 architecture at *every* location in the network.



This consistent architecture means more flexibility, more power, and much simpler application design. The confusion of linking minicomputer "satellites" to a general-purpose mainframe "host" is gone. Each Flexicom site can run the same applications, use the same database management system, and access the full range of IBM 360/370 software.

Flexicom systems come in a variety of sizes and speeds. They range from small remote satellites to powerful front-ends.

Each Flexicom system is a complete hardware/software package. Each system combines an IBM mainframe with proven software, peripheral devices, and complete transmission control facilities. In addition each member of the Flexicom family is interchangeable with any other, giving you almost unlimited flexibility in network planning.

For Front-Ending

When locally-attached to the host, a Flexicom system provides all of the advantages of a front-end processor—without the need for specialized hardware and software.

A Flexicom front-end will relieve your main computer of all line control, error recovery, queuing, and message switching overhead. Flexicom even supports a complete administrative message switching system that can be selectively or completely independent of the host. Best of all, a Flexicom front-end can off-load all message editing and formatting logic—sometimes more than half the transaction processing load—with little or no user programming.

Your existing staff can write programs for a Flexicom front-end using high-level languages such as COBOL, FORTRAN, and PL/I. This allows you to access your existing database to edit and process messages both before and after they are sent to the host, further reducing the host workload.

For Distributed Processing

When remote from the host, a Flexicom system provides many of the off-loading advantages of a front-end while also functioning as a powerful distributed processor. This means complete support for its own network of terminals, selective access to the host, truly distributed databases using identical host and satellite file structures, plus local batch processing on a full-feature CPU.

As with a Flexicom front-end, developing new applications is simple and straightforward. On-line programs can be written in high-level languages, message editing and formatting logic can be developed interactively at a terminal, and a complete on-line data entry system can be implemented without user programming.

A True Turnkey System

Flexicom is delivered with everything you need: prepackaged software, CPU, peripheral and transmission control hardware, complete installation services and full documentation. Trained Customer Service Representatives will provide on-site education in the use of Flexicom and will also show your staff how to integrate Flexicom into your existing CICS, IMS, or other telecommunication system.

Interested?

We'll be glad to send you a Flexicom brochure or enroll you in a free Flexicom seminar in your area. Just return the coupon or give us a call.

A computer is helping guide America's Cup defender Courageous, shown here (background, U.S. 26) opening a lead on challenger Australia last week.

Micro Challenges Tradition At America's Cup Races

By E. Drake Lundell Jr.
CW Staff

NEWPORT, R.I. — A century of sailing tradition is being challenged here during the 23rd America's Cup Challenge Races as an outsider gained the role of helmsman for the American defender Courageous and computers moved on board many of the contending yachts.

Ted Turner, who is sailing Courageous, clearly does not fit the image of the aristocratic gentleman yachtsman and in fact has been called the "mouth of the South" along the docks here.

Likewise, the computer system aboard Courageous that handles most of its navigation functions hardly fits the traditional image of a navigator clutching a compass in one hand and a pile of charts in the other.

But while the brash advertising executive from Atlanta may not set the style for future America's Cup helmsmen, the computers are clearly here to stay.

Of the two boats in the finals for the cup here this week, the Courageous is clearly the most computerized. 50% of the half-dozen original contenders, however, placed a great deal of reliance on computer systems.

The computer system aboard Courageous is based on an LSI-11 microprocessor from Digital Equipment Corp. and uses specially designed digital input units from Signet Instrument Co. and a hand-held terminal from Termiflex Corp., according to Bill Jorch, Courageous navigator.

Its competitor in the final best-of-seven series — the Australian yacht Australia — relies, on the other hand, on analog instrumentation and hand-held programmable calculators for its navigational duties, sources here said. The Australian challengers said they would rather not talk about equipment aboard the boat until the races end.

(Continued on Page 6)

Alternatives Catch Eye, Not Buy, of IBM Users

Almost all large IBM computer users have considered switching to alternative mainframes and two-thirds have gone as far as evaluating the independent CPUs, according to a *Computerworld* survey of 370/158 and 370/168 users.

However, while the users are apparently willing to at least look at the alternatives, less than one-fourth are actually switching from IBM systems.

In the survey, 97% of the users said they had considered the alternatives from Amdahl Corp. or Itel Corp.; the rest — only 3% — indicated they were such confirmed IBM shops they would not even consider switching.

Of the sample, 65% had carried their considerations as far as an evaluation of the alternative equipment; 23% said they were gong to switch and 61% said the evaluation had convinced them to stay with IBM. The remaining 16% have not yet made a decision on the alternative equipment.

Cost advantages and better delivery schedules were cited as reasons for switching to an Amdahl CPU, although those fortunate enough to be listed for early Model 3033 processors from IBM said delivery was not a criterion for them.

Several users who decided against an alternative system said they had reservations about support from the non-IBM vendors and also doubted these systems could offer full software interchangeability.

Ford Motor Co. in Detroit — one of the users that decided to switch — has scheduled installation of an Amdahl 470V/6-II mainframe for November. The company made an evaluation of alternative systems when the lease on its 370/165 was nearing its end, a spokesman said.

The Amdahl machine was evaluated against an IBM 3033 CPU and found to have two advantages: it offered cost savings and it could be delivered sooner than the 3033.

The Ford DP center that will install the Amdahl CPU will swap the 165 for the 470 while keeping presently installed peripherals. These include Storage Technology Corp. tapes and disks and Memorex Corp. disk drives.

This is the first article in a three-part survey of users' attitudes toward alternative CPUs, distributed processing and IBM's Systems Network Architecture (SNA) by Jeffry Beeler, Ronald A. Frank and Molly Upton.

One of the benefits of switching to the Amdahl machine is that the DP center can continue to operate with IBM's MVT operating system. The 3033 would have required an immediate upgrade to MVS, but the Amdahl 470 will operate with MVT and give Ford the option of upgrading to MVS at any time, the spokesman said.

Hallmark Cards, Inc. in Kansas City, Mo., also has been looking at Amdahl CPUs as alternatives to its dual 168s, according to Ron Schmidt, senior technical services analyst.

The company evaluated an Amdahl 470V/6 against the IBM 168 and found the 470 had about 1.4 to 1.8 times the processing power at about 10% to 12% less money on a price-performance comparison, Schmidt said.

Performance and support of the Amdahl CPU appears to be equal to that provided by IBM, he added, but delivery advantages seem to be getting reduced because Amdahl deliveries are "getting further out."

Comparisons with Itel processors were described as "less impressive." Control Data Corp.'s Omega systems were designed more for the smaller 370 systems, he added.

R.L. Babcock, information processing manager for the Joseph Schlitz Brewing Co., admitted that his company has toyed with the idea of replacing his company's 168 with an Amdahl machine (he doesn't remember the model number), but said the Milwaukee-based firm has never seriously considered the option.

Because the brewer was on the verge of installing a new IBM 168 when it met with Amdahl representatives, Schlitz officials saw no point in taking the time and trouble to evaluate equipment. Instead, they merely discussed the financial pros and cons of replacing the IBM mainframe with Amdahl hardware, Babcock said.

Schlitz purchased its 168 very re-

Technology or Applications More Crucial to Growth?

By Edith Holmes
CW Staff

WASHINGTON, D.C. — Which is the greater driving force behind the growth of the computer industry — technological advances or applications development?

The answer is technology, according to Isaac Auerbach, president of Auerbach Publishers, Inc. of Pennsauken, N.J. Speaking at the Fifteenth Computer Society International Conference, Compcon 77, sponsored by the Institute of Electrical and Electronic Engineers here recently, Auerbach made special note of the promises and problems associated with memory technologies.

For Joe M. Henson, vice-president of market planning for IBM's Data Processing Division, however, "productivity in applications development is really the critical challenge that faces the industry and users alike" if meaningful growth is to continue.

Both Auerbach and Henson agreed that users haven't taken advantage of the available technology which has come about "faster than anyone expected."

But the technology which facilitates applications also makes their development more difficult, Henson added

In Antitrust Testimony

Witnesses Agree: IBM a Monopoly

By Catherine Arnst
CW Staff

NEW YORK — After two years of presenting evidence, the government is providing some conclusions to the court in the U.S. vs. IBM antitrust case. The noteworthy point is that the conclusions of an industry observer who did not want to testify for the government closely paralleled those of the government's chief economic adviser for this lawsuit.

It is not surprising that Dr. Alan K. McAdams, a Cornell professor who has been working on this case since 1971, testified IBM erected significant barriers to entry to maintain its alleged monopoly position in the computer industry [CW, July 11, 18]. He helped prepare the pretrial brief and was naturally expected to make an anti-IBM analysis when he took the stand.

Observers were not so certain of the testimony of Frederic G. Withington, an Arthur D. Little, Inc. consultant who fought the government subpoena until the week before he appeared in court. One might have assumed that Withington, who testified after McAdams, would have been predisposed against the government's case. Instead, he may have been the Justice Department's best witness by substantiating McAdam's testimony [CW, Aug. 8, 22, 29].

Both men testified extensively on the subjects of market definitions and barriers to entry. With the first subject they were in almost complete agreement except for some semantic distinctions.

The computer mainframe market can be broken down into four subsections — scientific, general-purpose, small business and special-purpose computer systems, according to both men. The general-purpose computer system market is the largest subsection and IBM has 68% of that market, Withington said.

By dominating that market, IBM can control the other subsections as well as the plug-compatible peripherals market, testimony indicated. Users can utilize large general-purpose computer systems to do scientific applications, but scientific computers do not have the appropriate software to do business applications, thus limiting that market.

Because it dominates the largest subsection of the industry, IBM can also erect barriers that block entry into the entire industry, both Withington and McAdams testified. Both dwelled on "software lock-in" as one of the more substantial barriers to entry.

Analysis

IBM initiated software lock-in with its first systems in the early '60s, thus tying users to IBM systems because a switch to another manufacturer's computer requires scrapping the existing programming. IBM had a large installed base at that time because of its substantial punch card business; once these users switched to IBM computers, they tended to stay there.

This barrier to entry was cemented into place when IBM announced its 360 line, which promised a series of fully compatible systems, making it easy for users to upgrade from one IBM system to another.

Accordingly, for another manufacturer to effectively compete with IBM, it too must provide a full line of compatible systems, Withington asserted.

The competitor must also provide a large maintenance and support force with at least 100 regional offices, enough internal capital to support leasing and a line of plug-compatible peripherals broad enough to cover any type of application the user may want, Withington said. These are necessary because the industry giant has them and so established them as prerequisites for market entry.

Withington estimated the cost of entering the general-purpose market in 1977 would be $400 million.

McAdams, the economist, gave the theory behind Withington's observations. The test of a truly competitive market is the ease of both exit and entry, he testified.

If Withington's estimates were correct (and they were nearly identical to IBM estimates for market entry), then the market is monopolized, according to McAdams' criteria.

Only the largest and most well-established firms can even hope to successfully enter the computer market, he said. Even then, there is a good chance they won't succeed, as evidenced by the failures of General Electric, RCA, Singer and Xerox. These companies also proved the difficulty of exiting the market, as all suffered substantial losses by leaving.

A crucial element of McAdam's testimony was his observation that a monopolist has power over price and will raise or lower that price to contain competition, rather than to benefit the consumer. IBM always maintained a high profit margin for its products and, when it felt threatened by a competitor such as Memorex, would drop that price to the "Death Level," McAdams said.

"Death-level pricing" was the term used in an internal IBM document to describe the level to which a price can be lowered to cause a competitor to lose money if he tries to match it. The strategy was used time and again in the peripherals market, according to government charges.

Withington's description of IBM's pricing policies indicated he agreed with McAdam's view of the corporation's power over price. He insisted, even under intensive cross-examination, that IBM's motivation for lowering prices was to destroy competition.

The witness gave the same reason for most of the technological changes that IBM has developed, even though some of them have benefited the user.

As an example, he cited IBM's May announcement of its Model 3033 central processor, which he felt was obviously meant to stop competition from Amdahl Corp.'s 470V/6.

Strong Executive Role Urged in New OTP

By Edith Holmes
CW Staff

WASHINGTON, D.C. — President Carter's plan to move the Office of Telecommunications Policy (OTP) out of the White House and into the Department of Commerce under a new assistant secretary provides a "unique" opportunity for the executive branch to develop a strong leadership role in communication and information policy, the Aspen Institute and industry members told Congress here recently.

Appearing before Rep. Jack Brooks' (D-Texas) House Subcommittee on National Security and Legislation, Glen O. Robinson, a special adviser to the institute, added, "We would be disheartened if this opportunity evaporated from neglect or timidity in providing a purposeful mandate to the new office of the Assistant Secretary for Communication and Information."

Robinson and Paul G. Zurkowski, president of the Information Industry Association (IIA), agreed with congressional and industry criticisms leveled at teh President's reorganization team in recent weeks for its failure to specify what responsibilities the new Assistant Commerce Secretary and his office will have [CW, Aug. 15].

"Our guiding premise is that the assistant secretary should have a clearly defined policymaking role, with a clear specification of his or her policy domain," Robinson said.

First, the new office, created by the merger of OTP and the Office of Telecommunications (OT), won't be able to attract the high-level talent it needs to infuse the communication and information area with "a competence and professionalism" so badly needed, Robinson said.

Second, without a clear mission statement, the office can't be organized well internally, he added.

Finally, and "possibly the most important failure of all," the office will suffer "the awkward and embarrassing inability to relate to the other executive agencies that deal with communication and information policy," he stated. Robinson predicted that in the absence of a well-defined role, the assistant secretary could never be the President's principal spokesperson in these fields.

Urged Rewrite Support

The Aspen Institute representative urged Brooks and his House Government Operations Subcommittee to support the rewrite of the executive and departmental orders — the two documents which define the authority the assistant secretary and his office will have.

During the hearing, Congressman Brooks strongly expressed his desire to leave these orders alone.

Brooks suggested the executive branch "might write in all kinds of duties I won't agree with" if it is allowed to revise the orders. "I'm very cautious about executive orders," he added.

Arguing that there is no legal requirement to retain the present Executive Order 11556 which defines OTP's duties, Robinson said the departmental order is really the key to the new office's success.

Calling the new office the "National Communications Agency," for want of another name, he suggested its communication and information arms would be on a par with each other. The new agency would be responsible for formulating domestic communication and information policy relating in the private and public sectors.

The Commerce Department agency would also be in charge of setting international communications and information policy, under the Aspen scheme. This would include policies involving the industry structure and performance of the U.S. international communication carriers.

Policy formulation in the area of exports and imports of information and communication technologies and services and their domestic and foreign social and economic impacts would be still another field within the agency's realm of responsibility, Robinson said.

The Aspen Institute would have the national communications agency conduct a research program on the characteristics and uses of communication and information technologies and resources. The agency would also support the federal agencies in their procurement, system planning and implementation of these technologies, Robinson stated.

The new agency would be in a position to recommend to the Office of Management and Budget (OMB) policies for the procurement of communication and information technologies and services, he added. It would also be charged with the coordination of plans and programs to mobilize the nation's public and private communications and information resources in the event of a national emergency.

Like Robinson, Zurkowski of the IIA supported the opportunity for change provided by the reorganization of OTP and the creation of the new Assistant Commerce Secretary.

The new assistant secretary should have a deputy for information policy, Zurkowski stated. In addition, some of the computer policy roles of the Office of Science and Technology in the Commerce Department should be delegated to the new office as well, reflecting the overlap between these technologies, he added.

Life of Georgia Depends on ADR's ROSCOE® For Faster Job Turnaround, Faster Maintenance and Expanded System Access

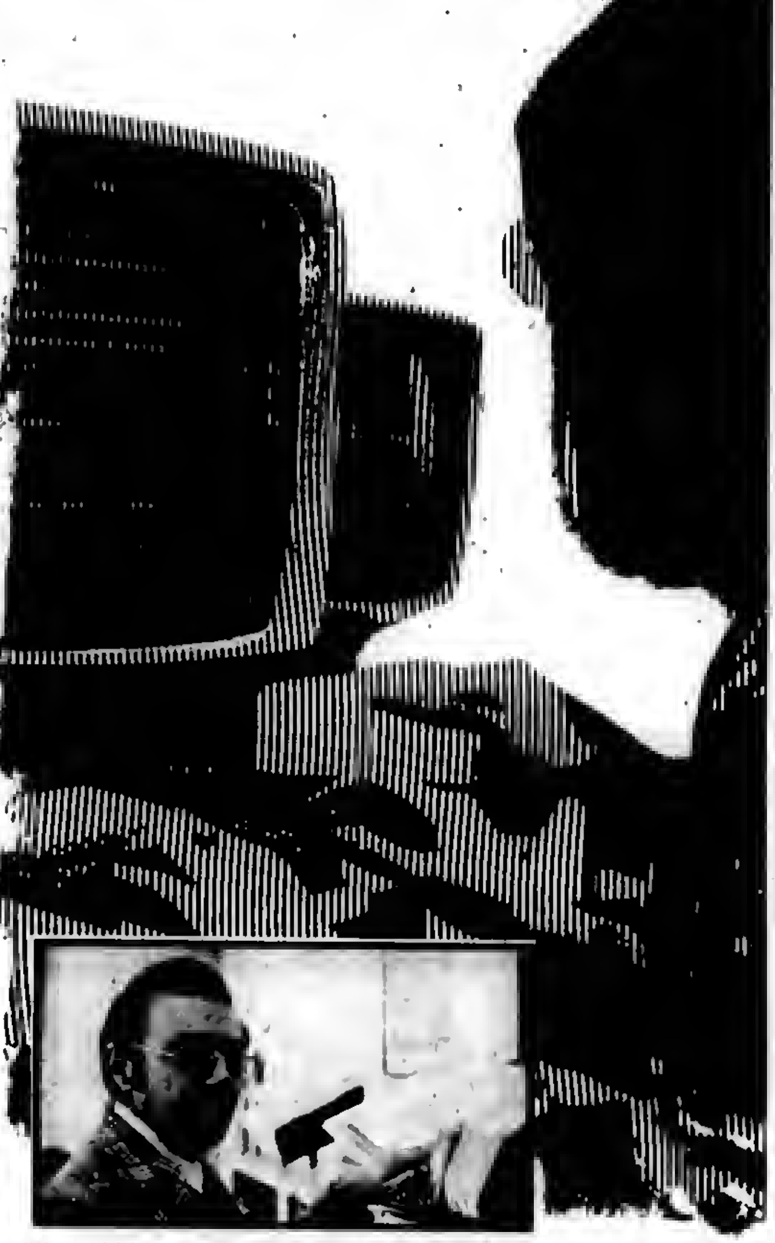
Two years ago, Life Insurance Company of Georgia installed ROSCOE, ADR's on-line conversational programming system. It was initially installed to speed computer program development, but Life of Georgia quickly found that ROSCOE also expanded direct computer access. Interactive procedures made the system easy to use without extensive training so that virtually any department could enter and update data through their own terminals. Self-prompting routines, using ROSPROCs, could direct users through even complex systems one step at a time. Information could be entered without keying-in locations or other detailed instructions, and corrections could be easily entered right over the old information, without re-keying whole data.

Today, nine ROSCOE equipped terminals are located throughout the company, giving many departments direct on-line access to 3400 operating programs. System specialists no longer wait in line to do a routine job.

Program development goes faster, too. With data-set recall, programmers call up the information they need, key-in required changes, and send it back again—without handling cards or paging through listings. "The greatest time savings comes from compiling COBOL programs," noted Earl Ryan. "ROSCOE asks the user what he wants to do and then tells him to enter the changes he wants to apply. As a result, turnaround time has been reduced at least 30%. And we have virtually eliminated JCL type errors."

"If we were to put our programmers back on the old keypunch system, we would have a real morale problem. It would be very difficult to take ROSCOE away now," Earl Ryan added.

Each ADR product is not just a program but a complete package with full documentation and on-site support. ADR is the only software company with 50 branch offices and representatives in over 30 countries—each staffed with ADR-trained technicians.



"It would be very difficult to take ROSCOE away now . . . ," Life of Georgia Technical Analyst, Earl Ryan, speaking about ADR's on-line conversational programming system.

Large IBM Users Browsing But Not Buying Alternatives

(Continued from Page 1)

cently, company officals are not inclined at this point to seriously consider installing an IBM replacement.

William Shine, senior vice-president of the Chase Manhattan Trust Department in New York, said his bank has considered both Amdahl and Itel machines as replacements for its 168. But, he added, the bank has decided against those alternatives.

The alternatives might have more appeal for the bank if they were intended for internal applications only. Unfortunately, the current computer system is for customer service applications, so the reliability of that system — or any replacement — is paramount, he explained.

Shine also expressed concern about the replacements' software. Theoretically, he said, the Amdahl and Itel software is interchangeable with IBM's, but in practice there are inconsistencies.

Sticking With IBM

Bill Fore, manager of the technical staff group for Sun Information Services in Dallas, said his firm looked at Amdahl's 470V/6 about a year ago, but decided on a 370/168 instead.

Sun stayed with IBM, he said, because there was a question of service with the Amdahl unit. Further, Sun got a good financial deal, so the difference in cost between a 168 on a long-term lease and the 470 "didn't seem to warrant the exposure and risk," Fore said.

In addition, Sun was running flat out; the company was in a transition period and didn't have software people to spare should the Amdahl need some special attention, he said.

Ralston Purina Co. in St. Louis didn't really consider Amdahl or other IBM alternatives because it got very good delivery dates on the two 3033s it ordered, according to Chuck Childers, general manager of computer services.

The IBM machines are due in September and December of 1978, he said, and the firm is investigating a package deal which would involve subleasing the 168 and 158 it has from Itel and arranging a long-term lease on the 3033s.

Ralston Purina has had IBM CPUs since 1966, although it has gone to other vendors for nearly everything else, including about 300 Univac Uniscope terminals which it links with IBM's IMS through its own teleprocessing program.

The firm has converted to MVS, according to Childers, who praised such capabilities of the system as resource management, more than 15 initiations and more concurrent jobs, as well as the ability to use new IBM peripherals.

But using MVS is also "a matter of keeping pace," Childers said. IBM plans to drop support on MVT.

With MVS, the firm has discovered some application program dropout. Although MVT tolerated various deviations from specifications in the programs, MVS didn't, he said.

Wavering on 470

Jeff Dunn, assistant DP director of Northwestern Mutual Life Insurance in Milwaukee, said his firm has considered replacing its 168 with an Amdahl 470V/6-II. In fact, the company already has placed an order for the Amdahl machine, but Dunn and his colleagues have not yet decided whether to confirm the order.

Dunn cited improved delivery as one reason Northwestern is considering replacing its IBM mainframe. If they confirmed the Amdahl order, company officials could expect delivery by the third quarter of next year.

Goodyear Tire and Rubber Co. in Akron, Ohio looked "lightly" at Amdahl's 470V/6, but made no decision to go with it. At the time Goodyear was looking, Amdahl had only about 30 installations, many of which were in university and government environments, according to John Longstreth, manager of DP support services.

The firm has no plans to reconsider Amdahl at this time, he said.

Monsanto Co. in St. Louis has looked at Amdahl's V6 and V7, but not really seriously because management has not indicated a desire to go outside of IBM for equipment, according to Frank X. Fallert, manager of performance analysis.

Monsanto has gotten as far as recognizing the existence of Amdahl, he added.

Firestone Tire & Rubber Co. has flirted briefly with the idea of installing an IBM replacement, according to the company's operations manager, H.W. Guthrie. But the Akron, Ohio firm never seriously followed through with the hardware installation.

Guthrie said Firestone's central computer system incorporates hardware from IBM competitors like Itel, so to dismiss Firestone's DP department as an all-IBM shop would be misleading. When it comes to CPUs, however, the company likes to avoid mixing equipment, the manager explained.

Firestone evaluated Amdahl equipment as a replacement for its IBM 158, but Guthrie said he didn't remember the model number of the potential alternative.

Leo Harris, operations manager for Blue Cross/Blue Shield in Richmond, Va., said that firm "briefly" considered replacing its IBM 158 with an Amdahl 470V/5 or 470V/6, but eventually decided against the switch.

Harris described his firm as "very conservative" and admitted company officials had expressed some concern about Amdahl's long-term viability. "Amdahl is still essentially a one-product company," Harris said.

If Amdahl gains a larger market saturation and wider product line, Blue Cross/Blue Shield would feel more confident about its long-term survival prospects, he added.

PPG Industries, Inc. has not seriously considered replacing its three IBM 158s with Amdahl, Itel or CDC hardware, according to D.L. Campbell, director of the company's computer center.

PPG is very conversative in its organization and corporate policy, Campbell explained, and has already committed itself strongly to IBM equipment. This commitment sometimes causes problems for the company, but it has the advantage of being safe, he said.

Ashland Oil in Ashland, Ky., is considering an Amdahl 470V/6, but Stan Wonn, administrative assistant for computer science and services, said the firm is a heavy IBM user.

Ronald Leone, data center manager for Sears Roebuck Co. in Philadelphia, said Sears has "tinkered with the idea" of replacing the firm's 158 with one of the IBM alternatives, but "has done nothing serious" about the matter. He doesn't know which of the alternatives the company has evaluated because most of the decision concerning computer equipment selection are made at Sear's Chicago headquarters.

Amoco Production Co. has considered replacing its IBM 168 with an Amdahl 470V/6 CPU, but the firm has not yet decided whether it will make the equipment switch, operations manager William Caldwell said.

Because Amoco is still in the early stages of evaluating the IBM replacement, it is unable to say at the moment what the potential advantages and disadvantages of the Amdahl hardware are.

No Switch Considered

J.C. Penney Co. has not considered switching to the IBM replacements because the Wauwatosa, Wis.-based firm wants to avoid the problems that arise from having too many different kinds of equipment at the same site. Penney already uses IBM peripherals at the Wauwatosa data center.

Nor has Oscar Mayer Co. considered switching from its 158 to the IBM replacements, according to Roger Tietz, the company's compoter manager. The Madison, Wis.-based firm considers itself an IBM shop and plans to maintain that status for some time to come, Tietz explained.

But Prudential Insurance Co. of America in Roseland, N.J., not only evaluated the Amdahl 470V/6, but installed one in addition to its 370/168 about eight months ago, according to Mike Capo, shift supervisor.

The 470V/6 was selected for teleprocessing duties because it was faster than a 168, John Richards, system programmer, indicated.

"Overall we've been very impressed with it," Richards said. Capo noted the system had been subject to some downtime, but said it does the work of a 168.

R.N. Wehling, technical services manager of Alcoa Aluminum in Pittsburgh, Pa., said his company has not considered replacing its 158 with any of the IBM alternatives. He said the firm already owns its mainframe and plans to use it for a while.

Bud Patterson, production manager of Union Carbide's Chemical Division in South Charleston, W. Va., refused to disclose whether his company has considered replacing its 168 with IBM alternatives. He said that information is confidential.

Comment Deadline Extension Delays Computer Inquiry Again

WASHINGTON, D.C. — The Federal Communication Commission's (FCC) second Computer Inquiry has been stalled a second time.

The latest delay to the year-old inquiry into the definition of data processing and potential DP service offerings by common carriers occurred when IBM requested the date for filing reply comments be extended from Sept. 12 to Oct. 14.

The initial holdup of the comment portion of the Inquiry came when AT&T asked for a 90-day delay of the due date for participation — from July 25 to Sept. 12.

In both cases, the corporation involved is preparing a study to accompany its comments as an appendix. IBM's "expert study" will be on "the effects of public utility regulation in a competitive environment," the corporation told the FCC.

Because they had already granted an extension of time for AT&T, the FCC comissioners felt they could do no less for IBM and thus moved up the deadline for filing reply comments to Monday, Oct. 17.

Some 80 participants in the Inquiry submitted comments on the FCC's proposed definition of Data processing last June 6 [CW, June 13]. The reply comments represent the second round of participation by users, trade associations and industry members.

IBM 3270 USERS GET 60 DAY DELIVERY ON PRINTERS

Interface Systems' 30 cps to 180 cps printers are 100% compatible (hardware and software) with IBM 328X printers but run faster and cost less. If you need to save money (purchase prices as low as $3,400), or need extras like:

- large 9 × 7 dot matrix for better readability
- better forms handling, 3" to 14" widths
- vertical forms control
- large size characters or bar code
- super reliability
- nationwide service

Bell's Remark Stirs Debate

Congress Eyed as Right AT&T Antitrust Forum

By Ronald A. Frank
And Edith Holmes
CW Staff

WASHINGTON, D.C. — A recent suggestion that the AT&T antitrust trial should be decided by Congress instead of the courts has drawn opposition statements from several communications organizations.

The suggestion was made by U.S. Attorney General Griffin Bell in an interview with *Fortune* magazine in which Bell said the AT&T suit should be handled by Congress.

Several organizations, including the Independent Data Communications Manufacturers Association, the North American Telephone Association and Phonetele, Inc., have taken issue with Bell, while AT&T has registered its general approval.

The attorney general has proposed on several occasions — most recently in the *Fortune* interview, scheduled for publication in November, that big antitrust cases involving a restructuring of an economic system "would perhaps be better . . . done by Congress than by a single federal judge."

The final judgment, the attorney general acknowledged, would be political. But why not, when most economic decisions on behalf of the U.S. are politically based? he asked.

Interest Waning?

A Justice Department spokesman, contacted for clarification of Bell's remarks, denied Bell's remarks signal the department's interest in the case is waning.

"We are committed to trying the AT&T case in court. Bell and John Shenefield [acting assistant attorney general] are doing everything possible to expedite the case," he said.

"Bell has no intention whatsoever of taking AT&T to Congress," the spokesman added.

Bell simply used the AT&T case as an example of the kind of antitrust suit so closely involved with economic and social issues that might be settled by Congress in the future, the spokesman explained.

A spokesman for the IDCMA said, "The attorney general has apparently admitted that the antitrust laws are unworkable — at least when a very large organization like AT&T is involved."

If the attorney general simply intends to abandon the AT&T suit, his action may be interpreted as a concession to monopoly and an admission that the U.S. is powerless to do anything about it under existing laws, the spokesman said.

The North American Telephone Association (Nata), an organization of companies that compete with the telephone company, issued a statement which said that Bell "apparently based his statements on the belief that the suit with appeals will take 10 to 15 years to settle.

"Bell's statements indicate a very dangerous situation. The Justice Department has a clear mandate under the antitrust statutes of this country to prosecute any company involved in restraints of trade. Furthermore, Congress should not be asked to reaffirm its clearly established procompetitive principles on a case by case basis," Nata said.

In a speech delivered at the annual Nata convention in Washington, D.C., Sen. Gary Hart (D-Col.) said Bell's remarks could signal the state of a debate on the proper role of Congress, the executive branch and the judicial branch in promoting free market principles.

"The attorney general suggested that Congress may be the better forum for reaching what he termed "political judgments." This strikes me as an oversimplified explanation of what is wrong with our current methods of antitrust enforcement," Hart said.

"I am not sure Congress is a better forum than the courts for resolving the AT&T case. That case involves not only political judgments, but also alleged predatory and anticompetitive practices, which have precise judicial and legislative definitions," he said.

A more favorable comment on Bell's opinions was made by AT&T board chairman John deButts. Appearing on a recent ABC "Issues and Answers" program, deButts told an interviewer: "When you get into organizational structure of an industry, it is beyond the antitrust laws and their purpose. If you're breaking the law, you should be penalized and should have to pay a fine or maybe even go to jail.

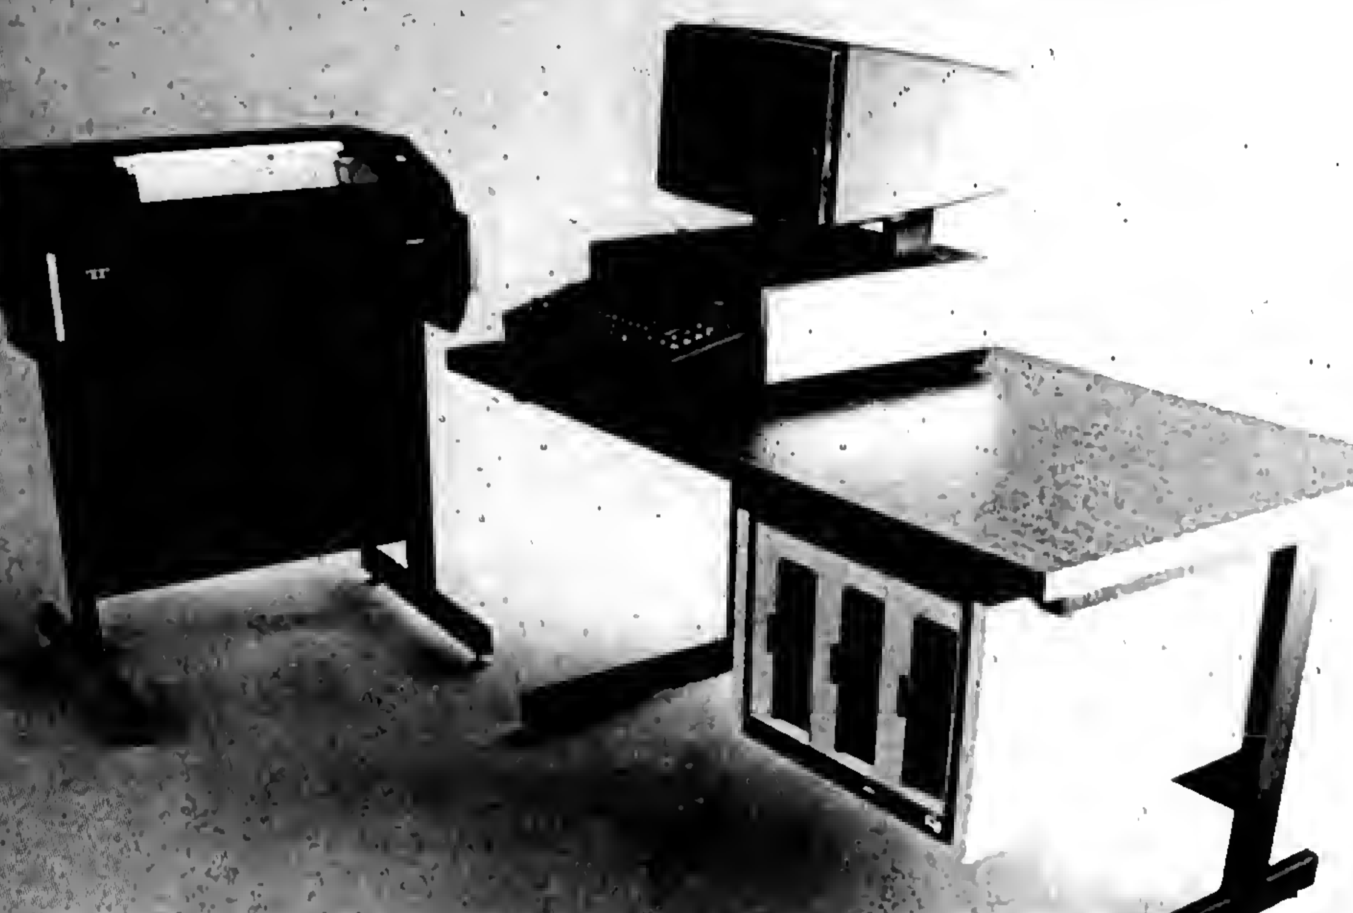
"But from the standpoint of the total society, the reorganization of the structure of an industry goes beyond that and maybe the decision should be made by the Congress of the United States. And with that philosophy I agree."

As a result of Bell's comments, a letter was sent to the attorney general by Robert Feiner, president of Phonetele, Inc.

In it, Feiner told Bell that "If you intend to refer any issues contained in your suit against [AT&T] to the Congress, then I believe it is now incumbent upon the Justice Department to investigate precisely how obligated each member of Congress may be to AT&T, et al."

Bell's statement "served no useful purpose to anyone but AT&T by fortifying its efforts in Congress."

WHO PUTS AT&T IN THE DATA PROCESSING BUSINESS?



CADO DOES.

We start with Bell System's CRT and 300 lines per minute impact printer. They're the world's most reliable and, because Bell makes so many, among the lowest in cost.

We add CADO computing power and up to 20 million characters of stored data.

Result: a remarkably intelligent and durable data processor that costs about half as much as IBM's work-alike model.

So now you have a Small Business Computer that will do all your accounting and inventory control better...for as little as $450 a month lease purchase.

Or if you need a distributed processor (with turnkey IBM communications emulators), this is all you need. And you can put the Bell half of the system on your phone bill.

CADOSYSTEMS

Send the coupon to (or call) your nearby CADO Representative. He'll send you a free brochure on the data processor that's part Bell ...part CADO...and all business!

Cado Systems
2730 Monterey Street
Torrance, California 90503
(213) 320-9660

It sounds like a Bell of an idea! Send me all I need to know about the ☐ CADO Business Computer, or the ☐ CADO Distributed Processor.

Technology or Applications More Crucial?

(Continued from Page 1)

"Computer technology has extended our applications horizons but those horizons are harder to achieve," he said. Techniques developed to reduce the problem of implementing applications such as interactive programming systems and program generators aren't being used to the extent they should be, according to Henson.

The IBM executive predicted that future developments in the area of applications will be "evolutionary." The industry won't see any "breakthroughs" in this field, he stated.

'More Profound' Results

While Henson applauded technological advances, he suggested that improvements in equipment price/performance ratios should result in more than the same job accomplished faster. Advancements in technology should permit "more profound things," he maintained.

Many applications include non-DP people whose part in the system is essential to its operatioin and so must be clearly understood, Henson said. There is a "user thrust toward operational systems" as a result, he noted.

Henson identified another class of applications — those involving technical and management forecasting modeling, end-use design and other planning functions. Both the operational and the planning applications demand more data, which often means a need for large data base systems. These systems add to the difficulty of developing the applications themselves, he said.

The problems presented by data bases, go hand in hand with those attendant with price/performance improvement in graphics and communications, Henson suggested. These technologies may have all kinds of potential uses, but their development into applications might cost more than the user can afford.

There are other problems which accompany technological advances as well. Among them are system security, auditing and privacy, he said.

The tools needed to simplify the development of applications are available but aren't used, Henson stressed. Virtual memory, preprogrammed telecommunication controllers, chief programmer teams and structured programming are among the aides at the users disposal if he would only employ them, Henson sid. Of all IBM system users, only one in seven uses interactive programming capabilities to solve problems, he noted.

Application program report generators can reduce by two-thirds the number of code steps required in a program and yet they aren't used. Instead, users continue to let an average of 85% of their programming costs be tied up in maintaining this software, Henson suggested.

The problem of efficient applications development "is serious' and "a major inhibitor to all computer users and thus to economic growth," he said.

On the other hand, the application of tools in program development should be dictated by economics, he added. "It costs more to develop and debug applications than to run them for their lifetime," Henson said, noting that 46% of IBM's programs require 2% of its computer capacity.

"It doesn't make sense to spend resources on fine tuning systems given the cost of the software development to be accomplished on them," he said.

Henson concluded that any progress in the area of applications development and hence in the growth of computing must come thorough discipline rather than breakthroughs. Programming is not an art "so individualized that it cannot be broadly controlled," Henson stressed. It must be viewed as a "pragmatic discipline" requiring a "good allocation" of resources, he added.

Henson looks to the mid-1980s and the development of automatic programming to assist the development of applications.

Auerbach suggested growth in the use of computers will stem from lower costs resulting from technological developments chiefly in the area of memories. He believes that in the next few years, users will see the cost of their processing power and internal memories diminish by one-third as the industry reaches the point at which more than a million circuits can be packed onto a chip.

The user cost of processing power and disks will go down two-thirds because of the increased densities of information that will be recorded, he predicted.

Read-only memory (ROM) promises to make the use of firmware more widespread, Auerbach said, adding that he expects the cost of reprogramming to decrease, given electrically programmable ROMs now being developed.

Both charge-coupled devices (CCDs) and bubble memories will depend on how suitable the programming is that accomplishes them, Auerbach stated. These techniques must be shown to be competitive with moving-head disk memory, he added.

And Auerbach predicted that "significant improvements" are still accessible in moving memory technology in the areas of bit density, track density and access time.

Micro Challenges Tradition By Taking to the High Seas

(Continued from Page 1)

The Courageous system is working "pretty well," Jorch said, adding there has been "no downtime" because of the CPU even though some downtime was experienced early in the trials because of problems with the power supply, which is fed by two automotive batteries.

Admitting that Turner was initially "very negative" about the computer system, Jorch said the helmsman is "still not in love with it" since he's a "seat-of-the-pants sailor."

However, Turner has come to accept the system because it proved its worth and reliability during the grueling summer of trials for the cup, Jorch said. "He panics a little" now if the system fails to work or an instrument goes out.

Jorch, on the other hand, is very comfortable with computer systems since he is a senior engineer in computer equipment design for Grumman Aerospace Corp. when not sailing.

In one example of the system's value, Jorch said that in an early race the power went down — and Courageous lost 20% of the lead it had gained at that point, even though it went on to win the race.

The system basically provides the navigator with position and speed information, including readouts on wind direction and speed, speed through the water and position on the course.

Previously all of these things had to be hand calculated by the navigator, taking up almost all of his time and providing less accurate information.

For example, even what would seem to be a relatively simple calculation — speed — is difficult in choppy seas aboard a 12-meter yacht. Each wave either boosts or slows the speed of the boat to some degree; with manual systems, the navigator has to use his judgement to try to determine the exact speed of the boat on the course.

The computer system, however, is constantly measuring the speed and calculating the averages, giving a more accurate readout, Jorch said.

Wind direction is another complex calculation handled by the system. About 60% of an America's Cup race is sailed into the wind with the boats tacking toward a mark.

There is an optimum angle that each boat can sail toward the wind. If the boat tries to sail closer than that angle, its speed slows; if it sails at a wider angle, it may actually go faster, but have a longer distance to the mark.

It is therefore extremely important for the navigator and helmsman to know the "true" wind direction at all times.

The computer system computes the boat angle and speed and adjusts for these in order to give the navigator a readout of the true wind direction, Jorch said.

Although computers are being used more widely here this year than ever before — with the Swedish yacht Sverige and another American contender, Independence, sporting computer systems, almost identical to the one on board Courageous — they have played a minor role in past races.

Beginning in 1970, attempts were made to use rather primitive analog computers for wind direction calculations, Jorch said, and in the 1974 series a Data General Corp. Nova system was installed aboard Courageous, which was the American boat then also.

After 'Unfair Treatment' Charges

State Picks New Group to Weigh Medicaid Bids

By Ann Dooley
CW Staff

BOSTON — A new selection committee has been chosen to evaluate bids for a state Medicaid system because the previous choice was disqualified after other bidders charged they were treated unfairly during the original selection process.

Blue Cross/Blue Shield of Massachusetts was originally awarded the $19 million contract with a subcontract to Electronic Data Systems, Inc. (EDS). When other bidders complained of "unfair treatment," a review board was established to examine the selection process [CW, Aug. 8].

The board determined that some of the complaints were valid and recommended that Gov. Michael S. Dukakis reopen the bidding.

The new selection committee, is already beginning work, according to chairman William O'Connor, assistant secretary of the Department of Administration and Finance (A&F). The other four members of the board are state employees, contrary to the hopes of some critics who felt members of the private sector should be included in the selection process this time.

Bidders Try Again

According to O'Connor, four of the five original bidders are bidding again — Blue Cross/Blue Shield; Pilgrim Health Applications, a subsidiary of Arthur D. Little, Inc.; Planning Research Corp. and System Development Corp.

Only Citibank is not trying a second time.

The committee, which acts in an advisory capacity to the Secretary of A&F, will probably not have an opinion ready for several months, O'Connor said.

Rebidding procedures are moving slower in another controversial state contract, that one involving a $23 million facilities management contract almost awarded to EDS [CW, Aug. 15].

The A&F contract was halted when the State Attorney General disclosed conflict of interest between EDS and Sci-Tek Associates. Two members of the selection board that awarded the job to EDS were also employees of Sci-Tek, a firm involved with EDS in a Tennessee contract.

The companies wishing to bid again on that contract must wait for a new selection committee to be formed. But the formation of that committee hinges upon what a conflict-of-interest investigation by the Attorney General may reveal.

The investigation is expected to continue for several more weeks.

EDS has stated it did nothing wrong in working in a joint business relationship with Sci-Tek. EDS said it had questioned Sci-Tek on the propriety of their arrangement before entering into the relationship, officials said, and Sci-Tek checked with the state and was told there would be no problem.

Relationship Okayed

The relationship between Sci-Tek and EDS on the contract in Tennessee had been approved by the state before EDS had entered its bid, John Buckley, A&F secretary, admitted.

Because the award of the Massachusetts contract was delayed, the two contracts were being negotiated at the same time and that plays a large part in the conflict-of-interest charge, Sci-Tek officials claimed.

Backus Receives Turing Award

NEW YORK — The Association for Computing Machinery (ACM) recently named John Backus the recipient of the organization's 1977 Turing Award.

Backus, an IBM Fellow at the Research Center in San Jose, Calif., was selected for his "profound, influential and lasting contributions to the design of practical high-level programming systems, notably through his work on Fortran," the award committee said.

The $2,000 award is ACM's most prestigious award for technical contributions to the computing community.

Development of Fortran

Backus headed a small IBM group in New York City during the early 1950s that developed "a high-level language for scientific and technical computations called Fortran," ACM continued. The group also translated the programs into machine language using "novel optimizing techniques" to generate fast machine language programs.

The award recipient also served on the international committees that developed Algol 58 and Algol 60, a later version. Algol received "broad acceptance in Europe as a means for developing programs and as a formal means of publishing the algorithms on which the programs are based," ACM continued.

Backus' present work concentrates on the foundations of programming languages in order to understand the simplest elements needed to build a programming language.

SMALL 370's CAN HAVE A MODERN TP SYSTEM

If you are the proud owner of a 370/115 or 125 or maybe a 360/40, you will have every right to expect your computer to run an efficient and sophisticated on-line system.

SHADOW II is the worlds most Advanced TP Monitor, and runs as happily on a 370/115 as it does on a 370/168.

Our medium and large size users like the enormous range of facilities provided with SHADOW II, and of course the world-renowned performance compared with any other system.

Our smaller users also appreciate these benefits of course. But they also find that their application programmers can write TP programs under SHADOW II as easily as writing in batch. And they get terrific performance without costly upgrades, because SHADOW II requires miserly quantities of Main Memory and CPU time, Just 2K of real storage under DOS VS for instance.

SHADOW II is a true Multi-tasking, Multi-threading system which allows you to grow from your first small TP applications, to your larger systems of a few years hence without a difficult and costly rewrite.

We don't ask the small user to accept an "Entry Version" with limited facilities and poor performance. SHADOW II is BIG on facilities but SMALL on resource requirements.

Get a BIG system without a BIG budget. Return the coupon for a copy of the SHADOW II Concepts and Facilities manual and a User Reference List.

Shadow II

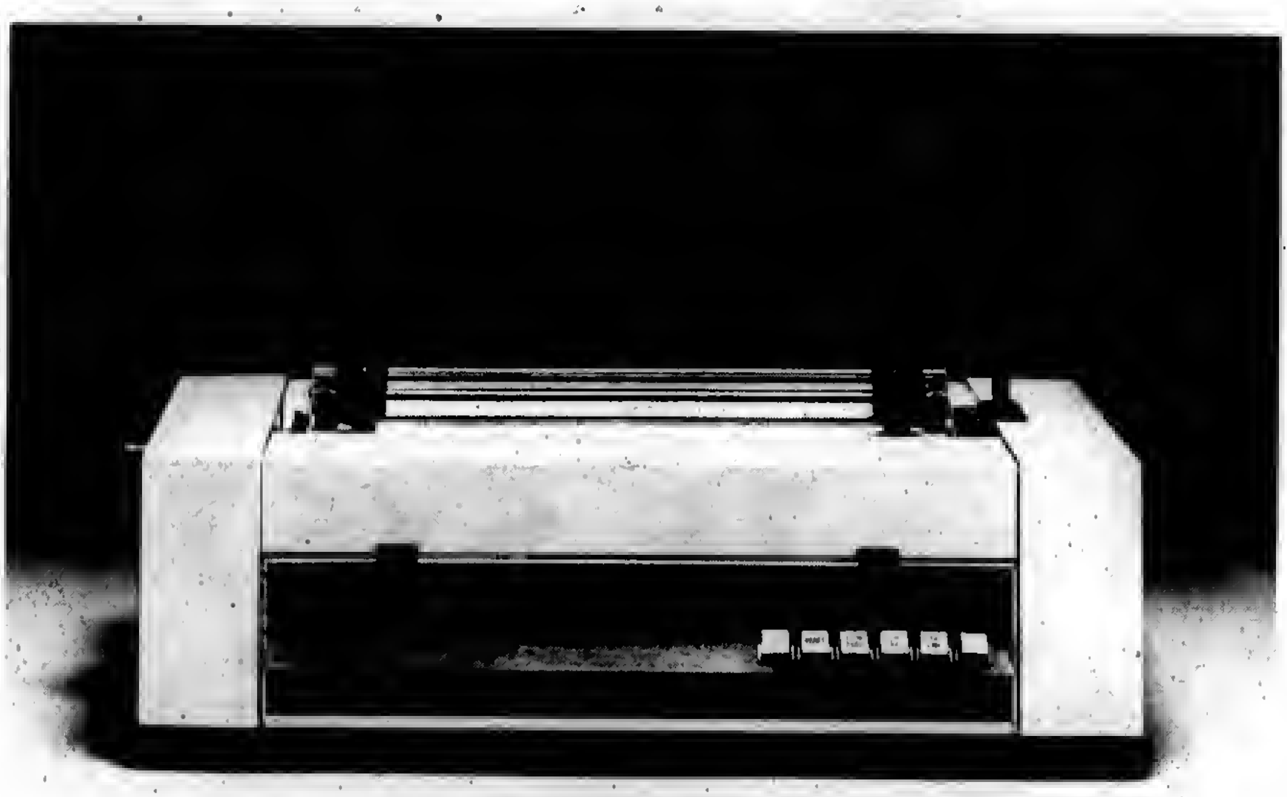
Now you can expect even more from Lear Siegler.



Printers.

Introducing Lear Siegler's new 200 series printer.

Our revolutionary Ballistic™ printer head design makes us unique among printer manufacturers. Unlike other matrix printers, there are no solenoids, and thus no moving cores attached to the wires. The Ballistic™ head uses small "swatters" that ballistically propel the matrix wires. This simplified system has eliminated clogging with inks, dust and paper fibers – so the Ballistic™ head requires no preventive maintenance. If you have a requirement that calls for continuous printing, and the cost of service is important to you, our 200 series printers will give you the lowest cost of ownership.

Lear Siegler's new 200 series printers are designed to have at least 10 times better reliability than presently existing printers. Remarkably, the Ballistic™ heads are capable of printing up to 1 billion characters before needing a replacement. And with a fully-buffered input for bi-directional printing, you can print an original and 5 copies at 180 cps. With no head adjustment.

Compare this with the up-to-now-best printer's head, which needs constant adjustment, and lasts only for about 100 million characters. If you were lucky. And many times you weren't.

So if you're tired of depending on luck, and need non-stop output, you owe it to yourself to look into our new printers.

You'll like what you see.

To Integrate Budgets, Accounting

Financial System to Straighten N.Y.'s Books

By Catherine Arnst
CW Staff

NEW YORK — New York's financial crisis of the past two years finally forced the city to design its first centralized financial management system, although the suggestion for one had been made at least two years earlier.

Jan Lodal, executive vice-president of American Management Systems, Inc. (AMS), designer of the system, had worked on New York's payroll system prior to the fiscal crisis in 1975 and had written studies suggesting an integrated centralized system.

When state and federal laws connected to the city's financial rescue required such a system be built, AMS was contacted again because "those studies proved right," Lodal said.

After 18 months of design and development, New York's Integrated Financial Management System (IFMS) was installed by AMS July 1.

IFMS will integrate the city's budget and accounting applications for all its agencies and the end result should be auditable financial statements for the fiscal year ending June 30, 1978.

The system runs on two IBM 370/158s and there are about 200 Genesis One G77 CRT terminals tied into the system, which allow agencies to retrieve information but not alter or input any data. All data is currently entered in a batch mode on 35 IBM 3277 terminals in a central location. Eventually, some data will be remotely entered, Lodal said.

6 Billion Bytes Storage

The system currently has 6 billion bytes of direct access storage available which will be expanded to a maximum of 12 billion. The system costs $16 million and is budgeted to operate at a cost of $10 million annually.

Prior to IFMS, New York's only automated financial systems were its budget, accounting and payroll systems. However, these were not integrated, according to Steven Clifford, special deputy comptroller. "There were a whole bunch of important functions that weren't being done," he added.

In December 1975, a report by Arthur Andersen & Co. highlighted some of the weaknesses in those systems. Among those cited were: lack of controls in the overall accounting systems and procedures; fund control structures that were not useful for control of revenues, expenditures and fund balance; expenses for contracts that were not recognized until vouchers were processed.

In addition, bank balances were not reconciled for several years and information on cash balances maintained by the comptroller and the director of finance differed by several million dollars.

One of the city's problems was that the comptroller and the mayor "were usually at each other's throats," Clifford said. To overcome that lack of cooperation, the Financial Information Services Agency (Fisa) — which is equally controlled by the comptroller and the mayor — was set up to administer the new system.

AMS was chosen to develop the system because Clifford had worked with it before and believed its personnel to be "the only people who could handle the job." City personnel and accountants from Touche Ross and Co. worked with AMS on the design.

Strapped for Time

"Our biggest problem was too little time," Lodal said. The systems contract was issued in September 1975 and the system had to be installed by July 1, 1977. That deadline was established by federal law.

"Almost nothing could be salvaged" from the existing systems and the city's accounting data was not in a standardized form. The city also never kept any inventory records of fixed assets, he added.

There was no time to accommodate the special needs of the different city agencies, Lodal said. Clifford described the system as a "top-down design. It had to be; with only 18 months to deliver.

"There was not as much input from agencies as would be expected. I wish the agencies had been more concerned," Clifford said. The result has been "numerous clerical problems and some grumbling, but I haven't paid any attention."

The system did start on schedule with only the usual start-up problems, Clifford said.

"As a big on-line system it's certainly not systems state-of-the-art — we had no time to be daring. But we do think it is applications state-of-the-art," Lodal said.

He added that no other city has a financial system of such size and flexibility, but "New York needs the best and fanciest because of its size."

The system issues about 200 reports, through an automated report distribution system, to about 2,000 separate user groups, allowing agencies for the first time to analyze their own financial data, Clifford said.

The programming is done in Cobol and operates under an information management system (IMS) which gives it great flexibility, Lodal said. Everything in the system is controlled by master tables which are core-resident but available to the system. This makes it very easy to use.

Afips Updates 1973 U.S. DP Summary

WASHINGTON, D.C. — Computer technology is a "nonscarce" national resource that is relevant to a broad range of policy questions, according to an American Federation of Information Processing Societies (Afips) study which is scheduled for release in October.

Updating a 1973 report by Afips, *Information Processing in the United States: A Quantitative Summary* estimates that the total computer labor force is 853,000 people.

While the insurance and banking industries have the largest number of firms using computer equipment or services, the manufacturing sector is the biggest computer user in the U.S. in terms of the amount spent on equipment and services, the Afips study found.

The report, which has already been presented to the White House Office of Science and Technology Policy, predicts that U.S. firms' world computer manufacturing and services revenues will double from $31.9 billion in 1976 to $64.0 billion in 1981.

Meanwhile, world computer equipment shipments for U.S. companies will also double from $15.9 billion in 1976 to $30.5 billion in 1981, Afips said.

Finally, the study shows that while the percentage of gross national product spent on computer usage in the U.S. is increasing dramatically, the amount spent per capita is increasing at an even faster rate.

The 85-page report updates the previous Afips study, entitled *The State of the Computer Industry in the United States.*

Intended to provide summary data on the information processing field, the report will be publicly available next month from Afips headquarters at 210 Summit Ave., Montvale, N.J., for $6.00 per copy.

MARKETING PROS

We need more marketing pros at Interdata

Our continued rapid growth and success as a top minicomputer manufacturer have opened up new opportunities for both product and market managers. Several levels of positions currently available include:

MARKET MANAGERS experienced with OEMs and end users in the business, simulation, and scientific marketplaces. Develop market strategy, coordinate advertising, offer sales consultation, analyze competiton, research markets and generally help us increase our market share.

PRODUCT MANAGERS with technical expertise, marketing savvy and experience with mini or mainframe vendors in:

- Processors—16 and 32-bit architectures, memory systems and I/O sub-systems.
- Software—OS's, Utilities, High Level Languages and Data Base Management Systems.
- Peripherals—Planning strategy with our affiliated companies, Perkin-Elmer Terminals and WANGCO, and our other peripheral vendors.
- Systems—integrating hardware packaged systems for special target markets.

Join the winning team at our attractive suburban headquarters on the Jersey Shore. Tell us about how tough you are in strictest confidence. Write or call me, Carl Whisner at (201) 229-4040.

We are an equal opportunity employer with virtually unlimited opportunities.

Programming Called 'Natural' Field for Blind

By Mary Kincaid
Special to CW

"Computer programming is a natural field for blind students to enter," according to Joyce Van Tuyl, a California transcriber whose braille transcriptions have launched a number of blind students into advanced math careers.

Van Tuyl, along with a band of other volunteers, has been a member of the California Sixth District State PTA Braille Transcription Project since 1968. A graduate of the University of Michigan College of Engineering, her sympathies lie with the thousands of gifted, intelligent blind young people who are inclined toward math and science. This is a group often turned away from their field of interest by counselors, who themselves may find math and science "impossibly difficult" and, therefore, unappealing.

Van Tuyl, who is fully sighted, signed up for the first adult education class in braille offered in Palo Alto in 1956. It was a providential choice. The tasks involved were intellectually stimulating and rewarding, and the need for trained personnel to learn the alphabet and the technique of transcribing it by machine was urgent.

15% Know Braille

Although braille transcriptions enable the blind to read textbooks, enrich their lives by reading the world's best literature, or follow new recipes from gourmet cookbooks, only 15% of the blind population knows how to read braille.

There are several reasons for this surprising statistic. Those who become blind as adults are often defeated by the enormity of their misfortune. They simply don't have the will to try to learn. On the other hand, the optimists don't want to learn because they believe their blindness is temporary.

In addition, many blind people are diabetic. They often have a reduction of the sensation of touch, preventing them from using their fingertips quickly to sense the pattern of raised dots that form the braille alphabet and other braille symbols.

During the '50s, better braille code was designed for math. The old math symbols, with positions both above and below line, and the incorporation of several foreign alphabets had prevented transcribers from using them in the rigidly coded single-line braille system used for text.

In 1952, Dr. Abraham Nemeth, now a mathematics professor at the University of Detroit, devised a way to adapt the existing braille system to incorporate modern math symbols.

Logical Link

"Computer programming," Van Tuyl said, "is a natural field for intelligent blind students, because from childhood on they have had to organize and systematize every aspect of their lives: Socks, kitchen utensils and furniture are all placed in specific places for ordered and efficient use. This is exactly the systemized procedure in which computer programmers must be trained to think. That practice sometimes even puts them ahead of sighted programming students."

A number of young Californians for whom Van Tuyl had transcribed textbooks have grown up and gone on to study advanced math. One boy received his BA in math at Stanford University, then took a Masters in operational research. Another of her students is now doing graduate work in computer science at Georgia Tech.

The Braille Transcription Project, sponsored by the Sixth District California State PTA, has been in operation for 21 years, not only training volunteers in transcription, but also in recording texts on tape.

Before a transcription is begun, a search is made with the American Printing House for the Blind, in Louisville, Ky., to see whether the requested text is already available. If not, a volunteer is assigned to the task.

Volunteers work at home on small machines that transform printed words into the raised dot patterns on paper. If that material is to be made into a book, these pages are duplicated a second time on more durable plastic sheets that will withstand the pressure of the readers' fingertips for a longer time.

Understandably, more pages and more labor hours per page are required to produce a book in braille than in print. The Transcription Project has produced such time-consuming volumes as Roget's *Thesaurus*, that in braille requires 45 volumes. A special system is used to transcribe music.

The project receives no funds from any governmental source. The thousands of hours per book are donated entirely by volunteers except for the paid work done by the blind proofreaders.

The Education for All Handicapped Children Act, passed in 1975, grants all children the right to a free public education. The federal government will now underwrite only 5% of these costs, but by 1982 will supply 40%. In the meantime, volunteers are needed.

Those interested in contributing to the cause may write to the National Braille Association, 85 Godwin Ave., Midland Park, N.J. 07432, or to the California Transcribers and Educators of the Visually Handicapped. Gifts and Tributes Chairperson for the latter is Margaret Parenty, 1103 Ortega Rd., Pebble Beach, Calif. 93953.

SYSTEM 70

The Intelligent Network Terminal
that does it all.

You need intelligent source data entry. *System 70's got it. System 70 reduces keypunching costs and increases reliability. And, it's got ADDS*PLUS, the special data entry language that makes customizing data entry forms a breeze.*

You need communications capability. *System 70's got it. System 70 provides remote sites with immediate information access to the central data base. And, it fits simply and easily into almost any new or existing network using any of several communication protocols including: Teletypewriter, IBM 2780, 3780 or 3740 and Burroughs. System 70 makes it* ***all*** *easy.*

You need local processing. *System 70's got it. Powerful programming languages such as ADDS*BASIC and ADDS*FORTRAN make it easy to accomplish local data processing functions on System 70.*

You need a remote print station. *System 70's got it. Distant offices generate hard copy using any of several ADDS printers ranging in speed from 30 cps to 340 lines per minute. No network terminal does it all like System 70.*

Because you need quality and reliability, you've got it. ADDS reputation for designing and building the finest equipment available is unsurpassed.

Quality, Reliability and Integrity. It all adds up to ADDS.

ADDS
Applied Digital Data Systems Inc.
100 Marcus Blvd., Hauppauge, N.Y. 11787
Telephone: (516) 231-5400

CRTs Help Drive-In Tellers Catch Forgers Red-Handed

Photos by Steve Stibbens

Drive-in teller uses a terminal from Signature Technology, Inc. of Dallas to verify signature.

LAKEWOOD, Colo. — Signature verification terminals in use by tellers at Jefferson Bank & Trust here are reportedly proving their worth in stopping forgers.

In the first four months after 52 Informer, Inc. Model 301 terminals were installed, Jefferson Bank's drive-in tellers caught three forgers red-handed, according to Sam Blackman, vice-president of customer operations.

When the tellers saw that signatures on checks averaging $600 each failed to match up with the authorized signature displayed on their mini CRT, they questioned the forgers.

Foiled in their attempt, the forgers sped off — but not before tellers copied their license numbers.

Teller in lobby calls up a signature from the bank computer's disk files for display on a 6-in. CRT.

The tellers kept the bad checks and the bank's money. Police got the forgers.

On-Line System Saves Lawyers Research Time

SAN DIEGO, Calif. — Law students and lawyers here can now save an estimated 70% in research time using Westlaw, a computer system that provides a list of past court cases on almost any subject.

Installed at Western State University College of Law about a year and a half ago, the computer facility communicates via an IBM 3275 CRT on-line to an IBM 370/158 located at the national Westlaw system in St. Paul, Minn.

The system contains summaries of every reported decision since 1967 for all state courts and from as far back as 1961 for all federal courts, according to James O. Werner, law librarian.

Westlaw retrieves information in summary form when an inquiry is keyed into the system and can save as much as a day of examining law reference books, Werner said.

The response to the system has been very enthusiastic, Finz said. People who have a prejudice against computers would change their minds once they tried the system, he said.

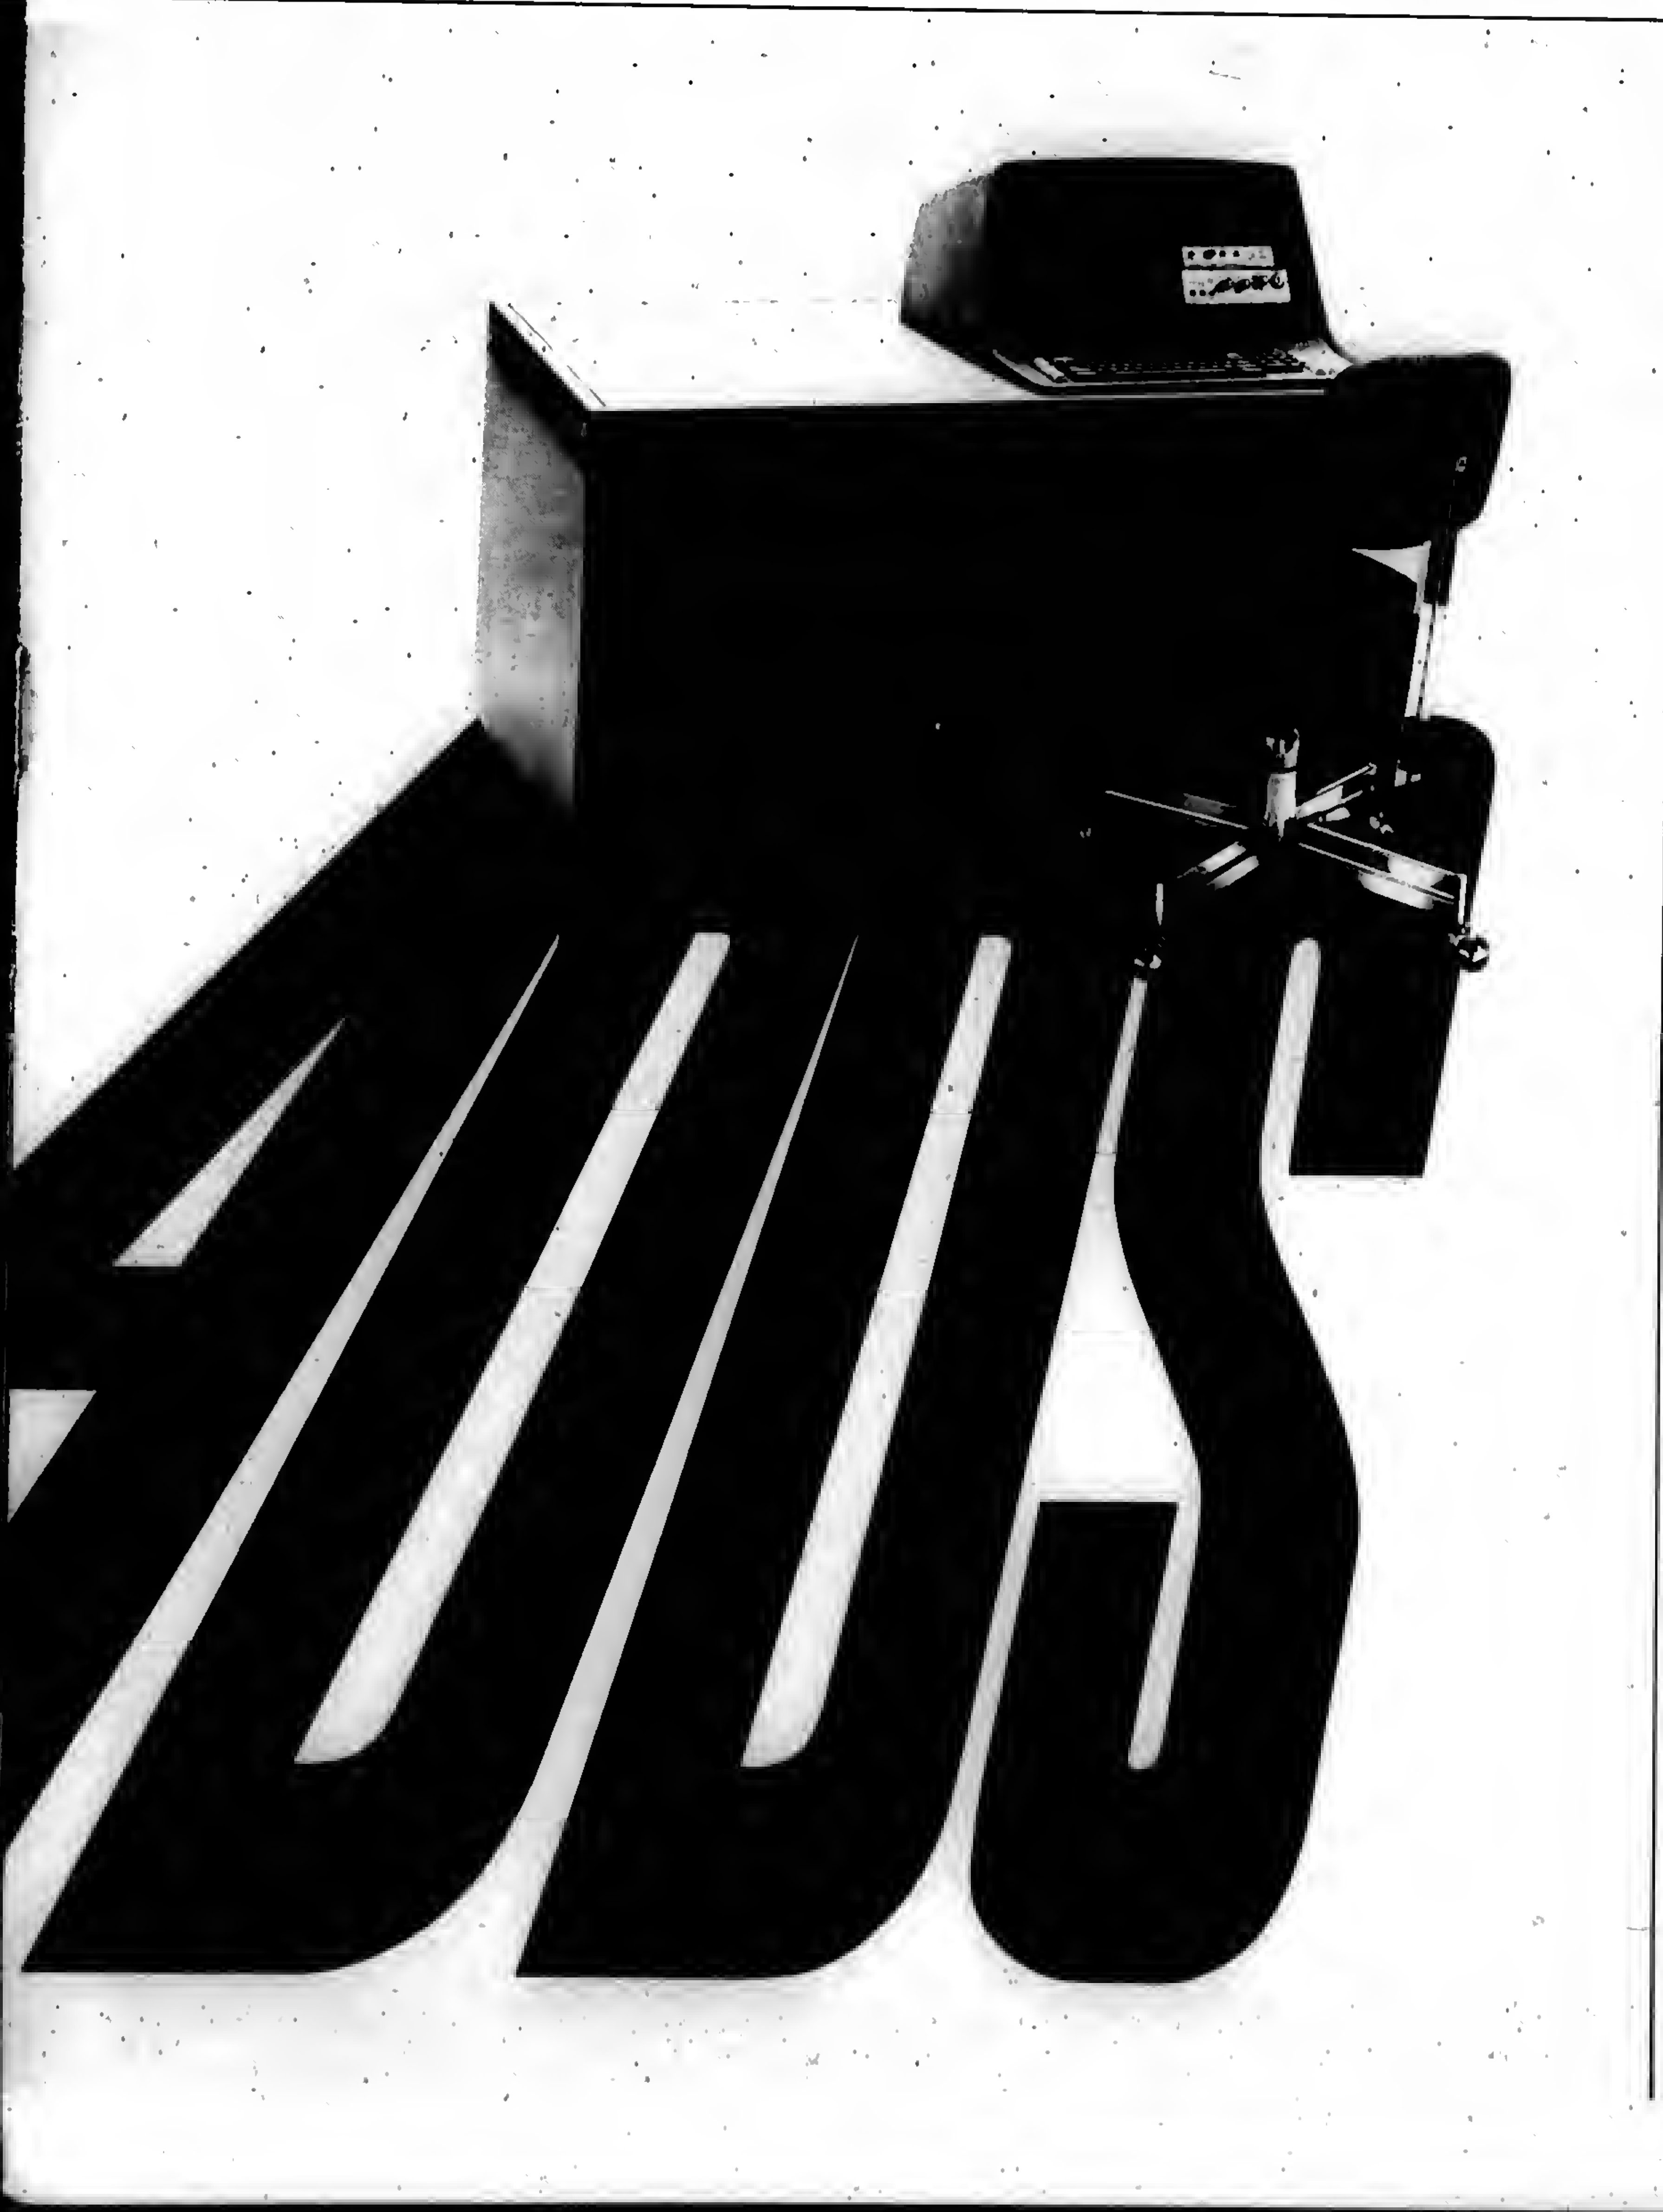
Westlaw is supplied by West Publishing Co. of St. Paul.

Liu, Ghosh to Take NCC Program Posts

MONTVALE, N.J. — Dr. Leonard Y. Liu, manager of the Computer Science Department at IBM's San Jose Research Laboratory, has been named chairman of the 1978 National Computer Conference (NCC) professional program. He will be responsible for the overall planning and implementation of the conference, to be held June 5-8 at Anaheim, Calif.

Dr. Sakti P. Ghosh, research staff member at the laboratory, has been appointed program vice-chairman.

The 1978 NCC is sponsored by the American Federation of Information Processing Societies, Inc. (Afip). Further information can be obtained by writing NCC '78, c/o Afips, 210 Summit Ave., Montvale, N.J. 07645



Editing System Expected to Save House $2 Million in Printing Bills

By Edith Holmes
CW Staff

WASHINGTON, D.C. — The U.S. House of Representatives estimates it will save over $2 million in printing legislative bills this year as a result of an electronic publishing system installed in April.

Operated by the House of Representatives Information Systems (HRIS) staff as a joint venture with the Committee Reporters' Office, the Committee on House Administration, several House committees and the Government Printing Office (GPO), the system is intended to cut the cost and time involved in converting hearings and committee reports to print.

After three months of limited operation, HRIS determined it had already saved the cost — $638,200 — of the Atex, Inc. CRT terminal-oriented composition and editing system, a spokesman said.

Using a Digital Equipment Corp. PDP-11 minicomputer to capture, edit and print transcripts, the system has reduced the average time required for printing hearings from more than three months to less than 20 days.

For example, the system made it possible for the House Ad Hoc Committee on Energy to print its June hearings within four working days after they were held, the Committee on House Administration reported.

The GPO can actually produce the original page copy for printing the same day a hearing is held, the spokesman noted.

Used by 19 House committees to prepare more than 250 transcripts and print more than 30 documents, at midsummer the Atex system resulted in a direct savings to taxpayers of $73.62 for each page that was composed electronically. The old hot-metal method of composing text costs $76.86 per page, while the new approach has averaged only $3.24 per page so far, including House and GPO personnel, labor and material costs, the GPO found.

The House figured it had to print a total of 8,669 pages before the equipment was paid for and real savings were received. As of July 15, the House had 8,664 pages ready for typesetting, the spokesman said.

The spokesman noted that the system has unexpectedly provided savings in another area as well: it has increased the speed and efficiency of the Committee Reporters' Office. The terminals have enabled more committee reporters to cover more hearings.

The House has not had to spend approximately $100,000 on commercial reporting services since the system has been in operation as a result of this increased reporter efficiency, the spokesman said.

Your investment didn't go down the drain when Gen Com did.

A lot of people think they're out of luck just because Gen Com's out of business.

Not true!

Because Design 100 is here to provide each and every Gen Com customer all the supplies, all the spares, all the accessories, all the enhancements they'll ever need.

After all, Design 100 is the company that built all Gen Com 300Q terminals until last year. And the ones Gen Com built on their own were based on our design.

So what could be more natural than Design 100 taking over Gen Com's customers?

No one's more familiar with the terminals. No one's more familiar with the problems. And no one's more familiar with the solutions.

We've even contracted with Sorbus to service all our terminals. Whether they carry our name or Gen Com's. Or, if you prefer, you can contact our nearest local distributor for service.

Take your choice.

Either way, with Design 100 the only things that go down the drain are your problems.

Emergency Registration Form

Dear Sir:
Help! Gen Com's gone, but my terminals are still here. Here's all the information you'll need to add me to your service and supplies list:

Name____________________

Title____________________

Company____________________

Address____________________

City____________________ State__________ Zip__________

I have ________ (number) Gen Com terminals; Serial Numbers as follows ____________________

Location of terminals ____________________

Please send me information on CleanPak, a Design 100 service that will save me money on printer terminal supplies.
If you need emergency parts or service, call us toll-free at 800-853-2865.

DESIGN 100™
Because clean is better than dirty.

Editorials

Do We Really Need It?

For years we have questioned the worth of the Federal Bureau of Investigation's computer-based National Crime Information Center (NCIC).

Now an independent panel of the Scientists' Institute for Public Information (Sipi) has also questioned the overall efficiency and effectiveness of the computerized system.

The earlier criticisms were mainly about the procedures used by the FBI to ensure that the racords contained in the system were both up-to-date and accurate.

Those criticisms are still valid, according to the new report.

But even more disturbing is the fact that Sipi concluded the system may not even be effective for its stated purposes.

For a "vast system, containing over six and one-half million records with 250,000 transactions per day, the 'hit' ratio was not demonstrated to be impressive.

"The actual henefits of NCIC still remain in the area of surmise, rather than demonstrated results," the report said.

In the past, many proponents of the FBI's system have argued that those benefits do outweigh the occasional violations of privacy and human rights that occur.

But now, even those benefits ara apparantly in doubt.

If the NCIC is as inefficient as charged even the arguments of efficiency are no longer valid — and clearly the system cannot be justified on its privacy record.

The NCIC should be taken out of the hands of the FBI immadiately and be constituted as a neutral independent agency such as that proposed by the original Project Search committee in the early '70s.

At the same time, the entire operation should be studied objectively and those parts which are found to be the most inefficient should be dropped out of the system.

As long as the NCIC is part of the FBI, that agency will continue to function more liko a national police force than like the federal investigative agency it is supposed to be.

If the NCIC is divorced from the FBI, that agency will be freed to do the job it was established to do — and the overtones ot "big brotherism" will be decreased.

And an independent study may find that we need no NCIC at all — finally.

Users Deserve to Know

IBM reportedly has several thousand orders for its 3033 processing unit — a CPU that clearly offers price/performance benefits for users.

At the same time, however, reliable reports both in the press and the user community indicate the firm will only build 800 to 1,000 of the units, which are not scheduled for initial delivery until next year.

Obviously, some users aro going to be disappointed when they find they are not scheduled to get their 3033s for quite a while.

IBM should immediately let users know when they can expect delivery of the new unit, so that users can make appropriate plans — including the 3033 or some alternative mainframe.

By playing it cozy with delivery dates, IBM will only serve to alienate more users than it satisfies.

Data Past

Five Years Ago
Sept. 20, 1972

WASHINGTON, D.C.— A draft revision of the 1968 Cobol standard was completed by the American National Standard Institute (Ansi) technical committee X3J4. Users were urged to comment before Ansi's full X3 Computers and Information Processing Committee began its formal consideration of the proposal. Under the plan, there was to be a nucleus and 11 functional processing modules in the complete ANS Cobol, rather than eight.

— — —

DES MOINES, Iowa — Des Moines police kept secret computerizad intelligence files on "persons of interest" for more than a year, and although some of the suspects were never convicted of any crime, the reports labeled the individuals as "known criminals." The descriptions could be made available, upon request, to law officials throughout Iowa, as well as police, FBI agents and other officials across the country.

Eight Years Ago
Sept. 24, 1969

Control Data Corp. separated the pricing of its hardware, software and services. At the same time, CDC announced a price increase averaging about 5% on hardware and maintenance.

General Electric, just before the CDC announcement, said it would not further separate the pricing of hardware, software and servicas. GE also announced price increases ranging from 3% to 5.1%.

— — —

NEW YORK — A microfilm retrieval system that made use of a remote time-sharing computer was damonstrated here.

The system, developed by DSI Systems, Inc., made it unnecessary for the user to have an in-housa computer available to retrieve documents from microfilm files. It was also much cheaper than maintaining data on tape or disk either in-house or at a service bureau, according to the company.

Letters to the Editor

Stronger, But Not Faster

I was somewhat amused by the implication in the article on the Voyager II computer problem [CW, Sept. 5] that the installation of the largest disk antenna ever used is resulting in a decrease in radio wave propagation time.

The size of the antenna, of course, will not affect propagation time. The increased distance involved requires that a stronger radio signal be transmitted in order that the signal strength, as received at the Earth, will be sufficient for reliable reception. The larger antenna effectively results in the transmission of a stronger signal.

Lakeland, Fla.

Cartoonist Needs Debugging

Jim Orton's cartoon about copyrights, on the editorial page of the Aug. 22 issue, looks like sour grapes to me.

The cartoon seems to imply that copyright lawyers who know something about DP are only interested in the money they can collect for rendering services to data processors by obtaining copyrights for them. I wonder how Orton ever developed such a notion.

It is easy for a data processor to obtain copyrights without the aid of a copyright attorney. All he has to do is write to the Register of Copyrights in Washington, D.C., and ask for a set of instructions and then follow them.

But a copyright lawyer familiar with DP can sometimes make the process simpler and less expensive.

There is a lot more to copyright law and program protection than just learning how to register a copyright, just as there is a lot more to programming than just reading a programming manual. There is a role for copyright lawyers, as well as programmers and even cartoonists, in society.

Let us debug your cartoonist.

IBM Sales in South Africa

An article in the Aug. 22 issue ["South African Users Tighten Belts"] implies that some IBM sales to Anglo-American Corp. in South Africa are inconsistent with a statement I made at our annual stockholders' meeting. That is not true.

What I said at our annual meeting was that IBM would not bid any business where we believe our products are going to be used to abridge human rights. We are satisfied, from the knowledge available to us, that the application mentioned in no way abridges human rights.

Frank T. Cary
Chairman of the Board
IBM
Armonk, N.Y.

Rigo 'Mandatory Reading'

Congratulations to Joe Rigo on his letter to Ken Lord in the Aug. 29 issue. Joa, I wish I had been the one to say what you said regarding the Certificate in Data Processing (CDP), the Certificate in Computer Programming (CCP), the Code of Ethics and professionalism in general in the data processing industry. This was one of the best reader commentaries I have read in the 12 years that I have been in the business. I have made it mandatory reading for my entire DP staff.

I agree with you that the Carmine Vonas of the world neither want nor need the CDP or CCP titles because they neither help nor hinder those people. Those who do need these titles will never be the Carmine Vonas of the world.

David A. Reser
Long Beach, Calif.

Meet Reveals DP Team Research 'Alive'

The Human Connection

By Jack Stone
Special to CW

Would you believe it? Several hundred data processing people plus a handful of sociologists and psychologists working beautifully together!

You and I both know that it was not a large-scale systems development project. The occasion was the annual meeting of the Association for Computing Machinery (ACM) Special Interest Group on Computer Personnel Research (SIGPCR), which spent two days in August grappling with the toughest set of problems facing DP management today — getting DPers to work and communicate together with other DPers — and users — and executives.

And what a job they did! In my opinion, it was the best organized and most meaningful conference of its kind.

I thought it might be useful to offer some general observations I made about the gathering and then discuss just a few of its many, many highlights.

First, I was very impressed to learn that so many projects dealing with DP team development have left the behavioral science laboratories and are now under test in "live" situations.

Second, I was rather overwhelmed with the quality and diversity of the topics covered in the conference. (This is a fancy way of saying that I felt like a rank amateur in this crowd.) But how knowledgeable are you about these ideas that were discussed?

They included structuring the organization "climate," "synergistic" EDP teams, the computer "job environment model," the theory of DP organization behavior and group effectiveness, the "creeping commitment" phenomenon, team "constituency," the DP "inspection team," "organic-adaptive" DP management, and "pluriprogramming"!

Third, there was a strong undercurrent of humility among the speakers and the audience. Most of the attendees seemed to feel, as did I, that the conference was breaking new ground in this most crucial field and a gigantic job lies ahead, but the effort is underway.

Now for a sprinkling of some of the high points.

Alonzo Grace of A.G. Grace and Co. has studied the application of the concepts and practices of structured programming to management problems In general, and DP systems management problems in particular. He observed that the recent stories of structured programming successes that have appeared in the literature have all involved productivity gains of *small* groups of people.

He has addressed the question of improving the productivity of the large DP organizations, seeking not the order of magnitude improvements that have been reported but rather a more modest 10% improvement per year sustained over several years. His approach is to view the productivity project as a systems problem to be attacked in an organized way.

Letters to Stone should be addressed to him at Suite 222, 2233 Wisconsin Ave. N.W., Washington, D.C. 20007.

However, he was quick to note that, for the large organization, a productivity project may be far more complex than any DP systems project because many DPers are not inclined to take DP organization strategies seriously enough.

Nancy Anderson and Ben Shneiderman of the University of Maryland talked about the use of peers, rather than managers, for the evaluation of the "quality" of programs. Their idea is to conduct an annual or semiannual review, administered by a practicing programmer. The review is not for the purposes of determining promotability or salary, but, for programmer education, improving cooperation and communication in the team, and self-evaluation. They are supportive of this approach in part based upon the practices of other professions, such as medical, psychological and academic, who typically use peer review boards to evaluate the quality of their work.

Philip Semprevivo, with the computer center of the State University of New York at Albany, presented some novel (to me, anyway) observations about team approaches to systems development. He noted, for example, that there is not, in practice, the team approach. Instead, there appears to be a wide variety of possible approaches.

The existence of this diversity derives from two factors. The first relates to the actual breakout of group vs. individual work, since the fact that a "team" has been organized does not necessarily mean the people will actually engage in group work activities.

The second relates to the notion of team "constituency" which helps to define the actual composition of the team, taking into account the formal versus informal modes of operation. He made explicit reference to a well-known adage (which we all ignore in practice) when he stated, "Groups whose organizations appear to be the same may possess very different informal organizations which affect dramatically the ways in which they operate."

David Skeen, with the Office of Naval Research, provided a thoughtful analysis of the involvement of users with DP systems development. In his introduction, he neatly identified the three major problems underlying the unending failures of software development projects when he said: "DP did not understand the area of application, the user did not or was not allowed to fully participate in developing the project, and commmunications between DP, the user, and top-level management deteriorated almost to the point of physical violence."

Finally, a personal note. My reason for attending the conference was to listen quietly (sometimes difficult for me) to the real experts in the field. Imagine my surprise and pleasure when Joan Franz, from the University of California, in her paper on DP group effectiveness, quoted liberally from a recent *Computerworld* article [Aug. 9, 1976] titled "DP Managers Must Stop Fire Fighting and Start Managing" written by that renowned authority, Jack Stone!

For information on SICCPR, contact ACM, 1133 Avenue of the Americas, New York, N.Y. 10036.

Loophole Crops Up on IBM/Australia Front

IBM World Trade's Ralph Pfeiffer narrowed the issues [CW, Sept. 5] but his letter showed up a loophole left by the Australian Parliament when it tried to forbid deceptive and misleading practices effective this July 1.

The Taylor Report

By Alan Taylor CDP

Apparently there is common ground in regarding any of the practices as wrong. Pfeiffer said the "Unfair Practices" section of the act is in keeping with the IBM guidelines on employees worldwide." But presumably, he would agree that what is wrong for individual employees is also wrong for the corporation itself. If so, we don't have to deal further with the question of right or wrong — merely with appropriate punishment. That simplifies matters.

However, his comment that IBM operations won't be strangled in Australia and that "It should be noted that contracts in force before July 1, 1977 are not affected by the amended act," does show up a loophole that arises from IBM's contracting techniques. It seems unlikely that the Australian Parliament was permittting any deceptive practices to continue after July 1 when it excluded contracts made before July 1. It seemed to have been seeing to it that people would not be punished for actions that were lawful when performed. Thus, any new computer or software that was ordered before July 1 presumably would not come under the Trade Practices Act.

What Pfieffer's letter draws attention to is that new computers can be announced and sold — even by deceptive and misleading practices which take place since the act went into effect — and yet may be excluded from its provisions! This is because IBM can claim that even newly announced machines are being sold under contracts that were signed before July 1 and which exclude or limit liability.

Under IBM's contracting practices, this is the normal state of affairs and apparently Pfeiffer believes that World Trade can indefinitely continue selling — outside the terms of the act — to the 312 or so current IBM installations.

Pfeiffer claimed he objects to open-ended liability for damages caused by World Trade. Apparently he wants some ceiling but does not suggest a specific one. Last April, IBM announced a new form of contracts which gave a ceiling of $100,000 or 12 monthly payments (about a quarter of the selling price) of the specific machine in question. Assuming Pfeiffer would propose a ceiling on a similar basis, let us see whether it would prevent a corporation that markets computers from profiting from deceptive practices in Australia.

The method of obtaining damages in Australia, as in most parts of the free world, is to take the matter to court. This can be expensive, and such expenses are often not under the control of the complaining party. The accused firm also has many rights under the court process and can, by perfectly proper legal

(Continued on Page 16)

What I Said Was . . .

Readers of Ralph A. Pfeiffer Jr.'s letter of Sept. 5 should know that the items he claimed I had stated are inaccurate interpretations of what I really wrote.

Pfeiffer said, "It is not true, as Taylor stated, that IBM is objecting to the 'Unfair Practices' section of the act." On Aug. 8 I wrote, "What is becoming clearer, however, is that what IBM is objecting to is Australia's action to make all firms, large and small, responsible *for damages caused by 'deceptive'* and 'misleading' conduct." It is that responsibility to which IBM still objects.

Second, Pfeiffer wrote, "Taylor also stated that IBM Australia's action could 'strangle' IBM customer operations there." In my column of Aug. 1, to show the power of IBM under its current contracts even with regard to non-IBM-owned IBM computers, I had written "Potentially, therefore, it would be possible for an IBM withdrawal to effectively strangle the use of any or all of the 312 installed IBM systems."

Letters to the Editor

Eyeing 'Big Brother Land'

All arguments and rationalizations that diminish the exclusivity of a mailing list are merely lubricants that grease the rails to "Big Brother Land."

The supposedly simple protective questions cited by Alan Taylor [CW, Aug. 15] are reduced to absurdities by their very nature. Consider the futility of attempting to define in advance those things that might "harm" or "embarrass" an individual at some future date or of predicting all the ". . . possible future uses of the information . . . "

Consider further the uselessness of the individual's being able to "withdraw approval" after some form of damage has already been done.

Obviously, if each compilation of personal data is treated as an absolutely exclusive domaln, vast redundancy and inefficiency will exist. However, bettar that than the slow erosion of privacy which (future technology permitting) must ensue if various sources of Information are exchanged and integrated until, quite logically, the entire society is included in one monolithic data base.

Sheldon J. Baer
Los Angeles, Calif.

Unjustified Assumption

Regarding the "Taylor Report" of Aug. 15, about selling DP lists, I think he has adopted the popular idea of today that all nonprofit organizations are good and all profit-oriented organizations are the bad guys.

I think this idea is too often unjustified. If, for example, the average corporate profit is about 5%, and I believe it is this or less for the latest year compiled, then similar nonprofit organizations should offer services that are at least 5% less cost per unit.

The nonprofit groups incur no property taxes, no sales taxes and no income taxes. In addition, they are entitled to reduced postage rates.

They often receive free labor from volunteers as well as discounts on purchases.

Do their services cost 5% or more less?

Robert Lumhrix
Marshfield, Wis.

STC Not Only Producer

The article entitled "STC 'Super Disk' Sales Enjoy Rapid Growth" [CW, Aug. 1] contained a glaring mistake.

In that article, it was stated "Today, the company has more than 15,000 tape drive installations and, except for IBM, is the only manufacturer in the world producing drives with a recording density of 6,250 bit/in." This is not exactly correct. Telex Corp. has also been producing 6,250 bit/in. tape drives as have both Siemens in Germany and Fujitsu in Japan.

In the OEM marketplace, Pertec Computer Corp. and Telex are also producing 6,250 hit/in. tape drives.

M.A. Lutvak
Memorex Corp.

4-Bit Word Too Short

In reading "Micro Programmers Seen Facing Old Prohlems" [CW, Aug. 15], I was struck by I. Barron's audacious suggestion of a 4- or 5-bit word.

4 bits allow 16 combinations; 5 allow 32. "English and a few numbers" indeed! Presumably, these would be numbers 1 through 6, and no spaces or punctuation.

Much data processing requires upper/lower case as well as the absolutely basic alphabet, numbers and a dozen or so punctuation marks. The minimal word length to allow this rather standard character sat is 7 bits.

Multilingual bibliographic (or any taxtual) processing really demands diacriticals, bringing the character set up to about 240-250 characters.

I would be delighted to see Barron's proposed 5-bit character set (it might handle Hawaiian). His 4-bit set should be even more instructive for English.

Walter C. Crawford
Walnut Creek, Calif.

For Conservation's Sake

In view of the current emphasis in many areas on conservation, especially in regard to DP and its use of paper, I would like to suggest what I regard as a potential for tremendous savings.

The idea is simple yet far reaching. Have the writers of language translators eliminate the needless page ejects between the EXEC card, source code, end of source code, various tables and maps, diagnostic messages, link edlt, cataloging status report and the end of job indicator.

In a typical compile, you probably have half a dozen pages with four or five lines printed on each ona. Not only are these page ejects unnecessary, in some cases they are unwantad. I would prefer to have the phase name on the sama page that the source code begins in order to eliminate confusion and possible loss of this valuable Information.

I make infraquent reference to literal pool, register assignment, field definitions and displacements, so I could care less if they do not each begin at the top of a page. What is essential is that I be able to find them when I need them, and I could still do thls with ease.

Two specific examples from my installation are:

- An 84K, 53-page Ansi Cobol compile could be reduced to 48 pages.
- A 14K, 12-page RPG II compile could be reduced to 7 pages.

The beauty of thls suggestion is that there is no trade-off required to achieve these savings.

Jack O'Connor
Conway, S.C.

Loophole Appears in Law

(Continued from Poge 15)

stratagems, push the cost of the suit above the $100,000 mark.

In the case of Australia, as with most World Trade countries, the cost would almost inevitably be above such a figure.

In fact, it would most likely be necessary to send lawyers from Australia to Tarrytown, where Pfeiffer's headquarters are, for instance, to find out what the corporation knew about potentially concealed defects. Even after visiting Tarrytown, the lawyers might well have to cover much more ground to track down IBM's knowledge. As a result, the damages ceiling would soon be reached in costs even before the trial started.

Furthar Victimization

So, a $100,000 ceiling would simply invite the further victimization of a complaining customer — which is what the Parliament clearly wanted to avoid happening in that country when it outlawed the enforcement of such limitations.

In fact, it seems likely that the victim's costs could reach a $10 million ceiling. Pfeiffer has given no indication that he would accept a $10 million ceiling, even though it would not be "open-ended liability."

Nor is the matter restricted to Australia. IBM tells me that when open-ended liability was being considered elsewhere, the firm took similar action. Where and how often I don't know, but it appears to be the general World Trade policy not to trade where it can be held fully responsible for damages it causes.

Hopefully World Trade will divulge its rationale for wanting to deny victims of admittedly wrong behavior their right to fully recover any losses. Such an explanation would fill a large void in the public understanding of the IBM vs. Australian Trade Practices issue.

HP 2648 - a bright idea in graphics terminals

The controllers

The HP 2026 keeps the data flowing

A bright idea for a graphics display

The world of graphics is expanding to serve more and more people. High-performance graphics, previously found only with more expensive systems, are now available on the new HP 2648 which has microprocessor control and uses raster scan technology.

The advantages of refreshed raster scan technology are a continually bright display and selective erase— the ability to make changes without having to redraw the entire image. Raster scan graphics require a bit of memory for each displayable point. Low-cost, high-density semiconductor memory now makes this technology economical.

Ready to plot

The HP 2648 is usable the minute you turn it on. The terminal was designed to be system and software independent, to solve real world problems right away without additional investment in software. All the graphics capabilities are hardware and firmware implemented and executable as simple keystroke functions. Off-line, the HP 2648 can record locally-generated drawing commands on optional tape cartridges, play them back, and support graphics program development. With a CPU complement, the user can interactively create more sophisticated graphics.

◀ *Cover*
The design on the screen of the HP 2648 was zoomed to a 10 times magnification. The pattern used emerged from that enlargement.

Auto plot

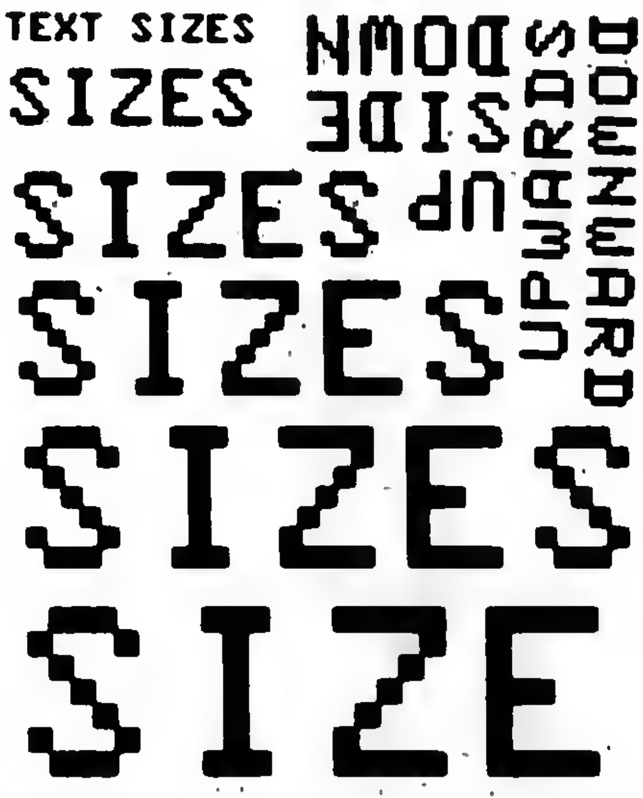
User-generated tabular data can be automatically plotted with X & Y axes. The data can originate from a computer program, from the mini-cartridge, or from the CRT screen. A simple set of questions, in the form of a "menu," is displayed for the user. After first answering these questions — thus defining the data parameters — the user starts the plotting with a single keystroke. Within seconds, and independent of any system or software, the data is plotted. Sophisticated graphic representation of data is now available to more people in business, education, science, and management.

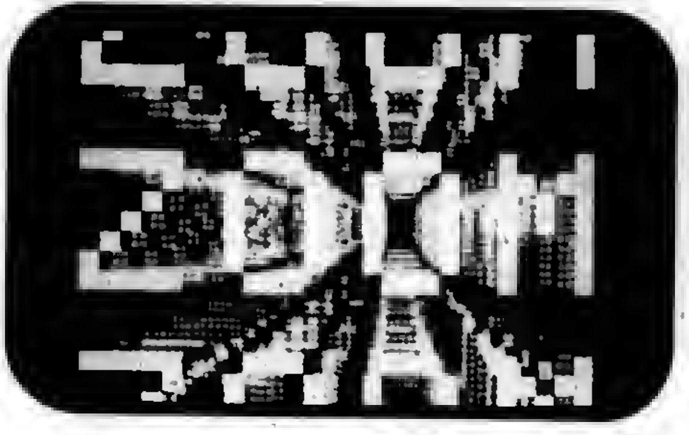
Try it first

There are times when you want to change your drawing without disturbing the data points stored in the CPU's memory. The rubber band line offers a snappy solution to such trial sketches. Line drawings, such as architectural floor plans, can be made and modified quickly. They can even be recorded off-line on the optional mini-cartridge tapes for later batch transmission.

Choices galore

As a user of an HP 2648, you can choose characters of varying shape, size, and orientation, and can right/left justify.



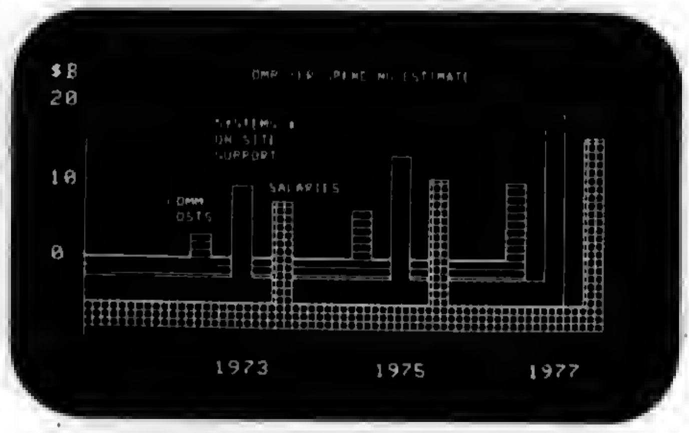


Zoom and pan

Select an area of your display; move right in and magnify it. Zoom one step at a time, or with the touch of a key, zoom automatically to sixteen times the size. Then, pan in any direction through this enlarged display for closer investigation of complex designs. You do not need to reinitialize the data, since the graphics memory has not been disturbed. As zoom and pan are under microprocessor control, they are system and software independent. Without any special software packages or user programming, you can zoom and pan on or off-line.

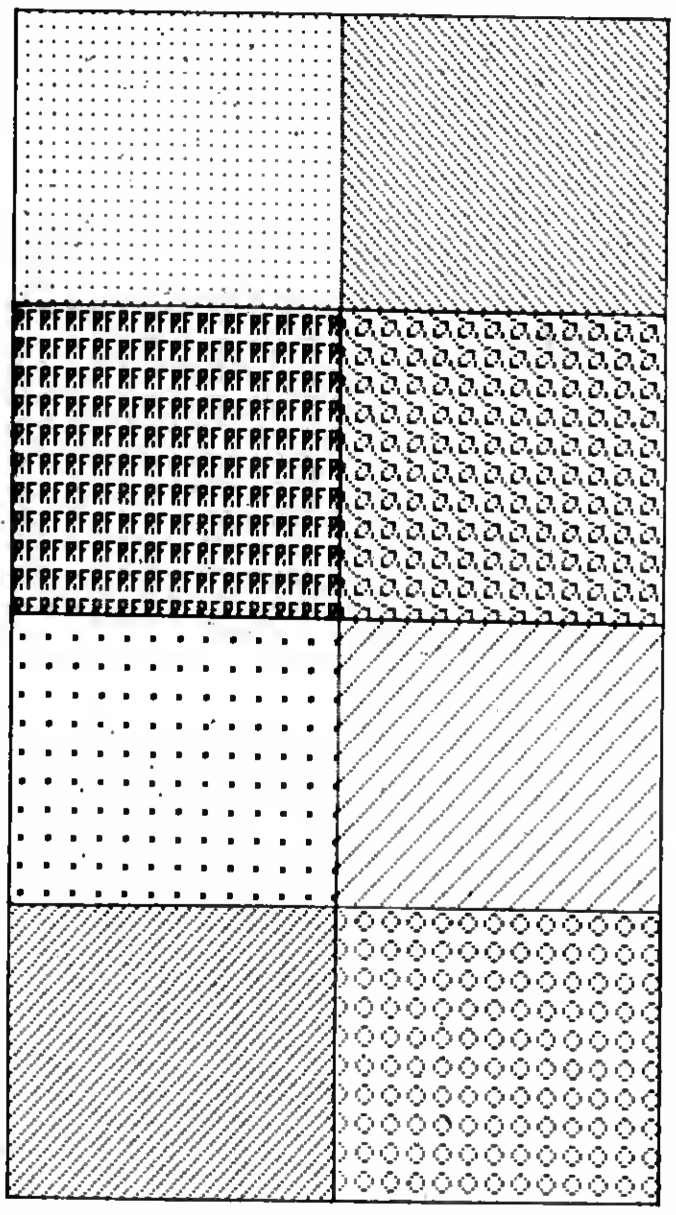
Now you see it, now you don't

The independent alphanumeric and graphics displays each have their own separate random access memory (RAM). So you can view the displays independently or both at the same time. Either memory can be suppressed without disturbing the other. Interact with the CPU/program in one memory and view the resultant picture in the other. This feature makes the HP 2648 perfect both for program development and trial-and-error graphics generation.



Shade your drawings

Rectangular area shading helps distinguish similar shapes. The user can specify different portions of the drawing to be shaded with any of eight available patterns or with his or her own design.



Two terminals in one

The HP 2648 is a dual-capability terminal. Not only can it do sophisticated graphics; it also has those characteristics of HP's 2645 data entry and communications terminal that make programming so easy. These include flexible communications protocols, eight user-programmable keys, full editing, block or character transmission, and off-line data preparation with the dual mini-cartridges. This graphics and alphanumeric combination results in an especially versatile tool.

In the U.S., the HP 2648 costs $5500; when equipped with cartridge tape drives, the price is $7100. Quantity discounts are available.

It is difficult to describe on paper what happens on the display of an HP 2648. **Check A on the reply card for a live demonstration or for more information.**

There's more than one way to weigh a mouse

There's more than one way to weigh a mouse because there's more than one Hewlett-Packard controller that can automate and control processes such as the weighing of medical research animals. Mettler Instrument Corporation of Princeton, N.J., for example, selected HP 9815 desk-top controllers for electronic balance systems that quickly weigh animals that don't want to be weighed. Hazeltine Corporation, of Green Lawn, N.J., on the other hand, plans to weigh fidgety animals using HP 2649 terminal/controllers. One of these products may be the way to solve your controller needs

Terminal controllers

Hewlett-Packard's 2649 is a versatile, microprocessor-based terminal/controller for which technically-oriented users can design their own firmware or hardware. With the help of a Technical Information Package, custom designing application firmware is a three-step process.

Application programs are first assembled on any system capable of producing 8080 object code, such as an HP 1000. Object code is transferred from the program development system to mini-cartridges using an HP 13290 development terminal.

The second step is to test and debug the application firmware by loading and executing these mini-cartridges into the RAM of the development terminal.

Then, application firmware object code is transferred to programmable-read-only-memory (PROM) chips for installation in multiple HP 2649 terminal/controllers. For high-volume applications, read-only-memory (ROM) chips are available from specified vendors.

There are two ways a designer can interface the HP 2649 to external devices. With HP's standard interface cards that provide for serial or parallel data transfer, the user need only fabricate a cable to complete the interface. If the application requires a nonstandard interface, users can design and build interface cards that plug into the back plane. The HP 2649 has eleven optional hardware slots available for I/O, display enhancements, or memory.

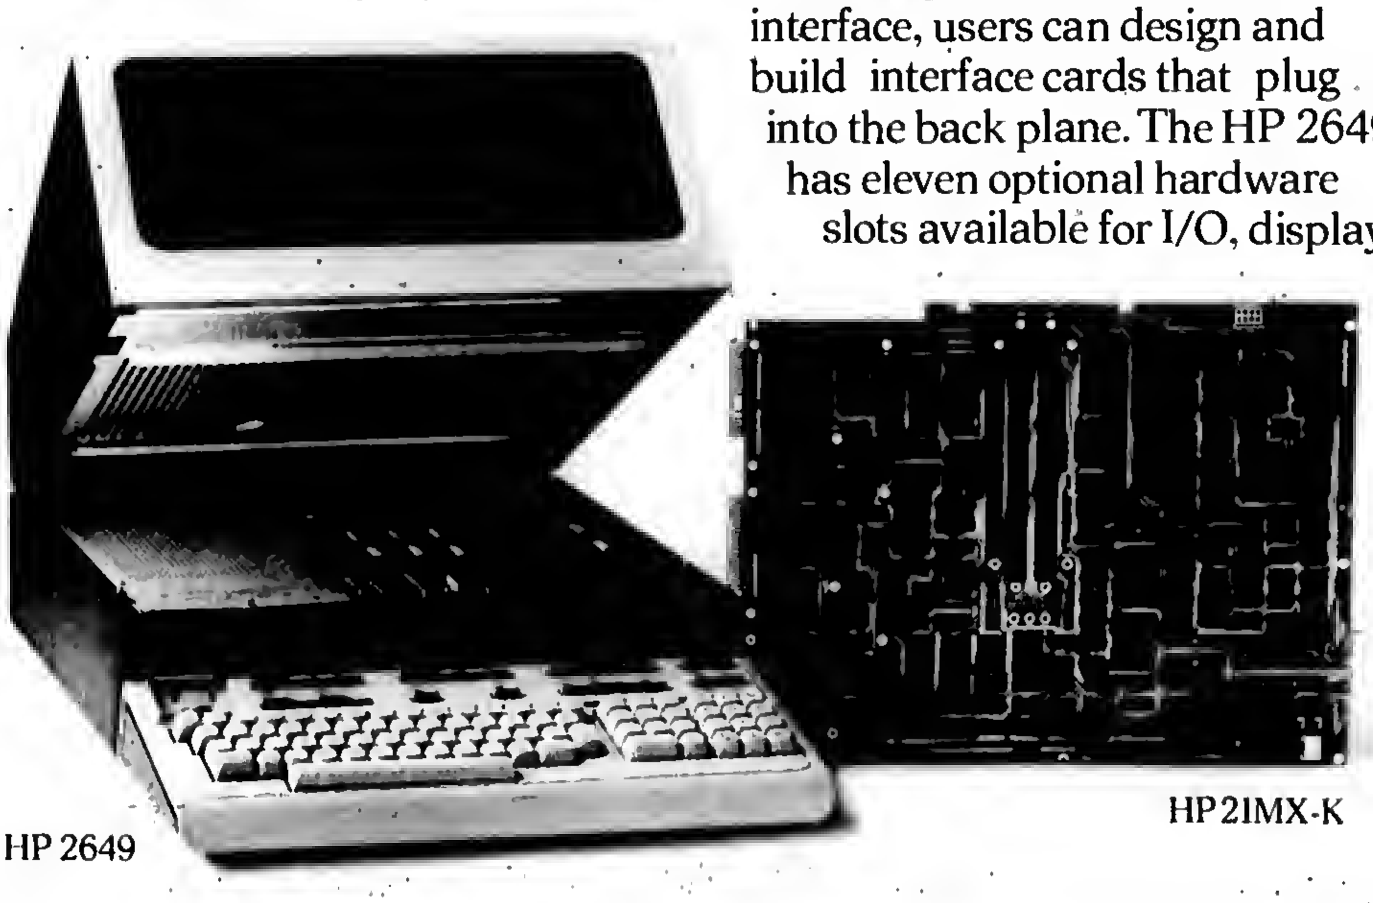
Inherent networking capability of the HP 2649 makes it an ideal tool for interfacing specialized devices to various mainframes. Devices controlled by the HP 2649 vary widely. Among them are laboratory scales, cash registers, typesetting equipment, and analog sensors.

Because of the software and hardware development needed to customize an HP 2649, it is most economical when a quantity of systems are needed for dedicated applications. In a business or industrial environment, where untrained people are using the terminal, the customized HP 2649, with its display screen and modifiable keyboard, becomes an especially friendly interface. The HP 2649 costs $2150.*

Buy a board, build a system

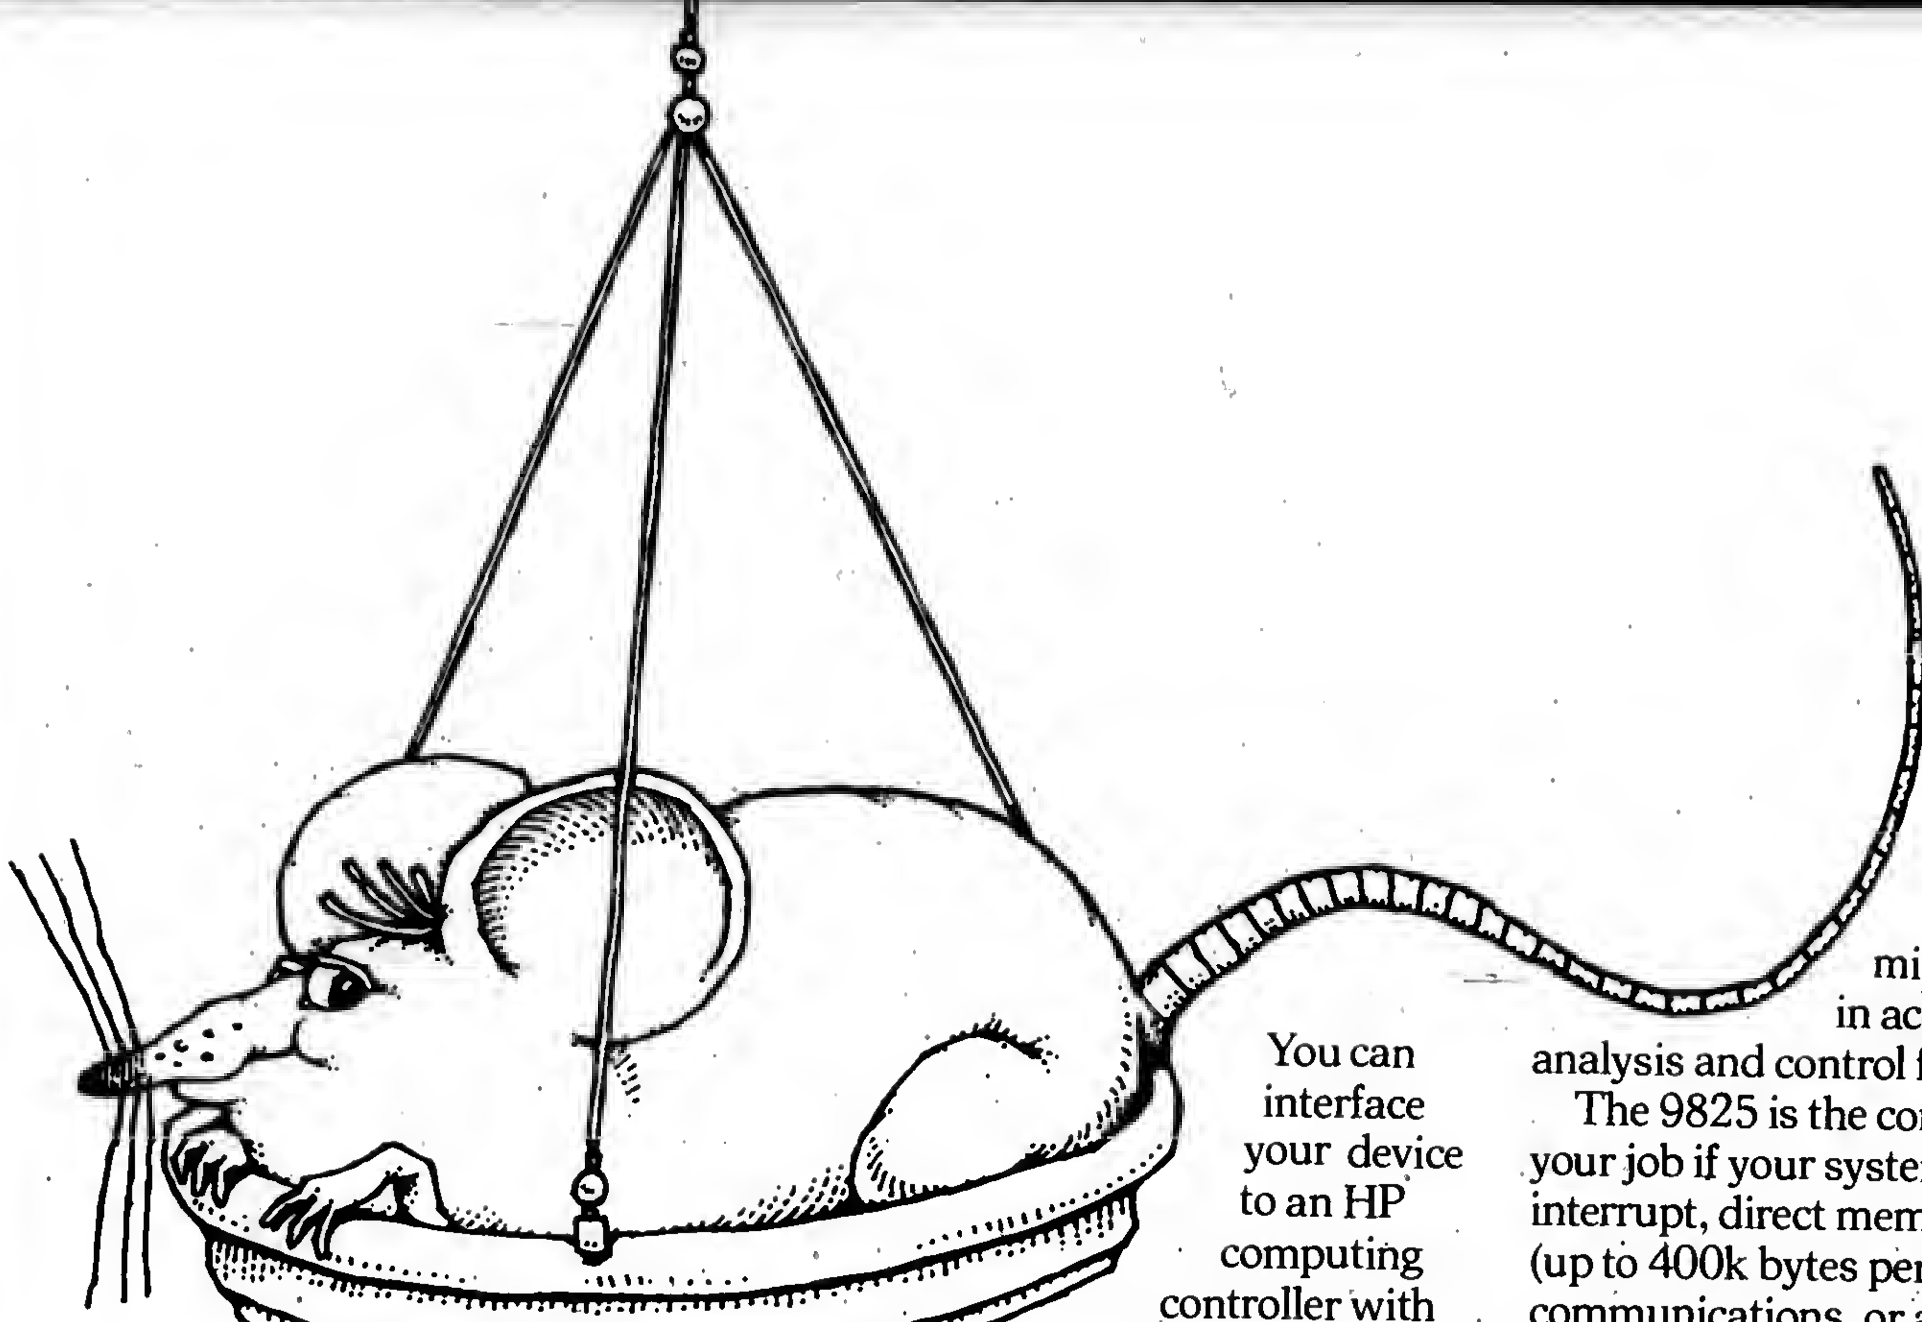
For the OEM designer who needs the power and flexibility of a microprogrammable minicomputer, HP offers the K-series processor, a component version of the 21MX computer family.

Designed to fill the need for high-power processing in a low-cost form that integrates easily into OEM systems, K-Series components offer flexibility in configuring inexpensive products with the full power of a minicomputer. The K-Series can be a full minicomputer that is hardware and software compatible with HP's entire 21MX line. Or, systems engineers can gain direct access to an extraordinarily fast control processor with 325 nano-second cycle time and 210 powerful microinstructions.



HP 2649

HP 21MX-K



Among the many systems applications which can use the speed and power of K-Series components are spectrophotometers, numerical control units, smart data-entry terminals, word processing equipment, graphic display systems, medical diagnostic systems, and many kinds of test equipment. Because the K-Series uses the same I/O scheme as the 21MX family, a wide selection of subsystems is available. These include interface cards for data communications, measurement and control, HP-IB**, and all of HP's broad range of computer peripherals. Prices for the processor board (OEM quantity 100) are $975.*

Just plug them in and program

HP computing controllers, the 9815 and 9825, make system automation easy and direct. Unlike microprocessors and minicomputers, these controllers are integrated in a small, self-contained package that includes printer, tape storage, display, and keyboard. And, you get an operating system and high-level language (pre-programmed in ROM) so you do not need to learn machine language.

You can interface your device to an HP computing controller with a minimum of development time. The physical connection is an off-the-shelf interfacing card with a pre-programmed I/O driver in its read-only memory. You choose from four different interface options — BCD, bit parallel, bit serial (RS-232-C), or HP-IB**. Just insert the card into the controller, and connect the cable to your product. The controller is ready to be programmed for your application using a powerful but simple-to-learn, high-level programming language. HP 9825's HPL provides the ease of BASIC with much of the power of FORTRAN. The HP 9815 uses reverse polish notation, RPN.

Computing controllers manage your instruments, gather data, and process the data to present it in an understandable form. For selected medical and analytical instrumentation applications, and for many measuring systems, HP's computing controllers deliver performance paralleling that of many minicomputers in acquisition analysis and control functions.

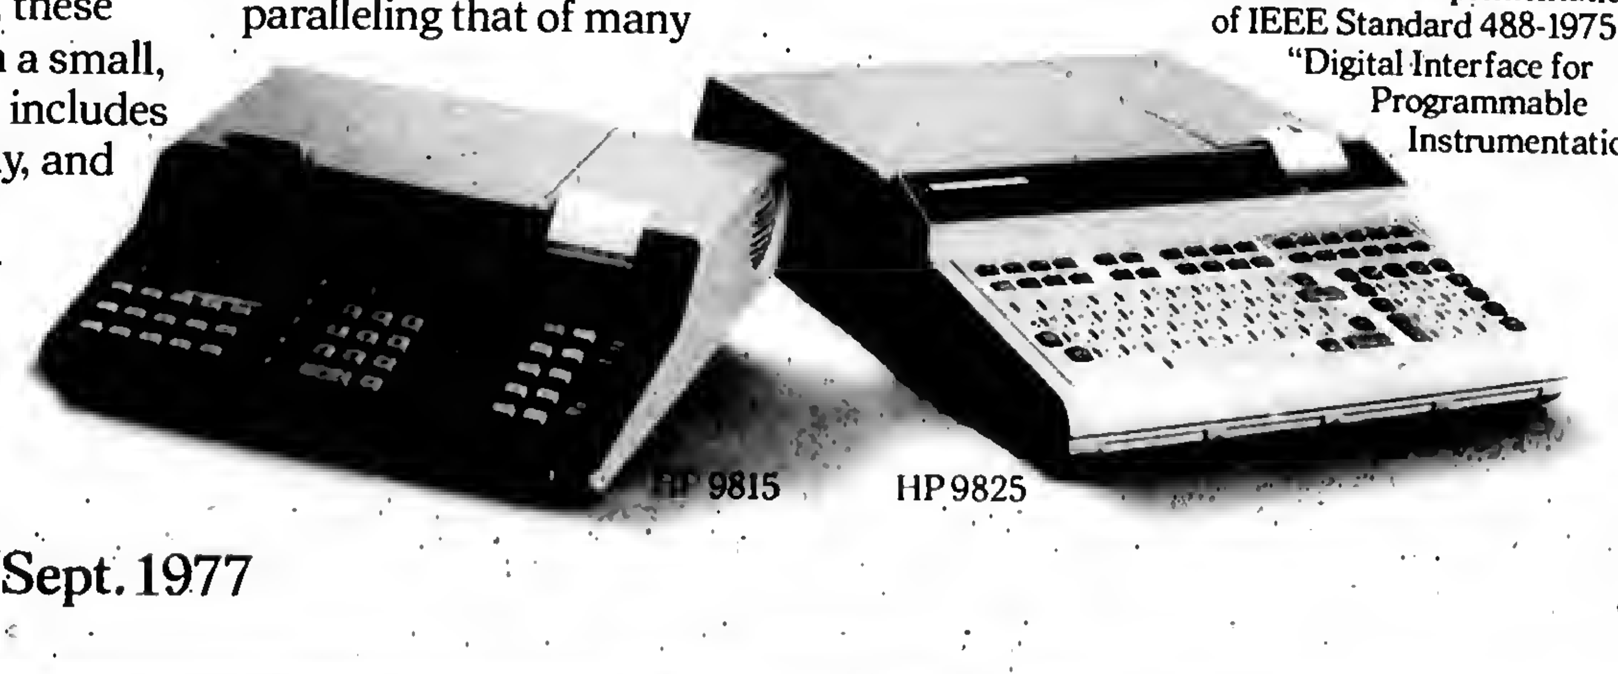
The 9825 is the controller for your job if your system requires interrupt, direct memory access (up to 400k bytes per second), data communications, or automatic data entry at random times; or if you will be working with data bases of more than 100,000 bytes. If these capabilities are not essential, consider the HP 9815. It is the perfect cost effective controller for systems of one or two input or output devices.

The HP 9825 is the first small desk-top computer with interrupt capability. Interrupt gives the controller flexibility to respond to several independent devices that require service at unpredictable times. "Live keyboard" capability enables you to interrupt the 9825's processing to calculate or to interrogate — for example, to monitor a program, or to alter a variable while a program is running.

The HP 9815 is available for $3100*; the HP 9825 for $5900.* **For more information on HP's controllers, the 2649, 21MX-K, 9815, and 9825 indicate B, C, D, and E respectively on the reply card.**

*U.S. domestic prices only.

**HP-IB is Hewlett-Packard's implementation of IEEE Standard 488-1975, "Digital Interface for Programmable Instrumentation."



The HP 2026–and how it keeps the data flowing at Hewlett-Packard

Hewlett-Packard's 2026 data entry and communications system takes a dramatic step beyond traditional data entry. Besides source data entry, it also supports local data storage and retrieval, data communications, and remote job entry —all in a single proven package that costs $38,500.*

The terminal-intensive HP 2026 system is suited to large companies with geographically-dispersed locations. It satisfies their need to enter, store, and retrieve data locally, yet process it elsewhere.

Source data entry

The powerful Data Entry Application Language (DEAL) makes the development of data entry applications quick and easy. With development of screen formats at a central location, DEAL ensures that the same set of screen formats and edit specifications are used throughout the HP 2026-based network. Source data entry, then, is complete, accurate, and consistent.

Local storage and retrieval

File management capability gives users the ability to quickly scan and retrieve information locally. It eliminates the need to enter repetitive data, and allows sophisticated source data editing.

Point-to-point communications

Any HP 2026 system can act as a central data collection point within the network or transmit information directly to any other HP 2026. Use of innovative software technology results in significant reduction of data communications costs.

Remote job entry

An RJE capability allows any HP 2026 system to communicate directly with large computers, such as HP 3000's or IBM 370's.

The basic HP 2026 system consists of an HP 21MX E-Series processor and disc drive in a desk-style cabinet, and an HP 2645A console terminal. Each HP 2026 can support a total of sixteen additional page-mode multidrop, 9600 baud 2645A CRT terminals. If your applications require more than just data entry and retrieval, and you need sophisticated data management, data processing, or program development using traditional programming languages, Hewlett-Packard offers the multi-purpose HP 3000 computer system.

The HP 2026 was originally developed to meet Hewlett-Packard's needs. Today, after six years of intensive use, it affects virtually everyone at HP...

"Over 10 million words funnel through my data center every single day"

Bill Taylor, HP 2026 manager at HP headquarters, comments; "It's a flexible, all-purpose network that transmits any digital information. Our central system receives data several times a day from other 2026 locations around the world.

"Sixty percent of the data is marketing-related," Bill states, "such as customer orders and acknowledgements. Fifteen percent is accounting data, 10% is employee personnel/payroll data, another 10% is general message traffic, and 5% special files.

"An RJE capability also allows HP 2026 sites to directly communicate with larger host computers. Communication is possible via

---

*U.S. domestic price (currently available in North America and Europe only)

2780 emulation and multileaving HASP workstation protocols. All data communications and RJE programs can be executed concurrently with data entry."

"With just 20¢ and four hours I can send a message to any HP office in the world"

"It wasn't that way six years ago; our commercial TWX service costs were skyrocketing," reflects Bob Boniface, Hewlett-Packard's executive vice president of administration. "Now, with the 2026 network, 117 systems at any of 94 network sites can communicate with each other. And...the costs are descending, not spiraling upward."

"If I ever again had to enter orders the way we used to, I'd quit"

"I transmit over 3700 sales and service orders monthly," begins Carol Larsen, HP order entry clerk. "As I input an order, the HP 2026's CRT terminal prompts me through all the screens I need. And, it blinks to alert me if I make a mistake. Most errors are corrected at the terminal, so only valid data is transmitted to the system.

"We received the system 1:30 one afternoon," Carol relates, "and, by the time I went home, I felt comfortable using it. I didn't even pick up a user's manual—the terminal taught me with a 'how to' tape cartridge.

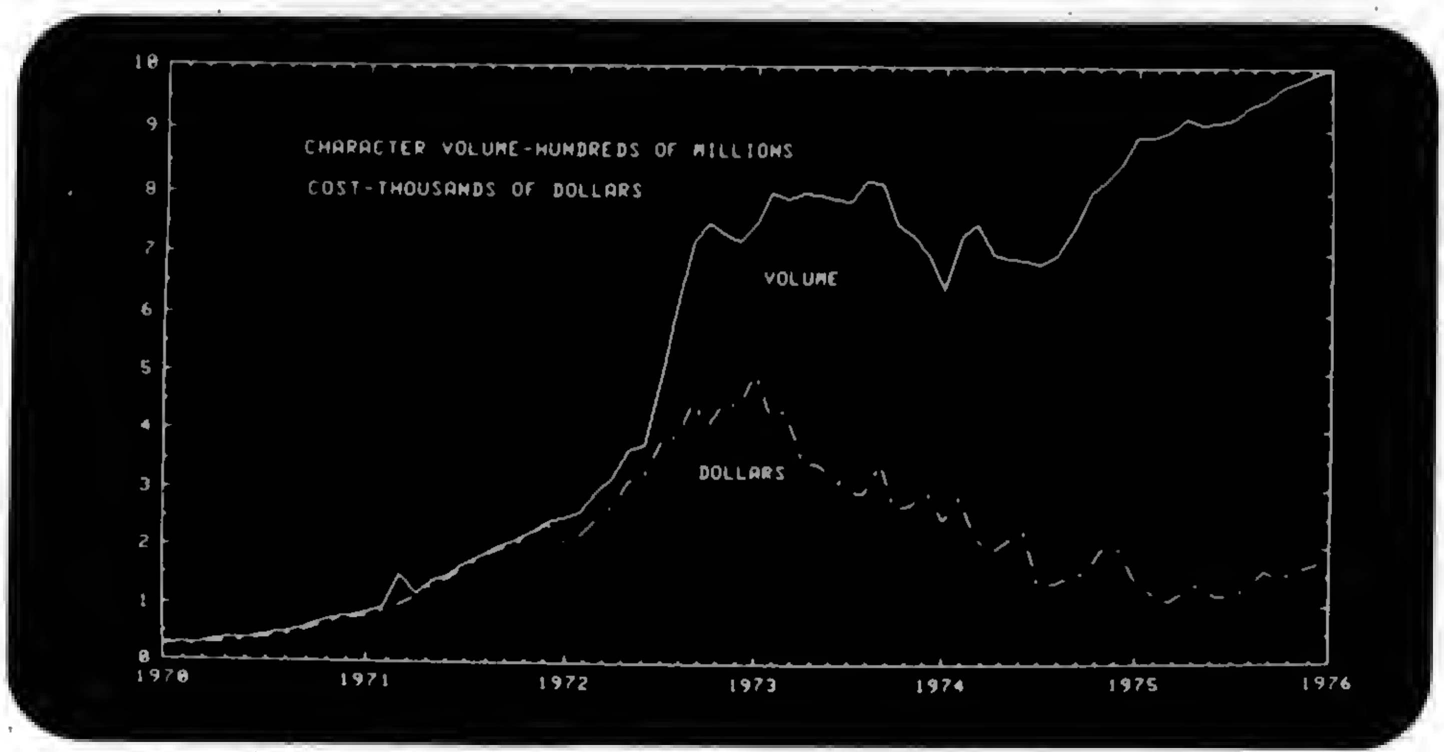
"Besides entering new orders, I can store and retrieve order status here, where we need it, to assure quick response to customer inquiries. If a customer calls me about an order, I simply key in that order name and number, and provide a timely status report over the phone.

"Plus, I don't have to type repetitive data. Our sales office assigns a number to each customer. By entering that number alone, I can retrieve and automatically include customer name, address, phone number, shipping destination, and other pertinent information—all stored on local files."

"We paid off all our capital equipment costs in nine months"

"The HP 2026 gave us a significant, easily-measured return-on-investment," says Hank Taylor, HP corporate marketing services manager.

The HP 2026 (cont.)



In the last four years, the domestic volume of data transmitted by the HP 2026 has more than doubled. But, during that same time, costs have decreased by 60%.

This graph was generated by "auto plot" on the new HP 2648 graphics terminal. (See page 3)

"Comparing data communications costs before and after installing the system revealed that, in less than a year, our line charge savings paid for the system.

"I also recall another significant measure. HP's data entry error rate decreased by 60% using HP 2026 system CRT's rather than former methods. This reduction in errors is also a result of the use of the HP 2026 Data Entry Application Language (DEAL). This powerful software simplifies and shortens the source data entry program development process.

"You see, our central data processing staff develops all data entry screens so that consistent formats and edits can be transmitted to each HP 2026 site. In this way, we maintain central control and ensure that everyone in the network is using the same set of data entry screens. All the development is done by one central data processing staff. Remote sites, of course, still have the capability through DEAL to quickly tailor our screen formats without data processing experts."

"HP'S 2026 is one of the most efficient point-to-point communication systems available"

"We use voice grade common carrier facilities and two HP 2026 data transmission innovations which make the system unusually efficient," explains Terry Eastham, lab engineer.

"A data compression/expansion technique used between HP 2026's typically compresses our data to 50% of its original volume," continues Terry. "Blanks, numeric strings, alpha strings, and redundant data are compressed and expanded by this feature. In addition, we use a reverse channel line protocol which can yield up to another 40% throughput improvement over normal bisynchronous techniques.

"The combination results in reduced data transmission time and, therefore, significant line cost savings."

Letters to the Editor

A Hearty Endorsement

I heartily endorse the sentiment expressed in the editorial of Aug. 29 entitled "First Things First." The continued development of the information sector is dependent upon public confidence that basic rights, such as the right to privacy, will be protected.

Problems arise when these rights collide with competing values such as freedom of information, criminal justice requirements, welfare reform, economic activity and oversight of government. Experience has shown that privacy protection must accommodate such values whenever possible; otherwise, it is privacy protection which is too often forced to give way.

National information policy should reflect the need for such accommodation by providing a focal point for choosing between competing values. In this way, it would neither threaten nor ignore individual rights but would instead be a major element in their preservation. Computer*world* has reminded those who will be shaping that policy of its importance.

Quincy Rodgers
Washington, D.C.

Rodgers is former director of the White House Committee on the Right of Privacy and project director of the "Report to the President on National Information Policy." Ed.

Advice for Mini Users

In the Aug. 29 issue, the report on a survey of over 200 mini users generally showed the minis were rated very highly, but there were some adverse comments on software.

As a user, I have found that if the jobs are small but complex, it is best to train the users to write their own limited software programs. If the jobs are complex with large amounts of number crunching, the best method is to use professional programmers. In either case, it is vital that users understand both software and hardware if they are to get good results.

With minis, the user comes closer to hardware and software, and with micros, hardware and software will often be on users' desks.

Under these circumstances, users of the future will prepare more of their own programs, Professional programmers will have to be more intelligent, sensitive, imaginative and even intuitive to meet the users on common ground. Programmers will have to understand users and the users might even have to understand the programmers.

James G. Ryan
Lexington, Mass.

Three Points to Make

The Aug. 29 issue contained three items of particular interest to me. The first is very important.

Robert Bigelow's letter in reference to Frederick Withington's testimony brings up a critical point. While a court might force a physician to reveal facts, I do not think it could force him to practice medicine, i.e., diagnose or treat a patient. In the same way, I feel the Arthur D. Little position is correct.

Second, Jack Stone's article on automated physicians is about as appropriate as some early thoughts about piloting planes. While coordinating the computer programming of all vendors on the Sage air defense system in the late 50's, I knew there were those who thought we could eliminate pilots. We still use pilots, accountants and part clerks. My organization uses computers to facilitate the work of physicians, but I'm sure the MDs will be around as long as the pilots, bookkeepers and the two men in the petroleum cracking plants.

And finally, Joe Rigo is very sharp after 13 years of experience in the field. When I had 13 years' experience, Roger Hallock of TAC taught me about whole new areas of pre-entry data organization. A few years back (17 years' experience) I discovered I knew nothing about data bases. Anything, even the Certificate in Data Processing, that broadens a practitioner's comprehension of the field is valuable.

Hugh Cort

Disturbed by 'Controls'

The article "Controls Urged on Technology" [CW, Aug. 15] disturbed me considerably. How a man (Josef Kates) from a free country can suggest "national controls on technological innovation" reaches far beyond my logical reasoning process. Surely he meant "guidelines" or "prevention of misuse" but not all-out government controls.

In the editorial "A Comforting Thought," in the same issue, an unnamed "Western Cybernetics expert" states "Americans have dealings linked with a computer at least 10 times a day." If that were even close to the truth, Mr. Kates' wishes, if ever realized, could have a profound effect on our lives.

"Technological sovereignty as a prescription for Canada's difficulties" is like a doctor prescribing cyanide to combat a cold. It eliminates the cold but kills the patient.

Wes Williams

Removing the rose-colored glasses.

A realistic look at *Data Base Management Systems* in the October 31st *Computerworld.*

In the ten years since Data Base Management Systems were introduced they've grown to a multimillion dollar subindustry in their own right. As late as 1973, less than 1,000 DBMS were installed; but International Data Corp. estimates that over 5,000 are in use today, and this number will increase to 8,200 in the next two years. This phenomenal growth has been fueled by the hoped-for benefits of DBMS, which include increased programmer efficiency, the elimination of redundant information in the data file, and greater ease in coping with system upgrades and reprogramming.

But a data base management system should be evaluated carefully before you commit to purchase. They have developed such a reputation as problem solvers that people tend to expect more from them than they can achieve, while overlooking or minimizing the effort required.

We'll have several experts on hand to help you arrive at a realistic understanding of DBMS in our October 31st special report edited by Don Leavitt. Here is a sampling of the kinds of articles you'll see:

- Combatting the "Holy Grail" syndrome — Being realistic about the benefits that are possible in relation to the effort required; how to assess whether DBMS will enable you to reach your goals.
- How well are installed systems living up to expectations? A review of typical problems that need to be overcome.
- The role of the Data Base Administrator in DBMS — including considerations like the physical arrangement of the data base.
- How dictionary packages, report writers, etc. interface with DBMS software.
- A review of selection criteria and the implementation process.
- How DBMS ties in with distributed data processing — matching intelligent front ends with intelligent back ends, for example.

As this short preview shows, our special report on Data Base Management Systems in the October 31st issue will interest people who are considering DBMS, as well as people who already have one installed. And if you market Data Base Management software, remember that your ad will reach more of your primary audience here. Ad closing date is October 14. Your *Computerworld* salesman has all the details. Or call Terry Williams at (617) 965-5800 to reserve space for your ad.

What makes them different is what they have in common.

What makes these units so practical, efficient and economical is the unique board design common to all three. Which means that even the lowest priced model has the same standard features as the top of the line unit. The difference in their functional capability is in the keyboards available with the COPS 20 and COPS 30. So, if you buy the COPS 15 and later want to upgrade the functions, you can add the COPS 20 or 30 *without changing the software*.

Write or call us at (203) 333-8339 and let us tell you how we can give you so much for so little.

Standard Features

- Characters per line — 80
- Lines per display — 24
- Screen Capacity — 1920 Characters
- Character Format — 7 x 9 dot matrix (10 x 12 field)
- Character Set — 128 ASCII
- CRT Screen — 12 inch diagonal, P 4 phosphor with etched face plate
- Display — White on Black or Black on White
- Cursor — Block or Blinking Underline
- Reverse Video (Character and Screen)
- Memory Type — 2084 x 8 Random Access Memory
- Auto Repeat
- Upper and Lower Case
- Bell
- Printer Port with on/off key
- 63, 80 and 104 Key Keyboards
- Cursor Keys up, down, left, right, home, CR, LF and Tab

Functional Capability

- Cursor address (absolute)
- Incremental cursor control
- Read cursor address

- Clear screen
- Clear to End of line/field
- Clear to End of screen
- Home Cursor
- Set hi/lo intensity
- Audible alarm
- Backspace
- Keyboard Lock
- Keyboard Unlock
- Insert line, Insert Character
- Delete line, Delete Character
- Tab/Back Tab
- Reverse Video By Character
- Inverse Video
- Cursor Commands, up, down, left, right, CR, LF, Home and Tab
- Transmission
  - Send Screen
  - Send Line
  - Send Message
- Protect Modes For Format

Communication Interface

- Full or Half Duplex/Buffered Transmission
- EIA RS 232C and Current Loop 20 ma.
- Switch Selectable Baud Rates — 110, 300, 600, 1200, 1800, 2400, 4800, 9600, 19,200

Poorly Developed Theory

The Aug. 22 column by Jack Stone, "Where Are the Operations Success Stories," contained a thesis I found poorly developed and unsubstantiated. Stone may have a wide circle of contacts but his implied conclusion that there are few successful operations is presumptuous and naive.

We all come to conclusions about our own experience and environment from time to time, but we cannot validly extend our conclusions universally without some kind of analysis, survey or substantiation.

I know of successful operations and of some rather less than successful. Condemning them all in a column of a widely read publication is old hat, passe, unrealistic and no longer interesting. I thought our profession was growing out of that tired approach.

Perhaps Stone was "baiting" readers. A simple request published in the column would have been more appropriate and perhaps more fruitful.

Jean A. Fowler
Raritan, N.J.

Umpires in the DP Game

In the Aug. 22nd issue, Jack Stone, in his search for a successful data processing manager (DPM), brought to light a tragedy caused by organizational hierarchy.

This company hierarchy includes everyone from the president to the lowest clerk. DPMs are somewhere in the middle, with roles similar to those of umpires in a baseball game. They must call the pitches (reports) but they have no control over the game (management).

Under these circumstances, DPMs must consider themselves successful when they do their job well, and then accept the boos as all good umpires do. It's a tough job!

Happy DPMs are those who are lucky enough to be either aware of or involved in the total operation of an enterprise. It was no coincidence that his one successful case was actually involved in a scientific problem.

James G. Ryan
Lexington, Mass.

Root of Antitrust Delays

I have just recently read the article in the May 9 issue entitled, "U.S. vs. IBM Shows Shambles of Antitrust Law, Senate Told." That article characterized my May 4 testimony before the Senate Subcommittee on Antitrust and Monopoly to the effect that "He, too, put the responsibility for defining the direction of these suits at the doors of the judges who hear them."

The title of your article, the above quote and your use of my statement to the subcommittee that I have "no defense" for the longevity of the IBM case make it appear that I singled out one government case for criticism, above other major government antitrust cases.

The article does not reflect my remarks in context, nor my views. I certainly did not criticize the competence or performance of any judge; my point was aimed at a larger, generic issue.

The thrust of my testimony concerned the government's failure to properly investigate and then to manageably define the issues *prior* to bringing massive antitrust cases. This lack of issue definition by the government, in cases of major economic (and social) consequence, places severe burdens on the judicial system when it attempts, under the liberal federal discovery rules, to manage pretrial discovery. This, in my view, is a principal cause of complexity and delay in "big" antitrust cases.

The problems of administering complex antitrust cases are generic and require across-the-board evaluation and solutions. Simplistic solutions suggested by others — such as an "elitist" group of roving antitrust judges — read better than they will play, and they miss the mark.

The essential problem is to find the means to quickly define the issues in these major cases and, without depriving the parties of due process, make discovery and trial manageable.

Ira M. Millstein
New York, N.Y.

CRTs Can Be 'Congested'

I was interested in the article "Caution: CRTs May Be Eye Hazard" [CW, July 18]. I must disagree with Jeryl Sparks, who stated that the dot matrix print is "horrible." I have never seen any research that indicates a dot pattern is more difficult to read than individual lines forming the same character.

It seems to me the main reason for CRT terminal eyestrain is too much information on the screen. Operators must move their eyes continuously, putting strain on the eye muscles. Publications such as Computer*world* recognize this problem and make their columns narrow. As a result, the eye can scan an entire line without having to move in a horizontal direction with resultant muscle strain.

I believe the problem is not having to focus on dots (although close work will cause eye strain), but simply that the eye has to move to read an 80-column wide line.

Los Angeles, Calif.

Ampex
memory for
PDP-11/70.
Spend less,
get more.

Add Ampex memory to your PDP-11/70. You'll get better performance than you would with DEC's own memory, and you'll only spend around half as much money.

Money isn't the only thing you'll save with Ampex memory. You'll save time, too. Using four-way interleaving, effective cycle time of an ARM-1170 memory is 350 nanoseconds. Even without interleaving, Ampex memory cycles within 725 nanoseconds.

Ampex ARM-1170 memory comes in increments of 128K bytes and can expand a PDP-11/70 computer all the way to 4 megabytes.

DEC has a great product in the PDP-11/70. And now you can make yours work even better, and save some money at the same time. Order your PDP-11/70 memory from Ampex and get it now.

AMPEX

Ampex Memory Products Division

I/O System Included

'TMS' Builds, Updates, Accesses Tables

By Don Leavitt

CW Staff

MILL VALLEY, Calif. — The Table Management System (TMS) from Jeffrey L. Walker & Co. was designed as a standardized, efficient means of storing and retrieving table information in an IBM 360/370 environment, according to a spokesman.

A table, in this context, is a group of arguments and results. An argument — essentially a record key — is known at table access time while the result — desired record data — is returned to the user by a successful table lookup operation, the spokesman explained.

TMS supports the creation and maintenance of tables used in systems and programs without requiring program changes, recompiles or relinks, he said. Using the software, tables can be created for one others.

Internally, the tables are retained on a random file and do not require reorganization even after changes of contents. A standard backup and restore capability is provided as part of the TMS package, the spokesman noted.

Each table can contain any number of entries; access to the table file from a user's application program is handled through the use of the package's search subroutine. It interfaces with the Input/Output System (Iosys) a file organization method used by TMS to perform all table I/O processing [CW, April 11].

Two user-oriented programs are part of the package. Tabsys is a batch program for table file maintenance; Tabl does equivalent work, on-line.

A series of available, separate-cost features can extend the basic package to include data compression and data protection support and interfaces to either the IBM CICS or the GBA International Swift teleprocessing monitors.

The basic package, described as device- and operating system-independent, requires 48K for the file maintenance subsystem.

The package costs $5,000 or $500/mo for a year; the options are typically an additional $1,000 each, the company noted from 655 Redwood Highway, Mill Valley, Calif. 94941.

For DG's RDOS Users

'Wordmap' Prints Cross-References

PALO ALTO, Calif. — A debugging and documentation tool, Wordmap from Information Processing Techniques Corp. (IPTC) was described by the vendor as a general-purpose, symbolic cross-reference generator for Data General Corp. minicomputers.

Given text files for input, Wordmap produces a listing of the files with line numbers and then generates an alphabetically sorted table of all symbols in the files, a spokesman said..

Along with each symbol in the table is a list of line numbers indicating where every reference to the symbol can be found, he said.

The package accepts "any form" of text including Fortran, Algol or Assembly language programs and English or other narrative documentation. Input files can be of any size and contain symbols of arbitrary length.

Wordmap suppresses any number of user-specified symbols such as Assembler op codes or compiler keywords, he said, and this results in a cross-reference table tailored to the user's requirements. The suppression facility allows Wordmap to be used for file comparison and spelling corrections, he added.

Global in Nature

The cross-reference listing produced by the package is global in nature: it can encompass a complete source file containing many subprograms, the spokesman said. Facilities provided with many compilers are limited to cross-referencing each program separately, he noted.

Output from this package includes page headers giving the date, time, file number and page number; output can be written to any file or device. No internal sorting methods are used, so Wordmap is not limited by memory, the vendor said.

The package functions on a minimum DG Nova needed for RDOS operations, as well as on larger Novas and Eclipses using that environment.

Wordmap is available on magnetic tape in RDOS-executable form for $950, IPTC said from 2462 Embarcadero Way, Palo Alto, Calif. 94303.

'Ramis' Gains Interface With IMS

PRINCETON, N.J. — An interface that provides users of the Ramis II and Ramis DOS information processing systems with fully automatic access to data bases under IBM's IMS and DL/1 has been announced by the Ramis vendor, Mathematica Products Group, Inc.

With the linkage, the Ramis nonprocedural language is used to issue the request while the standard Ramis report capability formats and displays the report, the vendor said.

Once the IMS data base is described to the system's internal dictionary, Ramis appears to process an IMS data base as though it were any other file.

The interface is efficient, Mathematica explained, because the appropriate sequence of DL/1 calls is issued by Ramis to retrieve the proper IMS segments; Ramis screening conditions, mapped into DL/1 logic, are used to provide qualified segment search arguments.

Batch Program

The interface operates as a batch program — in IMS terminology. It may be activated under IBM's TSO, effectively providing time-sharing access to off-line IMS data bases through the Ramis language, the spokeswoman continued.

The Ramis-IMS interface operates through a special module within the Reporting from External Files (REF) Ramis option. The module is currently available for $4,000 or $140/mo for 36 months.

The REF option can be purchased for $5,500. The basic Ramis II software needed to utilize the IMS interface costs $34,000 while the Ramis DOS packaging starts at $20,000.

Mathematica Products Group is at 14 Washington Road and can be reached through P.O. Box 2392, Princeton, N.J. 08540.

Directory Lists T/S Services

PHILADELPHIA — The looseleaf "Remotely Accessible Conversational Programs and Data Bases" directory contains descriptions of individual facilities offered by time-sharing vendors.

The $28 annual subscription includes bimonthly updates, according to the publisher, Gregory Research Associates, 1900 Greymount St., Philadelphia, Pa. 19116.

Siemens CPUs Get 'Easytrieve'

OAKBROOK, Ill. — Easytrieve, the information retrieval and data management system from Pansophic Systems, Inc., has been made compatible with Siemens 4000 series CPUs running under BS1000 or BS2000 environments.

The system was previously available only for IBM 360/370 hardware, a spokesman noted.

The Siemens hardware population is centered in Germany and Scandinavia; pilot versions of the Easytrieve package have been installed in both areas, Pansophic said from 709 Enterprise Drive, Oakbrook, Ill. 60521.

'CPS' Gives Mathematical Program Support

HOUSTON — Management scientists, operations researchers and others with mathematical programming requirements may get the help they need, regardless of what large-scale CPU they have, with the Key Conversational Planning System (CPS) now available from Lowell-Welter Associates (LWA).

The package incorporates an array of capabilities for interactive or batch operations, including linear programming, nonlinear programming and dynamic programming, an LWA spokesman said. Key CPS runs on Fortran-compatible CPUs, he added.

Users are said to have complete control of logic and solution strategy in both modes of operation. Only two control commands — which can be entered from terminal or console — are needed to make any of 125 million combinations of conditional changes to, for example, a 75x150 representation, the spokesman claimed.

The user may also enter data, examine selected portions of the results, change the data, change the solution strategy and continue the run under new conditions until either additional modifications are indicated or the desired results are achieved, he said.

In a single job stream, several cases may be run as variations of the original base case and results from previous cases can be used to specify a new case and then modify it.

Key CPS is designed to efficiently process 150x300 representations interactively in 78K bytes of memory, the spokesman claimed.

The package costs $11,500 or $400/mo for a minimum of six months. Two days of on-site training and consulting, ordered concurrently with the licensing, costs $1,000 plus travel expenses.

Lowell-Welter Associates can be reached through P.O. Box 1597, Houston, Texas 77001.

PDP-11 Linked to 360/370

IRVINE, Calif. — The Distributed Processor Communications Module (DPCM) from Computer Solutions is used to move data between a Digital Equipment Corp. PDP-11/03 processing station and any other devices that meet binary synchronous communications protocol, including IBM 360/370s.

The addition of DPCM allows a stand-alone PDP-11 to be extended to access the resources of a large-scale CPU to which it has been attached, while retaining features developed for its local operations, a spokesman explained.

The DPCM user need not know teleprocessing "internals" to work with the package. Application programs communicate with DPCM through READ and WRITE calls, much as any peripheral is addressed.

The parameters in the calls are validated by DPCM, which alerts the user if an error is sensed. This early warning system "significantly" reduces check-out time during program development, the spokesman asserted.

The package features data transmission rates up to 9,600 bit/sec and transparency is provided for binary data. Both the Ascii and Ebcdic character sets are supported, including error-checking routines and retransmission for bad blocks.

A trace table may be optionally loaded which aids in the identification of teleprocessing problems. DPCM is time-independent of the user: All timing is controlled internally, according to the spokesman.

DPCM requires a PDP-11/03 with 4K words of memory, a DEC DUV11 parallel synchronous interface and a modem. The software, distributed as a Fortran-callable routine, costs $2,000, Computer Solutions said from Suite L, 17922 Sky Park Circle, Irvine, Calif. 92714.

Impact of ZBB To Be Discussed

WASHINGTON, D.C. — "Zero-Base Budgeting in the Federal Government: A Performance Audit of the First Six Months" will be the topic of a meeting here in late October, sponsored by the Federal ADP Users Group Special Interest Group on Zero-Base Budgeting and Automated Data Processing (SIG/ZBB/ADP).

Logan Cheek, author of *Zero-Base Budgeting Comes of Age*, will be the principal speaker at the session, on Thursday morning, Oct. 20, at the General Services Administration Region 3 Auditorium.

More information is available from Ken Burroughs, Chairman of SIG/ZBB/ADP, c/o U.S. Chamber of Commerce, 1615 H St. N.W., Washington, D.C. 20062.

Energy Systems Listed

SPRINGFIELD, Va. — The $20 "Directory of Software Applications: Energy 1977" contains abstracts of 300 energy-related programs and reports in various computer languages. It is available under catalog #PB-264 200, in paperback or microfiche, from the National Technical Information Service, 5285 Port Royal Road, Springfield, Va. 22161.

Finally. A full-power
that doesn't tax a
Or an operat

We call it the CalComp IGT-100.

It's an acronym with the emphasis on action. Short for Interactive Graphics Terminal. A unique, new CalComp graphics tool that effectively combines built-in intelligence with advanced refresh technology.

The first in a new family of Interactive Graphic products from CalComp. All specifically designed to make things easier for both the host computer and the terminal operator.

For starters, we made the IGT-100 interactive. And truly intelligent. So it's fully capable of sharing the graphics workload with its host computer.

Then, we gave it a longer-lasting raster scan (TV) type display. To produce faster, brighter, flicker-free images. To give you sharper, black-and-white graphics. And to totally eliminate time-consuming image redrawing.

By contrast, most graphics terminals in the field today (with storage tubes) are about as far from interactive and intelligent as you can get.

Dependent is more like it. Because, typically, every graphic image — and every graphic manipulation — has to be carefully calculated, then transmitted, by the host computer to the waiting graphics terminal.

This whole routine not only puts a tremendous burden on the host computer (which usually has other jobs to do) but routinely requires lots of special software.

With storage tube type terminals, even routine manipulations like panning, zooming, selective erasing and message changing aren't very fast. In fact, the terminal operator is required to wait — up to several minutes — for a previous image to be completely erased and the second image to be tediously redrawn.

You get the picture, all right. But you'll get it faster with the new CalComp IGT-100. Because the IGT-100 is the quickest solution to these traditional problems. And easily, one of the most affordable.

Thanks to our built-in microprocessor, efficiency doesn't get lost in the shuffle.

A built-in microprocessor helps make the new IGT-100 one of the smartest graphics terminals you can buy. And one of the most efficient.

Coupled with 12K bytes of RAM memory, the IGT-100's microprocessor permits local storage, manipulation and completion of display functions. While providing an addressable memory matrix of 1024 X 680 bit positions. And a viewable matrix of 416 X 312 positions.

A keyboard with a 64 character ASCII set and an asynchronous RS-232-C interface are also supported by the IGT-100's microprocessor. Full or half duplex modes are switch-selectable. Along with asynchronous communication transmission rates from 300 to 9600 baud.

Give your new IGT-100 the whole picture and you'll never redraw it again.

Unlike most other graphics terminals, the new IGT-100 can store and manipulate images on a totally local level.

That means once an image is transmitted, you've got complete, autonomous control. All planning, selective erasing and message changing is instantaneously handled by the IGT-100's built-in microprocessor.

Even write-thru's, grids and zooms (2x, 4x, 6x and 8x) are displayed on the screen within 1/10th of a second.

And all without tying up your host computer. Or waiting several minutes for the image to be redrawn on a storage tube.

In fact, working with its built-in microprocessor, the IGT-100's longer-lasting raster scan screen will beat a conventional storage tube every time. Delivering a faster, brighter image at a flicker-free rate of 60 frames per second.

And that's a mighty pretty picture — any way you look at it.

Structured Maintenance — Part 2

Cost to Reshape User System Can Be Forecast

By Edward Yourdon

Special to CW

I would appreciate some feedback on the concepts of structured maintenance and some ideas on the guidelines needed to give it form as an approach to improved programmer productivity.

In last week's article, I suggested some of the things a programmer has to do to be successful and effective in reading "alien" code.

The other important part about reading programs is knowing what to look for. As many programmers know, most maintenance problems are associated with loops, decisions, logical expressions, subscripting, numerical operations, error-handling, data structures or input/output operations. For each of these areas, a number of specific "what-to-look-for" guidelines can be given.

Some of the other important pieces of structured maintenance are also the result of several years' experience with the structured development of new systems. For example, many of the "pilot projects" that have been used to demonstrate the effectiveness of structured techniques have been *conversions* of old systems to their new structured equivalents.

As a result, we now have a growing body of evidence with which we can estimate several factors:

- How much it costs to reanalyze, redesign and/or recode an existing system.

For example, it usually turns out that such efforts can be carried out at the rate of 20 to 25 debugged statements per day instead of the usual 10 to 15 statements per day. And it is reasonable to estimate, in the absence of any other evidence, that the new structured system will be approximately the same number of statements as the old version.

- How much more reliable the new system will be.

This depends largely on whether the old system has "settled down" or whether it continues to be unstable.

- How much more maintainable the new system will be.

In most cases, it is reasonable to assume that maintainability will improve by at least a factor of two, and possibly by as much as a factor of 10.

- How much more CPU time/memory will be required by the new system.

A reasonable "worst case" estimate is that a new structured system will require no more than 5% to 10% additional hardware resources. In addition, in a surprisingly large number of cases, the new system is considerably more effficent than the old system, since the new designers are, in a sense, able to stand on the shoulders of the original designers and see a better way of approaching the problem.

Readers are invited to comment on "structured maintenance," or any alternate technique they have developed to cope with the maintenance problem, by writing to Yourdon at Yourdon, Inc., 1133 Avenue of the Americas, New York, N.Y. 10017.

Program 'Restructuring'

Another structured maintenance technique involves the "restructuring" of existing programs. This, too, is based on techniques that were originally developed for structured programming. There are a number of techniques that can be applied either manually or mechanically to restructure code (see, for example, Brenda Baker's article in the January 1977 *Journal of the ACM*).

While there is considerable controversy about the merits of mechanically restructuring whole programs and systems (remember when we tried to mechnically convert 1401 Autocoder programs to Cobol?), there is no question that these techniques can be useful as a guideline for rewriting small chunks of existing logic that, in their present unstructured state, are impossible to understand.

All in all, structured maintenance is based largely on common sense and on techniques learned in structured programming and structured design. So why all the fuss about it?

Partly because, as Will Rogers once said, "Common sense isn't common." Remember, structured programming is still dismissed by some skeptics as trivial "common sense" — and yet it's evident that all of us need some rigorous, disciplined guidelines to ensure that we don't forget our common sense in the excitement of coding.

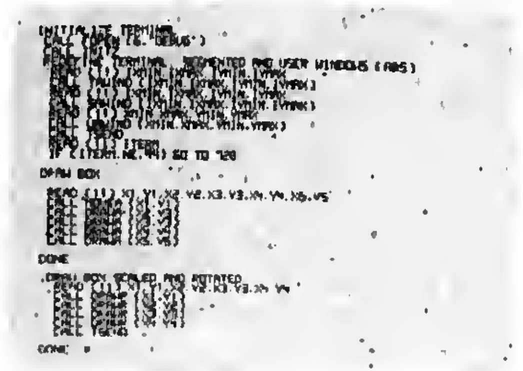
Also, it's evident that the structured design/programming movement has, to a large extent, been ignored by a large group of maintenance programmers. And who can blame them for ignoring discussions about the virtues of *future* systems when they're still responding to midnight phone calls about their *old* systems? So, it's time we developed a package of guidelines and techiques specifically tailored to the needs of such people — and that's what structured maintenance is all about.

Yourdon is chairman of the board of Yourdon, Inc., New York, and author/coauthor of several books on "structured" DP techniques.

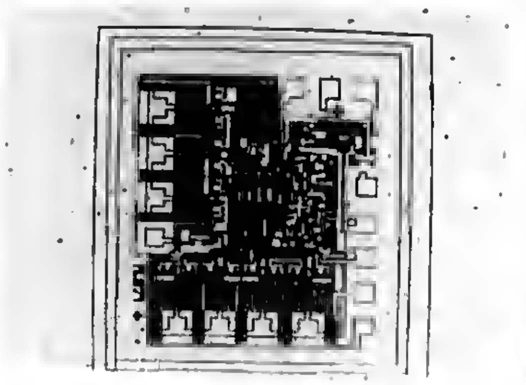
ed graphics terminal
computer's power.
or's patience.

Six images that warrant some serious comparison shopping.

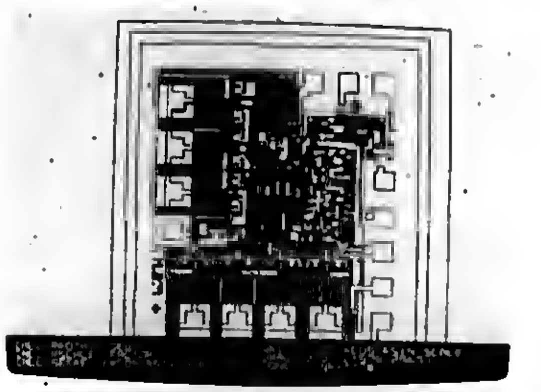
A quick look at basic viewing capabilities and you'll soon discover there's not a more versatile graphics terminal around than the CalComp IGT-100.



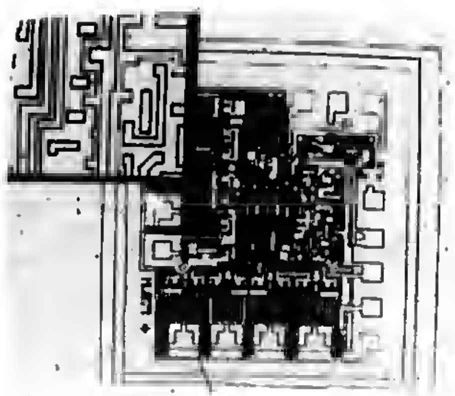
1. All alpha-numerics.



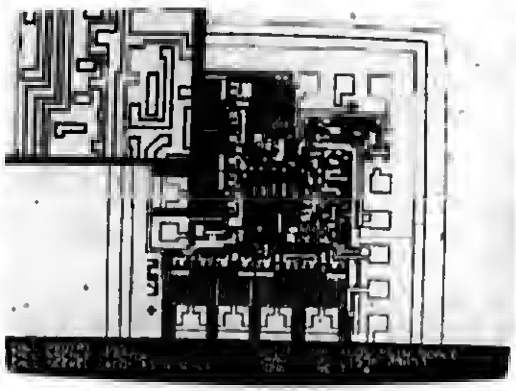
2. All graphics.



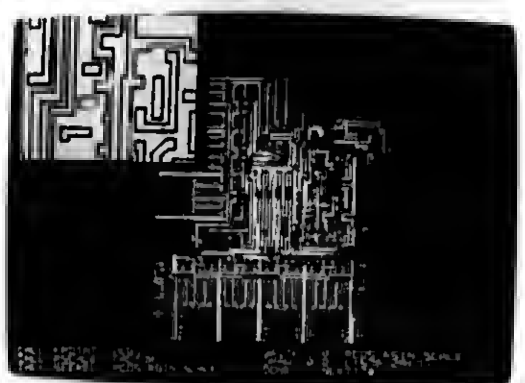
3. Alpha-numerics & graphics.



4. Graphics & View-window.



5. Alpha-numerics, graphics & View-window.



6. Alpha-numerics, Graphics & View-window (with reversed-out section).

To begin with, the IGT-100's special three-way, split-screen design provides you with separate alphanumeric, graphics and view-window sections.

Plus the ability to independently view and control (i.e. panning, zooming, etc.) one or a combination of these sections simultaneously.

Images can even be reversed (white on black) in the graphics and view-window sections.

The IGT-100's basic screen design maximizes the amount of data that can be displayed while providing you with six basic screen arrangements. Annoying superimposed messages have been totally eliminated.

It's about time someone came up with a screen that you can tailor to fit the job — instead of the other way around. And that's exactly what we did.

Did we mention the competitive price?

Price shouldn't be the primary consideration when you're looking for a full-powered graphics terminal.

But it's usually close to the top of everyone's list. That's why you'll be glad to know that the IGT-100's introductory price is super-competitive. Especially compared to storage tube devices. (And there's an equally attractive leasing plan, too.)

But we didn't stop with just a great terminal at a great price. We added an entire year's worth of service — labor, parts, everything — to the deal. Right along with the finest graphics terminal support software. (It's even compatible with standard CalComp plotting software and Plot 10.)

And then we backed it all up with CalComp's worldwide network of field engineers.

So if you're looking for a great deal on a graphics terminal, take a hard look at the new CalComp IGT-100.

And don't let a little thing like a low price scare you.

CalComp's New IGT-100.

The time you save may be your own.

Users Able to 'Own' Data In Distributed Data Bases

By Stephen L. Robinson
Special to CW

Data Base Corner

Every few months, it seems, there is a new technique, a new buzzword, guaranteed to revolutionize data processing. In the last few years we've heard about data base, intelligent terminals, bubble memories, microprocessors, EFTS and packet switching — to name but a few.

In part, the development and popularization of new techniques is a sign of the dynamic nature of our industry. The way we grasp for these new techniques is a sign of dissatisfaction with the status quo.

Consider data base systems. The concept has been developing for several years and data base packages sales are accelerating. However, all is not well in the world of data base.

Inherent in the development of a true data base system is a change in the philosophy of data management (see "Data Base Corner," CW, May 2). This change has not been very popular in many organizations.

Functional areas have lost "ownership" of their data. The concept of distributed data base systems, which would tend to restore some data ownership to functional areas, is therefore greeted with huzzahs that do not reflect all the technical and management problems associated with distributed data.

What Is It?

Let us first distinguish between distributed data processing and distributed data base; and then distinguish between types of distributed data base systems. (Note: the combination of distributed data base and distributed data processing is also clearly possible.)

Put very simply, a distributed data processing system consists of:

- A number of nodes (locations which may contain one or more input devices, computer configurations or output devices).
- The capability to enter a "job" at one node and have the "system" decide where to run the job (alternatively, the user may specify a particular node for the job).

Usually, a job submitted to a distributed DP environment carries with it a description of where its input data is to be found.

In a distributed data base system, a job is typically run at its own "home node," but the requisite input data is distributed at other nodes.

Data Base System Types

We should distinguish between two types of distributed data base systems. In a *static distributed system*, a prospective user must "know" which node has the data that is required. That is, a call for data must specify a node.

In a *dynamic distributed system*, a prospective user need not specify where the requisite data is to be found. Indeed, users will not know where the data is stored. The "system" will maintain a data dictionary of data element names, and aliases, and will generate data requests to the appropriate nodes.

Although I know of several operational static systems, I am not aware of any full-blown dynamic systems. The potential flexibility and adaptability of a dynamic system augurs well for the next five to seven years.

In the interim, static systems offer some interesting advantages over centralized data base systems. In particular, functional areas may once more "own" their data and they may organize their data to optimize their applications.

Following are some disadvantages of distributed data:

- Backup, recovery and restart are tougher problems.
- Synchronization of redundant data can be quite complex.
- Security/privacy issues are complicated.
- Performance of internode applications may degrade to the extent that functional areas may retreat into file system isolationism.
- The unknown always holds surprises.

There are, of course, many additional arguments — both for and against distributed data base systems. I would welcome reader descriptions of operational distributed data base systems — and especially reports on benefits and problems.

Robinson is an independent consultant, having recently organized S.L. Robinson & Associates, 517 N. Pennsylvania Ave., Morrisville, Pa. 19067.

'Plotall' Aids Graphics Work

AKRON, Ohio — The Plotall language developed by the University of Akron enables non-DP-trained people to use an IBM 360/370 to create a variety of graphics without getting involved at a programming level.

Plotall can be used to create line graphs, pie and bar charts, histograms and other "art work" that adds impact and understanding to verbal or written reports. The system supports four types of calendar and logarithmic axes, shading for pie and bar charts and up to six lines of title and text information, a spokesman noted.

Output Variable

The plotting software is basically designed to produce 8-1/2-in. by 11-in. output, but this can be adjusted — to larger or smaller dimensions — through control card entries prior to execution, he said.

Plotall is written in a combination of IBM's Assembler language and Fortran, for use with 360/370 systems equipped with Calcomp plotters. Access to all Calcomp plot routines is through individual subroutines provided to the user so that various graphics devices can be used.

License agreements to use Plotall, which functions under both OS/360 and OS/VS environments, cost $500 for educational institutions and $1,000 for industrial users.

More information is available from the Plotall Coordinator, University of Akron Computer Center, Akron, Ohio 44325.

8th National Conference on Human Resource Systems

You are cordially invited to attend the…

Information Science Incorporated 8th National Conference on Human Resource Systems

Place:

Hyatt Regency O'Hare
Chicago, Illinois

Time:

Monday, October 31,
Tuesday, November 1,
Wednesday, November 2

It's the key event of the year. Leaders in every area bring you up-to-date on latest developments and trends. Including EEO—ERISA—OSHA—The Privacy Issue—and the revolutionary new Human Resource Dedicated Computer.

If you are professionally interested in human resource systems management, you should seriously consider attending the 8th National Conference on Human Resource Systems:

The "main event" speakers include such distinguished individuals as: Edward Brooke, U.S. Senator, Massachusetts who will speak on "Jobs——Who Should Provide Them and How"; Abraham Ribicoff, U.S. Senator, Connecticut, who will speak on "Privacy as it Relates to Employment" and Weldon Rougeau, Director, Office of Federal Contract Compliance Programs, who will speak on "What to Expect From the Office of Federal Contract Compliance Programs as it Enforces the Law."

A special feature of the Conference this year will be a major study on **Human Resources Programs: Costs and Results**—prepared at the University of Minnesota.

In addition, there will be important follow-up Case Studies on other pivotal HRS problems—as encountered and solved by leading organizations. These Studies were also prepared at major universities.

Choice of 39 Workshops
You will have a choice of 39 exclusive Workshops to attend at the Conference. These stimulating one-hour sessions give you an in-depth briefing on the human resource subjects of greatest interest to you. No-where else in the country will you find so many top human resource leaders chairing such vitally *useful* discussions.

A unique attraction at this year's event will be the first public demonstration of the Human Resource Dedicated Computer. Dramatic proof that the mini-computer has come fully of age in the industry.

There will be several informal get-togethers in the course of the Conference. These provide excellent opportunities for spontaneous exchanges of views—and garnering of information.

An excellent Investment
Personal introductions can be easily arranged with any of the principal speakers, Workshop leaders and colleagues from other organizations with whom you may wish to confer.

Because of the tremendous and constantly growing stakes involved in human resource management, attending the Conference can be an excellent **Investment.**

To make reservations for yourself and your colleagues—just fill out and mail the attached Reservation Reply Coupon. Or, if you prefer, call: Sheila Alper at 201-391-1600.

We are looking forward to the pleasure of having you with us at the Conference.

Bring Your "Team" To The Conference

It can pay rich dividends to have several colleagues and associates from your organization attend the Conference.

- It enables your group to cover **all** Workshop sessions of special interest to you.
- It helps promote a "unified professional point of view"—a consistent, high standard on human resource matters within your organization.

Want more information about the Conference?

If you have questions—or want additional information about the Conference—call Sheila Alper at: 201-391-1600.

Reservation Reply Coupon

Mail Today—or phone: 201-391-1600—for reservations

NOW... FOR VM/370 USERS

Quick Guide to VM/370 Software from
COMPUTER ASSOCIATES

We have a new software systems catalog for VM/370 users and we'd like to send it to you.

BUT IBM WON'T TELL US WHERE YOU ARE!

You'll learn about the famed Computor Associates software products and systems that will far outperform any comparable ones you're using now. They'll save you time and money!

- **SYMBUG:** A completely integrated debugging system for the interactive debugging of COBOL, Fortran and Assembler programs.
- **IDOS/VS:** An interactive DOS/VS programming facility for VM/370 systems that allows DOS and CMS environments to exist concurrently in the same virtual machine.
- **VSORT:** Implementation of OS sort compatibility for CMS. Functions as a stand-alone utility, as support for COBOL Sort verb or callable from PL/I or Assembler routines.
- **ISAM:** CMS simulation of OS ISAM It also provides a CMS ISAM utility command to create, dump and reorganize an ISAM file.

COMPUTER ASSOCIATES IS ONE OF THE WORLD'S MOST DISTINGUISHED SOFTWARE RESEARCH AND DEVELOPMENT ORGANIZATIONS.

We serve you through offices throughout the United States and world-wide.

MAIL COUPON NOW FOR FREE VM/370 SOFTWARE SYSTEMS CATALOG!

School Days

Software Key To Sessions In New York

NEW YORK — "Software: Project Management, Tools and Techniques, New Developments" is the title of a two-and-a-half day conference to be presented by the American Institute of Industrial Engineers (AIIE) at the Hotel Roosevelt here, Oct. 17-19.

The meeting will include plenary sessions, the first day; workshops examining the impact of evolving technology, the second day; and a panel discussion analyzing software quality and conflicting trends.

Registration fees is $265 for AIIE members and $295 for others, with "team" discounts available. The seminar is being run by Management Education Corp., P.O. Box 3727, Santa Monica, Calif. 90403.

Career Concerns Covered in D.C.

WASHINGTON, D.C. — "How to Succeed in the World of EDP," a seminar described as the premiere presentation of the special interest group on career counseling of the Association of Computer Programmers and Analysts (Acpa), will be held this coming Saturday, Sept. 24, at the Quality Inn Central, Arlington, Va.

Topics ranging from individual career development and purpose of the resume to interview techniques will be considered during the working sessions. Jack Stone, author of *Computerworld*'s "Human Connection" column, will speak at lunch.

Registration fees now are $40 for Acpa members and $55 for others, with a $30 fee for students, the association said. Registrar is Linda Miller, 7708 Hanover Parkway T-3, Greenbelt, Md. 20770.

System Sessions Set in 2 Cities

ROCKVILLE, Md. — Effective Data Systems Development will be the subject of a three-day seminar by Barnett Data Systems in Houston and in Washington later this year.

The $425 course will be in Houston on Oct. 25-27; in Washington on Nov. 7-9 and again on Dec. 5-7. A one-day briefing keyed to the "problem definition" portion of systems work will be presented in each city, for $155/person, the day after the longer seminar.

Barnett Data Systems is at 19 Orchard Way North, Rockville, Md. 20854.

Topic: Tuning

DELRAN, N.J. — Datapro Research Corp. has scheduled a seminar on "Computer Performance Measurement: Tools and Techniques for Increased System Productivity" in four cities this autumn.

The seminar will be in Washington, D.C., Oct. 24-26; in San Francisco, Oct. 31-Nov. 2; in New York, Dec. 7-9; and in Chicago, Dec. 14-16. Cost is $425 for current Datapro subscribers and $475 for others, the company said from 1805 Underwood Blvd., Delran, N.J. 08075.

Management To Be Theme

NEW YORK — Each registrant attending the "Management Skills for the Systems Professional" seminar in late October will be assigned to work with a small group of other managers who have similar backgrounds and expertise, according to the American Management Association.

By working out solutions to simulated problems and presenting their findings to the entire class, participants should learn ways to organize the systems department, to interview potential employees, to train the systems team, to allocate personnel and set priorities, a spokeswoman said.

Running from Oct. 31 through Nov. 4, the course costs $610 for AMA members and $700 for others. The association is at 135 W. 50th St., New York, N.Y. 10020.

HP and College To Teach APL

FULLERTON, Calif. — Four independent but related seminars will be offered here late this month and in October by Orange Coast College and Hewlett-Packard Co.

The seminar schedule includes "A Manager's Hands-On Guide to APL on a Mini," Sept. 20; "Hidden Computer Treasures for Financial Executives," Sept. 27; "Engineering and Scientific Applications," Oct. 4; and, "Far Out APL," Oct. 11.

Sessions start in late afternoon and continue until 10 p.m. at the Hewlett-Packard Data Center here in Fullerton. The $48 registration fee for each seminar includes a buffet dinner, the APL seminar coordinator said from 1430 E. Orangethorpe Ave., Fullerton, Calif.

Productivity Ideas Offered

McLEAN, Va. — Courses on DP productivity improvement are being offered by Johnson Systems, Inc. this fall.

Johnson schedules three consecutive courses each week, including one on the basics and another on advanced techniques for use of the company's Job Accounting and Reporting System (Jars) package.

The third course is not Jars-oriented. Topics include Computer Performance Management, Hardware/Software Planning and Evaluation and Design and Implementation of a Data Center Chargeback System.

The Jars courses are included in the $295 fee charge for single courses, the spokesman noted from 8400 Westpark Drive, McLean, Va. 22101.

Data Base Applications on Minicomputers

Cincom Systems' Knock-About . . . first formed in 1970 by Cincom and its client user group . . . has truly become the premier forum for the exchange of information between successful implementors of data base/data communications systems.

Over 600 Cincom customers will gather at Knock-About/77, October 9-12, to attend and participate in 75 sessions presented in 8 concurrent tracks. The breadth and depth of the agenda (sample above) will enable each person to tailor a meaningful program to his or her professional responsibility . . . manager, system designer, programmer, data base administrator, on-line specialist, etc.

Special interest groups have been scheduled to provide the opportunity for industry-oriented interaction and in-depth discussions of subjects of common interest. State of the art presentations on material such as distributed data processing, structured programming and relational DB techniques punctuate the 3-day program.

While Cincom presents new product developments and enhancements to current products, such as TOTAL and ENVIRON/1, the majority of the topics are conducted by the users themselves. Clearly, the emphasis is on practical solutions to real world problems, contributed by experienced professionals from our resource of installations worldwide.

If you are a Cincom customer, we hope to see you at Knock-About/77. If your organization is considering data base or data communication software, why not contact Cincom Systems immediately. We can help you prepare your organization's DB/DC success story in time for presentation at the next Knock-About (April, 1978).

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development and testing of BASIC, RPG, COBOL, Compilers.

OPERATING SYSTEMS

Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER

Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK...

But PADs are Coming

X.25 Seen Awkward for Data Net Users

By Ronald A. Frank
CW Staff

TORONTO — The migration to packet switching is "particularly awkward" for data communications users because terminals adapted to the X.25 protocol standard are no longer operable on private lines or switched circuits, according to Louis Pouzin of France.

Speaking at a recent Conference here, Pouzin, for the French research institute IRIA, said the recent adoption of X.25 as a packet network standard has led computer terminal suppliers to introduce a variety of network architectures in answer to IBM's Systems Network Architecture (SNA).

"Every manufacturer is developing systems designed to tie up customers in a maze of specific products, all cunningly interdependent," Pouzin said.

The X.25 protocol allows setting up and clearing connections through virtual circuits. The virtual circuit is like a switched connection except that it is virtual. In terms of service characteristics, X.25 imposes transit delays typically between .5 sec and 1 sec; fixed packet formats; transmission procedures; several connections multiplexed on a single access circuit; and no error conrol end-to-end, Pouzin said.

'Total Incompatibility'

The X.25 protocol exhibits "total incompatibility" with previously defined public data networks, and the number of deficiencies identified with it "foretells a substantial revision," he said.

Since X.25 does not fit any existing equipment, it "is not very saleable." Because of this, the carriers have introduced the Packet Assembler/Disassembler (PAD), which is implemented in a terminal controller. Terminals supported by the PAD controllers must be either start/stop type operating at 110 or 300 bit/sec and must use Ascii code, Pouzin said. This year will be the year of the PAD within CCITT, with a strong drive to get a specification approved, he predicted.

On the other hand, the subject of X.25 consistency with other data communication services will not be given much attention within the standards-making body this year, he said.

The adoption of X.25 by the CCITT was the result of "worldwide salesmanship and rough pushing" which led to unanimous approval, although no votes were recorded, Pouzin said.

The standard was approved through the combined efforts of Bell Canada, Telenet Communications Corp. and the French and United Kingdom postal administrations. The X.25 protocol is basically a "carbon copy" of a procedure designed by Telenet for its own use and Telenet was the most influential carrier favoring its adoption. This was because Telenet is the only carrier operating in the packet switching area without cross subsidization.

Describing Telenet as a specialized carrier in the U.S., Pouzin said it does not offer a "full range of consistent public services." But turning a Telenet product into a CCITT recommendation "is certainly a highly prized reward for the company and explains why packet-switching services are out of context with other public data communications services in other countries," he said.

Telenet provides everything either as part of its network or as software packages for customer equipment. But the carrier is not selling a virtual circuit service. Instead, it is offering remote terminal handling and procedure conversion.

The next logical step will be a complete service for users in one of four one possible forms:

- Computer manufacturers provide converters and remote controllers to go with them.
- Entrepreneurs build and sell/rent converters and remote controllers.
- Entrepeneurs put up all necessary gear and sell composite services based on public data communications services.
- Carriers provide composite services.

The carriers will be dependent on the vendors' willingness to put X.25 interfaces in their products. The carriers would like to impose the network terminal access methods on the manufacturers so that "the whole terminal-handling business falls under carrier control," Pouzin said.

Users are realizing that building a system out of heterogeneous components may result in considerable economies. But in order for this to happen, common protocols are needed and boundaries of responsibility must be clearly defined, he said.

Terminal-Based Turnkey Helps Pharmacy With Recordkeeping

FORT WORTH, Texas — Pharmacists are discovering that a computerized communications network can provide a new prescription for an ailment as old as drug stores themselves.

That "ailment" is an overabundance of repetitive, routine, time-consuming tasks like typing prescription labels, storing patient profiles and family records, updating inventories and drug prices and processing Medicare and Medicaid paperwork.

The remedy is a $20,000 turnkey minicomputer system called "System 31", which features a mini-CRT terminal/keyboard by Informer, Inc. of Los Angeles.

Operated by V.C. Brown, Inc. of Fort Worth, the system serves nearly 100 pharmacies, and Brown officials claim the market is growing. The system, which has taken six years to develop, incorporates a Computer Automation, Inc. LSI-2 minicomputer, a Centronics Data Computer Corp. and the Informer Models 301 and 302 mini-CRT display screen and keyboard.

Dalton Carter, who owns Carter Pharmacy in Fort Worth, is so proud of his computer he advertises it in the Yellow Pages. His ad reads "Complete computerized prescriptions records for major medical and income tax."

"The first year I had the computer," Carter said, "I watched closely to see if it really would pay for itself. In that first year, I found that it saved me $11,500 by just keeping up with wholesale price increases on refills, not to mention the relief on handling the paperwork for Medicare and Medicaid."

Carter, whose small pharmacy fills an average of about 100 prescriptions a day, said he had four clerks to handle the third-party paperwork before he began subscribing to the computer system. Today, he employs two clerks.

"It's obvious that I can take two salaries and pay for the computer," he said. "When I came into the business, wholesale drug prices hadn't changed in 40 years. Now, with everyday's mail, we get price changes. And with welfare, etc., you have such a low margin that you've got to grab every penny to make a profit."

Carter said the V.C. Brown System 31 wouldn't be the same without the small Informer terminal. "I love it," he said. "It's obvious why. The terminal takes up very little space. There's no point in its being any bigger than it is. You've got all the information you need; and no more."

Bob Glenn, Brown's national sales manager, said one of the mini-CRT terminal's advantages, is its smallness. "You're talking about counter space that the pharmacist uses for everything," he explained. "Informer's terminal is 6 by 20 in. and has a pedestal-mounted six-in. CRT screen that stands 10 in. tall. It weighs 10 pounds and is easily moved around."

NOW, LEAR SIEGLER AND BURROUGHS ARE ON SPEAKING TERMS.

You're probably very happy with your Burroughs mainframe.

But you'd undoubtedly like to have the versatility and dependability of Lear Siegler terminals. If only they were compatible with your present system.

Now they are. Complete with standard Burroughs polling and address line disciplines.

What's more, the ADM-2B's forms mode capability is compatible with the TD-820.

The ADM-2B gives you full text editing capabilities. Including erase to end of line/field/page. Insert and delete character and line. Blinking and blanking fields. And tabbing.

Just flick a switch and you can convert the ADM-2B to a standard ADM-2 with Burroughs line discipline.

Line diagnostic mode is switch selectable—which makes it extremely valuable for troubleshooting.

Of course, there's all the support that Lear Siegler is famous for. Throughout the United States and in many foreign countries.

$2485.

That's the full price. Including serial printer port. Numeric keypad. 24x80 character screen. 16 function keys. 110-9600 baud. RS232 interface. Burroughs two-wire direct connect is available as an option.

The fact is, Lear Siegler's new ADM-2B terminal gives you the best of both terminals. So you can use it right alongside your present Burroughs terminals and mainframe.

So rest easy, Burroughs users. Because now Lear Siegler speaks your language.

For more information contact: Lear Siegler, Inc., E.I.D./Data Products, 714 N. Brookhurst St., Anaheim, CA 92803; (800) 854-3805. In California (714) 774-1010.

Clients Do Own Banking With Wall-Mounted 'Teller'

S. LAWRENCE, Mass. — Bay State National Bank has installed an IBM self-service banking terminal at its Winthrop Ave. branch here.

Called Instabank, the IBM 3614 consumer transaction facility has been installed in the branch's outside wall, permitting the bank's customers to make the following transactions:

- Withdraw cash in $5 and $20 denominations from savings or checking accounts, up to a daily limit of $250 from either account or a combined total of $350.
- Make deposits to checking or savings accounts.
- Transfer money from one account to another.
- Make installment loan, mortgage, Master Charge or club payments.
- Obtain current checking or savings account balance.

IN$TA-BAN
Bay State National

Bay State National Bank has installed an IBM 3614 consumer terminal at its Winthrop Ave. branch in South Lawrence, Mass., as part of an IBM 3600 finance terminal system.

"Instabank provides customers with the convenience and privacy of 24-hour banking every day," according to assistant vice-president John C. Hersey.

To initiate a transaction on the 3614, a customer inserts a plastic magnetic stripe identification card — called Instacard — into the terminal, which is connected to the bank's central IBM 370 CPU. After the card is validated, a display panel instructs the customer to enter a secret code number at the keyboard.

Then, guided by messages on the display panel, the customer presses a series of keys to indicate the transaction and its amount. After each withdrawal, the system debits the customer's account and returns the card.

When depositing funds or making loan payments, the customer presses the appropriate keys and inserts an envelope — containing payment documents, checks or cash — into a covered deposit slot. Customers also can make payments by inserting an envelope containing a payment stub or coupon and keying instructions to deduct funds from their checking or savings accounts.

The bank also has begun using teller-operated terminals in all 10 of its branches. All units are part of the IBM 3600 finance communication system.

The terminals include keyboard display units and passbook/document printers linked to the central computer, the bank said.

Spectron Devices Gain Send/Receive Option

MOORESTOWN, N.J. — The Spectron Corp. has introduced a send/-receive option for its T-511 tape unit.

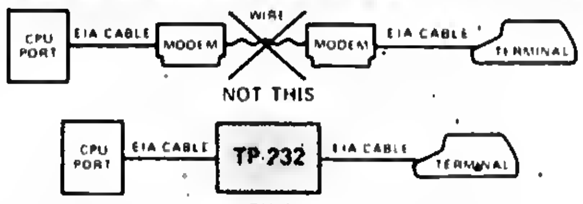
Data recorded on tape by a Spectron Datascope D-601 or on a T-511 can be transmitted between two T-511s equipped with the option.

Data can be sent between sites in simplex operation, a spokesman said.

The purchase price of the option is $800; previously delivered units can be retrofitted at a cost of $960, the firm said from 344 New Albany Road, Moorestown, N.J. 08057.

TP-232
MODEM
SIMULATOR

The TP-232 Modem Simulator replaces a pair of modems in local, in-house applications, as shown below. With its wide variety of strap selectable options, this unit is a versatile tool for system check-out as well as an economical replacement for a modem pair.



FEATURES

- Replaces any modem pair
- Synchronous or asynchronous operation
- Selectable data rates through 19,000 bps
- May be used in continuous carrier or polling systems
- Available in rack mount and stand-alone configurations
- Regenerates EIA signals allowing greater cable lengths
- RS-232 C compatible
- Digital data loopback

BANISH ABENDS FOREVER.

Computer-Link

And say hello to Computer-Link's complete Data Media Maintenance Systems.

Take a good look at the computer re-run time your ABENDS eat every month and then tell them to start packing their bags. With Computer-Link's complete Data Media Maintenance Systems, tape, disc and ribbon problems are fully evaluated and corrected giving you throughput instead of re-runs, reliability instead of shutdowns.

Features like Intensive Clean on the Tape Evaluator/Cleaner put even heavily contaminated tapes back on-line without re-runs. And its *five* tape evaluation tests find the causes of more ABENDS than any other similar unit.

Say goodbye to crashes with the Disc Inspector/Cleaner. Anywhere in the field it wipes away the slightest traces of fingerprints for constant head and disc protection. And for trouble-free print runs, Computer-Link's Line Counter records only *printed* lines for optimum ribbon performance and replacement.

Find out how much more reliable your tape or disc operation can become by filling out the coupon. Immediate detailed information is available by calling toll-free: 1-800-225-1616.

More Hookups Under Way

SNA-Based Net Links Mexican Bank Branches

Special to CW

A sophisticated tele-information network based on IBM's Systems Network Architecture (SNA) concept (and utilizing Vadic-licensed 1,200 bit/sec and 2,400 bit/sec CCITT-compatible modems) is now in use at Multibanco Comermex of Mexico City. The system places Multibanco Comermex in the lead within the Mexican banking industry for farsighted uses of data communications technology.

A desire to provide better daily services motivated the bank's directors to implement a comprehensive computer service expansion plan.

A fundamental requisite was a greater integration within the bank's offices throughout the country over a reliable data transmission network.

Once such a network was established, Multibanco Comermex decided to install backup systems both at the computer and at the telecommunications equipment levels.

To obtain the high levels of efficiency required, the use of distributed intelligence technology was supported by a high-level synchronous communication protocol.

One of the bank's objectives was to use modems manufactured in Mexico. It contacted the General de Telecommunicaciones S.A., who supplied modems manufactured in Mexico under license from Vadic Corp.

Two types of modems were licensed by Vadic: the VA-1200L CCITT V.23-compatible 1,200 bit/sec modem; and VA-2400L CCITT V.26-compatible 2,400 bit/sec modems.

The network is supported in a data processing center (CPD) and a data telecommunications center (CTD) located in Mexico City.

Multibanco Comermex also offers a consultation and protection telephone service to remote and branch offices, in case of catastrophic failure, such as power outage, at a remote office.

Installation of controls for remote terminal management of provincial branch offices has been planned, and integration of remote offices in the country's interior has already been started.

Network Configuration

The Multitronic network, based on the IBM 3600 financial system, includes an IBM 370/125, a 370/135 CPU and two IBM 3704 communication processors to provide redundant on-line operation.

Normally, the 370/135 is used on the first and last days of the week and on the 15th and 30th of each month (the bank's pay days).

Each 3704 communications processor is capable of managing the entire network, because of data divider bridges, following the VA-2400L modems.

The bridges accept four IBM terminal controls, backing up both the 1,200- and 2,400 bit/sec modems, which are housed in 16-channel multiple mounting racks.

The telephone lines are backed by a half-duplex line which is normally connected to the CCD in case of emergency.

Because of multipoint operation, the network can maintain eight branch offices with each 3601, of which there are currently nine in the system.

Emergency measures may also be taken to prevent any one branch in the multidrop loop from blocking the other branches in the same loop.

At present, the system as 46 branches, most of them in the metropolitan area of Mexico City. The system contains 140 data terminals linked by the Vadic-licensed modems.

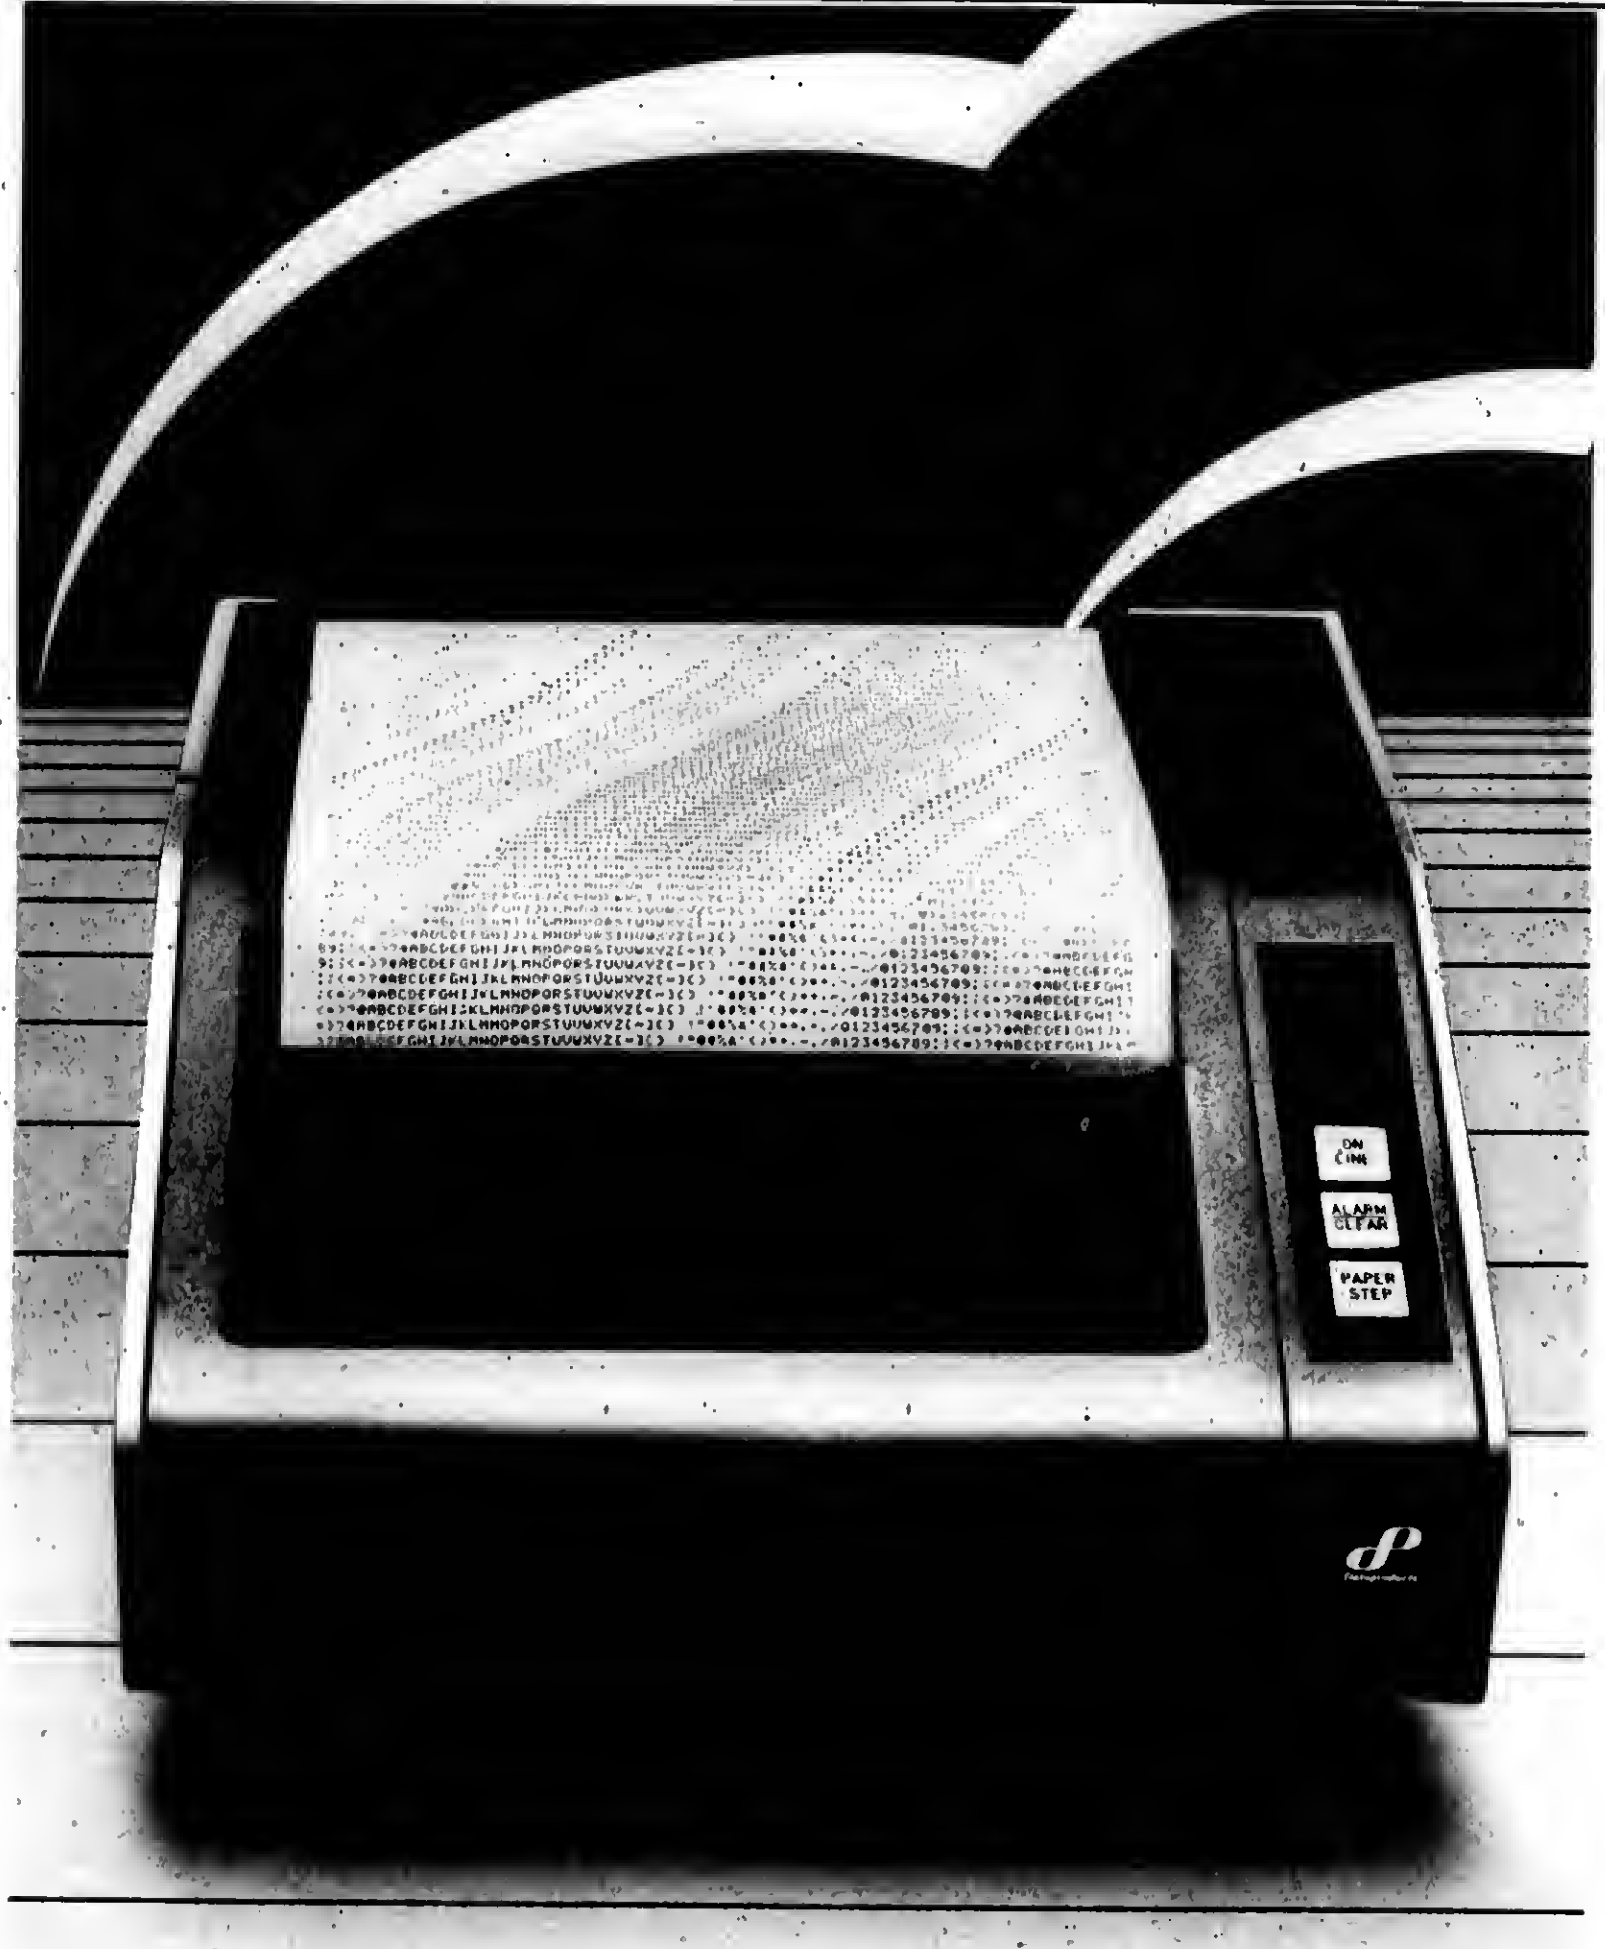
The 1,200 bit/sec modems are used at the branch level, while the 2,400 bit/-sec modems are used at a higher level. The system is used for debits, credits and inquiries on checking and savings accounts and loans.

Software used is IBM's Virtual Telecommunications Access Method/Extended Telecommunications Module (Vtam/EXTM) in the 370 CPUs Network Control Program/Virtual Storage NCP/VS in the 3704 communications processors; and Synchronous Data Link Control (SDLC) protocol for data communications. SDLC is compatible with the International Standards Organization's (ISO) proposed High-Level Data Link Control (HDLC), which has been adopted by France, Canada and other countries as a base for their public data networks.

Informarica y Telecommunicaciones S.A. is also involved, developing an efficient, simple system for switching to back-up equipment, plus a diagnostic and control system with a display panel to inform the CTD operator of the network status and to provide control of back-up switching from the panel.

Analog signal levels, noise levels on the telephone lines and digital interface signals from the 1,200- and 2,400 bit/sec modems can be monitored.

The Multitronic network reportedly is the first of its kind in Latin America to employ SNA. With this architecture, Multibanco Comermex achieves better integration with its finance group and can offer better service to clients and officials alike.



Services Firm Credits Net With Revenue Rise

SILVER SPRING, Md. — Because it converted to a national data communications network, a remote computing services firm here will double its revenues during the next year, the company's president predicted.

Dialcom, Inc., began using the Tymnet, Inc. communications network after executives in the computing services firm realized they wold have to make Dialcom's services more accessible to its customers, which include government agencies, financial institutions and businesses.

"Tymnet offered the only network service which met all our criteria," Dialcom president Robert F. Ryan recalled.

To save money, Dialcom in the past installed local dial-up lines in only a few high-density cities like Baltimore, New York, Philadelphia, Minneapolis and Pittsburgh. Because of rapid company growth and customer demand for access in other U.S. cities, however, the firm's management conducted a study of national network common carriers in early 1976.

Criteria for the selection of a network included the ability to base the network at Dialcom's computer facilities here, to provide Bell 113B-compatible transparent hookups and to cover many major U.S. metropolitan areas.

Even more important, the company demanded reliability and performance to ensure a level of quality acceptable to Dialcom's network customer base, Ryan said.

"An important reason we selected Tymnet," he continued, "was its history and experience with our industry. Because Tymnet has conveyed the services of Tymshare, Inc., for many years, it was my feeling that Tymnet would relate to the problems of a time-sharing concern better than the other common carriers."

Node Replaced

During December 1976, when Dialcom began using the Tymnet operation; surging volume forced the company to replace the original network node — a Varian 620L, wth 30 ports — with a Varian V72, 62-port configuration. Management attributed the change to increasing customer additional access points. Approximately 50% of Dialcom's customers draw usage in more than one location.

The network allows Dialcom to compete on a national level in additional areas of marketing like data collection and accessing of common data bases for large multi-city firms. By using Tymnet, Dialcom believes it can better serve the associations and corporations utilizing its software products, Ryan noted.

Dialcom's most widely offered services include a word processing correspondence tracking system and Federal Assistance Programs Retrieval System for state and local government agencies. It also offers software packages for business, accounting and engineering.

Dialcom does its processing at its dual-computer facilities here, which house four Honeywell 1648 time-sharing systems. The company plans to install an additional Honeywell 1648 system this year.

The company's 1976 estimated revenues will exceed $1.5 million, an increase of approximately $500,000 over the previous year.

DATAPRODUCTS'
NEW ERA
T-80 THERMAL PRINTER:

80 CPS
FOR THE PRICE OF 30.

Dataproducts' New Era T-80 thermal printer is nearly three times faster than other thermal printers.

Yet it costs about the same.

What's more, the T-80 offers you Dataproducts dependability, assured by a smartly conservative design, a unique solid-state print head, and a minimum of moving parts.

Noise, too, has been minimized.

The quiet T-80 hums at 80 cps, so it can be seen but barely heard.

And head changing is a snap.

Any operator can put in one of our incredibly small, self-cooling heads in a snappy 10 seconds.

Our New Era T-80 thermal printer, with its parallel or optional RS-232-C interface, is ready to tie into your CRT, your terminal, or your processor.

The T-80: fast, inexpensive, quiet, and reliable.

Altogether, an unbeatable combination.

Pharmacy Using Turnkey System

(Continued from Page 41)

System 31's disk memory stores about 70,000 accounts, enough to last the average pharmacy two years without purging. When a customer comes in for the first time, a druggist enters information like doctor's name, customer's name and account number, code of directions, allergies, drug name, quantity, price, cost, number of refills, predetermined fees and number of lables to print into the system.

When an account is established, a refill or new prescription takes only a few seconds.

Among its other functions, the system checks drug prices to ensure they are current; checks refill numbers to be sure the authorized number of refills have not been exceeded; updates family records; creates billing files for third-party payment; and prints prescription labels.

Another advantage of the CRT terminal is the ability to program private reminders on various customers, Glenn said. "You have all sorts of people walking into pharmacies," he explained. "You may only want to accept cash from some. Others may be suspect drug abusers or shoplifters. You can get a private message on the screen whenever that customer's number comes up and it will never be printed anywhere else that it could cause you embarrassment if it got into the customer's hands."

Carter described the network as nothing more than a sophisticated file clerk and filing system," which is exactly what he said his pharmacy needed. "Previously, we had two manual file systems, and if you had 10 or 15 refills on a prescription, you thumbed through them so many times you couldn't read the number," he recalled.

"Now, the pharmacist just takes the label off the printer and it's legible, the information is there in the same form every time and the drug prices are current."

You don't have to think big

One of the biggest names in big computers just became one of the biggest names in small computers.

Because Sperry Univac just acquired Varian Data Machines. Lock, stock, and slide rule.

From now on, Varian's complete line of mini's will be brought to you by the minicomputer operations of Sperry Univac. The whole family—from the world's first mainframe on a board to the top of the line—will carry the Sperry Univac label.

Of course, these machines were always a good buy. But now they're assured of all the service and support that Sperry Univac can command. All the former VDM employees, all the dollars, all the dedication.

What's more, we're totally committed to

to think Sperry Univac.

supporting and enhancing Varian's current product line.

Write to us at Sperry Univac Mini-computer Operations, 2722 Michelson Drive, Irvine, California 92713. Or call (714) 833-2400.

The fact is, Sperry Univac is going to be a big success in small computers.

Sperry Univac. Mini's that think like mainframes.

SPERRY UNIVAC

SPERRY UNIVAC IS A DIVISION OF SPERRY RAND CORPORATION

Infoton Adds Two CRTs

BURLINGTON, Mass. — Infoton Corp. recently introduced two CRT terminals. The 1200 is a Teletype Corp.-compatible display terminal with standard bottom-line entry and full-screen entry operating modes.

Features of the terminal include a 1,920-char. display in a 9 by 9 dot matrix format, RS-232C and current loop interfaces, 16 switch-selectable transmission rates from 50- to 19,200 bit/sec and a capacitor scan detachable keyboard, according to an Infoton spokesman.

Command functions of the 1200 enable X/Y cursor addressability, erase line or screen, and keyboard lock or unlock, he said.

Options available include upper/lower case printing, a printer interface, answerback, numeric keypad, function keys and non-scroll page mode of operation, Infoton noted.

The Model 1400 is said to be a multifunction CRT terminal which utilizes the full Ascii code set and is microprocessor based.

Features of the terminal include all those standard on the 1200, as well as character or block transmission, cursor control cluster, a numeric pad and editing capability, the spokesman noted.

Additional command functions on the 1400 include cursor sense, reverse video, and underline field.

The 1200 costs $1,195 in its basic form; and the 1400 is priced at $1,595, the spokesman noted from Second Ave., Burlington, Mass. 01803.

Microprogrammed System

CRT Does Publishing Jobs

CORNWELLS HEIGHTS, Pa. — Delta Data Systems (DDS), has introduced a video display terminal that its manufacturer claims minimizes errors in text processing applications. Dubbed Delta 4300E, the microprogrammed terminal incorporates a 4K-char. memory expandable to 8.5K char.

Designed exclusively for organizations like newspapers, publishing houses and other communications firms, the terminal provides text-manipulation features that include automatic word wrap, automatic ragged right sentence and paragraph justification and automatic justification of new insertions, the firm said.

In addition, four automatic search modes are possible including searching test for a specific word or word string; search and replace each occurrence in text with a new word or word string; search and replace upon request; and search and delete each occurrence in text of a specific word or word string.

Moves, Copies Text

Other features include the ability to move/copy/delete any defined text from the terminal's memory. The unit has an automatic carriage return. Memory preservation prevents loss of data and signals the operator when a character is added or inserted into a full memory, DDS added. To help conserve memory, a data compression code eliminates trailing spaces.

Like the firm's Delta 4000 microprogrammed video display terminal, the 4300E offers a 128 upper/lower case character set scroll up or down, full tab/clear control, end of data tab and protected text (format) control. Communications speeds up to 9,600 bit/sec are possible with the unit and a serial printer port for hard copy records is also available as an option.

Display Modes

Four display modes — normal, reverse, blink and reverse with blink — aid text processing jobs by calling attention to specific information on the screen, DDS said.

Used with a printer, the terminal can be used to prepare documents at insurance companies and financial institutions, research organizations and government agencies of all kinds.

The terminal displays 25 lines of 80 characters each. An exclusive paging feature displays all the characters in memory — regardless of the number of lines — in any format, without computer memory or regard to the number of lines of information transmitted, DDS claimed from Woodhaven Industrial Park, Cornwells Heights, Pa. 19020.

WUI to Start Serving Japan

NEW YORK — Western Union International, Inc. (WUI), a unit of WUI, Inc., and Kokusai Denshin Denwa Co., Ltd. (KDD), the international telecommunications entity of Japan, have agreed to begin operations for private line and other services. WUI will apply to the Federal Communications Commission soon for the necessary authority, a spokesman said.

Japan was the only major country not served directly by WUI. KDD provides all international telecommunications services, telephone and record, between Japan and the rest of the world.

KDD and WUI will offer private leased-channel services to commercial and government users via both cable and satellite.

Private leased channels constitute WUI's second largest service area, next to Telex, which is not covered by WUI's agreement with KDD. KDD and WUI are also currently exchanging views on a future data transmission service between Japan and the United States, WUI said.

OCR SAVES MONEY

How Westinghouse
Saves Over $10,000
A Month With OCR

Westinghouse Credit Corporation's business is financing at both retail and wholesale customer levels. Before OCR, credit applications for computer input were keyed from forms manually generated at a multitude of field offices.

Westinghouse's George Jordan was instrumental in replacing this costly and cumbersome keypunch operation with an Optical Business Machines Laser OCR-One optical character recognition system and seven newly designed forms. About 25,000-30,000 of these forms are scanned every month. The result . . . the keypunching staff has been reduced by over 50%. The savings from this alone amount to about $10,000 a month! More than that, Westinghouse Credit has reduced their reporting time by three days and has achieved much better control of their money.

For information on how you can cut data entry costs with the Laser OCR-One system, contact

Helps Assure Data Security

Bank's Film Stops Developing Problem

HALIFAX, Nova Scotia — The Bank of Nova Scotia, headquartered here has found an inexpensive solution to a potentially expensive problem — data security.

The problem was that confidential information shown on CRTs at teller stations could be seen by any customer standing in line.

"It wasn't long after our computer terminal was installed at a pilot branch in March 1976 that we realized we had a problem," according to George W. Tompkins, manager of implementation coordination. "I could read your business and you could read mine very easily."

This presented an undesirable situation since it varied with the traditional banking code of maintaining the security of customer records. "Because we were pioneers in this particular program, we had to find out for ourselves that a problem existed," Tompkins explained.

It wasn't the fault of the terminals, IBM 2970s, according to A.D. MacMillan, projects manager for corporate branch operations. "It was simply a case of our having a unique requirement for a product designed for the industry at large. The problem was, made more acute by our approach of using rotating pedestal bases for the terminals, rather than mounting them on the counter facing the teller," he said.

Pedestal-mounted terminals serve two tellers; this arrangement caused some of the data security problem faced by the bank.

"The pedestals are set back from the counter and can be turned from one teller to another. When the unit faced a teller, information displayed on the screen was visible to anyone in line at that window — the person's name, financial data and any messages.

"We began looking for remedies and obtained some quotes, but we had to move quickly. We were scheduled to have 440 of our 966 branches on the system by mid-1977 and couldn't afford to have that unsatisfactory situation cropping up in branch after branch.

"Meanwhile," he added, "our instruction to the branches was 'Do not turn the terminals' — a restriction that proved awkward at times, but we had no choice."

The problem was solved at a cost of less than $3 per terminal with sheets of light control film from the 3M Co. The film, a thin plastic sheet incorporating microlouvers, works like a tiny venetian blind to reduce glare, control light, improve contrast and control the viewing angle.

When placed in front of a lighted display, it directs light into a controlled viewing pattern and blocks out light from external ambient sources.

Film louvered at 0° restricts visibility to direct frontal viewing. Film louvered at 45° is used in certain branches where a cashier/teller system is employed; in those locations, terminals face the customer directly, but the angle of the louvers con-

(Continued on Page 56)

Savings & Loan Goes In-House After 10 Years With Services

Special to CW

NASHVILLE, Tenn. — After relying on computer service companies for 10 years, the Fidelity Federal Savings and Loan Association here recently opted for in-house DP. The move was prompted by a desire to save money and increase management's flexibility and responsiveness to a changing financial environment, according to Garnett Cothern, vice-president for computer operation.

"Just a few years ago we determined that we couldn't justify the cost of operating our own computer," he said. "Now it would cost us more to utilize an outside service.

"Furthermore, we have more flexibility, and we can prepare for electronic funds transfer, NOW accounts, variable rate mortgages and other likely trends — at our own pace," he added.

Fidelity has 10 branches supplementing the services offered at its 12-story main office in downtown Nashville. The branches extend Fidelity's service to a four-county area in mid-Tennessee. Another two branches are scheduled to open soon.

Based on his experience, Cothern believes associations smaller than one-third Fidelity's size may now find in-house operations financially attractive.

"Computer systems continue reductions in costs," he explained. "Savings and loans that couldn't afford their own DP systems a few years ago can now save money by going in-house.

"Unfortunately, many associations stay with service companies simply because their cost assessment is based upon outdated information," he pointed out. "It's not that

Bits & Pieces

Cleveland Society Sets Measurement Workshop

CLEVELAND — The Cleveland Engineering Society will hold a two-day workshop on computer measurement here Sept. 29-30.

The workshop, which will be directed by Donald C. Harder and David S. Hubbert, is designed for computer management personnel and capacity planning analysts.

The cost of the workshop is $335, which includes luncheons, coffee breaks and all materials. Additional registrants from the same firm will be charged $300; a 10% discount is available for teams of three or more persons from the same firm.

Registration information is available from the society's Education Office, which can be reached by telephone at (216) 361-3100. The society is at 3100 Chester Ave., Cleveland, Ohio 44114.

Brush Removes Static Charges

HILLSDALE, N.J. — The Texwipe Co. has introduced a static eliminator brush that reportedly eliminates the static charges that build up as a result of the movement of paper in hard-copy output devices.

The brush is a conduction-type device that collects static charges and "bleeds them to ground." The brush requires no chemical renewal and maintenance is nonexistent, according to the company.

The brush costs $27 from the firm in Hillsdale, N.J. 07642.

Pericomp Hikes Crimper Price

NATICK, Mass. — Pericomp Corp. has increased the price of its magnetic tape crimper from $28 to $30.

The price hike is a result of increased production costs, a spokesman said from 14 Huron Drive, Natick, Mass. 01760.

In-House DP Gives Savings & Loan Flexibility

(Continued from Page 51)

managers haven't been doing their jobs, but rapid changes have made it difficult for them to keep up-to-date."

Fidelity began planning its conversion in mid-1975. In April 1976, equipment installation was completed and the association began running parallel for its savings operation.

In less then three weeks, it was able to balance to the penny and close out the old savings system. Loans were converted as of June 30, 1976, and both applications are functioning "admirably," Cothern said.

Fidelity is leasing an NCR Corp. Century 151 computer with 128K bytes of memory and four spindles of disk storage; an NCR 640 printer for producing reports and other printouts; and an accessory tape drive. Each 657 disk has a capacity of 50 million bytes.

The association purchased all other system hardware, including two NCR 796-301 CRT terminals (with printer attachments) for file maintenance and inquiry and 19 NCR 270 electronic teller terminals for its main office and branch offices. Fidelity also utilizes NCR's software package for the savings and loan industry.

This combination of equipment and software provides Fidelity with a variety of capabilities not previously available, including on-line access to account histories and the opportunity to automatically calculate penalties on certificates of deposit.

The ability to produce special statistical reports for management is another significant benefit. Automatic generation of an auditor's report, covering all "unusual" transactions, such as those requiring officer approval, is one example of enhanced security; the chance to word customer communications as it wishes is another, Cothern said.

Time-saving features of the system are important, too. Using the terminals, which have the ability to write on tape, it is possible to store off-line transactions to be input automatically. The need to reenter data can be eliminated, reducing the chance for error. The upgraded equipment, especially the teller terminals, speeds customer service and simplifies new employee training, Cothern said.

"I'm not criticizing computer service companies," he added, "But the packages they develop for groups of savings and loan users must have inherent limitations. Consider, for example, delinquent loan notices.

"If a service company has several different associations, it can't possibly individualize the notice wording for each customer. Just changing paper in the printer would present a problem.

"Can you imagine the uproar if the wrong notice were used and a 'get tough' message went out to the customers of an association which had a more lenient approach?"

Concern With Money

In deciding upon its system design, Fidelity was very concerned with teller terminals, upward compatibility, the availability of software and, of course, money.

"Many terminals we looked at require more powerful equipment to drive them," Cothern recalled. "We felt the NCR Century offered us the power we needed to drive the terminals at an economical cost. We can also upgrade to a more powerful century computer without having to change language or software."

"Accessories can be added for electronic funds transfer and automatic teller services without scrapping our existing terminals," he noted.

The cost of software development ruled out some systems which Fidelity considered.

Further, Cothern finds it "reassuring to know that Fidelity will have access to new software modules as they are developed." Share loans, statement savings and construction loans are examples of software needs on the horizon, he said.

Fidelity's teller terminals feature a keyboard with a CRT that provides step-by-step instructions for handling each type of transaction. The backlit instruction panel assures that no steps are overlooked — even when a teller is handling unusual transactions. New tellers do not have to memorize complicated procedures, Cothern explained.

Another feature of the terminals is their ability to record on cassettes. "If the system's down, a teller must enter the information in some way to record the transaction in the customer's passbook," Cothern said. "Since the terminal has the ability to write entries onto a tape cassette, this information can be stored off-line for convenient data reentry.

"This capability can be particularly valuable for mailroom tellers who receive, batch, prove and balance about 80% of all loan payments and a large number of savings deposits. Though they don't need to immediately enter information for a customer, they must pace their work to keep up with the volume. It's a real advantage for them to be able to store information off-line," he said.

Automatic calculation of penalties on certificates of deposit is a benefit much closer at hand. To determine the penalty on an early withdrawal from a time deposit, a manager or teller has to determine the number of days the money has been on deposit, then adjust earnings back to the passbook rate. Fidelity has been using charts in its penalty procedure.

If the money has been on deposit for two years, it takes several minutes to figure, while the customer is kept waiting. When using this feature, Fidelity will be able to calculate penalties automatically. The teller will also be able to make an inquiry and tell the customer the penalty amount before processing.

In the future, on-line history and an alpha locator, or CIF file, will give Fidelity immediate access to every account a customer has with the association, using name or account numbers.

This information is currently kept on microfiche; to use fiche, however, the teller has to leave his station or turn his back on the customer. With the information on-line, it will be easier and more convenient.

Each terminal is designed to allow operation on a different key by up to four tellers. That is an important feature in the small branch offices where secretaries, branch managers, and part-time help may relieve regular tellers during vacations, lunches and breaks, according to Cothern.

With the terminal, some transactions aren't completed without supervisor override. For example, a teller can't make a withdrawal without a passbook unless a supervisor key is used to "unlock" the terminal. Every transaction for which the key is needed automatically appears on an auditor's report.

Future requirements played a large role in Fidelity's selection of the teller terminals. The future and a trend toward a paperless society also was a key in Fidelity's decision to include a tape drive unit in its system.

"Our requirements are going to change dramatically in the coming years," he concluded. "By going in-house, we have gained the flexibility we will need."

1401
payroll blues?

The 1401 is long dead but lots of 360/370 users are still struggling with retread 1401 software.

How to spot a retread? Easy . . . a half-astute system design, 50, 60, 100 small programs, time wasting multiple read/writes, no real EEO, or ERISA capabilities . . .

If you are struggling with a retread on your 360/370, Honeywell, Burroughs or Univac, all is not lost . . . call Joe Nestor (617) 851-4111, Wang Laboratories, Inc., Lowell, MA 01851. In California, call Carl Tarascio (714) 631-0138.

Honeywell's Level 6. The mini that lets you design aggressively for the future.

Honeywell's Level 6 minicomputer brings new design freedom to the OEM and systems builder.

With its fully open-ended, modular architecture and unique Megabus that lets you mix processors, memories, communications and peripherals to meet just about any system requirements.

With packaging versatility that includes table top, rack-mounted and office versions.

With modular software that's responsive to OEM needs. For example, GCOS 6/MDT, a Multi-Dimensional Tasking disk-based operating system provides a compatible interface to all language processors. You can mix or match FORTRAN, COBOL and RPG to speed applications development. And there's full compatibility between the ISAM file system and the language processors as well.

Furthermore, GCOS 6/MDT takes full advantage of Level 6 hardware features such as automatic context save and restore, independent traps and dynamically assignable priority levels.

With our attractive OEM pricing, contracts, and policies.

And with a worldwide mainframe supplier on your team, when you need maintenance or support, you don't have to hunt for it.

Report Eyes Contract Provisions

WINTER PARK, Fla. — A report outlining important user-oriented contractual provisions for an era of price cutting and new equipment introductions has been made available by International Computer Negotiations, Inc. (ICN).

These provisions are featured in ICN's *Computer Negotiations Report (CNReport)*, Issue 2.

In line with the latest round of hardware price cuts and new system introductions which have generated considerably interest in recent months, *CNReport*, Issue 2 deals with the numerous contractual provisions that are critical to the user in a price-cutting environment.

Four major contractual considerations are covered in the report:

- Guaranteeing the price — how to ensure that your organization will enjoy the benefit of any price reduction announced after you've signed the contract.
- Substitute or upgraded equipment — how to protect yourself (via the contract) from instant obsolescence.
- Cancellation of the order — how to get out if the price goes up or down or if new state-of-the-art equipment is announced.
- Residual guarantees — provisions to use to guarantee the future value of your system.

The report is available for $18 from International Computer Negotiations, Inc., 400 New York Ave., Box 364, Winter Park, Fla. 32790.

T/S System Drives Debut

SUNNYVALE, Calif. — Basic Timesharing, Inc. has introduced a disk drive and tape cartridge drive for its Model 4000 series interactive time-sharing systems.

The Model 4460 disk drive provides 10M bytes of non-removable formatted storage and replaces the 7.5M-byte drive previously incorporated in the 4000/15 system, according to a spokesman.

The Model 4560 magnetic tape cartridge drive provides 10M bytes of storage using 6,400 bit/in. recording density.

The drives are included as standard equipment on the 4000/15 system at no additional cost. A dual-drive version of the tape drive is included along with a disk drive in the 4000/25 system at no additional cost, the spokesman said from 870 W. Maude Ave., Sunnyvale, Calif. 94086.

Card Reader Has Buffer

MELBOURNE, Fla. — Documation, Inc. has introduced a fully buffered card reader that reportedly appears as an IBM 2501 reader to IBM 360 or 370 CPUs.

The 1,000 card/min reader, the DOC 6501, is unlike the 2501 in that it is fully buffered and can be installed as a low-priority device on any position on the channel, a spokesman claimed.

The unit has a "pick and riffle" vacuum air system that the firm claims will virtually eliminate the normal card edge damage found in mechanical feed mechanisms. The unit also features data resynchronizing logic which reportedly provides accurate reading of cards with punching misregistered by more than 50% over the industry standard, the spokesman said.

The unit sells for $14,000 from the firm at P.O. Box 1240, Melbourne, Fla. 32901.

Firm Adds Two Printer Systems

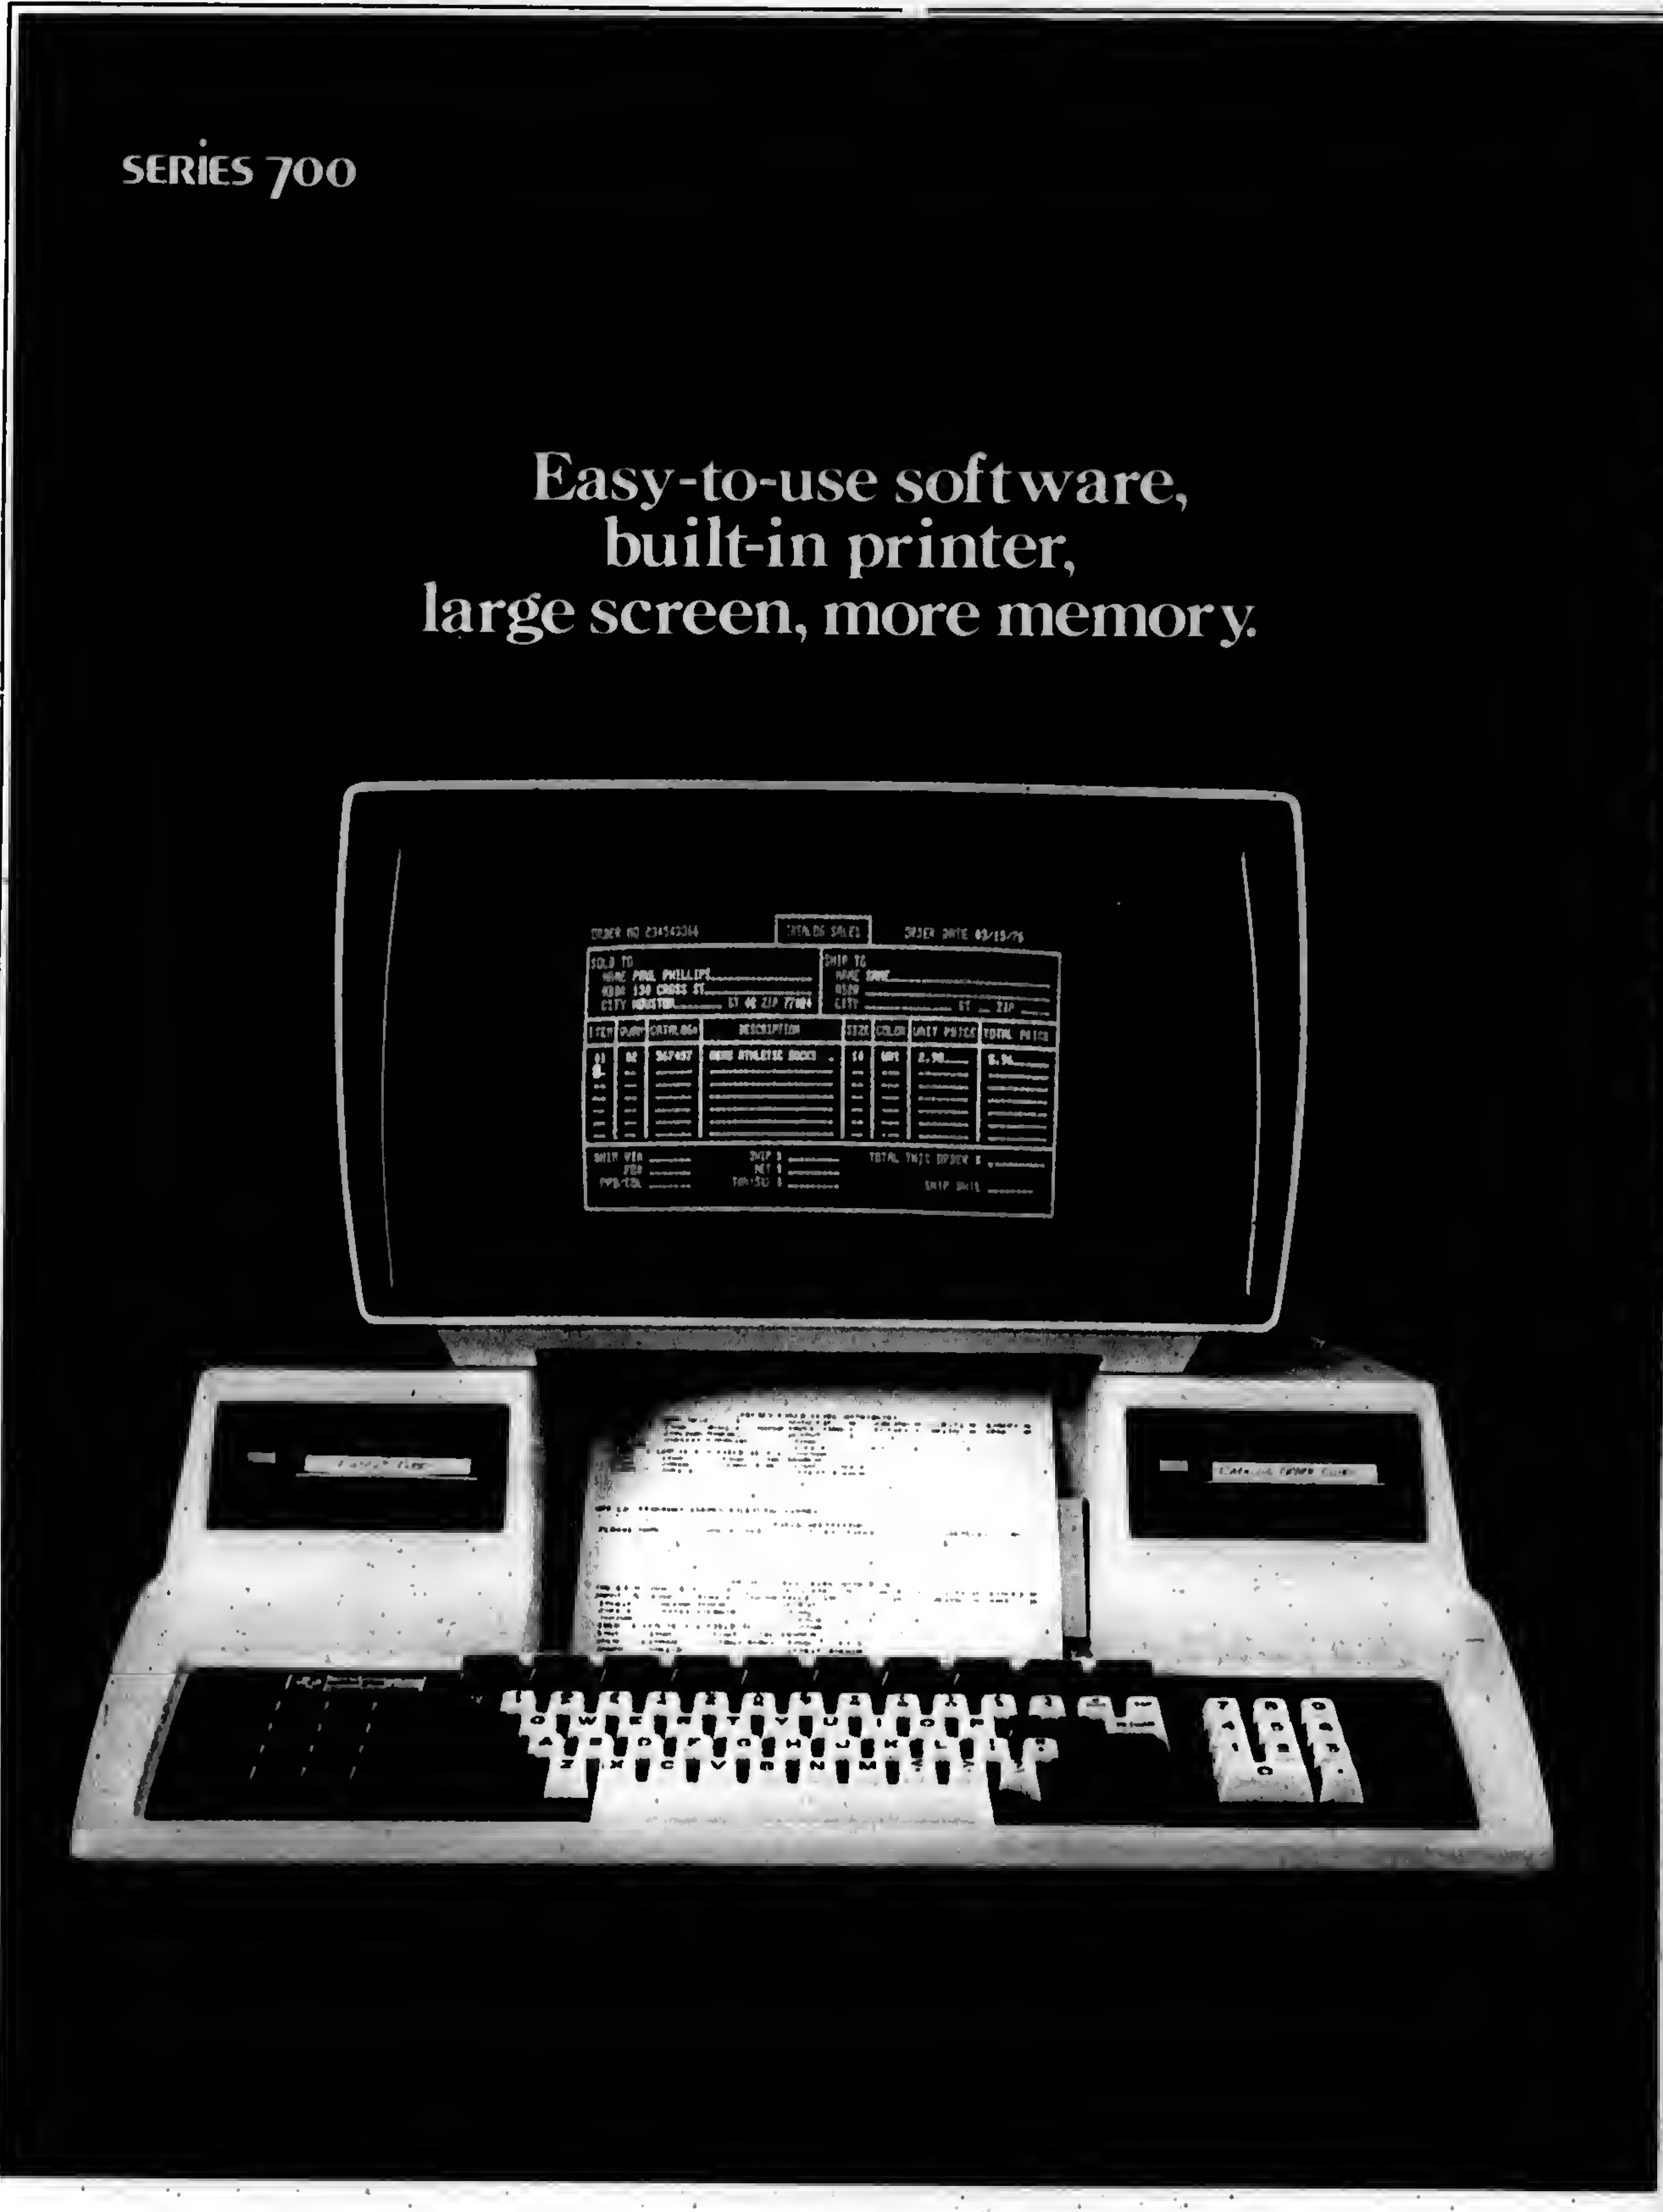
MELBOURNE, Fla. — Documation, Inc. has expanded its family of line printer subsystems with the introduction of both a 1,250 line/min and a 1,500 line/min printer.

The DOC 1250 and DOC 1500 are microprocessor-controlled, fully buffered, 132-char. systems that are IBM 1403 plug-compatible.

Standard features include six-part form printing, interchangeable print bands, a forms control buffer, vertical line spacing of either 6 or 8 line/in. and a 75 in./sec slew rate, the spokesman said.

An integrated controller communicates through the interface to the host CPU, decodes all commands, controls printer hardware and reports both errors and status, the spokesman explained.

The DOC 1250 costs $45,000 and the DOC 1500 sells for $50,000 from the firm at P.O. Box 1240, Melbourne, Fla. 32901.



Programmable Device Records Transaction Data

PENNSAUKEN, N.J. – The Danyl Corp. here has introduced a microprocessor-controlled transaction recorder. The unit was designed for a variety of data acquisition and data logging applications, the firm said.

System 80, which features a cassette recorder and an 8080-based microprocessor controller, allows the installation of a 17-char. badge reader and 32-key calculator-style keyboard as optional input devices, according to a spokesman.

The use of the microprocessor-based controller allows the System 80 to be programmed and tailored for specific data entry and acquisition requirements.

Input data may be checked for validity and analog data may be compared to go/no-go thresholds or may be averaged over time, the spokesman explained.

All transaction information may be recorded on tape for subsequent processing and the tape capacity exceeds 125,000 bytes, he said.

The system may be purchased without firmware for user programming and Danyl will provide programming and external interfaces per user specifications. The recorder accommodates up to 1.5K bytes of read-only memory and 256 bytes of random-access memory, the spokesman said.

System 80 costs $1,250 and delivery is 60 days from the firm at N. Park Drive and Browning Road, Pennsauken, N.J. 08109.

Free Catalogs Offered

The following brochures and catalogs are available free of charge from vendors:

CW Industries, Inc. has a 12-page catalog describing the company's Cee Wee connectors for flat flexible cable with round connectors. The firm can be reached at P.O. Box 96, Warminster, Pa. 18974.

A 24-page full-color brochure covering Versatec Co.'s line of printers and plotters is available from the firm at 2805 Bowers Ave., Santa Clara, Calif. 95051.

A one-sheet catalog of capabilities describing the sonic digitizers, data converters, interfaces and accessories produced by Science Accessories Corp. is available from the firm at 970 Kings Highway West, Southport, Conn. 06490.

Literature describing the processing of payments by transaction at high speed is available from Cummins-Allison Corp., Data Systems Division, 800 Waukegan Road, Glenview, Ill. 60025.

A brochure covering Tenny Engineering, Inc.'s digital instrumentation options is offered by the firm at 1090G Springfield Road, Union, N.J. 07083.

A technical bulletin from Mavilor Motors describes the firm's line of .25-through 13-horsepower DC motors. The firm is at 285 Murphy Road, Hartford, Conn. 06114.

Breadboards

A 32-page catalog describing over 100 different breadboards for use by prototyping engineers is available from Douglas Electronics, 718 Marina Blvd., San Leandro, Calif. 94577..

A 12-page brochure that provides a graphic presentation of the metal cabinetry capability of Electronic Enclosures, Inc. is available from the firm at 225 S. Aviation Blvd., El Segundo, Calif. 90245.

A 14-page, four-color brochure by Datel Systems, Inc. describes its 40-column alphanumeric impact printer. The firm is at 1020 Turnpike St., Canton, Mass. 02021.

Network Systems Corp. is offering six application data sheets featuring Hyperchannel, a product for multiple computer interconnects. The firm is at 6820 Shingle Creek Pkwy., Brooklyn Center, Minn. 55430.

An illustrated 8-page bulletin explains in management terms the problems and solutions encountered with computer systems involving power deviation, brownouts and blackouts. It is available from Cybernex, Inc., 7171 Industrial Park Blvd., Mentor, Ohio 44060.

Introducing the Model 770 Intelligent Terminal.

From the company that makes technology affordable.

TEXAS INSTRUMENTS.

The Model 770 Intelligent Terminal is a powerful system designed to meet your distributed processing needs. Better than sending your data to your host by mail or teletypewriter, better than entering it by keypunch or key-to-disk, the 770 provides the ideal, cost-effective solution for source data entry, data pre-processing and communications for your distributed processing applications.

Reduces your communications costs.
The Model 770 removes a substantial burden from your host computer and reduces your data communications costs. By pre-processing your data on the spot, errors are reduced, and speed and accuracy are increased. Additional communications savings can result by transmitting batched data at high speed during unattended operation when line rates are lower.

Totally integrated package.
The Model 770 terminal includes all the components of an entire system. It has features like dual mini-cartridge tapes, a 1920-character video display and up to 48K bytes of memory. And it's the first video display-based intelligent terminal on the market that offers a built-in 80-column printer.

For multi-copy and 132-column capability, TI's compact, microprocessor-based Model 810 impact printer is also available.

Model 810 Impact Printer

Easy-to-use software, easy-to-learn language.
Model 770 terminals are easy to program and operate with TPL 700, the flexible, powerful Terminal Programming Language. TPL 700 is a high-level business-oriented language that greatly simplifies forms generation and procedures for data entry and local processing. Programs can be developed interactively on the 770 without ever writing lines of code.

And, of course, TI offers total service and support, including flexible maintenance plans and a nationwide network of factory-trained customer service engineers. For your distributed processing needs, TI clearly has a better solution. For more information, mail back the coupon. Or call your nearest TI sales office or Terminal Systems Marketing, (512) 258-7176.

Yes! I am interested in the Model 770 Intelligent Terminal.

Inforex Hikes Disk Capacity of System 5000

BURLINGTON, Mass. — Infurex, Inc. has reportedly quadrupled the disk storage capacity uf its System 5000 file management system with the introduction of two dual-density disk storage units.

The Inforex offerings are the 62.1M-byte Mudel 5303 and the 236.1M-byte Model 5304. Up to four drives of either density can be attached tu each System 5000 cuntrul unit, pruviding a maximum capacity of 944M bytes rather than the previous limit uf 200M bytes, according to a spokesman.

The Model 5303 featues 256 byte/-sector, 59 sector/track and 5 track/cylinder. Each pack contains 823 cylinders and five platters. All five platters can be multitrack searched, he said.

The units have a rotational speed of 16.67 msec with 8.33 sec uf latency; the unit achieves 3,600 rev/min, he added.

The drive supports 4,040 tracks/-pack on the initial drive and hosts up to four drives, allowing a total of 16,385 maximum usable tracks.

Extra Drives Optional

A 5303 drive with contruller sells for $40,000. A controller can handle four drives and an additional drive sells for $27,000. Munthly rentals on the drive and controller range from $960- to $1,370/mo. Rentals on the additional drive range from $630 - to $830/mo.

The Model 5304 drive features 256 byte/sector, 59 sector/track and 19 track/cylinder. Each pack contains 823 cylinders and 10 platters.

Eight uf the platters can be multitrack searched. Rotational speed, latency and rev/min rates are the same as those of the 5303.

The drive supports 15,562 track/pack un the initial drive and hosts up to four drives, allowing a total of 62,473 usable tracks, the spokesman said.

The 5304 with controller sells for $80,000 and a second drive sells for $42,000. Monthly rentals range from $1,835- to $2,160/mo for a single-drive unit to $940- to $1,230/mo for the second drive.

Infurex is at 21 North Ave., Burlington, Mass. 01830.

IBM Microfilmer Enhances Deposit Processing System

WHITE PLAINS, N.Y. — IBM Corp. has introduced a microfilm recorder that gives banks a sequenced tally of checks and deposit slips that have been processed by the firm's 3895 deposit processing system.

The unit records documents as they move through the 3895 reader/-inscriber, making pictures of one or both sides of each document, a spokesman explained. The unit can record more than 100,000 items daily, he said.

Eight-digit index numbers are printed on the microfilm next to document images for retrieval of specific items. The numbers match those the 3895 prints on the face of each item, permitting stored documents to be matched with the film record, the spokesman said.

Additional item-tracking capability is provided by frame marks exposed along the film edge.

The recorder, which can be field-installed, fits into a 4-ft wide section of the 3895. The accessory film cassette can store approximately 380,000 front and back images on 2,000 linear ft of microfilm, the spokesman noted.

Software Support

The on-line microfilming feature will be supported by application software, the Check Processing Control System-Deposit Processing Feature and by Deposit Processing-Operating System/Virtual Storage (OS/VS).

The monthly lease charge for the feature is $2,725; monthly use charge is 1.9 cents per 100 item passes. Purchase price is $100,000 and the price of the film cassette is $424.

First shipments will be scheduled for November 1978, the spokesman said from 1133 Westchester Ave., White Plains, N.Y. 10604.

Film Puts Stop To Data Problem

(Continued from Page 51)

trols the distance from which the information can be seen. Someone six feet away, for example, sees only a blank screen.

The screens are now in place in 440 branches, and the bank expects to have more than 900 branches on the system equipped with the light control film by 1980, Tompkins noted.

More Than a Service

Maintaining the confidentiality of customer records is more than a service, it's a basic principle of banking, he said. "Fortunately, we were able to correct a potenitally damaging situation before it went too far. Had we done nothing at the time and looked the other way, I'm certain there'd be action by now in many quarters.

"The potential ramifications of doing nothing far outweigh what it has cost us," he added.

It took less than five minutes to install the sheets of film and conversion has posed no problems, except for the occasional human error, Tompkins said.

"When we started the test, one of the employees in the corporate data center indicated that nothing could be read through the new film," he recalled. "The employee said that the screens were not at all what was ordered and they didn't work.

"I told the employee to bring them over and we'd take a look at them here. They worked fine. They had been installed upside down."

erisa?

If the personal penalties for management violation of the Employee Retirement Income Security Act of 1974 have you worried, then take heart.

Survey Shows Users Happy With Minis

By Esther Surden
CW Staff

Most minicomputer users who responded to CW's recent survey were very pleased with their small systems despite problems with software support [CW, Aug. 29].

Those who responded were dedicated to using the small systems. For example, when asked what their firms will do when they outgrow their present mini, most users said the companies will either get a larger mini or off-load the small system with another small system. Few believed they will ever outgrow their present system.

Adding memory, disks or terminals to the present system was a growth alternative often cited. Only a few users said they would grow into a mainframe when their processing needs become too complex for their present mini.

Outgrowing the system "is not forseeable at the present time," one user told CW, while another said "it cannot happen."

Upgrade Capability

System upgradability was a topic touched upon often by users explaining why they switched from one system to another or why they liked their particular mini.

One company that was happy with its Hewlett-Packard 2100 system converted to a Prime Computer, Inc. 400 minicomputer. "The reason we did not stay with HP is that it is not easy to upgrade in small steps. With Prime, we can gradually upgrade as (and how) we need it with no software modifications," the DP manager said.

Another user, explaining why his company will get another supermini if it ever outgrows the one it owns, said: "Two superminis are better than one large mainframe. Also [this] helps cash flow [because] you buy it when/-as you become ready."

The price/performance benefits of minis were touted by many users. "Transaction-oriented minis are great. They give users control of their systems and the price/performance is outstanding," in the opinion of one systems manager.

A Los Angeles company using Digital Equipment Corp., Qantel Corp., Data General Corp. and IBM minis said, "generally, price/performance ratio and type of applications are superior for minis."

Minis bring processing power closer to the user, several respondees pointed out. "The trend toward minis will continue as large systems remain unmanageably complex," a user of a mainframe who also copes with 50 minis predicted. "Using a mini allows local users access to data and fast turnaround," a DP manager said.

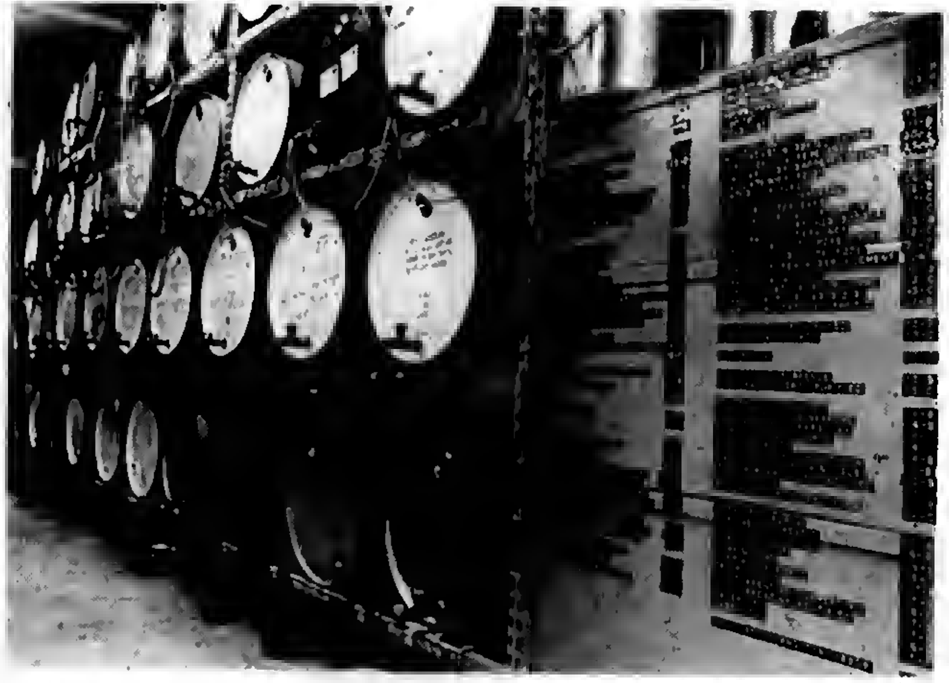
System Sniffs Out Savings

By Esther Surden
CW Staff

NEW YORK — "Our inventory made up our largest investment, so we thought we'd better go after our bread and butter application first," William Bulger, treasurer of Fritzsche, Dodge and Olcott, Inc., said.

The firm's system has been credited with cutting response to inventory inquiries from three days to 10 seconds and reducing the disparity between physical inventory and recorded inventory from 7% to 1%.

The firm is using an IBM 3/15 small business system to keep track of more than 4,000 off-the-shelf products, 3,000 special orders and more than 180,000 formulas for the flavors, fragrances and oils it produces.



Inventory system at Fritzsche Dodge and Olcott, Inc. copes with materials for 180,000 flavor and fragrance formulas.

Prior to the company's first move to a computer, an IBM 1401, the inventory was kept on receiving and withdrawal slips for each product and each lot of the product. The slips were kept in a file cabinet clipped to "long skinny plates."' When a withdrawal was made from a particular product supply and lot, a withdrawal slip was added to the file and the balance left was forwarded, Bulger said.

Files Unwieldly

The business grew to the point where the file cabinet became a cumbersome way to do business. In addition, "the company's needs were getting more sophisticated" and government regulations more complicated.

"If the Federal Drug Administration, for example, banned certain chemicals, we would have to find which products in the line used those chemicals in order to revise the formulas" or else withdraw the product, he continued.

The 1401 performed the inventory application using cards "but it was still too slow." Teletypes at the company's remote locations in New Jersey transmitted inventory data daily, so the records at company headquarters were only behind by a day and a half, rather than three days.

Anticipating a move to an on-line system, the firm then installed an IBM 360 which emulated the 1401, because it was "easier to go from a 360 to a 3," Bulger said. This allowed the company to keep in business while the programs were being changed to on-line status.

The present IBM 3/15 is attached to six remote terminals in the firm's manufacturing facilities. The terminals are directly on-line to the 3/15 and data is entered at the remote locations. The firm recently installed two additional terminals for inventory and stock maintenance.

"When we used to take physical inventory we were happy with a 7% or less disparity between our figures and inventory. With this system, there is less than a 1% difference," he said.

Using Effectiveness Grid — Part 1

Method Aids Firms Nearing DDP

By Carl Masi
Special to CW

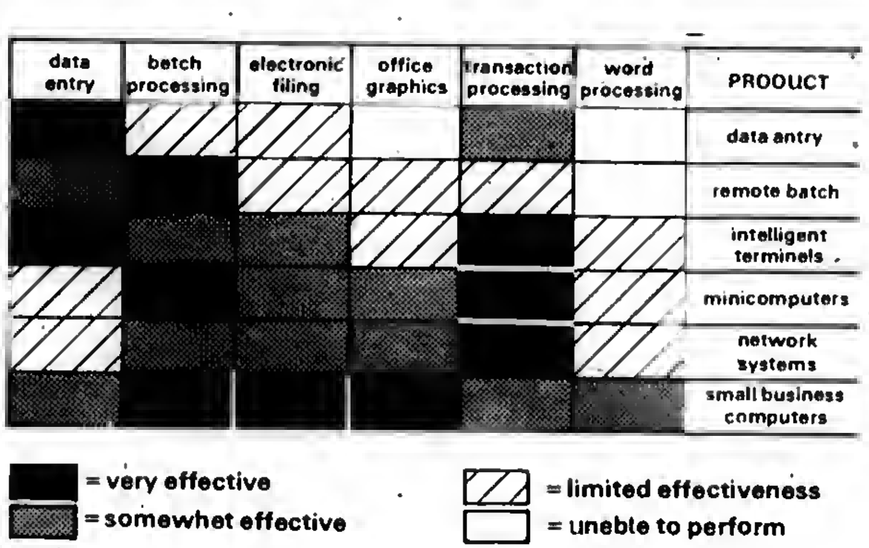
We recommend that users evaluate their needs in selecting small systems for distributed processing based upon an analysis of what we call an effectiveness grid. In fact, the larger and more diversified the company, the more important this effectiveness grid becomes.

The purpose of the grid is straightforward. It is designed to help a user measure the utility (of a product) to his organizatin vs. the commitments and risks it faces (by choosing a particular piece of equipment).

This is the first part of a two-part series on using an effectiveness grid to determine distributed systems requirements. The second part will cover organizational enrichment, policy impact and measuring productivity of such a system.

There are six relevant issues not usually considered by users in their development of dispersed information systems.

First, we have the issue of functional range: the extent to which a single product or product type can fulfill all of the most commonly needed functions in the departments, offices and other locations that the user might wish to incorporate in a distributed network.



data entry	batch processing	electronic filing	office graphics	transaction processing	word processing	PRODUCT
■	▨	▨	□	▒	□	data entry
▒	■	▨	▨	▨	□	remote batch
■	▒	▒	▨	■	▨	intelligent terminals
▨	■	▒	▒	■	▨	minicomputers
▨	▒	▒	▒	■	▨	network systems
▒	■	■	■	▒	▒	small business computers

■ = very effective
▒ = somewhat effective
▨ = limited effectiveness
□ = unable to perform

An example of a functional range effectiveness grid.

Essentially, data entry, electronic filing, transaction processing, batch processing, office graphics and word processing are all of the functions that one is likely to have occasion to perform in a distributed network, now or in the future.

The available classes of products with which to perform those functions are data entry systems, remote batch terminals, intelligent terminals, minicomputers, networked systems and small business computers.

Any or all of these products can be clustered or stand-alone, on-line or off-line, or available in any one of a number of configurations. What is important to measure is the extent to which each class can perform the maximum number of planned and anticipated functions in the network, not through massive customized development, which is costly to initiate and even more costly to maintain, but as standard off-the-shelf product capability.

The second major issue to be

(Continued on Page 58)

Industrial Process Controller

SANTA CLARA, Calif. — Selanar Corp.'s MC-1 process controller is designed to handle large industrial control and data acquisition projects, the firm said.

The MC-1 was designed to operate in a variety of industrial applications including industrial equipment monitoring, power demand regulation, chemical and petroleum process control and scientific experimentation control.

The UCP operating system aids engineering firms and end users who cannot afford to develop extensive software capabilities, the vendor claimed.

A user enters simple statements and the compiler composes the control programs using appropriate translation for each statement, the firm explained.

The MC-1 controller consists of a 16K-word CPU, 1,920-char. CRT terminal, 30 char./sec matrix printer, IBM-compatible diskette storage system and a 64-channel analog measurement device.

A custom digital I/O interface includes 256 inputs and 128 outputs with a basic scan rate of 10 times per second per channel under program control. The interface also has two serial I/O ports for the CRT and printer. An 8-bit parallel interface is also part of the package.

The package costs $26,000 including on-site setup and test plus software instruction. Selanar is located at 3054 Lawrence Expressway, Santa Clara, Calif. 95051.

Video Unit Fits DG Minis

BURLINGTON, Mass. — The Model 200-D Graphics and Imaging Video Processor from Lexidata Corp. generates raster-scanned, refresh, graphics and imaging displays, according to the firm.

The unit is contained on a 15 in. by 15 in. printed circuit board and fits into "any standard Data General Corp. Nova or Eclipse," the firm noted.

A standard upper case Ascii alphanumeric character generator produces 5 by 7 dot matrix characters which may be superimposed on the image displayed.

Featuring a writable control store, the Model 200-D allows modification of all image-processing and data-formatting routines under program control from the host system, the company said.

Model 200-D costs $4,900 for a basic black and white model and $5,300 for the basic color version, Lexidata said from 215 Middlesex Tnpk., Burlington, Mass, 01830.

Grid Aids DDP Selection

(Continued from Page 57)

faced in terms of distributed processing is transitional ease — the ease with which the user can take the current system and planned new products and integrate them into the dynamics and geography of the business. This integration must be accomplished in six ways — selecting and preparing sites, training the staff, converting and developing software, insuring compatibility with existing systems if needed, implementing procedural changes and ensuring adaptability to both initial and longer term requirements of the business.

Using the grid it becomes clear that some products are much easier to install painlessly than others. Some will require substantial software development and conversion. Others, by their nature, have limited future growth potential. And some will require heavy training commitments.

To many users, one or more of these limitations may be unimportant, since they are planning major changes for which training or conversion efforts should be heavy. But the point of this grid evaluation is to anticipate and clarify in advance and with precision the extent of such requirements.

The third major issue in distributed processing development is the configurability of the various product classes, both now and in the future. If the organization is changing constantly, the requirement for equipment to keep up with that change is of paramount importance.

System Expandability

Therefore, when we talk of configurability, we are talking about the ease with which product classes can be reshaped, when and as needed from single stand-alone devices to small, medium or large clusters; or expanded to become multiprocessing systems, if such is required; or through minor software modification made to perform in concurrent or multiprogramming modes.

Another key aspect of configuring a network of small systems is mobility, the ease with which Product A, no longer needed in Location B, can be packed up and moved to Site C.

Peripherals Important

So also is the peripheral equipment complement important. The 15 char./sec printer in use today at a specific site will probably have to grow to 45 char./sec or 60 line/min before long. It may have to have some disk storage as well. Thus it is very important to rate product classes on their effectiveness in terms of configurability.

This article was excerpted from a speech delivered by Masi, director of product marketing for Wang Laboratories, Inc., Lowell, Mass., at a recent conference.

Sooner or later your management is going to ask you for a casualty risk and insurance information system, so . . . you should know about

corporate systems

a company devoted exclusively to Risk and Insurance Information

Our only business is helping corporations, governments and institutions control the mushrooming cost of accidental loss. Information is essential to reducing these costs. Our system provides your insurance department and/or top management with monthly or quarterly reports covering any or all of these things:

- **total risk cost—insured, self-insured and non-insured**
- **the how and why of all losses**
- **allocation of cost-of-risk to corporate subdivisions based on experience as well as exposure (forecast premium allocation with retrospective adjustments)**
- **monitor claim reserves or determine an IBNR for self-insurance**
- **accurately allocate property premiums**
- **show how risk and risk management is affecting the corporate P & L**

We can have a system operating for your company sooner than you could complete a feasibility study—and for less money than your feasibility study would cost. Ten years of actual use eliminates the months of testing of a do-it-yourself program.

We've got lots of good references. We're now providing this service to hundreds of major corporations, governmental entities and institutions. When you get the call . . . give us a call. Whether or not you're interested in our service, we can help you understand the problem and point you toward a solution.

Dual Minis Offer Process Control

PRINCETON, N.J. — A minicomputer-based process control system that uses dual Modular Computer Systems, Inc. 32-bit CPUs is available from Metromation, Inc.

The system was designed to "meet information and control requirements for large refineries, gas pipeline systems and petrochemical plant complexes," Metromation said. Typical applications include data gathering, monitoring of utility services and control of unit operations, it added.

The CPUs share data loads by "functional splitting" rather than having a redundant CPU on stand-by, a spokeswoman explained. The first CPU handles real-time functions while the second handles interactive/batch operations.

Either CPU can take over the operations by dual addressing of key peripherals, redundant data recording techniques and inter-CPU communications techniques, the firm noted.

Prices for the system range from $500,000 to $2 million and are dependent on the individual user's requirements, the spokeswoman stated. The company can be reached at 1100 State Road, Princeton, N.J. 08540.

Memory Replaces DEC Disk

ENGLEWOOD, Colo. — A solid-state replacement memory unit for the Digital Equipment Corp. RF/RS-11 fixed-head disk is available from Monolithic Systems Corp.

Dubbed the Extended Memory Unit, (EMU), the device features an access time of 2.1 microsec, required to set up control registers and initiate the transfer of information to and from the main memory, Monolithic said.

The unit can be used in DEC PDP-11/04 to 11/70 systems.

Using interchangeable memory modules, the unit features a dual-port Unibus interface, the vendor said.

The EMU costs $23,795 for one million bytes. Monolithic is located at 14 Inverness Drive East, Englewood, Colo. 80110.

Micro Debuts

LA JOLLA, Calif. — The Micro-740 from Micro Business Applications, Inc. is a small business system based on a microcomputer.

The basic system, configured around an Intel 8020 microprocessor, includes 58K bytes of user-accessible memory; one CRT; a 6M-byte fixed platter disk drive; cartridge tape drive capable of handling 2.4M- to 11.2M bytes of data depending on how it is formatted; a 125 line/min printer.

The basic system, available next month, will cost $24,750. The Fortran compiler will cost $1,000. The company can be reached through P.O. Box 2888, La Jolla, Calif. 92038.

Controller Fits Nova, DCC-116

PALISADES PARK, N.J. — A peripheral controller for Data General Corp. Nova 1200 and Digital Computer Controls, Inc. DCC-116 minicomputers that reportedly can replace up to five DG controller boards is available from Computer Data Access, Inc. (CDA).

The Model 6100 controller provides all controllers needed for a small on-line, multiterminal computer system. It can handle up to four California Computer Products, Inc. 140 series floppy disk drives, up to three RS-232 devices and a line printer, the firm noted.

The unit costs $2,200 with quantity discounts available, a spokesman noted from CDA at 470 Commercial Ave., Palisades Park, N.J. 07650.

IDS Introduces Impact Printer

WATERTOWN, Mass. — A tabletop dot matrix impact printer designed for use with minicomputers and microcomputers is available from Integral Data Systems, Inc. (IDS).

The printer operates at up to 120 char./sec and accommodates up to 132 char./line, IDS said. An RS-232 and current-loop serial interface are standard.

Other features include enhanced mode double-width characters, selectable character and line sizes and multiple copy capability on both fanfold and roll paper.

A 5 by 7 dot matrix is used to print the standard 64-character Ascii set, the company noted.

The unit costs $745 from IDS at 5 Bridge St., Watertown, Mass. 02172.

3M Offers Cartridge For HP 7905 Drive

ST. PAUL, Minn. — A front-loading, single-disk cartridge for the Hewlett-Packard Co. 7905 disk cartridge drive is available from 3M Co.

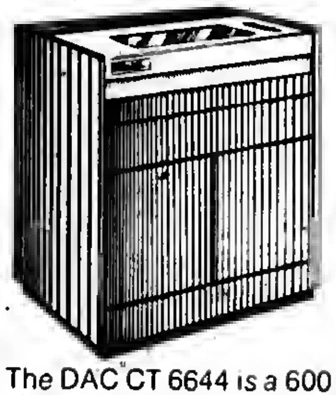
The Scotch Brand 932 disk cartridge features a 200 track/in. track density and a bit density of 4,400 bit/in. It has a capacity of 10M bytes per cartridge, the firm noted.

The disk costs $150 to $160, depending on quantity, from 3M at Department DR7-6, 3M Center, St. Paul, Minn. 55133.

The Printer Store

Digital Associates Corporation

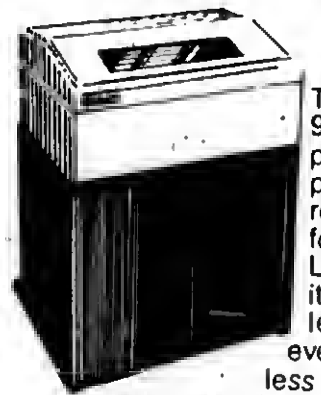
Or, switch to chain-train quality.



The DAC CT 6644 is a 600 LPM chain-train printer that replaces LP11-YA.
It gives letter-quality printing, and costs about 40% less than DEC's 600 LPM drum printer.
Again it comes with PDP-11 interface, installation and maintenance.

Specification:
Solid-font chain-train printer
600 LPM, 132 column/line
64 character/column
Available in u/l case

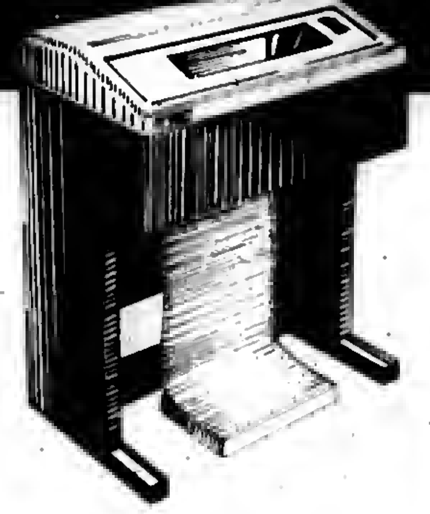
Or, upgrade to a 900 LPM printer for 25% less than you now pay for 600 LPM.



The DAC 2290 900 LPM printer is a plug-to-plug replacement for the LP11-CA. But it costs 30% less. In fact, it even costs 25% less than DEC's 600 LPM printer. Comes with PDP-11 interface, installation and maintenance.

Specification:
Solid-font drum printer
900 LPM, 136 column/line
64 character/column

PDP-11 USERS: Save 40% on your LP11-YA printer costs.



Replace your LP11-YA with our DAC 2260

The DAC-2260 is a 600 LPM, plug-to-plug replacement for your LP11-YA. It comes with PDP-11 interface, installation and complete maintenance service. Buy, rent, or lease. The saving is 40%.

Specification:
Solid-font drum printer
600 LPM, 136 column/line
64 character/column

Why we can offer such extraordinary savings.

The Digital Associates Printer Store is the largest independent outlet of quality line printers for mini-computer systems.
We buy printers, in quantity, directly from the manufacturers, and add interfaces to all the popular mini-computer CPU's. Then we offer complete printer systems (printer interface, installation and service) at prices the mini-computer suppliers simply can't match.
The Printer Store can supply printers from 100 to 1500 LPM, dot matrix, drum, chain train or band technology, for DEC, Data General, Hewlett-Packard, Interdata, G.A. and most other mini-computer systems! And for IBM Series 1 and S/3 computers. We install what we sell, and service what we install (unless you insist on doing it yourself). Buy, lease or rent, you'll save 20% to 50% on prices you'd pay to the mini-computer manufacturer.

Have you ordered a DEC-20?

Before you sign up for an LP-20 printer, call The Printer Store. We'll give you a wider choice of printers with substantial savings on any type you choose.

PDP-11 Changes Eased

WOODLAND HILLS, Calif. — A device designed to let Digital Equipment Corp. PDP-11 minicomputer users physically and electrically reconfigure their systems is available from Datafusion Corp.

Called the OSR11-A Busrouter, the unit can aid users who, for example, have "too many peripherals for a single CPU, causing the Unibus to be overloaded," a spokesman explained.

The Busrouter can have up to eight switching planes in its housing, the company said. The Unibus plugs into one of the switching planes and comes out as two cables on the other side of the box, a spokesman explained.

Two different sets of peripherals can then be attached to the cables. A user could run for four hours with one set, for example, and then switch to the other set for the rest of the processing.

A number of different configurations can be accommodated involving multiple CPUs, the spokesman added.

A single-plane version of the product costs $995. The systems are delivered configured to the user's particular application with delivery available in "about three weeks," the spokesman continued. Datafusion Corp. is located at 21031 Ventura Blvd., Woodland Hills, Calif. 91364.

Mini Controls Library Circulation

CINCINNATI — A minicomputer-based book circulation and control system is available from Cincinnati Electronics Corp. here.

Called Classic for Circulation Library Automated System for Inventory Control, the system can be supplied as a complete turnkey unit, a spokesman noted.

The system operates without the need for a trained computer operator, the company stated.

Hardware for the unit includes the CPU, a Univac V77 (formerly from Varian Data Systems) with a minimum of 64K of memory. Also included are a printer ranging in speed from 180 char./sec to 1,200 line/min, a single magnetic tape unit for backup and one disk or multiple disks with up to 600M bytes of storage.

Terminals include a JRL-1000 circulation terminal with a built-in bar code reader and a 45 char./sec receive-only printer.

Supplied with all peripherals, terminals and software, the system ranges in price from $100,000 to $300,000 depending on the library. The system is multiprogrammable so users can run other applications on it, a spokesman noted from the company at 2630 Glendale Milford Road, Cincinnati, Ohio 45241.

Decitek Adds Reader

WORCESTER, Mass. — A paper tape reader that can be configured for desktop or rack mounting with or without fanfold bins is available from Decitek.

The Model 262D9 reads at up to 300 char./sec bidirectionally and synchronously or asynchronously, according to the vendor. Standard features include an RS-232C connection, current loop and parallel I/O interfacing. Transmission rates for the unit are selectable up to 9,600 bit/sec.

Interface characteristics are also selectable by a switch mounted on the rear panel. Additional program functions are internally programmable by jumpers, the company noted.

The unit costs $675. Decitek is located at 250 Chandler St., Worcester, Mass. 01602.

COM Recorder Handles Color

MINNEAPOLIS — A computer output microfilm (COM) graphics-recorder that operates with Digital Equipment Corp.'s PDP-11 family running under RT-11 or RSX-11 is available from Dicomed Corp.

The system was designed to satisfy both black and white and color scientific and business graphics needs, the firm said. It is available in either on-line or off-line system configurations and produces black and white and color vector or raster images on 16mm, 35mm, 70mm and 105mm film

A software package provides for job and recorder control, software character generation, color control and microfiche camera control.

The base price of the D48 is $99,750. Ten optical assemblies ranging from $3,750 to $24,750 are also available.

Off-line systems begin at about $200,000, a spokesman said from the company at 9700 Newton Ave. South, Minneapolis, Minn. 55431.

Stein Has Array Processor

WALTHAM, Mass. — Stein Associates, Inc. has introduced an array processor designed for use as a number cruncher along with minicomputers.

The AR-10 has a multiprocessor design. Subprocessors operate in parallel and are interconnected by the system's bus, which performs direct memory access transfers without cycle stealing.

The unit also features a cross-assembler and linker written in Ansi Fortran, he said.

The unit has an AR/Scan panel that allows operational analysis and program debugging by trapping and displaying data, addresses or other program parameters in any of the subprocessors while the program operates at full speed, the company added.

A single subprocessor configuration costs $28,000 and a three-processor configuration costs $100,000. Stein is at 280 Bear Hill Road, Waltham, Mass. 02154.

Olivetti A-6, A-7 Get Floppy Disk

NEW YORK — Olivetti has enhanced its A-6 and A-7 small business systems with the addition of floppy disk subsystem.

The subsystem, which can also be used with the firm's TC800 terminal, is said to be compatible with IBM 3740 floppy disks.

The floppy unit is made up of an automatic loader, dual read/write floppy disk unit and a power supply.

The unit costs $4,560 from Olivetti at 500 Park Ave., New York, N.Y. 10022.

'Typical' One a Professional

Hald: Hobbyists Come in Three Varieties

By Frank Vaughan
CW Staff

ATLANTIC CITY, N.J. — Much attention has been given to the hobbyist use, but little has been done to find out exactly who that user is. The hobbyist user can actually be divided into three categories, according to Alan P. Hald.

Hald is in a good position to know about hobbyist users because he is a co-owner of the Phoenix Group, Inc. The Phoenix Group owns the Byte Shops of Arizona, Byte Shop mail order organization and Micro Age, which specializes in wholesale and special retail sales.

The first category is the pure hobbyist, according to Hald. This person wants to build the microcomputer from the bare boards up.

The second and commonest type of hobbyist is interested in a kit-type system that requires a fair degree of time and effort, but has much of the complex assembly already done.

The third category is the casual hobbyist who is interested in either a kit or assembled mainframe and is willing to purchase assembled memory, CRTs and other peripherals.

The typical hobbyist — if there is such a creature — is usually a professional in a field that is oriented toward technology, according to Hald. Another way to describe this person would be as a "forward-looking professional," he said.

It is not uncommon for this person to have a goal of eventually integrating hobby and profession, he noted.

This integration of hobby and profession can come when a person is, for example, a writer who uses a system for text editing or a businessman who uses a system for computational tasks. Hald knows one architect who uses his hobby system for doing his contract bidding.

People want to get involved with microcomputing as a hobby, he said, but they also are looking for some long-range applications, like the retired person he knows who is working to develop a system to help the blind interact with a CPU.

The hobbyist is generally buying an integrated system consisting of a microprocessor unit (MPU) with about 8K bytes of memory, Hald said, but it is not unusual to find some systems with a standard of 16K to 24K bytes of memory. The systems are initially tape-oriented, but now people are getting floppy disk systems.

This increase in the number of floppy disk systems is driving the average investment in a microcomputing system up from the $1,500 to $3,000 range to the $4,000 to $6,000 range. The higher investments are not uncommon, especially since the price of CRTs is coming down and they are easily within the reach of the hobbyist.

Most of the hobbyists are still involved with 8-bit machines, Hald said. The 8080 is still king, but the Z80 is "hot on its tail."

Some 16-bit machines are emerging as the systems for small businesses that require greater capabilities, such as some form of mass storage and access to established software.

Each of the different categories of hobbyists is approaching the problem of system cost in a different manner, Hald noted. Prices are a main concern for the pure hobbyist, who is able to keep costs to bare bottom by building most or all of the system, often just for the joy of builidng.

The hobbyist who would like to build a kit doesn't consider cost a critical factor. The purchase of a system for this user doesn't have to be cost-justified because it is purely for personal use.

The casual hobbyist, on the other hand, is often interested in a micro only if it can do a certain job and if it is somehow cost-justified.

All three types of hobbyists are going to be quite dependent upon the retail store, which will fall in two categories, he said.

The systems store will be the main place for the hobbyist, he predicted, noting that the user will be able to find everything from the smallest micro up to small minicomputers.

Turnkey Based on 8080

PALO ALTO, Calif. — Promedics Data Corp. has introduced a turnkey microcomputer system for accounting applications in medical offices that incorporate a hobby microcomputer and standard peripherals.

The PAC 1 is an 8080-based system that uses the S-100 bus design and incoporates dual Shugart Associates floppy disk drives, a Digital Equipment Corp. LA-36 hard-copy printer and a Perkin-Elmer Fox CRT. The turnkey system uses Promedics applications software.

The system allows a doctor or small clinic to establish uniform accounting procedures for patient ledgers and gives random access to patient information seconds after the account is keyed in, according to a spokesman. A special report generator allows each end user to configure individual reports using any information stored in the patient data base, he added.

The current PAC 1 uses two 16K dynamic memory boards, a dual serial I/O board and either a Z80 or 8080 MPU card. An additional disk interface card is also housed in the system, he said.

Complementing the hardware is a disk operating system and language compiler/interpreter that generates pseudo operating code which can be run independently from the source code.

The disk operating system takes up approximately 20K bytes of memory, leaving 12K for application and data, the spokesman noted. Larger programs can be implemented by either adding more memory or using the operating system's overlay capabilities, he claimed.

Found Reliable

Promedics has found the hobby-type computer mainframe to be reliable and cost-effective when built and tested to commercial standards, he said. The firm is committed to microcomputers and believes "hobby computers are here to stay if they can be used for practical DP applications and achieve a price/performance ratio lower than their competition," he stated.

A PAC 1 system costs $13,500, which includes operator training and support for one year. Promedics is at Suite 210A, 560 San Antonio Road, Palo Alto, Calif. 94306.

Controller Gets Basic I/O Driver

VAN NUYS, Calif. — Roche Systems has enhanced its multicassette controller with an I/O driver for Basic, the firm said. Basic programs can now read records from cassette tape and write records to cassette tape under program control, a spokesman explained.

The I/O driver is accessed from Basic and handles all I/O to either the cassette operating system or to the console. The cassette operating system opens and closes files.

When a logical record is written, the blanks are compressed out and the record is stored in a buffer. When the buffer is filled, the physical record is written into the cassette, the spokesman said.

Each read from the cassette brings 256 bytes into the input buffer. Blanks are added back into the logical records and they are passed on to the program for processing one record at a time, he noted.

The multicassette controller, which plugs into an interface board, comes in two models, a 4-port kit that costs $140 and a 2-port kit priced at $110.

Software included consists of the cassette operating system, Basic I/O driver and listing, assembler with patches to assemble large programs from tape, demo Basic program and demo record file.

Optional application software is available for such functions as text editing, formatting, sorting and merging, the spokesman said from the vendor at 7101 Mammoth Ave., Van Nuys, Calif. 91405.

Line Tamers Regulate Voltages

ADDISON, Ill. — Shape Magnetronics, Inc. has expanded its line of constant voltage transformers by adding the LT-2 series of Line Tamers.

The LT-2 series units have low harmonic content and can be used to prevent memory loss and operating errors caused by line noise, spikes and transients, the firm claimed.

The series will produce regulated output voltages of 120Vac or 120- and 240Vac. Output will vary less than 3V RMS from nominal for total input variations up to 35V RMS for the 120V transformers, Shape said.

Volt-ampere ratings of the transformers range from 500VA to 7,500VA, and all transformers rated at 2,000VA and below are provided with output recepticles, an on/off switch, line cord and indicator light.

The units are designed for 60Hz operation.

Prices range from $212.50 to $1,335, a spokeswoman said from 815 Kay St., Addison, Ill. 60101.

8080 Can Use PDP-8 Software

SAG HARBOR, N.Y. — The Amide Corp. here has introduced a simulator that allows 8080 users to utilize Digital Equipment Corp. PDP-8 programs.

The software is available in two formats, Intel paper tape and Intel Tarbell cassette, according to a spokesman. It comes with a user's manual, PDP-8 programming tutorial, PDP-8 loader, Decus library information and a source listing of the I/O routines.

The paper tape version costs $20 and the Tarbell cassette costs $23 from the firm at P.O. Box 600, Sag Harbor, N.Y. 11963.

Mijobe Offers Altair Power

UPLAND, Calif. — A custom power supply kit for the direct replacement and upgrading of the power supply provided with the Mits, Inc. Altair 8800 microcomputer is available from the Mijobe Corp.

The Mijobe kit 10-1026K reportedly enables the user to operate a full complement of plug-in boards with a safety margin of power.

The design incorporation of grounded electrostatic shielding between the primary and secondary windings of the kit's transformer virtually eliminates the propagation of external electrical noise into the microcomputer itself, the firm claimed.

The unit operates from 110- to 130 Vac, 60Hz, single-phase power and provides outputs of 16 Vdc +2A and one output of 8Vdc at 20A with forced air cooling.

The unit costs under $60 from Mijobe at 657 N. Benson, Upland, Calif. 91786.

Compiler Basic Comes on Tape

CERRITOS, Calif. — Software Dynamics has a compiler version of Basic for 6800-based microprocessor systems.

The Basic permits decimal arithmetic, formatted output, file I/O and multiple statements per line.

The Basic compiler costs $150 and comes in a cassette tape formatted for the "Kansas City" standard. Software Dynamics is at 17914 S. Laurelbrook Place, Cerritos, Calif. 90701.

Drives, S-100 Linked

CULVER CITY, Calif. — Info 2000 here has an adapter to interface Persci, Inc. diskette drives to S-100 bus microcomputers, according to the firm.

The adapter costs $120 in kit form and $195 fully assembled and tested.

An additional 1K byte of random-access memory costs $40 and 3K bytes of optional erasable programmable read-only memory costs $120 from Info 2000 at P.O. Box 3196, Culver City, Calif. 90230.

Wintek Has Interface

LAFAYETTE, Ind. — Wintek Corp. has a cassette interface that operates at speeds up to 2,400 char./sec.

The interface supports the "Kansas City" standard.

The interface sells for $139 from the firm at 902 N. 9th St., Lafayette, Ind. 47904.

Chess Out in Basic

COCKEYSVILLE, Md. — Chess, in standard Basic, is available from Tenberg Software Systems here.

The program takes 16K bytes of memory, a spokesman noted.

The program, on paper tape with documentation, costs $20 from the firm at 10311-J Malcolm Circle, Cockeysville, Md. 21030.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5 00 per insertion. Send replies to box numbers to:

Heath Course To Teach Basic

BENTON HARBOR, Mich. — Heath Co. introduced a self-instruction course in Basic language programming techniques.

The course was designed "to teach even those with little or no computer experience the skills necessary to intelligently converse, create and program in Basic," a spokesman said.

Programmed instruction tests combined with demonstration programs and practice problems are employed in the course to teach Basic formats, commands, statements and procedures.

The course is keyed to the Heath computer systems; however, because of the universal machine-independent nature of Basic, it can be a supplement to any other computer systems using Basic, the spokesman noted.

The course, EC-1100, costs $29.95 from Heath at Dept. 350-450, Benton Harbor, Mich. 49022.

RAM 'Semikit'

EMERYVILLE, Calif. — A 16K-byte random-access memory (RAM) board in semikit form has been introduced by Processor Technology Corp.

The RAM board is, despite the "semikit" name, fully assembled and wave-soldered with pretested integrated circuits.

Board capabilities include independently addressable 4K-byte blocks, 5 watt power consumption, invisible refresh and 400 nsec worst-case access time, he claimed.

The board also has built-in backup power connections, he noted.

The board costs $369 in semikit form and $399 fully tested and burned in form from the firm at 6200 Hollis St., Emeryville, Calif. 98608.

Membership means many things to the more than 1000 member units that belong to the Association of Data Processing Service Organizations.

WHY ADAPSO IS NUMBER ONE

Membership means an opportunity to learn new management skills, to help form industry policy, and to fully understand the business challenges facing the computer services industry.

Toward these ends, ADAPSO offers a wide-range of services:

- Semi-annual management conferences to explore the opportunities motivating this $5.5 billion industry.
- Management seminars on such timely subjects as turnkey minicomputer systems, advertising, international marketing and data communications.
- Development of positions on such governmental topics as privacy and security and electronic funds transfer.
- Commitment to forming policy on state taxation of computer and software products and services.
- Industry economic reports to use as a planning tool.
- Identification with the only association that represents software, data center and timesharing companies.

On October 19-21, ADAPSO will hold its 17th annual membership meeting and 47th management conference at the Hyatt House on Union Square in San Francisco. The conference provides a chance to learn about the major issues confronting the computer services industry. It will also furnish an opportunity to visit Computer Services Exposition—1, the first exposition held in conjunction with an ADAPSO management conference. Exhibitors can directly market their products and services to several hundred industry decision makers, executives who are responsible for buying such products as computer hardware and terminals, maintenance contracts, security systems, and software products.

ADAPSO 210 Summit Avenue, Montvale, N.J. 07645 (201) 391/0870

Settlement Discounted

Interim Relief Viewed IBM Trial Option

By Molly Upton
CW Staff

What are the alternatives to a trial — U.S. vs. IBM — that seems like it will last forever?

Justice could ask for interim relief which, if granted, could tie IBM's hands in specified areas. A likely time for such a motion would be at the completion of the government's case, observers recently indicated.

There could be a settlement, but sources generally discount that possibility for the present. One industry analyst, however, said the Greyhound decision [CW, Aug. 29] has increased the possibility of settlements in other cases pending against IBM.

One consultant believes the current antitrust case is a smokescreen for IBM. Although the general public thinks it would be unreasonable of IBM to violate the antitrust laws while the current case is being prosecuted, IBM in fact has received a monopoly license during the "interregnum" since the case was filed about eight years ago, he said.

During this time, IBM has put through a revolution, he said.

All the issues in the government case are academic, the consultant remarked. In effect, the government should abandon this suit and draw up a new complaint based on current IBM actions, he said.

Justice conceivably could ask for interim relief to prevent a continuation of this "interregnum," he said.

If the Department of Justice asks for interim relief, Computer & Communications Industry Association (CCIA) president A.G.W. (Jack) Biddle thinks Judge David N. Edelstein might well consider the motion favorably, especially in view of the fact that IBM has refused for the last 18 months to stipulate the record.

Without a stipulated record, the trial would go back to square one if Edelstein had to step down from his post, Biddle said.

And if Edelstein granted some form of interim relief, there are good reasons why IBM might not want to appeal it, he continued.

For instance, if the Second Circuit Court of Appeals and/or the Supreme Court denied the appeal, thus concurring with Edelstein, IBM's whole delaying tactic would be "blown sky high," Biddle said.

The Department of Justice, in a motion for interim relief, could seek injunctions forcing IBM to disclose its installed base on a regular basis, disclose to the industry any new de facto standards at the same time as they are introduced internally and forcing it to engage in total unbundling, Biddle suggested.

On the other hand, another possibility is that Edelstein could deny both a motion for interim relief from Justice and IBM's motion for summary judgment, Biddle speculated.

"In my opinion, based on the record, Edelstein will probably deny a motion of summary judgment by IBM because the evidence is overwhelming," Biddle said.

Long Time Coming

Jim Peacock, editor of *EDP Industry Report*, a newsletter from International Data Corp., observed that if the trial continues as scheduled, the decision probably would not be forthcoming until the early 1980s — and then it will be essentially academic unless Justice keeps bringing in new issues, he said.

Thus there is the possibility Edelstein could invoke an interim relief after the government presents its case, he added.

The powers of interim relief can be very broad, Peacock said, observing one judge used them to tell a firm to fire its president.

However, Cal Crary, litigation analyst for Bache, Halsey, Stuart and Shields, sees no possibility of any motion for interim relief in the near future.

Two Pico Directors File Charges Against Firm's Chairman Potter

By Toni Wiseman
CW Staff

PLAINVIEW, N.Y. — Two directors of Potter Instrument Co. (Pico) have filed a series of applications and complaints charging company founder and chairman John T. Potter Sr. with misappropriation of company assets, failure to perform duties and harassment.

The actions were filed in the U.S. District Court for the Eastern District of New York here by Samuel A. Alexander, vice-president, and David Porter, secretary, both of whom Potter is seeking to oust as Pico directors.

Counsel for Potter called the claims "inaccurate and distorted," adding only that "Mr. Potter's response to all actions will be contained in his answer which will be filed soon."

In response to the directors' applications, Bankruptcy Judge William J. Rudin signed an order requiring Potter to show cause by Sept. 12 why Pico should continue to pay him "any further remuneration or compensation."

The first action filed by Alexander and Porter asks for the return of two 1971 Cadillac Eldorados which Pico has been maintaining at "a cost in excess of $1,000 per year per automobile" and of a 20-foot catamaran sailboat. All three items are alleged property of Pico.

In their application to cut off any further payments to Potter, the directors charged:

- "Potter is not now performing any work or services for Pico and only rarely is he at Pico's offices."
- "He has advised key Pico personnel that he will ruin Pico if he does not regain personal control of Pico."
- "Potter has deliverately attempted to subvert management policies and orders."
- "Potter has solicited and used Pico employees on company time for personal services unrelated to Pico business."
- "Potter has ordered Pico employees to cease work on projects to which they have been assigned and to work on other projects which interest Mr. Potter personally."
- "He has created extreme disruption, confusion and turmoil among Pico employees by making excessive and unwarranted demands for papers, documents and information, by promoting the so-called 'merits' of his lawsuit against . . . Alexander and Porter . . . and by threatening employees with the loss of their jobs if they did not assist him in his attempts to oust . . . Alexander and Porter."

A third action charges Potter "unlawfully received and collected from Pico a sum of not less than $1,113,629.37 belonging to Pico, willfully, maliciously, wrongfully and unlawfully converted the same to his own use." The action asks for repayment of the sum with interest.

It's only logical that you should expect the best lease terms from the leader in computer re-marketing.

Comdisco Financial Services Inc is our subsidiary that will package the best finance lease arrangement for your new 158 168 or 470V We can react quickly to assure you a lease with the best rate and flexible terms If you need help in disposing of your current system we will buy it or help you sub-lease it

When you re-think about it, it makes a lot of sense to lease your large systems from Comdisco, the logical choice

THE SEARCH IS ON

For The Top Sales & Support People In The Computer Industry.

Marketing and Services Information Systems Division (MSISD)

has embarked on a major expansion program, sparked by both the outstanding success of our current state-of-the-art hardware and software systems and the promising new mini, small, medium and large computer systems going into production shortly. Honeywell MSISD is exploding throughout the country and seeks qualified professionals at all levels of experience to join them in the exciting computer future. Honeywell will be a major factor in this future. Talk to us and we will give you the hows and the whys as well as the whats about your future.

Hardware Marketing Representatives

Career and growth opportunities exist for sales/marketing representatives with experience in one or more of the following areas: LARGE SYSTEMS, MEDIUM SYSTEMS, SMALL SYSTEMS, MINI SYSTEMS AND PERIPHERALS. It will be your responsibility to develop and cultivate prospective clients and to ensure that all Honeywell marketing and service functions are coordinated to offer the most effective presentation of the company product lines. Expansion openings exist in major cities coast-to-coast.

Systems Representatives

This extremely important function involves planning, designing, developing and implementing systems applications and/or modifications to meet specific customer or prospective customer requirements. Career openings exist at all levels of experience from entry level with college degree or equivalent and at least one year programming background. Experience with languages such as: Fortran, Cobol, RPG-II, PL1 and Operating Systems, GCOS, and GMAP is desirable.

Field Engineering Representatives

At Honeywell, we seek Field Engineering Representatives to maintain and service computer systems and/or peripherals. You should have 2 years technical training or equivalent military/industrial electronics experience.

Please forward your resume or the coupon to one of the following appropriate individuals:

What Might Have Been

By Molly Upton
CW Staff

NEW YORK — IBM's Input/Output Division was ready, willing and able to produce lower cost terminals and other peripherals in 1964 than IBM's current product line, according to a memo from G.W. Tuttle to J. McDermott entered as evidence in the U.S. vs. IBM trial here.

The memo outlining the division's capabilities was issued July 17 in response to the System 360/Compatibility Committee's expectation of plug-to-plug competitiun in both the peripherals and systems areas [CW, Sept. 5].

McDermott was chairman of the processor group of the compatibility committee and Tuttle was a member of the I/O group.

The memo contained recommendations from the Product Review Board of the I/O Division.

The I/O Division was also developing a "flexible file" with a capacity of up to 11 million characters.

"We feel in looking over our laboratories that we can develop a complete line of terminal equipment at more than 20% off IBM prices. Evidence that this can be done has been shown by the Friden Collectadata, the Tele-Register 200 and the Teletype Data Speed.

"In addition, we are planning to spend additional development dollars for industry-oriented terminals," Tuttle's memo said.

The I/O Division planned to make tape drives that it considered to be attractively priced for use in conjunction with the 360. The prices per drive were about $100 less than those quoted for current IBM drives.

The controller for printers and I/O equipment proposed by the division would be a nonprofit item priced at about $600 compared with the IBM existing price of $1,045.

"We will continue our development work, however, on a flexible file with a goal of $475 to $675 with a control price of $350. This file will have a capacity of up to 11 million characters and would compete with the 2311 which rents for $575 with the control at $525 and a capacity of 14.5 million," the memo said.

Interim Relief Seen Trial Option

(Continued from Page 65)

Justice could conceivably file such a motion at the time Edelstein announces his decision, he said. Edelstein's ruling will prubably favor the Justice Department, Crary added.

He expects IBM to file for summary judgment and added he would be very surprised if Edelstein granted that.

Commenting on the Ninth Circuit Court of Appeals' decision remanding the Greyhuund Computer Corp. vs. IBM antitrust case back to trial, Peacock said it could open the door for more settlements between various plaintifs and IBM.

He declined to speculate on whether the Justice case might also be a candidate for settlement. The stakes are bigger and the process interminable, he commented.

However, he said, the others all will settle if the price is right.

The Ninth Circuit's extensive opinion seemed to clarify a lot of issues in the cases from a legal point of view and should certainly improve the atmosphere for settlement by IBM of some or more of the cases, he said.

The decision in the Greyhound case means it is very likely the California Computer Products, Inc. vs. IBM case will also go back to trial. In addition, "now Memorex knows what kind of atmosphere it is looking at up the ladder, so the signs are not great for IBM, which might be more willing to settle some cases," he observed.

The Ninth Circuit is also the appeals court for the Memorex and Calcomp cases, he noted.

Extensibility Seen Trend In Industry

PORTSMOUTH, N.H. — "The overriding trend (in the computer industry) can be characterized as 'computer extensibility,'" according to Jerome Kanter, Honeywell Information Systems' product director for minisystems.

"Computers and electronics are reaching out more and more — from individual company sites to intracompany remote networks to intercompany/interindustry systems . . . Computers are reaching and influencing small elements of the community such as the auto parts dealer, the gasoline station attendant, the small business merchant, the professional man and even the household," Kanter said.

"This extensibility is made possible by the computer trends of transaction processing . . . networking and distributed processing," he added.

Most enterprises are constantly considering two major managerial decisions concerning data processing: whether DP functions should be centralized or distributed, and whether managerial control of these operations should be centralized or distributed, Kanter told a group of financial analysts at the Mini/-Micro Industry Conference here recently.

Looking toward the future, Kanter said that both the OEM and system builder "want the mini vendor to furnish more of the basic hardware and software for their systems. They can then concentrate on . . . doing what they do best, whcih is application software, industry know-how and specialized marketing capability.

"Frankly," Kanter continued, "this allows us to do what we do best, which is providing more pieces of the system."

DBL Cites Problems

Reports of Japanese Threat Called 'Exaggerated'

By Toni Wiseman
CW Staff

NEW YORK – The Japanese computer industry's threat to IBM and other U.S. manufacturers has received a great deal of coverage, but that coverage has been largely one-sided and exaggerated, according to a report published by Drexel Burnham Lambert, Inc. (DBL).

In fact, the report listed 17 separate reasons why the Japanese may not be so tough.

The report acknowledged several truths: the Japanese government has "(1) organized consortiums of computer companies, (2) assigned specific tasks to each company, (3) subsidized computer R&D, (4) purchased domestically made computers almost exclusively and (5) provided financing for companies leasing Japanese computers."

However, without wishing to belittle the Japanese threat, DBL emphasized that "formidable obstacles stand in the way of Japan, Inc." and that in its opinion "the brouhaha about the potential impact of Japanese exports on U.S. computer manufacturers has been exaggerated."

The report pointed out, for instance, that while several countries have successfully competed with Japan for various export markets, such as Germany and automobiles, only the U.S. has ever successfully exported computers.

In addition, computers are more complex than any other product that Japan has successfully exported, it said.

Software is a third problem for the Japanese. "Japan may have caught up with the U.S. in hardware, but industry experts acknowledge that Japan is still far behind in the development of software,"DBL stated.

The report also suggested the Japanese might face language problems in Western Europe, which Americans would not since English is widely spoken.

"The language barrier does not pose a serious problem when selling consumer or price-oriented products; however, it presents a formidable obstacle when selling complex products, such as computers," the report indicated.

And then there is IBM. IBM's recently announced 3033 has 2.5 times the price/performance of a 370/168-3, the report noted, adding this is the market the Japanese will be competing in since, in 1976, 57% of the Japanese installed base was large-scale systems.

DBL saw service as another possible problem for the Japanese. "A network of maintenance centers is a prerequisite for selling computers in quantity," it said, but "a maintenance network is hard to start, difficult to staff and expensive to support."

Depressed Stocks

"In recent months, the stocks of American multinational companies have been depressed because of fears of foreign nationalism and lagging economic growth overseas," DBL stated.

"Those same problems would affect Japan, Inc. even more than [its] U.S. counterparts, yet the Japanese threat appears to remain undiminished in the eyes of many analysts.

"Moreover, in most countries, U.S. companies have become firmly entrenched and tolerated, while the Japanese have become unwelcome because of their surging exports and resulting trade imbalances.

"Japanese computer exports represent a threat to the status quo and, ipso facto, the health of struggling foreign computer companies."

While many view Japanese government subsidies as an added threat to the U.S. market, the report observed that many of these subsidies cannot be transferred abroad – i.e., government purchases of Japanese computers and financing of domestic leasing firms.

"So although the Japanese computer industry has enjoyed considerable success at home, it may not be indicative of the potential for success overseas," the report said.

In fiscal 1976, Japan produced about $2.5 billion in computer equipment, of which $71 million was exported, the report noted. Even if exports grew at the government's goal of 30.4% per year, Japanese exports would reach only $1 billion by 1985, a year in which IBM revenues should be about $50 billion, according to DBL.

"Moreover, a portion of Japanese computer exports will go to markets not heavily served by U.S. companies, such as China and Korea. . .In any event, weak foreign computer companies will very likely suffer proportionately more than U.S. computer companies if Japan, Inc., were successful," the report stated.

EMM Expands in Europe

Special to Computerworld

BAD HOMBURG, W. Germany — As an extension of its expanded commitment to the end-user business, Electronic Memories & Magnetics Corp. (EMM) has expanded the European operations of its Computer Product Division.

The success of its add-on memory business philosophy in the U.S. has prompted the independent supplier of add-on memory to capitalize on the potential abroad, it said.

EMM started this foreign expansion with what it already considered a strong market position. It has established EMM GmbH as its European divisional headquarters here. The sales and service operations are directed from this centrally located area, which also has easy access to Eastern Europe.

The sales staff presently operates from Germany. However, additional salesmen will be appointed in the near future and will be located in major market areas. The company also has appointed agents in the UK, Switzerland and Austria.

Reference selling is important in Europe and the company believes it is in a good position to draw on its current customer base and parlay that success into bigger and better things. Major installations are already in Swiss and French banks, a major German automobile manufacturer and a major European airline.

Also included are one of Germany's more prominent breweries; a large construction company; one of the world's largest multinationals; and Eurocontrol, the air traffic control operation built by the common market countries and the North Atlantic Treaty Organization. Products installed cover a wide variety — from IBM 360/65s to 370/168s — with as much as 5M bytes of memory.

Eastern Market

In addition to this list, EMM has three orders from Rumania and one from the USSR. The Eastern European market appears to have enough profit potential for EMM to position itself accordingly, a spokesman stated.

Under the direction of Dieter Huhn, European sales manager, the headquarters has been staffed with "a number of people whose expertise is commensurate with the company's overall commitment," according to the spokesman.

The staff personnel offer varied backgrounds in engineering, sales and marketing — including past associations with IBM, Siemens, 3M and CMI.

EMM is looking to this European operation as a key element in future growth plans, the spokesman said.

Foreign Orders & Installations

The Centro de Investigacion Cientifica y Educacion Superior de Ensenada, a scientific research and educational institution funded by the Mexican government, has ordered a Prime Computer, Inc. Prime 400 computational timesharing system to be used for seismic and oceanographic analysis projects.

The Overseas Fixed Telecommunication Service has ordered Codex Corp. 6000 Series Intelligent Network Processors and LSI high speed data modems worth over $1,000,000.

Toyota Auto Body Co., a Japanese automobile body manufacturer, has ordered a Univac 1100/11 system for use in on-line control system covering planning, phototype production, testing and preparation of new cards.

The Telephone Authority of Singapore has ordered 300 medium-speed modems from General Datacomm Industries, Inc.

The Australian Broadcasting Commission has ordered two PAL version Compositor 1 systems from TeleMation, Inc. to be used for graphics geneation in their Melbourne and Sydney stations.

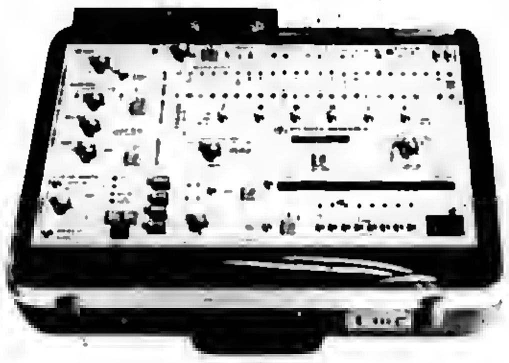
International Studies Set

MANCHESTER, England — The Council of the European Communities has approved a group of studies in support of the use of data processing which will be carried out in collaboration between The National Computing Centre in the UK, Gesellschaft fur Mathematik und Datenverarbeitung (GMD) in Germany, Institut de Recherche d'Informatique et d'Automatique (Iria) in France and Consiglio Nazionalle Delle Ricerca (CNR) in Italy.

The studies, which cover work related to privacy and security, data base and programming techniques, will be financed half by the European Economic Community (EEC) and half by the various nations concerned.

Given approval for the further stages currently envisaged, the cost of the entire program for all four countries will probably total about $1.4 million.

Now-a DATA COMMUNICATIONS
TEST SYSTEM
YOU CAN GROW INTO
INTERSHAKE II®/INTERVIEW™(CRT)



Designed for today and tomorrow

Monitoring — Simulation — Data Acquisition

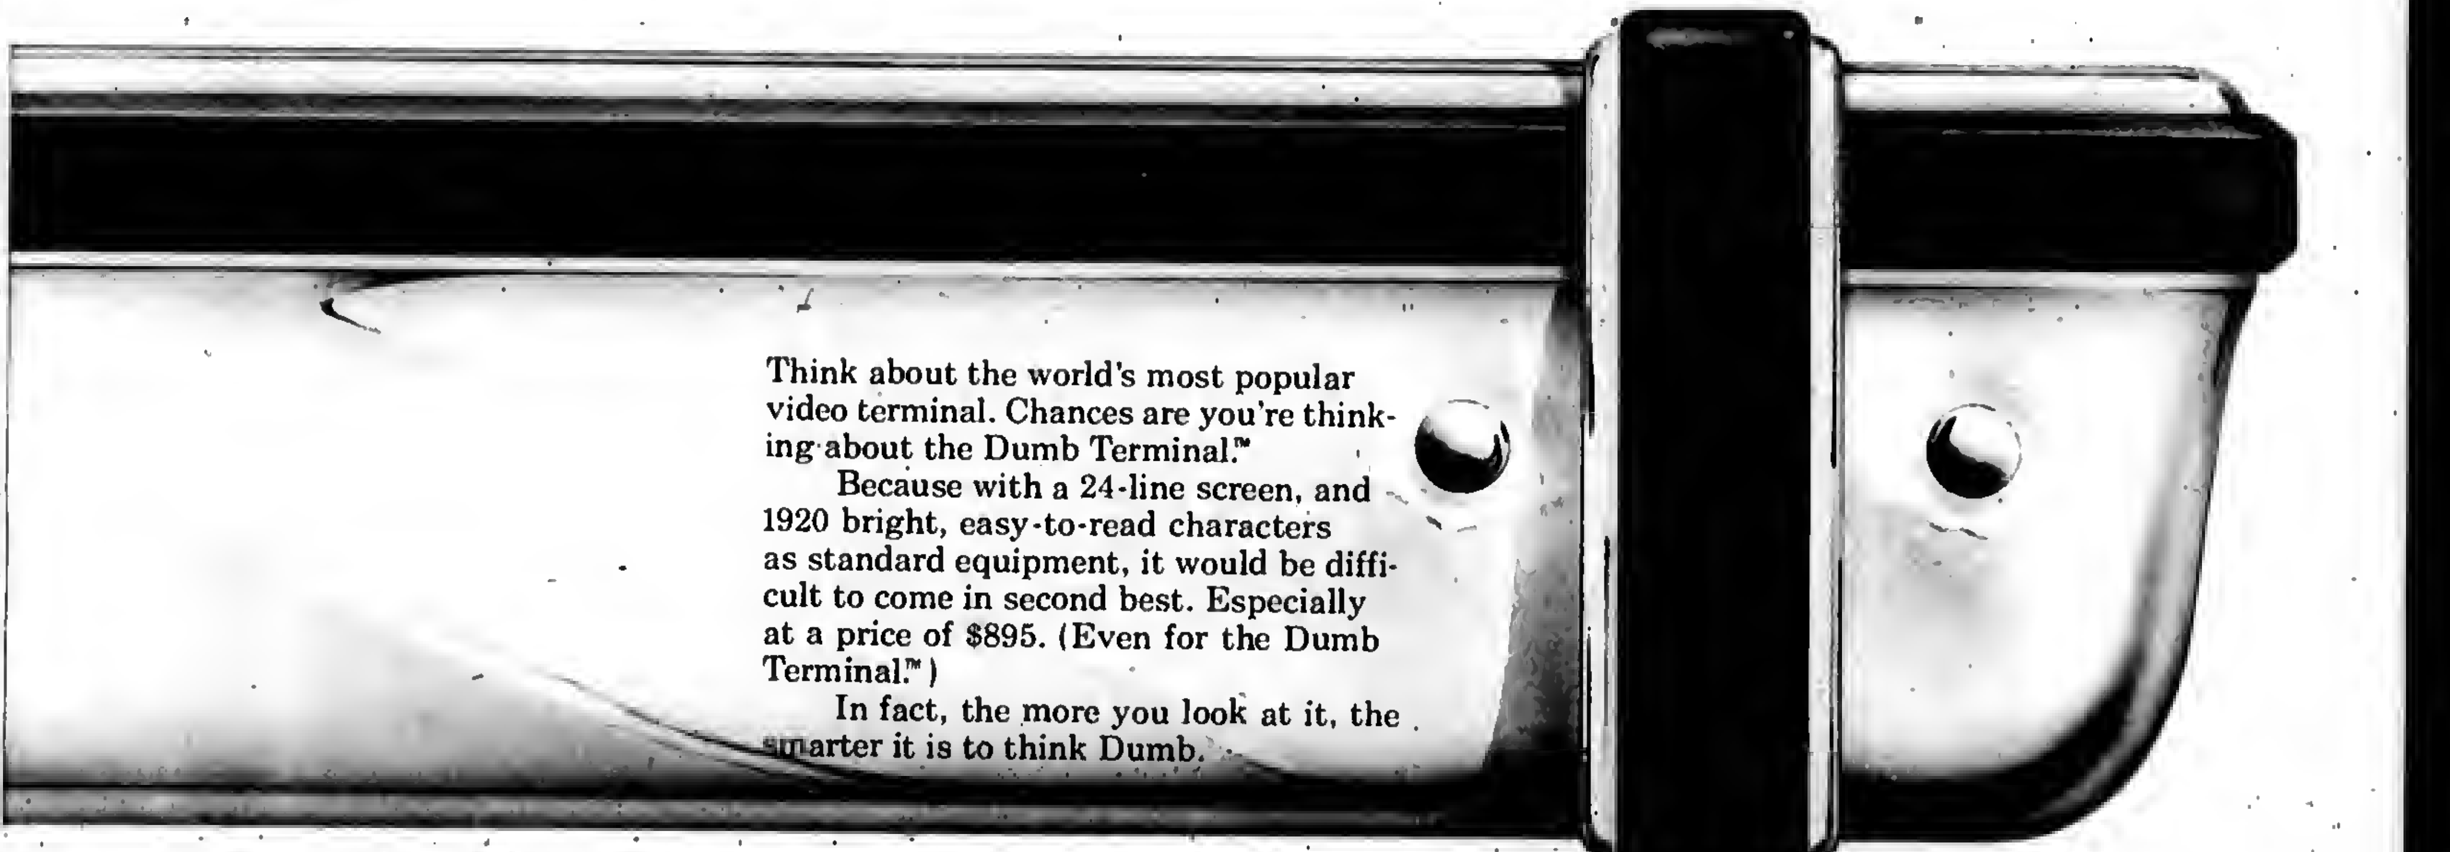
The most powerful portable or rack-mounted data communications test system available today—Intershake II/Interview will monitor full duplex transmissions at speeds up to 256 Kbps, display all or selected transmissions, trap and record protocol or messages, make timing measurements and record status of all EIA/V.24 leads et any time in the test. Powerful new jump and branch instructions permit on-line test subroutines for fully defining anomalies.

As a simulator, Intershake II will duplicate any modem, front end, terminel—even a cluster of terminals. And with a program of 1024 steps with nonvolatile memory, Intershake is ready to go when you are.

Most importantly, Intershake II/Interview will run tests, measure results and retransmit the results to your printer or CRT. Used as a full-time performance evaluation system, Intershake II/Interview will pay for itself by identifying and eliminating excessive turnaround times, downtimes, extra sync end pad characters and system degradation (excessive NAK's) before the system washes.

Intershake II/Interview—another quality product from

ATLANTIC RESEARCH CORPORATION
5390 CHEROKEE AVENUE • ALEXANDRIA, VIRGINIA 22314 703-354-3400



Think about the world's most popular video terminal. Chances are you're thinking about the Dumb Terminal.™

Because with a 24-line screen, and 1920 bright, easy-to-read characters as standard equipment, it would be difficult to come in second best. Especially at a price of $895. (Even for the Dumb Terminal.™)

In fact, the more you look at it, the smarter it is to think Dumb.

Lear Siegler, Inc., E.I.D./Data Products, 714 N. Brookhurst St., Anaheim, CA 92803; (800) 854-3805. In California (714) 774-1010.

Intel delivers PDP-11 memory for people who can't afford to wait.

When you're in a hurry for more semiconductor memory for your PDP-11, call Intel. We deliver memory for the full PDP-11 line. And because we're the largest manufacturer of semiconductor memory in the world, delivery is when you want it.

Why wait? Since you've chosen the leader to supply your minicomputer, it makes sense to go to the leader for memory, too. That's us.

Intel memory systems save you more than time. Our in-1670 add-on memory for the PDP-11/70 is one example. It gives you four times the capacity in the same frame compared to the DEC MJ11-A core memory. And built in Error Correction Code (ECC) and Error Logging improve up-time and reduce maintenance time by automatically correcting and recording single-bit failures and detecting and recording double-bit errors.

For PDP-11 add-in memory go with our in-4711 plug in boards. You'll get memory that's even faster than DEC's. 16K words per hex-wide board. With or without parity. To further expand PDP-11 memory and reduce UNIBUS™ loading choose our in-4011 add-on. With memory management you can expand to 128K words in 16K increments. And since the in-4011 requires only one UNIBUS load, you get added system flexibility.

Get more memory for your LSI-11 and PDP-11/03 in less space with our in-1611 add-in memory. You get up to 32K words, in 8K increments, on a single, two-wide, board. That's up to eight times the memory you get with a DEC board.

When you can't afford to wait call us at 800-538-8476. In California and Canada, call 408-734-8102, x575. We'll save you time, and much more.

intel delivers.

Adapso Sets Theme

SAN FRANCISCO — "Responding to Change —A Program of Action" is the theme for the Association of Data Processing Service Organizations' (Adapso) 47th Management Conference.

The conference, which will be held in conjunction with Adapso's first computer services industry exposition, will take place at the Hyatt Hotel on Union Square here Oct. 19-21.

Workshop topics will range from "User Panel: Why Buy Computer Services," "Running a Small Data Center for Profit" and "How to Make Money in the Mini-Micro-OEM Marketplace" to "Taxation," "Acquisition Strategy" and "Is There Any Accounting for Software?"

There will also be general sessions dealing with communications activities, security and the computer services industry and IBM and the U.S. computer services industry.

Registration for the conference is $195 for Adapso members and $295 for nonmembers, with discounts for additional registrants from the same company. Further details are available from Adapso at 210 Summit Ave., Montvale, N.J. 07645.

Acquisitions

Dun & Bradstreet has agreed in principle to acquire **Technical Publishing Co.,** publisher of *Datamation*, for Dun & Bradstreet stock with a current market value of about $45.6 million.

TRW, Inc. has acquired **Gier Electronics GmbH** of Hanover, a German distributor of American DP equipment.

Perkin-Elmer Corp. and **Physical Electronics Industries, Inc.** have merged. Under terms of the agreement, four shares of Perkin-Elmer common stock will be exchanged for each share of Physical Electronics common, resulting in the issuance of approximately 540,000 shares of Perkin-Elmer common. Physical Electronics will operate as a wholly owned subsidiary of Perkin-Elmer.

Systems Dimensions Limited (SDL) has received a formal offer from **Sun Life Assurance Co. of Canada** to purchase all common shares of SDL at a price of $4.50 (Canadian) per share.

Itel Corp. has acquired certain assets of **Bankputer Corp.** for an undisclosed amount of cash.

Medical Computer Systems, Inc. has agreed in principle to acquire all of **Health Management Corp.'s** 1,040,000 common shares outstanding through a swap of stock.

Digilin, a manufacturer of digital panel meters, has been acquired by **Dynamic Sciences, Inc.** for cash.

Membership Still Open In Battelle EFT Program

WASHINGTON, D.C. — If you supply or are interested in suppliers of electronic funds transfer (EFT) systems, you might want to investigate a research program currently being conducted by Battelle Memorial Institute.

Titled "A Worldwide Study of Electronic Funds Transfer Systems and Equipment Requirements," the proprietary project is the third in a series of international payment systems studies run by the institute.

Co-sponsored by several supplier organizations, the study will analyze the market for EFT delivery systems and components within selected countries.

EFT models will be developed for each nation investigated, including Belgium, Canada, France, Germany, Italy, Japan, The Netherlands, Spain, Sweden, Great Britain and the U.S., according to Joanne Hartley, the project's manager.

An initial interactive workshop session with the sponsors has been held at Battelle Columbus Laboratories, but membership in the program is still open, Harley said.

In profiling the worldwide markets for EFT delivery system components, the Battelle project team will analyze global issues that affect all suppliers as an industry, as well as specific issues which affect different supplier types, Hartley said.

Among the issues to be investigated are standards, security, communications traffic, transitional technologies and functional specifications for EFT equipment, Hartley said.

The institute hopes for as much interaction as possible between the clients of the study and its project team.

A major Battelle objective is to determine what experience or technology might readily be transferred from one country to the next, the project manager stated.

The sum of $18,000 and participation will give you a full sponsorship in Battelle's study. Further information is available from Hartley at the institute's Washington operation, 2030 M St. N.W., Washington, D.C. 20036.

CCIA Reelects Amdahl

WASHINGTON, D.C. — Dr. Gene M. Amdahl, chairman of the board of Amdahl Corp., has been unanimously reelected chairman of the Computer & Communications Association's (CCIA) board of directors.

Four regional vice-chairmen were also elected: Timothy C. Cronin, chairman of the board of Inforex, Inc., for the eastern U.S.; Harold E. O'Kelley, president of Datapoint Corp., for the central U.S.; Ryal R. Poppa, chairman of the board of Pertec Computer Corp., for the southwestern U.S.; and Richard Lussier, executive vice-president of Itel Corp., for the northwestern U.S.

A.G.W. Biddle was reelected to the post of CCIA president.

DDP Seen Making Users More Independent

BOSTON — As the industry moves toward distributed processing, users will and should become considerably more independent than they have been traditionally, according to an NCR executive.

"They no longer see themselves tied to a particular vendor," G.P. Williamson, an NCR marketing vice-president told a group of electronics analysts here recently.

"In fact," he said, "the particular vendor to whom they are most likely tied has not, typically, been a leader in moving into distributed processing. More likely than not, when today's user begins implementing a distributed processing network, he will be moving into a non-IBM world."

Williamson said, the key element in distributed processing is the inclusion of a distributed data base. "It means that not only is processing power distributed to whomever needs it, but also that the data base is distributed along with responsibility for the system."

Distributing responsibility for the system to the end user, Williamson added, is one of the biggest reasons distributed processing will eventually become the dominant form of processing.

End User Responsibility

"Complete responsibility can be fully allocated to the actual end user of the system," he said. "The people who control the budget and put out the money will no longer have to handle DP as a single general-overhead type of account. They can allocate its cost to a specific end user, just as they allocate payroll or material costs today.

Also behind the trend toward distributed processing, Williamson said, is the reduction in processing costs.

"We are on a downhill cost curve so far as memory, processor and communications costs are concerned, and those lower costs are making possible different approaches to information handling.

"In the area of memory, charge-coupled devices and bubbles, now becoming commercially feasible, offer great potential for lowering costs in some applications. Fixed-head disk technology, solid-state storage, and helical-scan, mass-storage systems promise equally dramatic price/performance improvements in the area of auxiliary storage."

Although the trend toward distributed processing is very strong, it will be several years before it materializes on a wide, general scale, Williamson said.

One reason is that large CPU's still enjoy a price/performance advantage over small systems. "However, given the continuing decline in the absolute amount of cost difference in units of processor power between large and small computers, it is becoming increasingly attractive to exchange this large-system advantage in return for the efficiency gains achieved when information, processing power and the responsibility for them are placed where they are most needed," according to Williamson.

A second reason for distributed networks' not becoming widespread overnight, he said, is that the currently installed base of computer systems is primarily a centralized, batch-oriented base. "That investment in equipment and software cannot be lightly tossed aside. It will continue in place and will be enhanced. Existing equipment and systems continue to function; new systems will supplement, rather than replace current systems."

Williamson also cited the current lack of distributed data base software. "It is for that reason, more than any other, that today the industry finds itself primarily in an era of announcements so far as distributed processing is concerned. The technology is here and systems are in operation. Generalized systems are on the drawing boards and in fairly advanced stages. But the missing link is software. In the end, it will be software — data base software, terminal control software, networking software — that will determine success or failure in this field.

System 'Free' With Software

IRVINE, Calif. — Liberal Computer Corp. is promoting the concept of "rebundling," according to chief executive officer Bernie Lumbert.

The firm plans to provide a microprocessor-based system free — along with the $200 monthly rental fee for software, he said. There will be an additional charge for customized software, he added.

Liberal's product will be called the "Generous/1" and will consist of a Motorola 6800 with 32K, a Shugart floppy disk drive, a Lear Siegler CRT and AT&T's Dataspeed Model 43, he said.

Initially, Lumbert plans to concentrate on the word processing and text editing area and then broaden into small business applications such as general ledger, he said.

More specifically, he said, he is looking at the mortgage banking document area as well as packages for small banks.

The time has come once again for "rebundling," he said, noting Eastman gave away cameras and Gillette gave away razors when starting their businesses.

Liberal Computer Corp. is at 4301 Birch, Newport Beach, Calif. 92660.

COMPUTERWORLD INDEX

SUBSCRIBE TO THE 1977 COMPUTERWORLD INDEX AND GET SIX MONTHS OF REFERENCE INFORMATION FREE.

The new Computerworld Index, published quarterly and cumulative, is an invaluable reference tool for organizations that have a need-to-know about what's going on in the computer world.

The first issue of the Index for example, covers the last six months of 1976, and it includes more than 4,000 entries by subject, author and name of any company mentioned. It breaks topics down into highly usable and convenient categories:

- There are entries by *product or service*, like *PRINTERS*, which has 37 entries in the six-month period covered; or *LEASING*, which has 10.
- There are entries by *industry*, like *INSURANCE*, under which there are 17 entries for various stories on the use of computers in the insurance industry.
- *Types of computer applications* is another way you can look something up in The Index. The category *INVENTORY SYSTEMS*, for example, has 21 entries.
- *Regulatory, security* and *social issues* are also indexed. There are 34 entries under *PRIVACY*, 10 under *PRIVACY ACT* and 9 under *PRIVACY PROTECTION COMMISSION*, for example.
- The Index also makes it easy to look into *legal aspects of computer use* with categories like *LITIGATION*, which has 24 entries in the last six months of 1976.
- Even *foreign countries* are indexed. The category *JAPAN*, for example, has 9 entries.
- ... and there are *others: KIT COMPUTERS* (the kind you build yourself) are the latest thing, and The Index shows 5 entries. *POINT-OF-SALE SYSTEMS* has 14 entries ... and there's much, much more.

Company Names, for example, are a very important part of The Index. Looking under IBM, we find *ten* categories:

- IBM GENERAL
- IBM LITIGATION
- IBM SOFTWARE
- IBM SYSTEM 3
- IBM SYSTEM 7
- IBM HARDWARE
- IBM PRICING
- IBM POLICY
- IBM SERIES 1
- IBM SYSTEM 32

Our special, no-risk offer:
Subscribe to one year of the Computerworld Index (4 quarterly issues, published three months after each quarter ends and cumulative) at the regular rate of $150; and we'll send you the Index for the last six months of 1976 FREE. In addition, we'll give you ten days to look over the 1976 Index AT NO OBLIGATION. Should you decide it's not what you need, just return it to us marked "cancel" and we'll cancel your subscription.

GAINING MANAGEMENT CONTROL OF TSO

. . . a seminar for EDP professionals interested in systematically planning, controlling, and evaluating the use of TSO.

. . . presented by Mario Morino of MORINO ASSOCIATES, INC.

Topics will include —

- the time sharing management problem
- establishment of management objectives
- implementing a planning mechanism
- management reporting strategies
- discussion of the TSO/MON product

If you are interested in the management and control of TSO you should make plans to attend (no tuition fee of course).

POSITION ANNOUNCEMENTS

UNIVERSITY OF ILLINOIS
COMPUTING SERVICES OFFICE
URBANA CAMPUS

THE FOLLOWING POSITIONS ARE OPEN WITH THE COMPUTING SERVICES OFFICE:

Computing Documentation Writer

This full time position involves the writing/editing and maintenance of a large scale user document for the services offered on a COC CYBER 175 and an IBM 360/75. A knowledge of computer programming, experience with time-sharing systems, a university degree with a background in communication arts and experience in composing and/or editing computing documentation are required. The position offers avenues for imaginative expression and initiative. Initial salary: $11,000 to $13,000.

Statistical Computer Consultant

This full time position for a statistical computing consultant involves the research, development and maintenance of statistical software on the COC CYBER 175 and IBM 360/75 computers. The ability to help computer users with statistical computing is of prime importance. This individual should also have the following qualifications:

- General statistical knowledge a must, while experience with statistical software (SPSS, SOUPAC, SAS, BMO, etc.) desirable.
- Programmer/analyst experience with FORTRAN a must, while knowledge of COC NOS and IBM OS operating systems desirable.

All applicants should have at least one year of experience in the areas described above, and have a university degree with a background in statistics and computer science or closely related fields. Initial salary: $11,000 to $15,000.

Research Programmer—Senior Research Programmer

This full time position is for an individual with demonstrated skills and achievements in at least one of the following areas:

- CYBER 175 NOS systems programming, development, and performance analysis.
- IBM 360 HASP-OS/MVT systems programming performance analysis and maintenance.
- OEC POP-11 systems programming and hardware development, with an accent on on-line applications.
- Systems measurement and quantitative performance analysis.
- Synchronous and Asynchronous data communications measurement, analysts and development. Knowledge of COC 2550 desirable.
- Oevelopment and implementation of large storage hierarchies.

All applicants should have at least two years experience as a systems programmer, and have at least a bachelor's degree with a strong mathematical basis. Initial salary: $12,000 to $18,000.

PROGRAMMERS

SYSTEMS PROGRAMMERS

Fluor Corporation, a dynamic and internationally respected leader in the engineering and construction field, has immediate openings for CDC Cyber 170 systems programmers with SCOPE OR NOS/BE experience.

OPERATING SYSTEM SUPPORT

- A minimum of 2 years' experience maintaining a CDC SCOPE 3.4 or NOS/BE operating system.
- Proficiency with CP and PP COMPASS
- Experience in analyzing dumps from system failures and generating/locating corrective codes.
- Familiarity with basic internals of SCOPE or INTERCOM

The individuals selected must be able to maintain a stable version of NOS/BE at current PSR levels. Additional duties will include installation of local modifications, evaluation of system performance and user consultation.

PRODUCT SET SUPPORT

- A minimum of 2 years' experience with internals of compilers and compiler object time routines
- Proficiency with CP COMPASS and/or SYMPL
- A working knowledge of FORTRAN and COBOL

The individuals selected will be responsible for maintenance of product sets, installation and testing new versions supporting applications programmers, writing utilities and specialized subroutines in the area of application support.

Our employees enjoy excellent benefits including profit sharing and savings investment program. Positions are located in our new innovatively designed facility in the Newport Beach area. Relocation allowance available.

Please send resume, complete with salary history to:

Let's Talk About Your Future With CSC's SYSTEM SCIENCES DIVISION

Naturally, you are seeking an opportunity that will capitalize on your education, training and experience . . . a dynamic position that will offer a steady flow of career-building assignments that challenge the best that's in you.

You'll find all this and more with CSC's System Sciences Division where we are deeply involved with several projects for which we are seeking skilled and imaginative Programmer/Analysts. One is an FAA assignment to develop and implement Air Traffic Control Systems; the others are in support of NASA projects . . .

AIR TRAFFIC CONTROL SYSTEMS

We are seeking experience on IBM 360/OS or Minicomputers (XDS-Sigma series preferred) in any one of the following areas:

- Simulation/modeling of air traffic patterns. Knowledge of JOVIAL a plus
- Design and implementation of data base management systems
- OS/360 System generation and maintenence
- Diagnostic design, development or enhancement end hardware orientation
- Software test and validation including development of tools to test end validate real-time software systems
- Software Quality Assurance
- Performance Analysis & Modeling
- Human Factor Studies (N.J. only)

Assembly (BAL) and/or high level language (preferably JOVIAL) highly desirable.

Positions are available in Atlantic City, New Jersey or Jacksonville, Florida.

SPACE SCIENCES

Current positions in support of our Goddard Real-Time System, Spaceflight Trecking Data Network and On/Off Site Project for the NASA Goddard Space Flight Center require a degree in Computer Science, Math, Physics, Astronomy, Meteorology or Engineering with experience using FORTRAN end/or Assembly languages on lerge-scale or mini-computers. These skills will be applied in the following concentrations:

- Telemetry application with multi-computer configuretion
- Integration and testing of real-time display softwere
- Data base management
- Real-time scientific applications
- Network management
- Computer-to-computer communications
- System requirements definition
- Analysis and application of climatological data
- Simulation/modeling of real-time systems
- Optical Analyst (MS, PhD-Physics or Astronomy)
- 360/370 OS systems programming

CSC offers a liberal relocation policy in addition to a complete benefits package. For immediate consideration; please send resume or call:

Grow with Amdahl and be a part of the future.

Software Opportunities

Are you good at diagnosing system level problems? Amdahl needs...

FIELD SUPPORT REPRESENTATIVES

You should be able to work on your own in the resolution of complex system level problems encountered by Amdahl users. You should have good MVS internals experience plus expertise in one or more of the following components or subsystems:

- VTAM/NCP
- JES3
- IMS
- VSAM
- TCAM/TSO
- CICS

We also have a very limited number of positions available for those select few highly motivated, technically inquisitive application programmers seeking a career in systems programming. Prerequisites are total proficiency in ALC plus one higher level language and a good knowledge of the relationship between major components of an IBM virtual SCP. Current openings are in the San Francisco Bay Area.

Can you accept the challenge of creating an error free system? How: by building test cases that really put all operating system components through a real test. If so, Amdahl needs you as a...

SOFTWARE QUALITY CONTROL SPECIALIST

to generate, apply and verify VS1, SVS, VM or MVS software and material distributed to our Amdahl customers. You should have a close working knowledge of the VS1, SVS, VM or MVS operating system internals, utilities, SMP and assembler language. Current openings are in the San Francisco Bay Area.

Can you build a better mousetrap? Amdahl needs...

SOFTWARE SYSTEMS MAINTENANCE SPECIALISTS

to create all Amdahl SCP maintenance materials. You should possess a detailed knowledge of the VS1, MVS, VM or SVS operating system internals as well as a good working knowledge of utilities, SMP and assembler language. Current openings are in the San Francisco Bay Area.

Do you enjoy customer contact? Amdahl needs...

FIELD SYSTEMS ENGINEERS

at customer locations. You need the ability to handle problems encountered on a daily basis in a large commercial data processing environment. You should have good diagnostic expertise in VS1, SVS, VM or MVS and the ability to be a jack-of-all-trades. Currently there are several openings throughout the United States.

Do you enjoy traveling? Amdahl needs...

HEADQUARTERS SYSTEMS ENGINEERS

to work with Field Systems Engineers at customer locations solving difficult problems. You will also assist customers and Field Systems Engineers in the complex area of system performance and tuning. You should have very good diagnostic techniques and MVS, VS1, VM or SVS internals experience. Current openings are in the San Francisco Bay Area.

Have you been active in recent MVS conversions? Amdahl needs...

MVS CONVERSION SPECIALISTS

to work closely with Field Systems Engineers and Amdahl customers converting to MVS. You should have several years' MVS internals and externals experience, as well as either JES2 or JES3 expertise. Opportunities available for extended travel. Current openings are in the San Francisco Bay Area.

Do you enjoy teaching? Amdahl needs...

SYSTEMS ENGINEERING INSTRUCTORS

to teach MVS or JES3 classes for our Field Systems Engineers. You should have current experience teaching MVS or JES3 internals. Current openings are in the San Francisco Bay Area.

ASP/JES3

Amdahl is looking for people with detailed knowledge of ASP or JES3. Opportunities exist in many functional areas of system programming. Current openings are in the San Francisco Bay Area and throughout the United States.

ACP

We are building our team to support those customers who utilize this specialized high performance DB/DC system. You must have an intimate knowledge of CP internals and be well versed in the application as well. Current openings are in the San Francisco Bay Area.

Send your resume to Phil Beckhelm, Amdahl Corporation, Department A01, 1250 East Arques Avenue, Sunnyvale, CA 94086, or call Tony Price collect at 408/735-4500 between 9:00 AM and 5:00 PM. We are, of course, an equal opportunity employer.

CHEMINEER, INC.

Equal Opportunity Employer M/F

We're Staffing for a Major DP Expansion

We're W.W. Grainger, a rapidly growing distributor of electrical motors and equipment and are currently taking major steps to expand our IBM 370/158 OS/VS1 installation using CICS to meet current and future business demands. Accompanying this growth is an ambitious plan for new systems development offering unlimited opportunities for professional and technical betterment.

Systems Analyst

A degree coupled with a 3-5 year background in accounting systems that documents achievements in project leadership is essential. Strong interpersonal skills are a must.

Programmers

Openings exist for Senior and Junior Level Programmers as well as Programmer Analysts. Proven ability in COBOL programming is mandatory. Any exposure to OS, JCL, CICS, or BAL would be helpful. Some college is desired.

Software Manager

This position requires 5 or more years in supporting operating systems through internal specification and a proven track record in supervising the software function. This key management position calls for strong leadership skills and the capability to interface consistently with top management.

Software Analyst

This position requires 2 or more years working with either OS/VS1 or CICS/VS internals. A history of achievements as a member of a software group is essential.

Professionals who join the Grainger team will find a highly technical and secure environment where individual contribution is quickly recognized and rewarded. Offered are excellent starting salaries and comprehensive benefits including profit sharing.

If your interested in taking a closer look at our advanced state-of-the-art installation, we invite you to apply. Send a resume or a brief letter outlining your background in confidence to:

PROGRAMMER/ANALYST

Foremost Insurance Company is the leading national mobile home and recreational vehicle insurer, with corporate offices located in Grand Rapids, Michigan. Our office complex is located in a picturesque suburban erea with many excellent residential facilities available nearby. Grand Rapids has most of the advantages of a large city plus many recreational activities for after work and weekend enjoyment.

We have ultra modern facilities end up-to-date technology utilizing IBM 370/158, OS/VSII, ANS COBOL, with interactive programming. We are staffing for major development projects to begin this fall. Several openings exist in the following areas:

PROGRAMMER I

The candidate must be able to write efficient and maintainable program modules from detail design specifications.

PROGRAMMER II

Candidate will be responsible for the writing of difficult or critical program modules plus translation of system requirements into program specifications. Will assist the project leader in providing functional guidance.

SYSTEMS ANALYST II

The applicant must be able to work well with user personnel, determine needs, define alternative solutions and develop conceptual and detailed system specifications. Will be required to assist in the management of the project.

Previous experience with top down design, structure programming, data base and insurance would be a plus. Opportunities for personal growth are excellent. Foremost offers a complete insurance benefit package plus tuition reimbursement, vacation and profit plan, with an excellent starting salary. Send resume with salary requirements to B. Jourdan, Professional Placement.

SYSTEMS PROFESSIONALS

First Federal of Chicago, the Midwest's largest savings and loan association, with a strong and continuous pattern of growth, is actively seeking systems professionals to develop new financial systems in conjunction with it's dynamic management team. Our operating environment consists of a 370/158-370/145 operating under OS/VS1/CICS driving a teleprocessing network of 250 on-line real-time terminals (and growing).

LEAD PROGRAMMER

For consideration, you will need a 2-3 year background as a programmer analyst or senior programmer, heavy experience in BAL and a working knowledge of COBOL, CICS and OS training. Any on-line real-time teleprocessing experience would be a plus. Primary emphasis will center on your interest in taking up professional project supervisory responsibilities as a lead programmer.

PROGRAMMERS

We wish to provide applications programmers with an opportunity to further develop and enhance their EDP backgrounds thru company-sponsored training on CICS. Programming requirements ere 1-2 years BAL and OS expertise. Experience in an on-line real-time environment a plus. Major emphasis will be placed on new systems development.

In return for your technical know-how, you'll be additionally rewarded with an excellent sterting salary that includes a comprehensive benefits package. Forward resumes in confidence, including salary history, to:

MANAGER OF ACADEMIC SYSTEMS AND PROGRAMMING

The University of Akron is seeking a Manager of Academic Systems and Programming who will support the Academic community in computing. The Manager reports to the Director of Computer Services and supervises seven full time computer analysts. The person we seek will have a Master's Degree in a computer-related area, and at least five years of technical experience in scientific applications. The ability to present himself/herself to all members of the academic community, discuss problems and propose solutions is a must. The position requires supervisory, technical and administrative expertise. The University supports a combined academic and administrative Computer Center with an IBM S/370-158 model III running under SVS. Timesharing with APL, CAI, and CICS is provided to the University community.

If you are the person described above who can plan, organize, supervise, and work well with people, please submit your resume with salary history to:
Mr. Frenk Thomes, Director of Computer Services, The University of Akron, 302 E. Buchtel Avenue, Akron, OH 44325.

An Equal Opportunity Employer.

We can give you 3 good reasons to call Robert Half for data processing positions:

1. Robert Half has been in business for about 30 years. Can you name an EDP personnel service that's been around longer?
2. Robert Half specializes. We've been an integral part of the data processing community through all its generations.
3. Robert Half's offices are staffed by experts in the EDP field.

and if 3 reasons aren't enough, we can give you 55 more:

55 offices. Robert Half is a network throughout the U.S., Canada and Great Britain. One call and you've searched the local market ... or the world.

and if 58 reasons aren't enough, we can give you Half a reason more:

Robert Half. Where integrity is a lot more than just HALF.

OUTSTANDING CAREER PACKAGE

Engineers — Software Design

3 Reasons Why You Should Look Into the Career Opportunities at GTE Automatic Electric!

Career challenge: the opportunity to make significant contributions at the beginning of a new era in a major industry.

The technical evolution in telecommunications is underway. We're working in many areas of software design in an on-line, real-time environment. Definition, design and implementation projects include CAD, Data Base Systems, Simulation, Fault Recovery, Diagnostics, and very complex switching networks using distributed control system technology. These are the forerunners of even more advanced systems that will be designed for the next generation.

SOFTWARE DESIGN

We're looking for an indepth background in the development of systems software and a minimum of 3 years' experience in structured design, testing and documentation of programs running on large data base, multi-file systems in real-time. Familiarity with HIPO design documentation, TSO usage and software simulation techniques as well as PL1, Fortran and assembler languages for the 8080 and PDP 11 programming is also important.

DATA BASE DESIGN

This position requires a minimum of 5 years' experience in the planning development, design and implementation of data base software, including data base management systems administration. Your primary responsibilities will be the development of data base system for a large on-going project including the implementation, support and administration of systems.

COMPUTER AIDED DESIGN

We are looking for an extensive background in the design of CAD/CAM systems and the development of interactive access by the users of CAD/CAM functions. Required is 5-10 years' experience in both hardware and software aspects; DA systems operations, and design, and systems engineering. Your initial responsibilities will include evaluation of existing systems, and working with a project team in the Architectural Planning of a major new system.

MINI-COMPUTER PROGRAMMERS

We have specific assignments available on project development teams responsible for the design implementation of various telecommunication processing systems utilizing mini-computers as the processing element. Responsibilities will include the development of software programs for real-time operating systems as well as unique hardware elements incorporated into the systems.

Call now and let us fill-in more details . . .

CALL (800) 323-1966

In Illinois call (800) 942-0491
Monday thru Friday, from 8 am to 4 pm cdt

If you have current experience in one of these areas, a BS, MS or PhD in Electrical Engineering, Computer Sciences, Math, or other appropriate discipline, let us count out more of the benefits and challenges you receive as a member of the GTE family.

If unable to call, please send your resume to:
Manager of Technical Employment, Dept. 471 A6

San Diego opportunity in advanced-technology EDP SYSTEMS DEVELOPMENT

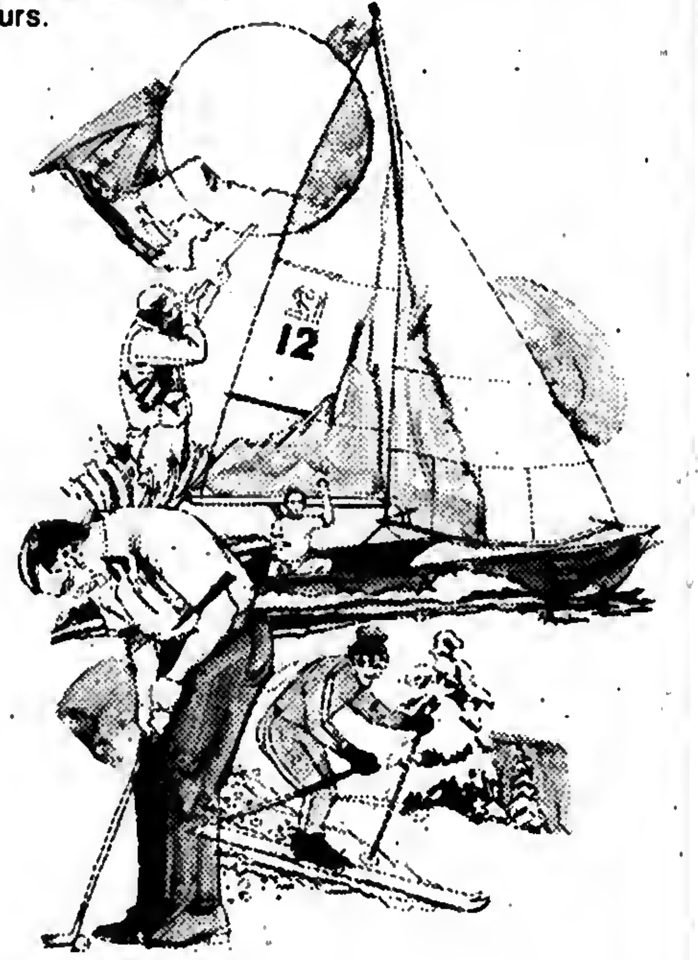
Want to combine the ideal career opportunity with your favorite lifestyle? NCR Special Systems Division needs your help now in developing advanced, high-technology EDP systems for customers around the world. You'll be doing important work in our Sorrento Valley facility, just three miles from the ocean and only minutes from Torrey Pines, La Jolla and downtown San Diego. You can live in the setting of your choice—beach, valley, mountain, country, small-town or urban—and still be only a short drive from work. Spend your leisure hours golfing, swimming, hiking, getting advanced degrees from major universities, attending theatrical, music, art and sports events, or soaking up the year-round sun. Pick your climate, too—from mild coast to dry desert. San Diego is a place of extraordinary choices—and right now the choice is yours.

COMPUTER PROFESSIONALS

The Special Systems Division has opportunities for software professionals in a broad range of disciplines and in all experience levels. Our current and firm future programs require top people with experience in any of the following areas:

- ■ TELECOMMUNICATIONS SOFTWARE
- ■ FILE PROCESSING
- ■ NETWORK DEVELOPMENT
- ■ LARGE MAINFRAME, MINI and MICRO PROCESSOR
- ■ OPERATING SYSTEMS
- ■ COBOL APPLICATIONS
- ■ ASSEMBLY LANGUAGE

Assignments will include the development and implementation of various EDP systems for specific customers as well as the development of future NCR total systems; both requiring state-of-the-art knowledge.



Our benefit package is what you would expect from a major blue chip corporation. What you might *not* expect is the relaxed and very creative environment of this small, highly specialized division. The facilities are modern, comfortable, designed to provide an atmosphere in which every employee can achieve an uncommon degree of personal and professional satisfaction. May I offer you the opportunity to judge for yourself? Please send your resume (with salary history) to me,

Thom Harris, Employment Specialist

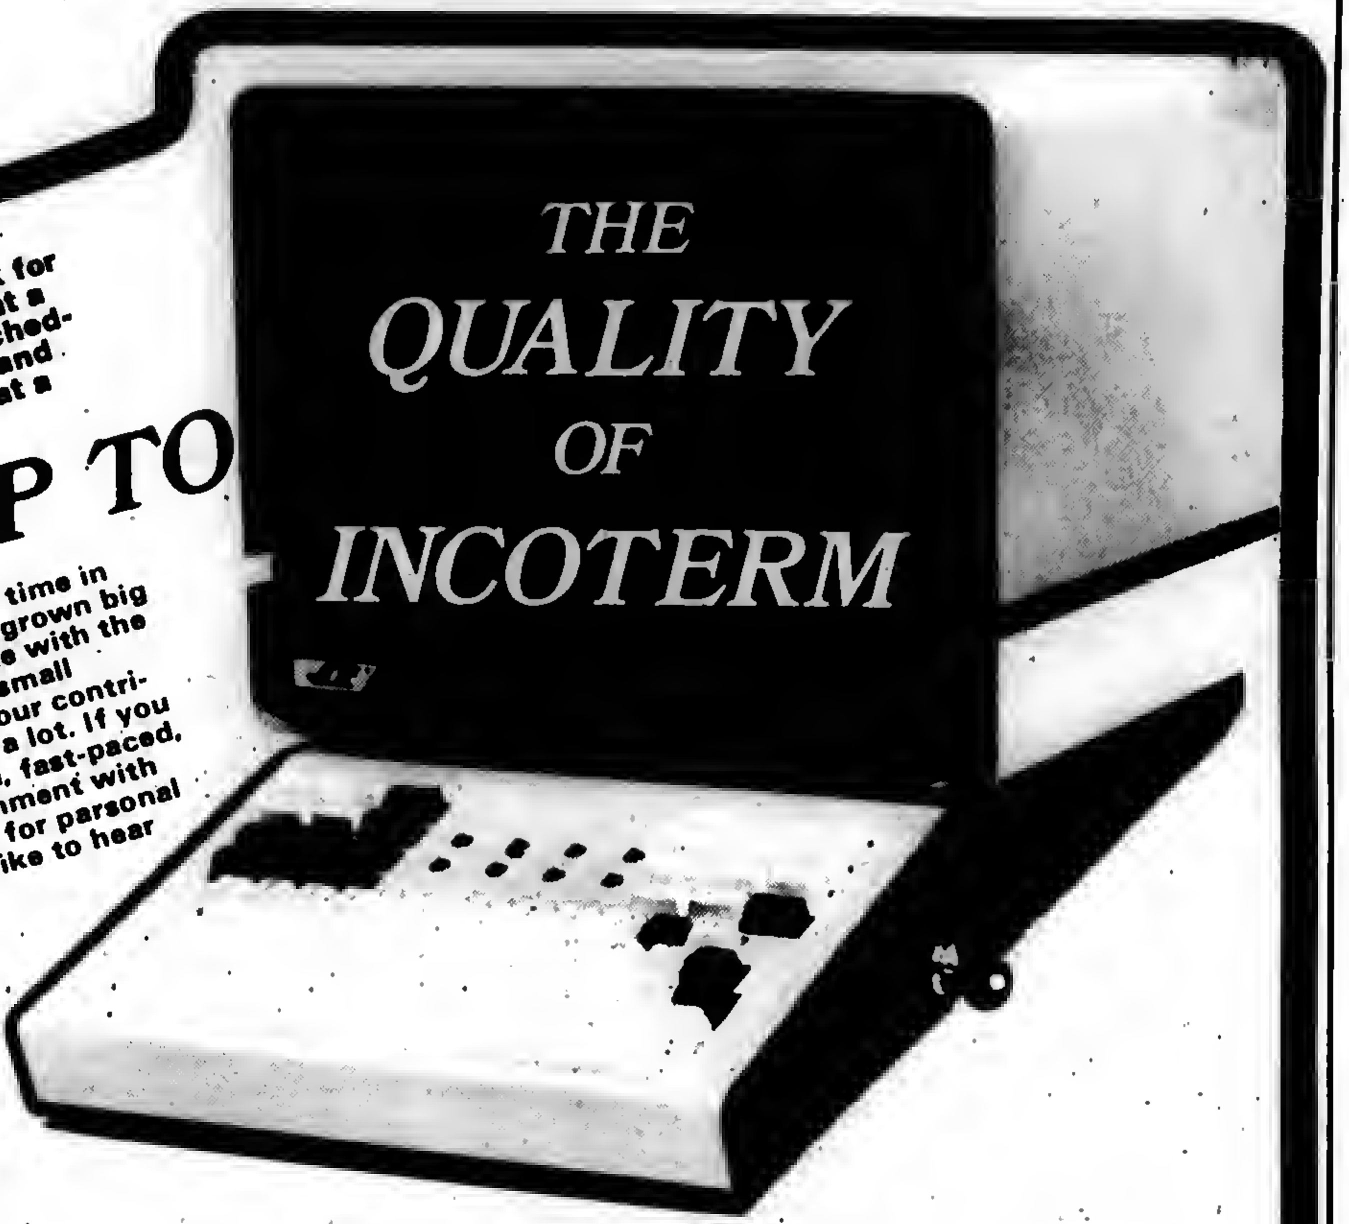
Marion/Salem Data Center
690 Ferry St. SE
Salem, Oregon 97301

You'll be proud to work for INCOTERM! We turn out a quality product...on schedule...we are leaders...and we've been growing at a phenomenal rate.

STEP UP TO



This is a wonderful time in our history. We've grown big enough to compete with the big guys, but are small enough so that your contribution matters - a lot. If you like a controlled, fast-paced, exciting environment with plenty of room for personal growth, we'd like to hear from you.

New Product Development

If you need to take charge and be given the opportunity to develop new computer systems the way it should be done, come and talk with INCOTERM. We need experienced, prolific, innovative technical leaders who want to immediately begin work on new product development. Skeptical because all growth-oriented companies are doing research and development? That's true, but at INCOTERM we have unique opportunities that may be just what you need in the way of professional satisfaction. Interviews with technical staff and the Personnel Department will be available at times convenient to you, any evening, and weekends as well.

Software Development Monitor

We have an immediate senior level opening for a person to monitor the status of software development being performed by outside vendors. This position will include technical evaluation of vendor produced specifications, the development of task requirements for outside consultants and the monitoring of software development tasks. This opening requires a high level of technical expertise as well as an ability to relate well to the various consultants. The successful applicant should expect assignments that require some travel.

Applications Programmers

We have immediate openings for real-time assembly language programmers with minicomputer experience. These programmers will be heavily involved in the development of customer software for our users on our Intelligent Terminal Systems. Applications are in areas such as Banking Systems, Data Entry, Airline Reservations and other similar real-time terminal applications. These positions require a minimum of 3 years of experience.

Systems Programmers

INCOTERM has immediate openings for Systems Programmers to work on our Program Development Systems that are being developed on our PDP-11/70. These are opportunities that will provide in-depth insight into the workings of our systems and will allow for a high level of contribution and responsibility in this system development. Areas in which these programmers will be involved will be cross assembler development, macroprocessor development and the general development and enhancement of Programming Development Systems. These positions require a minimum of 3-5 years system experience, and familiarity with the PDP-11/70. Exposure to the UNIX Operating System is highly desirable.

Operating System Leader

This job entails the successful candidate to lead a small group in the specification, design, code and testing of a contemporary minicomputer sized operating system. Are you an individual who has demonstrated the ability to put together non-trivial systems in an elegant and simple manner (as opposed to non-maintainable complex systems)? We need a strong individual who is willing to take charge in the building of an operating system.

Language Group Leader

The successful candidate will be responsible for leading a group developing high-level language compilers, symbolic debuggers, assemblers and linking loaders. Proven compiler writing experience in block-structured languages such as PL/1 is necessary.

Application Support Leader

This is a multi-dimension position whose bottom line is programmer productivity. The responsibilities of the job are two-fold: oversee the specification and construction of application-support tools from memory dumps to data base, and oversee the development and execution of programming methodology. Extensive experience with end-users data base, distributive processing, minis and intelligent terminals a plus.

Firmware Coder

This individual will probably have a BSEE and is becoming more and more interested in programming. The job will be to code the firmware, i.e., the ROM state machine, for a new central processor. The job requires a super-competent, intelligent person who strives for perfection, can spend days squeezing a single line of code out of 200, and has both hardware and software savvy. The successful candidate may not be experienced in this area, but feels he has the qualifications for the position.

Verification

The successful candidate will assist in the testing and verification of INCOTERM software and documentation to assure compliance with specifications. Experience in testing and verifying software is desirable as is a mathematics background.

Senior Software Writer

This is a ground-floor opportunity to start the preparation of documentation during the development stage! In the beginning the successful candidate will assist in the development of internal specifications and other documents for an advanced computer system development. Required qualifications include experience in software oriented technical writing.

Diagnostic Programmers

Experienced Diagnostic Programmers are needed to provide quality software support in development of off-line and on-line diagnostic test programs.

We offer a most competitive compensation plan and an outstanding benefit program.

INCOTERM CORPORATION is a leader in the development and manufacture of "intelligent" computer display terminals.

COMPUTER CENTER DIRECTOR

Clemson University is seeking a Computer Center Director to be responsible for academic, administrative, and contract computing services. The director is responsible for the host computer facility (IBM 370/165-II under MVS) as well as local and remote terminal networks. The director will maintain computing facilities at a state-of-the-art level to support research and instructional needs as well as maintain maximum system availability for production support of statewide on-line systems. The director reviews and coordinates computer resource needs with two directors of application programming divisions which serve on-campus departments and off-campus agencies. The Director supervises managers of computer operations, software systems, hardware systems, and academic computing services. Minimum qualifications include five years experience in data processing management. Salary negotiable and commensurate with qualifications. Submit three letters of reference relevant to technical and management qualifications and complete resume to:

Search Committee, Computer Center Director, c/o Graduate School, E-106 Martin Hall, Clemson University, Clemson, S.C. 29631. Closing date for applications is Oct. 31, 1977. Clemson University is an equal opportunity, affirmative action employer.

Senior Programmers

Due to company growth we are expanding our Data Systems activities. Responsibilities include applications programming in a number of systems areas utilizing our COBOL-based Main System and our various minicomputer-based systems.

To qualify you should have a computer science degree and a minimum of two years programming experience in a COBOL environment. These interesting positions will offer you career growth along with a good starting salary and fringe benefit program.

If you are interested in joining our team of professionals, send your resume and salary history in complete confidence to:

Join the TI Minicomputer Team

In Austin, Texas

Texas Instruments is seeking highly motivated and creative individuals in its rapidly growing Digital Systems Division in Austin, Texas. Selected individuals will join the 990 minicomputer team which is one of the new thrusts of the corporation. You'll enjoy life in Austin – one of the fastest growing major cities in the U.S. It's got the kind of riches every city wants. Beautiful lakes and hills. The South's largest university. Outstanding parks and public schools. And Texas has no state income tax. Join Texas Instruments – a name synonymous with technological achievement and product reliability.

System Analyst/Project Leader

Develop software for the exciting 990 Computer Family. Performing functional systems design of Software Projects. Requires implementation of operating systems, data communications, languages, data management and utilities. Will assume project management status after initial training and performance period. Aptitude in assembly language required. Familiarity with PASCAL desirable. BS or MS in Computer Science, mathematics, physics, or engineering with 4-10 years' experience.

System Software Designers

Take a career jump into the TI minicomputer software team. Duties will include the design and development of extensive systems level diagnostics software for 990 computers in a stand-alone and real-time environment. Excellent knowledge of assembly language programming, diagnostic software and digital logic design required. BSEE with computer science background and 3-7 years' related experience.

Product Marketing Engineer

A real opportunity to conduct market analysis and definition for minicomputers and intelligent terminals. Duties will expand to include writing new product marketability specifications, preparing business plans, competitive analysis and making pricing recommendations. Also, responsibilities will include some sales training regarding market analysis and new product strategies. Requires comprehensive knowledge of intelligent terminal/minicomputer business with related experience in product planning. Requires BS/MS in Computer Science with BA/MBA or related business experience.

Marketing Applications Engineers

Work in the forefront of new product development at TI. Duties include analysis of customer requirements and systems design. Direct daily communications in advising and counseling current and potential customers in TI's new distributed processing product lines. Individual will also develop demonstration packages and provide general technical and new product support. Software background, knowledge of digital communications and 3-7 years of directly related experience required as well as BSEE, Computer Science or related technical degree.

Product Planner

Duties would include product/marketing analysis for specific opportunities, conducting competitive analysis, developing specific marketability specifications and communications to management. Requires a BS in Engineering with an MBA preferred, and 4-7 years' experience with 2-5 years in the minicomputer or data processing industry.

Product Services Engineers

A career development opportunity in the support of new computer products from conception to field maturity. Duties will require coordination of service planning-maintenance philosophy, spares requirements, tooling, RMR, training and field installation and sustaining product until field and product reach service maturity by product and/or by account. Similar responsibility will include policy development for product maintainability, serviceability and test design. BSEE with a minimum of 2 years of design or sustaining of minicomputers or related peripherals.

Technical Writers

Experienced digital hardware and software technical writers are needed to join in the development of TI's rapidly growing minicomputer business. Electrical Engineers and computer programmers with good writing skills should also apply.

Send resume in complete confidence to: **Lee Cooke, Staffing Manager/P. O. Box 2909, M.S. 2106/Austin, TX 78769.**

Computer Architecture

Our Systems Architecture group seeks talented professionals to help design future high-performance computer systems. You should have a broad educational background in EE or CS with emphasis on computer architecture or design and be familiar with most of these areas: computer systems organization; storage systems organization; operating systems theory; assembler/high-level languages; data base fundamentals. Combined hardware and software experience and familiarity with system 370 is desirable. We have immediate openings for the following positions.

SENIOR SYSTEMS ARCHITECT

You will be a key decision maker on an architectural team. You have experience in either computer systems or operating systems architecture or design.

CONSOLE AND MAINTENANCE ARCHITECT

You will be responsible for the design of system consoles and work on system maintenance strategies. You have experience or aptitude in most of these areas: small and large computer systems; diagnostics; small operating systems and project management.

STORAGE SYSTEMS ARCHITECT

You will be key in defining the architecture of of future storage and data base sub-systems. You have experience in either of these areas.

SOFTWARE SYSTEMS ARCHITECT

You will be a software systems specialist on an architectural team. You have an architectural orientation and experience with operating systems/data base, preferably on system 370.

SYSTEMS ARCHITECT

You will be a member of an architectural team working on diverse investigations. This position offers tremendous educational and advancement opportunities. You have at least 2 years' related experience.

SYSTEM PERFORMANCE ARCHITECT

You will be the performance specialist on an architectural team. You are a qualified professional in computer system performance measurement, evaluation and modeling with emphasis on architecture or design. Research into key areas of new product development will be a major responsibility.

PERFORMANCE MEASUREMENT SPECIALIST

You will be responsible for the development of measurement methodologies to provide the measurement support of future product development. The position requires broad experience and knowledge of computer system operation, measurement methods and system modeling.

WORKLOAD SPECIALIST

You will be responsible for research of computer system workload classification and analysis, including workload creation and synthesis. Research ability in the areas of performance measurement and evaluation is necessary.

We're looking for exceptional talent. You can expect an exceptional compensation and benefits package. Please direct your response to Manager, Professional Employment, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. To expedite your application, please indicate 416-E on your resume or letter. We are, of course, an equal opportunity employer.

If you're seeking a challenging career
in communications software, consider

NCR's Communication Systems Division

COLUMBIA
South Carolina

NCR's Communication Systems Division, specializing in the development and manufacturing of data communications products and systems, is currently expanding its COMMUNICATIONS SOFTWARE group.

Get in on the ground floor of advanced communications design and participate in NCR's entry to DISTRIBUTIVE NETWORK ARCHITECTURE consisting of a series of microprocessor-based terminal systems and node connected by communications lines.

We are looking for key individuals who have indepth software background with solid communications experience. Qualified applicants must provide definition, design and implementation leadership, and have experience in any of the following areas:

- Microprocessor software (assembly level)
- Communications links disciplines (SDLC, bisynch, ISO, etc.)
- Front end processor software
- Network node software.
- Network definition language (system generator)
- Constructors for nodes, cluster controllers, and front ends (COBOL)

All our positions are in our beautiful, sunny South Carolina location, close to the seashores and mountains. Columbia offers a lifestyle that includes both city and country living with excellent recreational facilities for tennis, golf, fishing, boating and swimming. The area also offers excellent housing opportunities, low taxes, and it is the home of the University of South Carolina and other fine educational institutions.

If you are seeking a challenging career with a leader in the industry, need a new lifestyle and have the above experience, we'd like to speak with you.

A degree in Engineering, Math or Computer Science is required. For consideration, please send your resume and salary requirements in complete confidence to:

SCIENTIFIC PROGRAMMER

Los Alamos Scientific Laboratory, a multi-faceted national R&D facility, is seeking a professional with broad experience in FORTRAN programming for scientific applications. The position involves satisfying the software needs of LASL's multi-disciplined Environmental Studies group.

The successful candidate must have the ability to communicate effectively with professionals in other technical disciplines, and to develop codes from descriptions of need from non-programmers. Three years' experience in developing user-oriented software in one or more of the following areas is desired: statistical analysis, computer graphics, scientific data bases, and simulation models. A bachelor's degree in math or computer science is preferred.

The Laboratory, located in the beautiful mountains of northern New Mexico, offers excellent working conditions and benefits, including 24 days' annual vacation and a variety of professional growth opportunities. Los Alamos offers a pleasing lifestyle, with small-town friendliness, abundant recreational opportunities, and an excellent school system. Send complete resume, in confidence, to:

Patricia O. Beck, Recruiting Rep. Div. 77-AS, Los Alamos Scientific Laboratory, P.O. Box 1663, Los Alamos, N.M. 87112. AAA/EOE, Women, Minorities, Veterans, Handicapped urged to apply. U.S. citizenship required.

PROGRAMMER
Manufacturing Data Systems

Pitney Bowes a Fortune 500 leader in the field of Business Communications is seeking an individual with an extensive programming/technical background.

You will be working in a sophisticated environment — UNIVAC 1122 MP, UNIC, DMS-1100, TIP-utilizing state-of-the-art techniques in systems design and implementation. Applicant should demonstrate a proven ability in all aspects of sophisticated data based development, implementation and operations.

Qualified applicant will possess two plus years successful experience in UNIVAC 1100 series systems, ASCII, COBOL (preferably modular) and all other attributes such as data communications and distributed processing.

You will become an integral part of a small, dynamic staff, affording a self starter who can work independently and interface effectively with all levels of management a high degree of visibility and realistic financial and professional gains.

Position offers a truly competitive salary as well as participation in an outstanding benefits program designed for you and your family.

For your prompt consideration, please submit your resume including salary history and requirements in complete confidence to Larry Bohn-Manager of Professional and Technical Employment.

in*sight

DISPLAY DATA CORPORATION

Four years ago, Display Data Corporation set out to develop the best in-house computer system for selected industries. The result was "In*Sight", a turn-key mini-computer system designed to satisfy the entire information processing needs of our selected industries.

Today there are over 170 "In*Sight" systems serviced by 14 sales/service branches. But more importantly, over 100 have been installed in the last year . . . and that's why we need help. We have grown over 100% each year of our existence and plan to continue the same growth rate over the next several years. Therefore, openings exist in all major U.S. metropolitan areas for the following positions:

Branch Managers

Effective, proven salesmen, demonstrators, and closers. Responsible for directing both sales and service personnel in a profitable branch operation. Highly motivated individuals with a desire to excell. Superior compensation plan.

Project Leaders

Proven ability to manage teams of installation representatives in coordinating customer training, support, and satisfaction. Experience in problem solving necessary, computer knowledge helpful.

Account Managers

Experienced salesmen willing to work hard developing prospects, presenting demonstrations, closing sales; and desiring excellent rewards and advancements.

Customer Engineers

Proven ability to diagnose and correct computer realated hardware problems. One year's field experience on mini systems, a customer oriented personality and aspirations for customer engineering management are characteristics of our customer engineers.

If you share our belief that customers and employees are the most important assets of a computer company, and you are the best at one of the positions mentioned above, please send your resume to:

Display Data Corporation
Executive Plaza IV
Hunt Valley, Maryland 2103Z 21031

BIG ENOUGH FOR YOUR LIFETIME CAREER

Since its founding in 1962, Kranzley & Co. has been involved with the design and implementation of proprietary application systems with major emphasis in banking. Kranzley & Co.'s systems are now installed and operating at scores of the nation's leading banks and financial institutions.

In addition to the application systems, Kranzley & Co. provides a series of computer programs for virtually all aspects of communication network analysis and design. The Company's broad background and involvement in these directions over the past ten years has provided the expertise and resources required to meet the exciting challenge of EFT Systems.

Consider Applications Programming

Three or more years COBOL programming experience. Banking or financial applications preferred. Solid self-starter.

Consider EFTS Involvement

Three to five years of strong Assembly programming. Mini exposure helpful. Operating Systems internals. On-line experience. Heavy communications background.

Consider the Leader . . .

Manufacturers' Rep

Experienced computer-terminal sales representatives wanted by small but expanding systems house that engineers and manufacturers patented brailling devices, printers and terminals. The fast-growing market for these devices in education, industry and government, both here and abroad, provides an excellent opportunity. Educational "mainstreaming" of handicapped students, as well as affirmative action programs, are stimulating demand for these devices. Generous commission arrangement. For more information, call Lee Brown, collect, at (813) 879-4452.

Q.

Where do I turn for the best software packages available?

FREE SOFTWARE

Why pay thousands of dollars for Payroll, Billing, Inventory, or Accounts Receivable software. Unlike other software cos. we don't believe in making all our profit off you! We have compiled a 'Library of Money making, Money saving' Advanced Business programs, all written in a language your computer will comprehend, BASIC. We also offer Games Eng, Stat, etc. For a little more than the price of the paper you could own tens of thousands of $$$ worth of powerful software. Vol. III, Ad. Bus.-$39.95. While they last. Add $2 for hndl. plus postage. (Includes: A/R, Inventory, Payroll, etc. software) CASH/CK/MO/MC/BAC * S.R.I. 1712C Farmington Ct., Crofton, MD 21114.

ACCOUNTING SOFTWARE FOR DEC RSTS/E CTS-500 USERS

From one of the pioneers in commercial data processing using RSTS. Successful installations in manufacturing, distribution, service bureau uses. Completely on-line, interactive systems. If you are installing or have installed a RSTS/E or CTS-500 system, contact us first for cost-effective solutions in: **ACCOUNTS PAYABLE; GENERAL LEDGER; FINANCIAL REPORTING**

The design specifications for these packages were developed by accountants for use by accountants. All packages provide excellent audit-trail, extensive user prompting, fast data entry, full file-maintenance and inquiry capabilities, modular design and construction.
These are consolidating packages and support multi-division company and multi-company corporate accounting functions.

SOFTWARE WANTED

Australian software company is seeking marketing agency for financial accounting and other market proven packages for the Australia/South Pacific region.

We are an organization of D.P. professionals with a proven track record in the sale and support of application packages. We do not as yet have any agency arrangements for US software products.

One of our directors will be in the US during October/November to evaluate potential software products.

If you are interested in profits from 'down under' send details of available packages and agency requirements to:

Management Application Systems Pty. Ltd.
140 Arthur Street
North Sydney
Australia 2060.

John P. Imlay, Jr.
President
Management Science America, Inc.
3445 Peachtree Road, N.E.
Atlanta, Georgia 30326

Dear John:

I'm going to send you eight tickets to this year's Super Bowl. Each NFL player gets an allotment and I thought you might put them to good use.

As you know, I really enjoy my association with MSA during the off-season. You've put together a great team and it's a pleasure working with them.

When you're Number One in anything, you can't let up a minute. And it's pretty obvious that MSA is the leader in the financial software industry. So your customers get the best of everything.

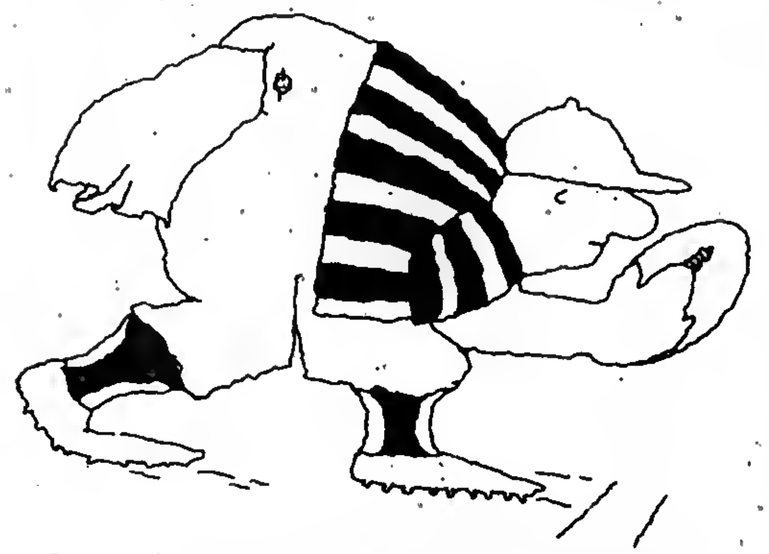
Hope you enjoy the tickets!

Sincerely,

Fran

Fran Tarkenton

All you do is peer into the future and pick the winning team of each upcoming NFL Monday Nite Football game (plus one extra game to make things even), plus a tie breaker for the season. All are ABC televised games.



Circle the winners, do not pick ties, clip the entry blank and send to MSA Super Pool, 3445 Peachtree Rd., N.E., Atlanta, Georgia 30326.

"That's all there is to it."

Circle the Winning Team for Each Game.

Oct. 3	Oakland	at Kansas City
Oct. 10	Los Angeles	at Chicago
Oct. 17	Cincinnati	at Pittsburgh
Oct. 24	Minnesota	at Los Angeles
Oct. 31	N.Y. Giants	at St. Louis
Nov. 7	Washington	at Baltimore
Nov. 14	St. Louis	at Dallas
Nov. 21	Green Bay	at Washington
Nov. 28	Buffalo	at Oakland
Dec. 5	Baltimore	at Miami
Dec. 12	Dallas	at San Francisco
Dec. 17	Minnesota	at Detroit

Tie Breaker:

The team scoring the most points in any one of these games will be ________ (Team).

The game in which the most points will be scored will be ________ (Date of Game).

The number of points scored will be ____ (Number).

Send this entry blank to:
MSA Super Pool
3445 Peachtree Road, N.E.
Atlanta, Georgia 30326

Please Print

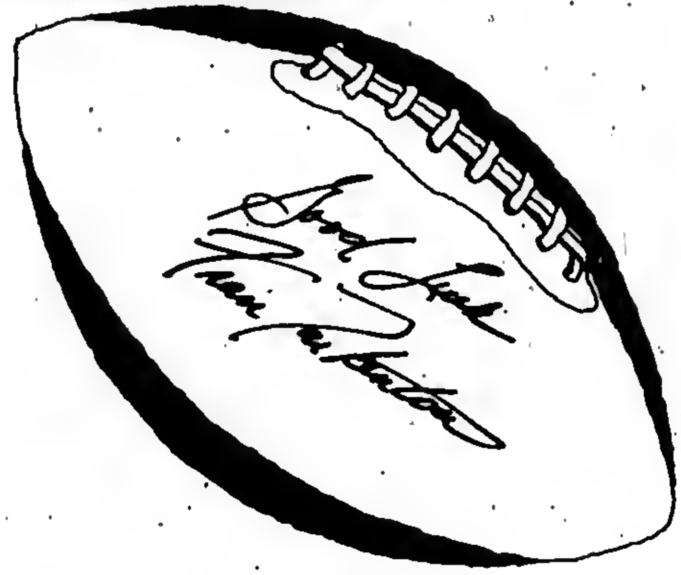
Void where prohibited by law.

There will be one winner of a Super Bowl Trip for four, two winners of a trip for two, and twenty third place winners who will each receive a leather exhibition football, autographed by Fran Tarkenton.



Entries must be postmarked no later than Sept. 30. Facsimiles of the entry blank are acceptable, however, only one entry per person. An independent judging firm will announce the winners in late December.

1978
SUPER
BOWL

So get busy, sports fans. Make your selections and send them in. Someone will win these glorious, fun-filled Super Bowl trips to New Orleans next January, and it could be you!

MSA
THE FINANCIAL SOFTWARE COMPANY

MSA markets financial accounting software packages including: General Ledger, Payroll, Personnel, Accounts Payable, Accounts Receivable, Supplies Inventory, and Fixed Assets

Survey Finds Users Slow To Adopt DDP

Many users of large IBM computers think and talk a lot about distributed processing, but relatively few have done much about it, a *Computerworld* survey of 20 370/168 and 370/158 users has found.

Seventy percent of the users surveyed reported that they had considered implementing a distributed processing system, but only nine of the respondents said they had already installed such a network or planned to do so soon.

And of the nine systems labeled as distributed, three proved to be centralized data bases that had been divided among several sites. So users of truly distributed processing systems accounted for only six respondents, or 30% of the survey population.

In other findings, the survey revealed that only 20% of the users contacted plan to split their data bases among several remote locations, while 35% definitely had decided against that option. The remaining 45% either declined to discuss the specifics of their distributed processing plans or confessed they were not privy to their companies' long-term DP policy.

This is the second article in a three-part survey of users' attitudes toward alternative CPUs, distributed processing and IBM's Systems Network Architecture (SNA) by Jeffry Beeler, Ronald A. Frank and Molly Upton.

The survey also found that exactly half the users intend to install a terminal-based system, if they have not done so already, and that 35% plan to acquire at least one minicomputer-based system.

Burroughs Unit Speeds Running Fortran Code

By Frank Vaughan
CW Staff

DETROIT — The Burroughs Corp. here has introduced an Attached Fortran Processor (AFP) that can reportedly sustain a computing rate of up to 1.5 million floating point operations per second.

The AFP can be installed on any Burroughs B6700, B6800, B7700 or B7800 general-purpose systems, according to a spokesman, who noted that the AFP can execute Fortran programs at up to 10 times the speed of the B6807 large-scale system.

The AFP serves as a mathematical program-oriented subsystem to the companion Burroughs system, which acts as the AFP's system manager.

Operating under a new release of the Master Control Program (MCP), the system manager provides a control environment for the attached processor and at the same time performs the user's business-related DP tasks, which may include on-line and real-time operations.

The spokesman estimated that between 10% and 15% of the capacity of a 6000 series system is utilized managing the AFP, leaving the remaining 85% to 90% of system capability for other work.

The system manager also compiles Fortran application programs, schedules jobs for the AFP to run, provides data I/O, controls peripherals and permanent storage devices, monitors errors and performs on-line diagnostics.

The Fortran processor itself operates at 12.5MHz, and the spokesman noted that the system's processing speed can be attributed not only to the speed of the processor but to the AFP's local buffering. It also does some look-ahead before the actual operation of an

Annual Survey Indicates

DP Salaries Up; Increases Slowing

By Ann Dooley
CW Staff

LAKE, BLUFF, Ill. — Although the economy was looking brighter, DP salaries rose more slowly this year than they did in 1975-1976, according to the annual *Hansen's Weber Salary Survey*.

Salaries grew at 5.1% this year compared with a 5.7% rate last year, the report said.

Top DP managers fared the best in salary hikes, experiencing an 11.2% increase amounting to an average salary of $36,036 nationally.

The highest paid person in that job category earned $86,084 this year, whereas five years ago the top salary was $46,176.

The salary statistics for the Hansen survey cover June 1976 to June 1977 and include 1,157 DP installations; 75 different cities and salary rates of 88,166 employees.

Nationally, systems analysts received a 6.2% increase based on six levels within the systems analyst job function as defined by the Hansen survey. The levels include manager, lead systems analyst, senior systems analyst and levels A, B and C.

The senior level systems analyst earned a 6% increase for an average yearly salary of $20,384. The entry level position (C) had a 4.5% increase, earning an average salary of $12,584 annually.

The senior applications programmer earned a 5% increase, receiving an average salary of $17,524 nationally, while the entry level position in that same function stayed at the same level as last year. The entry level salary is $11,076 nationally, which was an average increase of only two dollars a year, according to Sandra Green, compensation survey coordinator.

The average nationwide increase for all six levels of applications programmer amounted to 4.6%, according to the survey.

Computer operators on the senior

Kreps Considering IBMer For Post in Revamped OTP

By Edith Holmes
CW Staff

WASHINGTON, D.C. — Still another attorney with an IBM connection is being considered for a top-level position in the Carter Administration.

Anne W. Branscomb, vice-president of Kalba-Bowen Associates — consultants in telecommunications, is one of five candidates for the new position of Assistant Secretary of Commerce for Communication and Information, created out of the President's reorganization of the Office of Telecommunications Policy (OTP). She is also the wife of Dr. Lewis M. Branscomb, vice-president and chief scientist of IBM.

If selected by Commerce Secretary Juanita Kreps to be recommended to the President for the communication and information policy job, Branscomb would join several other key federal government officials who have been linked to the corporation, including Secretary of State Cyrus Vance, Secretary of Housing and Urban Development Patricia Harris, Secretary of Defense Harold Brown and Attorney General Griffin Bell.

Branscomb, who attended George Washington University's law school and was admitted to the bar in 1962, was among five people included in a group interview conducted here re-

Jury Verdict Directs IBM To Pay Forro $2.7 Million

By Molly Upton
CW Staff

SAN FRANCISCO — A five-woman, one-man jury has ordered IBM to pay Forro Precision, Inc. $2.7 million in a verdict on Forro's charges that IBM interfered with its components business.

The jury failed to reach a verdict on the antitrust charges pressed by Forro. It did, however, order Forro to pay IBM $260,777 on a counterclaim alleging misappropriation of trade secrets.

Both sides indicated they plan appeals and motions on the findings.

In awarding Forro the $2.7 million, the jury considered seven counts pertaining to how IBM interfered with Forro's business.

The complaint said IBM, in violation of a protective order, made available to Forro customers and to the San Jose, Calif., police information contained in the depositions of Forro employees and Forro documents produced for the IBM vs. Memorex case.

Furthermore, Forro alleged, IBM approached various law enforcement agencies and officials asking them to

Salary Increases Slowing Down: Survey

(Continued from Page 1)

level had a 7.5% salary increase, earning an average $12,792 nationally. At the entry level; the salary average drops to $8,320 with no percentage increase large enough to be calculated in the survey.

Further Breakdown

In addition to salary breakdown by DP position, the Hansen survey also examines wage increases by size of installation, type of city and industry.

Installation size is based on the monthly rental of equipment hardware. A Size One site spends up to $12,000 a month on rental equipment, Size Two spends $12,000 to $25,000. Size Three spends $25,000 to $50,000, Size Four spends $50,000 to $150,000 and Size Five spends over $150,000 on hardware.

The size of the installation is correlated to a city level which consists of a number of cities with similar characteristics. Of the five city levels used in the survey, Chicago is calculated as the base number and all other cities are compared with it.

For instance, Chicago is rated as a Level Two city based on its cost of living, salary index and nomerous other factors. New York is a Level One city, Denver is a Level Three, Jacksonville, Fla., is a Level Four and Des Moines, Iowa is a Level Five city.

Correlating installation size with a Level Two city, a top DP manager there earns $30,056 in a Size One installation, $32,760 in a Size Two, $34,320 in a Size Three, $37,024 in a Size Four and $43,316 in a Size Five installation.

For the top manager, a definite correlation appears between installation size and salary.

In the case of a senior systems analyst, however, installation size doesn't seem to mean as much. The average salary was found to be $19,396 in a Size One installation and a Level Two city, $21,476 for a Size Two installation, $20,800 for a Size Three, $21,268 for Size Four and $20,280 for a Size Five installation.

The senior applications programmer in a Size One installation in a Level Two city received $16,588 yearly, $18,824 in a Size Two installation, $17,836 in a Size Three, $18,616 in a Size Four and $18,616 in a Size-Five installation.

A senior computer operator for a Level Two city and a Size One installation received $11,544 yearly, $12,948 in a Size Two, $12,688 in a Size Three, $13,104 in a Size Four and $13,988 in a Size Five installation, according to the survey.

Installation Size

The figures indicate that salary was correlated to the installation size for the top manager and for the computer operator, although less significantly. For the programmers and systems analysts, installation size was not important to their wages.

The size of the installation might prove important in a top DP management position, because job competition is usually from a nationwide market. While this is not true of computer operators who are drawn from a local market, the size of the installation could prove important because operators must have more knowledge and sophistication to work in a correspondingly more sophisticated DP environment and their salaries would rise with their skills, the survey said.

Analysts and programmers are also taken from a local market, but their job function and level of sophistication might be incidental to the size of the installation, according to Green.

The survey also covers 10 types of industries including manufacturing, transportation, communication, utilities, wholesale trade, retail trade, finance, insurance and real estate, services and government.

Looking at the manufacturing figures from a Level Two city, the top DP manager in manufacturing earned $38,012, in finance the manager earned a yearly salary of $33,228 and in government he earned $42,068.

The senior systems analyst earned an average of $21,892 yearly in manufacturing, a salary of $19,708 in finance and $22,568 in a government DP installation.

The senior applications programmer who is in manufacturing in a Level Two city earned $18,408 on a yearly average, $17,056 in finance and $20,280 in government.

The senior manufacturing computer operator earned $13,156 yearly, in finance $12,532 and in government $15,756.

The survey indicated that some cities experienced higher-than-average increases such as Dallas which was up 9.4%, Houston up 9.9%, Denver up 7.4% and St. Louis up 7.6%.

Large northern cities such as Chicago and New York experienced lower wage increases than the national average, the survey determined.

Possible explanations for the low gain could be that the DP employees in large installations found in those cities move rapidly through the levels of their job in a large DP installation. They don't stay at one level long enough to gain an increases at that level before moving on to the next, Green hypothesized.

The Hansen survey also indicates that the trend of companies to move to the sunbelt might have created a supply-and-demand problem for those DP people who refused to relocate. Those extra people might have had something to do with bringing the figures down, Green suggested.

But it is too soon to determine accurately the reasons for the low increases in the north, she said.

In addition, the reason for the large increase in salaries might be that the South has never had to pay the premium wages that the Northeast, Midwest and California do. Those areas have a high cost of living and a high level of DP sophistication. Given a few more years, the salary statistics might equalize somewhat, Green predicted.

The 1977 Hansen survey can be purchased for $95 from A.S. Hansen, Inc. at 1080 Green Bay Road, Lake Bluff, Ill. 60044.

MUSCLE

Sure, MVS gives you more power. But watch out for sorting charley horses!

(SyncSort's preferable to liniment.)

Call (201) 568-9700.

Get into shape with a free sorting survey.

Do you ever get the feeling that the Computer Giant would like to see *everybody* go to MVS?

We do. Particularly when we read ads like "MVS: Real Muscle for Large Systems," which appeared in a recent DP Dialogue. The lead paragraph went like this:

> "Processing a complex job stream makes unique demands on operating system software. And in a communications-oriented environment, the system must be able to handle large volumes of work in an unpredictable mix of batch tasks and terminal transactions."

So far, so good. MVS *is* a powerful tool in multi-programming, and heaven knows we have nothing against it. Some of our best friends use it. (In fact, *more than half* of all MVS users sort with SyncSort.)

But you have to be careful of software programs that don't fit into multi-programming. Otherwise you may end up with a painful charley horse in all that new muscle.

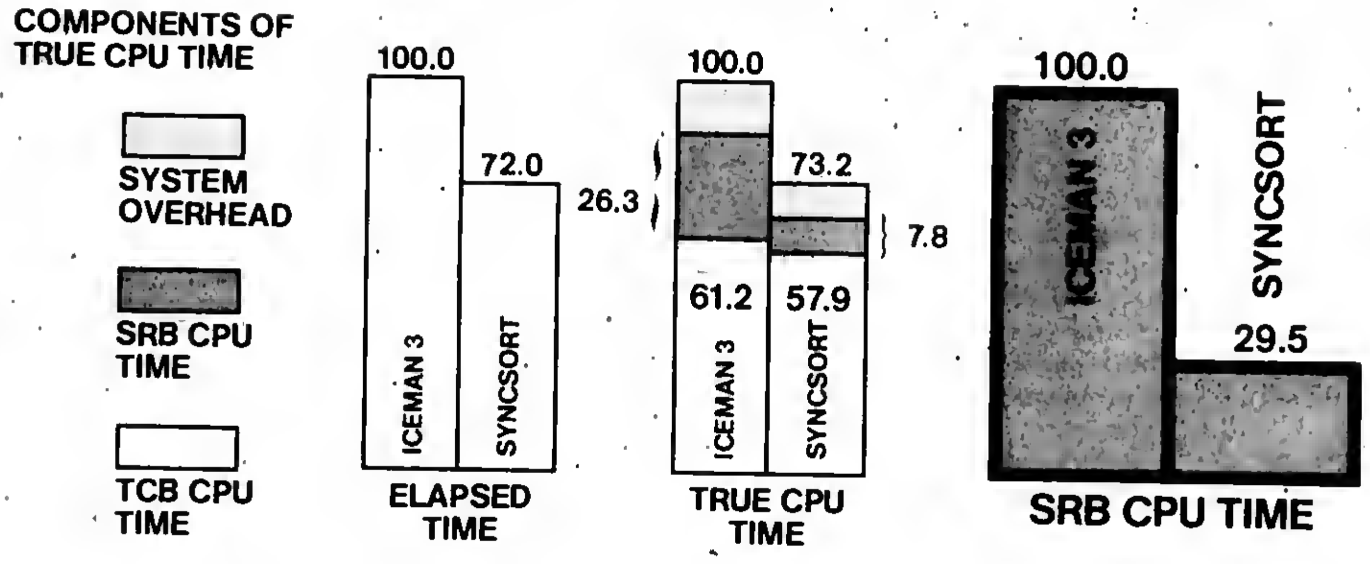
Take sorting operations, for example. They represent a big chunk of those "large volumes of work in an unpredictable mix." In fact, your MVS system may spend 20 or more percent of its time doing *nothing* but sorting.

If you happen to sort with SyncSort III-and-a-half, you're going to have no problems whatever. It's a natural for busy, multi-programming operations. But if you happen to have chosen the Computer Giant's 5740-SM1, Release 3, look out for "locked up" CPU time.

In MVS, there are two components of True CPU Time, apart from systems overhead. They are:

- TCB Time (Task Control Blocks) — which is *interruptible*. If the CPU wants to switch signals and run another job, the message gets through.
- SRB Time (Service Request Blocks) — which is *non-interruptible*. The line is *always* busy. And this directly affects the performance of other jobs in a multi-programming mix.

Take a look at the charts below. They compare SyncSort's overall MVS performance with IBM's 5740-SM1, Release 3. And the two on the right pinpoint the SRB Time differences.



No matter what system you use, SyncSort will give you major savings in computer resources. But it's particularly useful in multi-programming, where that "go to jail" time is reduced by a whopping 70%.

We call it "time off for good sorting behavior."

WHITLOW
COMPUTER SYSTEMS Inc. 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

Survey Finds Users Not Rushing to Use DDP

(Continued from Page 1)

The most frequently cited reason for not considering distributed processing was satisfaction with existing computer configurations or fear that a hardware change might disrupt long-standing operations. Five respondents used those or similar arguments to justify their preference for centralized data bases.

Thus far, only one of the users interviewed has rejected distributed processing outright after thoroughly evaluating the alternative. Four other users, however, are undecided about the approach, either because they suspect that distributed processing will clash with their existing procedures or because their DP plans are still in the formative stage.

A case in point is the Aluminum Co. of America (Alcoa). There, officials have long considered installing a distributed processing system, but thus far they have remained unconvinced of its value, according to technical services manager R.N. Wehling. If the Pittsburgh firm ever did acquire a distributed processing system, it would probably consist of a central minicomputer linked to 23 remote terminals, he said.

Chase's Schemes

In contrast to Alcoa's cautious and deliberate pace of development, the Chase Manhattan Bank's Trust Department has already implemented two distributed processing schemes. One of these schemes is a communications network based on the department's central 370/168.

The other uses stand-alone minis with little or no communications capability, senior vice-president William Shine said. Those minis include a DEC PDP-11/35, a General Automation, Inc. 3000, a Singer Business Machines Model 10 and several intelligent terminals.

Compared to Chase Manhattan, Blue Cross/Blue Shield's computer center in Richmond, Va., has made less of a commitment thus far to distributed processing, but the health insurance organization has already begun formulating plans to implement a distributed system, according to operations manager Leo Harris.

When fully installed, the distributed processing network will off-load localized data bases and allow remote offices to enter data into Blue Cross/Blue Shield's 370/158 central computer. The proposed network will be based on both terminals and minicomputers, Harris predicted.

Firestone Switching

Firestone Tire & Rubber Co. is also in the process of switching to a distributed processing system, H.W. Guthrie, the firm's operations manager, said. In that system, Data 100 terminals (models yet undecided) will link to a central 370/168 and 370/158 at the company's DP center in Akron, Ohio.

Among its other distributed processing plans, the firm will split its data base and install both a terminal-based and a minicomputer-based system.

Hallmark Cards, Inc. regards distributed processing and a move to IBM's Systems Network Architecture (SNA) as part of the same potential systems upgrade, Ron Schmidt, the firm's senior technical services analyst, explained.

Early next year, the Kansas City company plans to install an IBM 3705 with a 3790 remote terminal system. At first, the firm will test the 3790 alongside its central 370/168s, but if the results prove positive, Hallmark will place additional terminal systems, Schmidt said.

Northwestern Mutual Life Insurance Co. is another of the survey respondents that has already created a distributed processing system. Jeff Dunn, the firm's assistant DP director, said the system consists basically of Texas Instruments DX-20 minicomputer terminals that connect all the company's remote locations to its central 370/168 in Milwaukee.

Separate Data Bases

Prudential Insurance Co. of America maintains several computer sites and has distributed some of its computing power to each of those locations, according to shift supervisor Mike Capo.

Rather than split its data base among several sites, the Roseland, N.J., firm operates a separate data base for each of its computing applications, Capo added.

Sears Roebuck Co. uses distributed processing only on a "very limited" scale at its Philadelphia computing center, data center manager Ronald Leone explained.

In fact, that system is confined to one building, where a series of remote minicomputers links several of the company's administrative departments to a central 370/158. At its Chicago headquarters, however, Sears is further exploring distributed processing techniques in research and development projects, Leone said.

A distributed processing system of sorts also is operating out of Amoco Production Co.'s computing center in Tulsa, Okla., according to operations manager William Caldwell. That system, however, consists primarily of large mainframes — a 370/168 in Tulsa and a 370/145 plus a 370/148 at its Chicago office, he explained.

Others Less Developed

Compared to companies like Amoco, however, many other 370/158 and 370/168 users are much less developed in their distributed processing capability. In Akron, Ohio, for example, Goodyear Tire & Rubber Co. has considered distributing its computing power to various sites, but the company has not yet formally committed itself to that approach, according to John Longstreth, manager of data processing support services.

Ford Motor Co.'s computing center in Dearborn, Mich., is also evaluating the potential of distributed processing, equipment manager Roger Bisschop said.

The Ford DP center, which acts as a service bureau for several departments within the company, has assigned a task force to assess the feasibiity of complementing its existing computer hardware with a second processing center, Bisschop explained.

"Before we can think about dual sites, we have to be sure we can continue to provide the current functions to our users," he said. Ford's computing center houses seven IBM mainframes, including a 370/168 and a 370/165, plus two Burroughs CPUs.

Evaluation of distributed processing possibilities likewise continues at Sun Oil Co.'s Information Services Division, but as with Ford, the Tulsa, Okla.-based company has formulated no firm plans, according to Bill Fore, a manager of Sunoco's technical staff group.

Two 370/168s and several 360/30s run under RJE at the company's cen-

Are Your DASD's Drowning
. . . in a Sea of Data?

DMS/OS the Wave of the Future in Disk Management

For the first time in software history there is now a total disk management system. DMS/OS is the wave of the future in DASD management.

DMS/OS contains all of the ingredients of a successful package. It is extremely easy to load, use and maintain; it is well documented; it is user-proven in all types of environments; it offers strong technical support from DASD experts; it solves many major user problems; and it is easily cost justifiable.

The **BASIC SYSTEM** includes:
1. Management Reports
2. Archival/Retrieval
3. Data Set Retention Control
4. Migration of Sequential GDG's From Disk to Tape
5. PDS Management
6. DSCB Retriever
7. Module Intercept (Source code not available)
8. Report Writer
9. Table Support System
10. Selective Dump/Restore

SELECTABLE UNITS
1. VSAM Support
2. TSO Command Processor
3. DASD Space Billing
4. Mass Storage Support*
5. Volume Configurator

Let DMS/OS save your DASD's from drowning in a sea of data. DMS/OS is available for a free 30-day on site evaluation. Call or write today for our brochure, functional overview or for your on-site evaluation. DMS/OS . . . the wave of the future in total DASD management.

'Not a Technical Problem'

Distributed DP Seen Efficient Business Tactic

By Toni Wiseman
CW Staff

Business is most efficiently conducted through decentralization, and distribution of computer resources is not only desirable, but also possible and probably inevitable, according to speakers at the Western Electronic Show and Convention (Wescon 77) here last week.

A session on the meaning and impact of distributed processing began with a formal definition of the term: "Distributed processing is an umbrella term for a variety of processing structures whose common goal is the placement of local computer power at the disposal of every unit of the business for the purpose of enhancing each unit's operations and controlling a timely flow of intelligence among these units."

While advocating the move to decentralization, speakers agreed it is not an easy task to accomplish, particularly since the investment in a centralized facility is usually large. In addition, disturbing the calm of the "old regime" may be disastrous.

Jacob Sternberg of Conversational Systems Corp. pointed out the move to distributed processing is not a technical problem. "Once management decides where computer power assistance is required, the technologist can supply that power in a variety of forms," he said.

Sternberg backed up his optimistic statement with several observations.

First, minis and micros are now highly reliable and the concern technologists once had regarding placing hardware in the boondocks is slowly becoming a moot issue.

Further, the small boxes are as intelligent or as dumb as required and local customization can be easily accomplished through hardware or software.

In addition, hardware interfaces, controllers, peripherals and communications devices all have sufficient intelligence to enable timely hook-ups of plug-to-plug compatible hardware, he stated.

Compatibility Goal

The plug-to-plug compatibility goal for both hardware and software enables capitalizing on the coming technical breakthroughs in mass memories, communications and other peripherals.

Plug-to-plug compatible software can be attained. Sternberg added that while current software costs of over $4.50 per documented instruction are ridiculously high, the cost stems from the complexity of the designs and from excessive documentation requirements.

"Specific software is easier to write and document;" Sternberg said. "Interfaces between software modules can be created to replace the overhead burden inherent in the complex and general software currently in use," he said.

Taking a look at the question from management's point of view, Sternberg said it should be reassured by the commitments being made by large manufacturers, led by IBM, and by the fact that "pioneering" is no longer required since a large number of successful implementations already exist..

Patrick LaMalva of Citibank N.A. told the audience he was there to "debunk" a few myths about the firmly entrenched business axiom of "economy of scale."

Citibank, he noted, is opposed to the "conventional wisdoms" and believes in keeping operations on a small scale.

"Our concept of economy of scale in banking says operations should be a small unit — one person if possible — with a personal relationship with the customer," he said.

From a systems standpoint, the fundamental problem is the functional approach to systems development that prevails today, La Malva stated. This stems from the fact that most equipment manufacturers still look at functions individually and not as parts of a system, he added.

CW at Wescon

The primary example of this philosophy is the large, powerful multiprogramming computer that has been marketed as the answer to today's operating problems, he said.

This approach is machine-efficient and people-inefficient, he said, and in a people-intensive business such as banking, that adds up to substantial inefficiencies of cost.

"Because it is based on the principle of 'economy of scale,' this approach militates against the ability of the manager to solve the small-scale problems," LaMalva charged. "And small-scale local, immediate problems are precisely what the business manager worries most about, and where most of his short-term cost and quality opportunities lie."

Finally, and perhaps most important, "This approach encourages — indeed demands — the optimization of specific functions at the expense of all other functions," LaMalva said.

FREE
TP SEMINARS

SHADOW II is now the World's leading TP Monitor for IBM 360/370 users running DOS, DOS/VS, DOS/RS, DOS/MVT, EDOS, VM, MFT, MVT, VS1, VS2 or MVS.

To explain its unique functions and the reasons for its major advantages over other TP Monitors, ALTERGO is running a first series of seminars for both Data Processing Management and Technical Staff involved in selection and use of TP systems.

Each Seminar will run from 9:00 am to 4:30 pm and cover such ground as:

Recent technological advances, management benefits, cost savings, integrated DB/DC systems, major features, and simplicity of conversion to SHADOW II from other TP Monitors.

Please Hurry. Return the coupon right away to reserve your places at the location of your choice.

Kreps Eyes IBMer for Post in Revamped OTP

(Continued from Page 1)

cently by Kreps and Dr. Sidney Harman, deputy undersecretary of the Commerce Department, sources close to the selection process said.

All those interviewed are attorneys. They include Henry Geller, a Fellow at the Aspen Institute who used to be general counsel of the Federal Communications Commission (FCC); Nick Miller, now an OTP consultant, but formerly counsel for the Senate Commerce Committee; Henry M. (Chip) Sooshan III, presently counsel to the House Communications Subcommittee; and Frank Lloyd, recently an executive director of the Citizens Communications Center and now an OTP consultant, the sources added.

The post of assistant secretary for communication and information was created by the President's Reorganization Plan No. 1, which will go into effect, unless voted down by Congress, in mid-October. That same reorganization plan abolished OTP as a White House office and transferred many of its functions and staff to the Commerce Department.

The new office is a Presidential appointment and as such can only be made by Carter himself, a Commerce spokesman pointed out. The Senate must then confirm the appointment.

Carter, however, will probably rely on Kreps' recommendation, he added.

A government official involved in the assistant Commerce secretary selection process described Branscomb as "an attorney from Armonk and involved in broadcasting matters." Kalba/Bowen Associates is based in Cambridge, Mass.

Branscomb's husband, Lewis, served as head of the National Bureau of Standards in Commerce during the Nixon Administration.

Secretaries Vance, Harris and Brown have all served as directors of IBM's board. Attorney General Bell must disqualify himself from all Justice Department matters concerning IBM because the Atlanta law firm of which he was a partner represented the corporation on various occasions.

Kreps herself was rumored to have been recommended to Carter by IBM for the position of Commerce Secretary when Jane Cahill Pfeiffer, an IBM vice-president, dropped out of the running for that position last January.

IBM Ordered to Pay Forro

(Continued from Page 1)

conduct an investigation of Forro based on information IBM knew to be false.

In 1973, IBM, "acting together with others, seized [Forro's] business records, including confidential pricing information and blueprints, for the purpose and with the intent of destroying plaintiff's business and impeding and eliminating competition in peripheral devices and computer components . . .," Forro stated.

Between 1972 and 1976, IBM "knowingly made false statements of fact to police" and to the Santa Clara County district attorney "for the purpose of securing criminal indictments against certain of its competitors and to hide and obscure the unlawful relationship between IBM and said authorities," the Forro complaint continued.

Forro also charged IBM with misusing its subpoena power issued in IBM vs. Memorex to "intimidate, threaten and harass key employees of Forro [and] gain unlawful access to secret and proprietary documents and business information of Forro and others."

Forro sought a minimum of $220,000 in direct damages and $14 million in punitive damages for the common law counts. It also asked for $12 million under the antitrust charges.

IBM's counterclaim charged Forro, a maker of disk drive components, with misappropriation of trade secrets. IBM sought $5 million in damages and $20 million in punitive damages.

After assessing the verdict, Forro attorney Joseph M. Alioto said he plans to ask for a retrial on the antitrust grounds and the punitive damage claim. He also plans to ask that the jury's award to IBM be thrown out because "the evidence isn't there" for such a decision.

IBM plans to appeal the decision ordering it to pay Forro $2.7 million. IBM chairman Frank T. Cary said, "We are obviously disappointed that the jury didn't reach a decision on the antitrust charges, since we are confident of our position. It's difficult to understand the award to Forro since the 'interference' was related to a search of Forro's premises by the police with respect to IBM trade secrets. We intend to appeal."

SUPERWYLBUR*

A POWERHOUSE OF PRODUCTIVITY
. . . ON YOUR SYSTEM OR OURS!

SUPERWYLBUR* is the powerful multi-purpose software package that's boosting productivity for data processors nationwide.

This conversational computer system and service, available exclusively from Optimum Systems Incorporated, offers advanced word processing capabilities, an interactive programming language, comprehensive text editing and a remote job entry/retrieval controller. And you can use SUPERWYLBUR on your equipment or as a service through any of our data centers.

Word processing potential is nearly limitless. SUPERWYLBUR aligns, justifies, hyphenates, generates automatic tables of contents, and permanently paginates with headings and footings.

Macro programming capabilities permit automation of virtually any routine activity. Process pre-stored commands with comparisons and branching, and expression evaluation.

Text editing with SUPERWYLBUR is fast and accurate. You can create, modify, and retrieve a wide variety of text, program source code, data, letters, manuals, financial statements, and proposals.

Remote Job Entry using SUPERWYLBUR permits jobs to be submitted to computers' batch streams; lets you check, alter job status, selectively retrieve job output at your terminal and route output to remote sites.

Triple your TSO productivity with SUPERWYLBUR by relieving TSO of its editing load and permitting it to function more efficiently in executing user programs.

Pack more power into your programming and processing! Write today for details about SUPERWYLBUR. We'll send you a brochure that outlines SUPERWYLBUR's extensive capabilities and a current price list. Or send your check for $20 for a complete set of SUPERWYLBUR reference manuals.

SUPERWYLBUR IS IBM MAINFRAME COMPATIBLE AND SUPPORTS O/S, VS1, SVS, and MVS.

In Survey of Large IBM Installations

Users Found Slow to Move to Distributed DP

(Continued from Page 4)

tral computer site in Dallas, but Sunoco is not considering splitting its data base among several locations, Fore said.

The company expects its first terminal-based system, which it admits is still fairly primitive, to continue growing, and Sun is also putting the finishing touches on its own standalone minicomputer systems, the technical staff manager added.

In contrast to companies like Sunoco, several 370/158 and 370/168 users contacted during the survey expressed little or no interest in distributed processing. Oscar Mayer Co., for example, has declined even to consider a distributed processing system, Roger Tietz, the firm's computer manager, said.

Oscar Mayer has decided to retain its centralized data base because the Madison, Wis., company believes the relatively small volume of data it processes does not justify the changeover to distributed processing, Tietz explained.

Ashland Oil Co. also has chosen not to consider replacing its centralized data base with a distributed computing system. The Ashland, Ky., firm has concluded that decentralization would hamper its operations, according to Stan Wonn, the company's administrative assistant for computer services and sciences.

Not Much Headway

Nor has distributed processing made much headway at Ralston Purina Co. in St. Louis. Company officials have had little incentive to consider that option, primarily because they have found that their firm's current computing configuration, built around a 370/158 and 370/168, can meet all of Ralston Purina's DP requirements, according to Chuck Childers, general manager of computer services.

The Joseph Schlitz Brewing Co. flirted briefly with the idea of converting to a distributed processing system, but for the most part the company has rejected that approach, according to information processing manager R.L. Babcock.

The Milwaukee-based brewer has concluded that distributed procesing does not fit in with its existing operations or DP applications, Babcock added.

As an alternative to distributed processing, the company "does a lot of remote job entry," he said.

Bureaucratic reasons are primarily responsible for PPG Industries, Inc.'s decision not to consider switching from a centralized to a distributed computing system, according to D.L. Campbell, director of the company's computer center in Pittsburgh.

To make a change as drastic as the creation of a distributed processing system requires a central DP policy-making body, and PPG Industries lacks such a body, Campbell complained. Rather, the responsibility for creating the company's DP policy is divided among the managers of the firm's four corporate divisions.

Monsanto Co. in St. Louis credits its decision not to seriously evaluate distributed procesing to satisfaction with its existing centralized system, explained Frank X. Fallert, manager of performance analysis. That computing system consists basically of two major DP centers, one in the U.S. and the other in Europe.

The firm maintains a 370/158 and 370/165 that connect to interactive and RJE terminals, respectively.

Bud Patterson, a production manager with Union Carbide's Chemical Division in S. Charleston, W. Va., declined to comment on his firm's distributed processing plans. Such considerations are the concern of high management and beyond the scope of his responsibilities, he said.

Unit Processes Fortran Coding

(Continued from Page 1)

instruction, and instruction set is optimized for floating point operations, he added.

Processor memory has 128,000 words of 4K metal-oxide semiconductor (MOS) integrated circuits and is expandable to one million words. Memory cycle speed is 160 nsec.

File memory provides the AFP with 2 million to 16 million words of secondary storage utilizing Burroughs disk files. Average access time is 5 msec and information is transferred at a rate of 600,000 byte/sec, the spokesman said.

AFP Fortran is compatible with Burroughs large systems Fortran and the user can develop and test the syntax of AFP programs interactively on the system manager before executing them on the AFP.

Purchase prices range from $850,000 for a basic AFP subsystem with 128,0000 words of main memory and 2 million words of file memory to $2,640,000 for an AFP with the maximum of one million words of main memory and 16 million words of file memory. Lease rate equivalents range from $22,500 to $67,470 a month. Deliveries are expected to start in the third quarter of 1978; the spokesman said.

IMPROVE COBOL PROGRAM PERFORMANCE. DRAMATICALLY. AUTOMATICALLY. GET THE FACTS:

Now, over 500 MFT, MVT, VS1, SVS and MVS sites worldwide are obtaining dramatic savings in COBOL CPU time and storage requirements *automatically* by using OPTIMIZER II, a program product from Capex.

Using techniques inaccessible to your programmer or compiler, OPTIMIZER II works as a final phase to any IBM OS or OS/VS compiler, automatically analyzing and optimizing every path, every loop, typically eliminating more than 30% of the compiled instruction. It's transparent—no system or source program changes are required.

And since it works at the machine language level, its savings are available even for your best hand-tuned programs.

Results: COBOL programs run faster and use less system resources. Storage requirements are reduced. Capacity is increased. Turnaround is improved. You get more from your current system; even more when you expand or upgrade.

OPTIMIZER II is a proven package. It's easy to install and benefits are immediate. More about how and why is yours for the asking:

Distributed DP No Longer Vague Concept for Malmo

By Esther Surden
CW Staff

MALMO, Sweden — For the third largest city in Sweden, distributed processing is no longer a nebulous concept — it is an already-implemented, cost-saving alternative to using large mainframes to process the city's applications.

And it's an alternative that when properly designed — with the end user in mind — reaps rewards in user satisfaction, according to Nils Dahlberg, the city's DP manager.

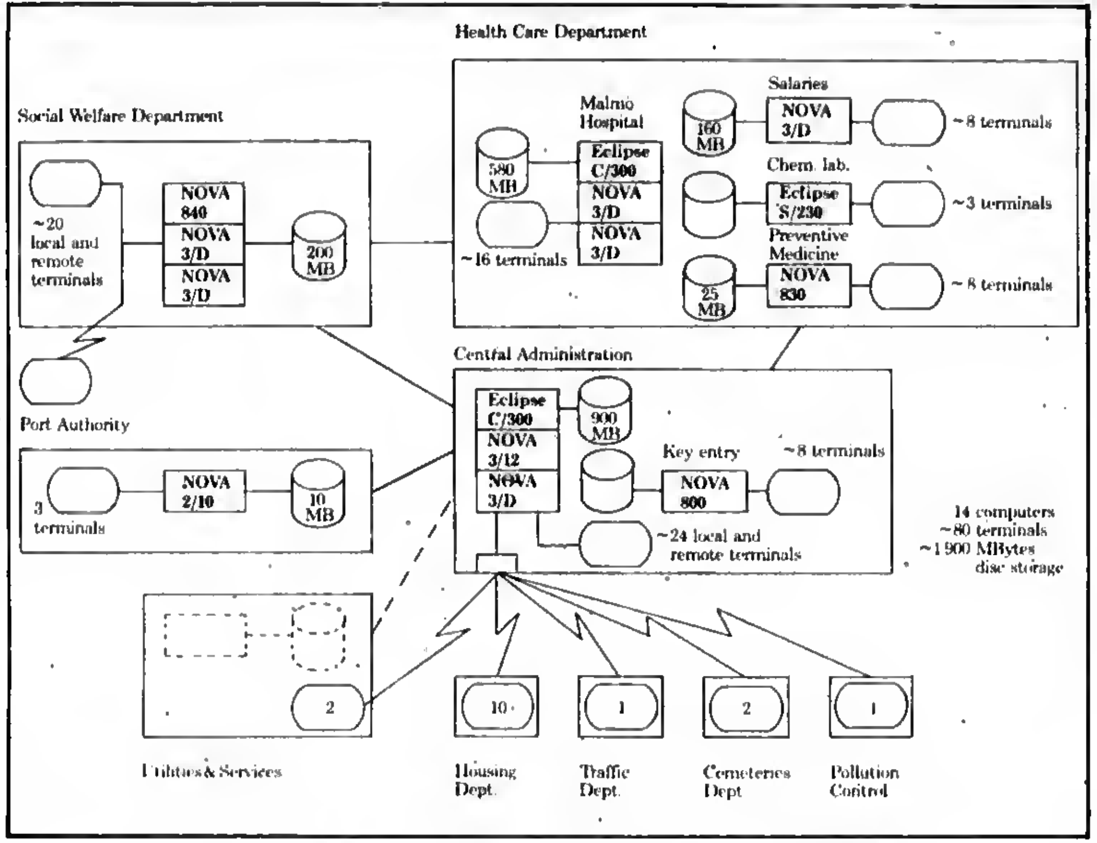
From its first brush with punch card equipment to the centralization of most of its applications on a mainframe, Malmo's DP history followed a traditional path.

By 1972 the city had large Datasaab systems and a centralized data base; all of its large applications were running in batch mode. In that year, the DP department decided to try to develop an interactive system, still using the large systems, for its social welfare application.

"We worked with the people in the field, we talked to the users and found that when we were finished there was much enthusiasm for what had been developed. It was no longer our system, it was their system," Dahlberg said in a recent interview.

The interactive processing created a heavy demand from users for more interactive processing, but Malmo's two large-scale systems had reached their limits.

The DP department calculated that in order to implement all the systems the city planned in interactive mode, a capacity of 130 transaction/sec was needed. No single system, large or small, could provide that capacity.



Malmo's system is based on 14 Data General minis.

The city then made some price/performance comparisons. For example, it found an IBM 370/148 with 2M bytes of memory and a capacity of 10 transaction/sec cost about 5 million kroner (one kroner equals about 23 cents), while a minicomputer with a capacity of 4 transaction/sec cost about 200,000 kroner. Thus it would take 13 large systems at about 65 million kroner to do the job that 32 minis could perform for 6.5 million kroner.

This CPU-to-CPU comparison came up with a 10:1 ratio in favor of minis, Dahlberg noted, and with the price/performance breakdown favoring the minis it was "easy to convince the city council" to give the go-ahead.

The manager estimated that when calculated on a system-by-system basis, the minis are 1.5 to 2.5 times more cost-effective than their batch counterparts.

"It took about two years to look at the mini market," Dahlberg recalled. "In 1974 no one was interested in interactive systems software development."

So the city looked for a company that could provide the tools it needed to develop the overall system. Data General Corp. could provide a multiprocessor communications adapter (MCA) as standard hardware.

The MCA allowed the DP department to link the minis.

All development work then stopped on the big systems and "during the next two years we worked on developing software for interactive processing." The city developed its own language with screen-handling techniques, communications routines, multiprogramming capability, Isam structure and multiterminal capability.

About 20% of the programming on the system is done in Fortran and the rest is done in the language the DP department developed.

Presently the city has 14 DG minis with about 80 terminals and disk storage totaling about 1.9G bytes. Ten different groups of users are running about 25 different applications.

Among the applications now tied into the distributed system are the Department of Social Welfare's system, which maintains waiting lists and books places in the city's nursery schools and old people's homes; the port authority system that bills harbor charges and performs all bookkeeping; the billing system for city's utilities; and the Department of Health's systems for patient administration and preventive medicine.

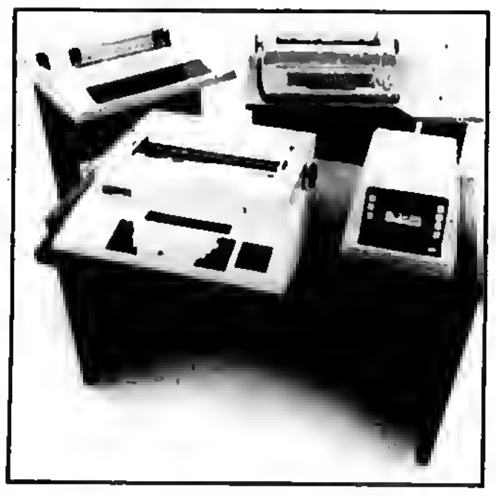
When we plant a terminal...



It gets as much TLC as Marilyn gives her potted Spathiphyllum.

Terminals are just as sensitive as plants so it's important to pick the right one for *your* job. That's why Trendata offers a wide range of printing terminals and magnetic tape recorders to fit any number of applications.

And since terminal productivity stems from proper training, Trendata field reps make sure your people understand all the do's and don'ts of terminal operations.

Should maintenance problems arise, they are immediately pruned out by our own nationwide service people. The last thing you need is a terminal withering on the line.

As we mentioned, anything that grows needs TLC . . . and if your system isn't getting Terminal Loving Care, we'd like to cultivate a little conversation.

Detach here, fold, and place in post-paid envelope attached through binding.

Absolutely no distributed processing system offers you all these 10 features except Series 21 from MDS:

1. An intelligent data entry system which installs as easily as a keypunch and is fully operational as soon as you plug it in.

2. Formatted data entry software—fully developed and ready to use.

3. On-site upgradability so you can utilize a powerful programming language specifically developed for interactive processing with CRT/Keyboard.

4. Growth capability so you can accommodate your peak production periods by allowing expansion to up to four operator stations—any time—on one controller.

5. Modular design so you can configure a system to fit the requirements of your various locations—exactly, now and for the future.

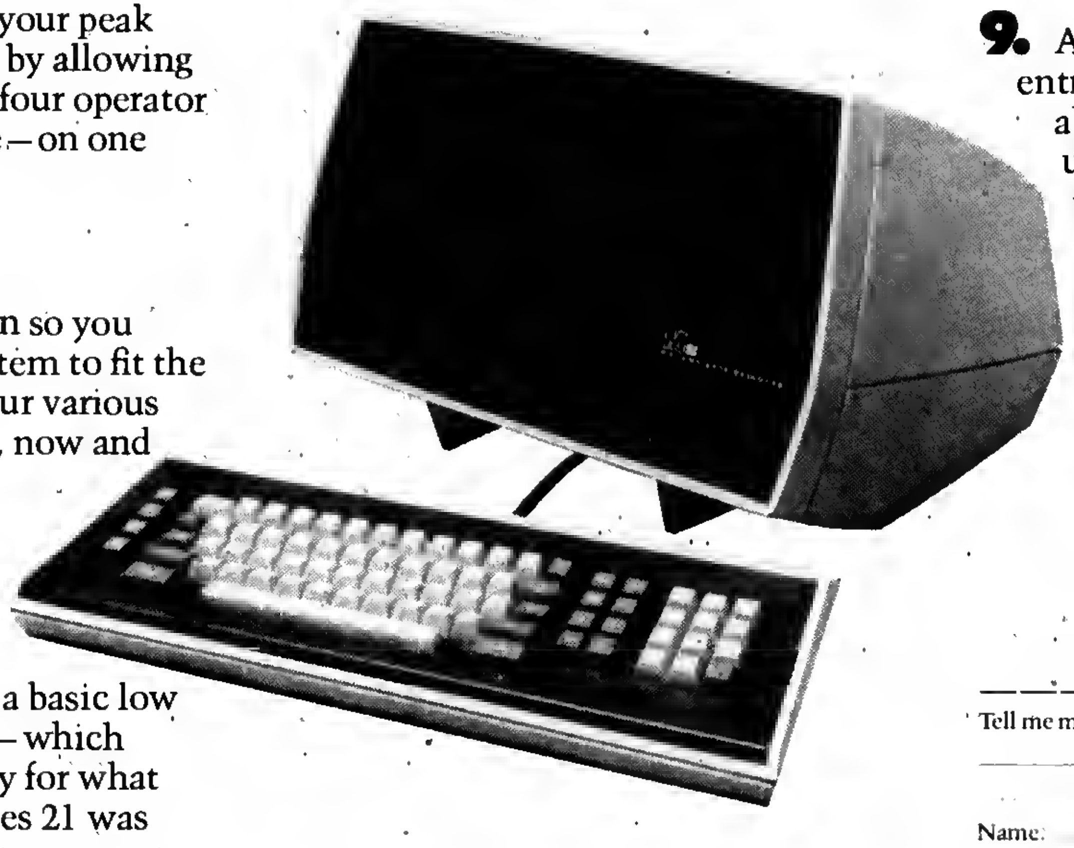
6. A comprehensive line of peripherals, like large capacity disk drives, tape transports and printers, together with powerful systems software enabling high performance transaction processing.

7. Communications in BSC or SDLC, or both.

8. A large 15-inch CRT display in 480 or 1920 characters for easy operator prompting and sight verification of data.

9. A choice of either data entry or typewriter-style movable keyboards so you can use experienced data entry people or those with only clerical experience.

10. Popular flexible diskette recording media using IBM Basic Data Exchange conventions.



You can start with a basic low cost configuration—which means you pay only for what you need now. Series 21 was designed to take into account all your future distributed data processing system requirements by way of its upgradability. A Series 21 system with 4 operator stations costs only $110.50 per month per operator station, including maintenance, on a 3-year lease.

We would like to tell you more about Series 21—and why we say it's absolutely the best distributed data processing system available anywhere.

Series 21—a solution for today—and tomorrow. Call MDS Executive Headquarters at 201-540-9080, or fill out the coupon and find out more.

Tell me more about Series 21. I'm interested in applying it to ______ applications.

Scandinavians Seek Solutions to Dependency

By G. Russell Pipe

Special to CW

COPENHAGEN, Denmark — An association of top-level government and business DP executives here is encouraging public debate and public policy to reduce the impact of computers on employment, privacy, transnational data flow and other legal issues.

At a recent conference of the Nordic Data Union (NDU), Danish Minister of Justice Orla Moller opened a session by saying "The main reason for discussing the risk of computer dependency is the great efficiency of the machines which have major political consequences. It is claimed we are slaves of the technique because of its immense impact."

Some participants responded by stressing that the machine is not so much at fault as the resulting imbalances of power and loss of the ability to bring about social change attributed to DP.

But Moller discounted the threat of computers by noting that "they give politicians a tool for improved decision making." He cautioned, however, that "the more complicated the society, the more restrained the advice from specialists should be and the greater the role of decision makers."

The conference's theme was the increased dependency and vulnerability attributed to computerization in Denmark, Finland, Norway and Sweden. "National vulnerability is something countries must be vitally concerned about," according to Allan Eriksson, director of the Swedish Ministry of Defense's research committee on the subject.

Eriksson outlined three dangers:

- Concentration of computers in a few cities and a handful of major facilities.
- Technological dependence on DP for all forms of administration.
- Foreign data sources and services.

This heavy concentration of computer facilities and services is a product of centralization, particularly by national governments. It is a circular argument, according to one participant: "The concentration of computers requires a very big control system and vice-versa.

"If we could begin computerization today with all the knowledge we now have we could have stopped a number of techno-bureaucratic monsters," according to Jan Freese, director general of the Swedish Data Inspection Board.

"A techno-administrative alliance is believed to be a real threat to many Europeans, according to Paul Sveistrup, a Danish DP consultant and lecturer.

Computing has a bias toward the status quo because of the huge investments involved, it was noted. It was claimed this results in social paralysis, rather than causing needed reforms of government programs and in structures of commercial organizations.

Two Solutions

Two separate but complementary solutions were advanced to alleviate these problems: public discussions and debate on further "automation" of society; and creation of broadly representative data councils to conduct research and make advisory recommendations to governments and private industry.

"A main reason we are in this perplexing situation," Sveistrup believes, "is that the politicians, technicians, administrators and general public are not talking to each other on plans and goals for our societies."

By injecting public discussion and stimulating parliamentary concern, the "unholy alliance" between the technician and bureaucrat may be retarded, if not broken.

The concept of national data advisory councils, even with formal Nordic-level interaction, is not new. In Denmark an Economic Council studies trends and problems and submits suggestions to both government and business.

While no formal decisions were made, the chairman of the last panel, Prof. Knut Selmer of the Oslo University Law School, stated, "We have a much clearer picture of the problems and can go home to fit them into a plan of action."

Dossiers Under Probe

Special to CW

COPENHAGEN, Denmark — The Danish Government in 1969 forbade authorities from maintaining lists of persons because of their political beliefs or activities. It was recently discovered, however, that the editor of a Danish magazine, a right-wing conservative, has been keeping political dossiers on 60,000 persons and supplying their contents to the military security forces.

This practice was known to have been going on at least through 1973 and possibly longer and may involve improper government financial support.

Opposition parties in Parliament have called for a complete investigation of the affair. The Ministry of Justice, responsible for privacy legislation before the parliament, has downplayed any connection between the files and privacy.

Look who's here!

ICL and the System Ten 220

Ask about ICL almost anywhere in the world. You'll learn that we're Europe's largest computer producer, with manufacturing facilities on three continents and customers in 83 countries ranging in size from small businesses to multi-national giants.

Ask about our System Ten.

You'll learn that it's at work on five continents in over 4,000 installations with a proven record of dependability and operational features that out-perform any other mini-computer of comparable configuration.

Now we're introducing the newest generation of this respected series, the System Ten 220 and it's loaded with features you should learn about:

- A processor expandable from 20,000 to 160,000 characters
- A core that can be divided into as many as 20 partitions each running its own program and each able to handle ten I/O devices.
- A range of disc drives providing from 8 million to 160 million characters of on-line storage.

The System Ten 220 is ready for use with an extensive library of real-time packages for applications in Manufacturing, Retail Sales, Distribution and Service operations. Starting price for the basic hardware system is less than $40,000.

If you're a computer professional planning a new system or upgrading a present one, you should learn all about the System Ten 220.

Contact us now for full details on the System and on the $650 million world leader that was first in Virtual Memory, Platter technology, MOS storage and many other computer innovations that may surprise you.

Contact us today. We're here now...to serve you.

Scheduling System Helps Double Court Docket

By Jeffry Beeler
CW Staff

PONTIAC, Mich. — Circuit court judges in Oakland County have nearly doubled the number of civil and criminal cases they try each year as a result of an on-line justice system that both schedules court cases and keeps track of all public records filed in the office of County Clerk Lynn Allen.

Since installing the computerized system, each of the suburban Detroit county's 11 circuit court judges has heard about 2,000 cases per year, compared with an annual average of only about 1,000 cases for their counterparts elsewhere in Michigan.

This jump in courtroom efficiency contrasts sharply with the trend in most of the nation's other courts, where judges have complained about caseloads that in some instances have nearly brought the criminal justice system to a standstill. They see speedier court trials as one way to combat the nation's soaring crime rate.

Built around 1M-byte IBM 370/148, the automated justice system uses a data base in the county clerk's office to schedule court appearances so they will not conflict with lawyer's agendas. In this way, full docket for each circuit judge is assured each day.

"Case backlogs occur when there is not a full docket of cases each day," Fred Mester, court administrator explained. "The best way to keep the docket full is to get trial notices to attorneys before they make other commitments."

To date, the justice system computer, which operates in the county's computer services Division, has inventoried legal papers for about 300,000 circuit court cases, with 5,000 to 7,000 entries added daily.

Besides speeding the flow of courtroom litigation here, the system has minimized personnel expenses in both the court administrator's and the county clerk's offices, Mester said. Since the county installed the system in 1975, neither office has had to increase the size of its clerical and administrative staff.

Anyone interested in an Oakland County court case can use a terminal in the clerk's office to check on it. Here, Deputy County Clerk Richard A. Elliott (behind counter) helps E. Leonard Howarth, a local attorney, retrieve information on a pending case.

The computer also allows the county to notify attorneys up to eight weeks in advance of their scheduled court appearances. Lawyers here previously had only two and a half to three weeks' notice, Mester recalled.

These longer leadtimes have proved an important asset for Oakland County, which competes for each attorney's courtroom services on a first-come-first-served basis with four other nearby counties, he explained.

From Days to Hours

Before the county installed the current system, officials maintained their trial records on cards that had to be retrieved manually when clerks needed important information, like the number of court actions of a given type still pending. With that recordkeeping system, Mester's clerical staff spent the equivalent of three days to a week each year just processing the county's trial notices. Today, the staff does the same job in about three hours.

Last year, the county administrator's office generated about 30,000 trial notices, (excluding adjournment and other types of notices); during recent years, the volume of paperwork has grown steadily as the number of criminal cases climbed from just over 9,000 in 1965 to slightly under 20,000 in 1975.

With the earlier system, the county administrator's office was also unable to perform a number of other important recordkeeping functions like keeping track of the number of cases of each type (mediation, malpractice, etc.) heard by each of the 11 circuit judges.

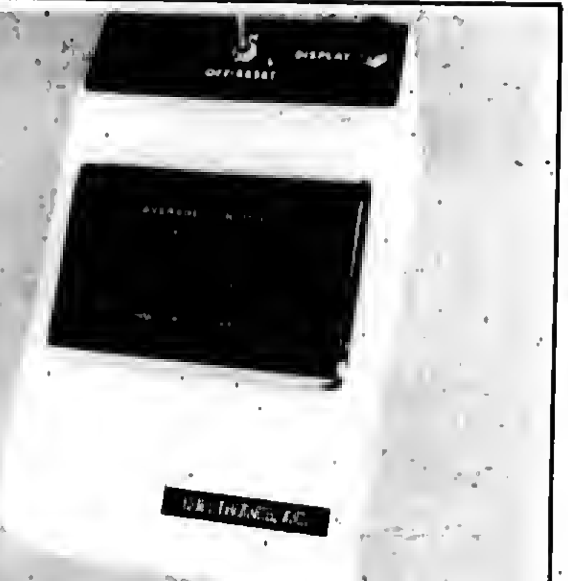
To eliminate these and other shortcomings, Mester and his staff replaced their manual recordkeeping method with the current system, which consists entirely of IBM hardware, including a Model 3286-2 printer, a 3704 communications controller, Model 3330-11 disk drive units and a Model 3277-2 CRT terminals.

Except for the CRT terminals, the system was configured from hardware already installed in the county's Computer Services Division.

The county administrator's office plans eventually to expand this configuration to include a CRT terminal in each courtroom, Mester said. When this proposed expansion takes place, circuit judges will be able to retrieve their caseload schedules from computer memory so they can plan their court appearances in advance and find out which of the county's courtrooms will be available at any given time or date.

Mester also plans to upgrade the system soon to track delinquent child support cases and to supplement the listings catalog in the county administrator's law library with pertinent titles from the Computer Service Division's five institutional libraries.

Terminal response time diagnosis.



If you suspect response time problems, find out for sure. Get the real response time with a TERMINAL RESPONSE TIME MONITOR. This is a hardware monitor that measures the average, minimum, and maximum response time along with the number of transactions. Terminal connection is by optical coupler which eliminates internal probe points. Operation is unattended and automatic. Price: $950.

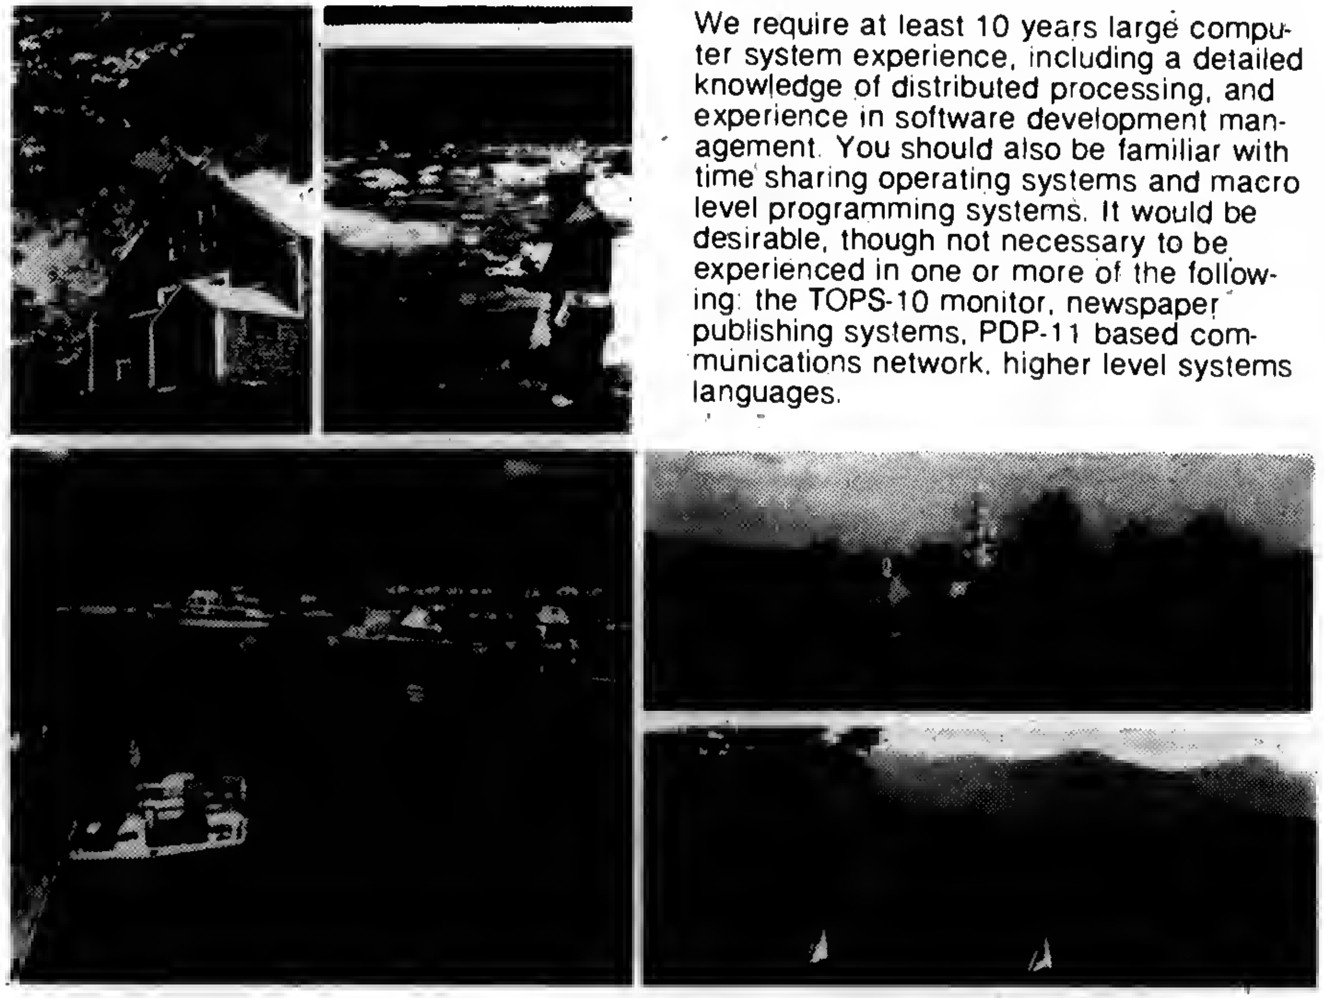
Hendrix/ New Hampshire

The Best of Both Worlds.

HENDRIX's extraordinary growth is a result of an environment that encourages rapid achievement and advancement for talented individuals. In just a few years, we've become a world leader in providing sophisticated text editing systems to newspapers, commercial printers and large offices. Now, the demand for our interactive, minicomputer-based systems is creating additional outstanding opportunities for dedicated and imaginative computer professionals.

And just as you'll get more out of working at HENDRIX, you'll get more out of living in Southern New Hampshire. In our 4-season climate, HENDRIX employees and their families enjoy skiing, boating, swimming, and a wide variety of other recreational activities all year round. And we're just a short drive away from any of the cultural and educational resources of New England.

Come share in the success of our continuing development and the benefits of our ideal location . . . the best of both worlds.



Software Manager

In conjunction with your staff of Senior Programmers, you will be responsible for the overall design specification software development and system integrity of a multi-processing system. This system, which will be installed at a large metropolitan newspaper within the next two years, consists of two dual processor DECsystem-1099 host machines with up to 32 PDP-11 peripheral controllers and over 300 intelligent terminals. Applications will include the automation of the editorial, classified advertising, production operations and support for the overall commercial EDP operations of the newspaper. The complete system must have the capability to be expanded to meet the requirements of the second phase of systems specifications. This expansion is expected to produce the next generation of newspaper publishing systems.

In addition to the direct line management of your immediate staff, you will provide technical leadership and guidance to a large staff of professionals involved in this project.

We require at least 10 years large computer system experience, including a detailed knowledge of distributed processing, and experience in software development management. You should also be familiar with time sharing operating systems and macro level programming systems. It would be desirable, though not necessary to be experienced in one or more of the following: the TOPS-10 monitor, newspaper publishing systems, PDP-11 based communications network, higher level systems languages.

System Programmers

We currently have positions available in several areas for experienced PDP-11 System Programmers. They all require professionals with a detailed knowledge of assembly level software development and familiarity with distributed processor system concepts. Openings exist at all levels of seniority from entry level to and including group leader.

- COMMUNICATIONS
  Involved with high speed parallel communications channel between host 1099 and PDP-11's. You'll need device driver programming experience under the TOPS-10 monitor system and a thorough knowledge of PDP-11 operations.
- APPLICATIONS
  You'll design and implement publishing system software. Knowledge of computerized newspaper applications and/or text processing desired.
- DATA BASE
  We're looking for key specialists to be responsible for the design and implementation of a large editorial data base using complex queue and access mechanisms. Base must be designed with minimum access time as the top priority goal with complete redundancy as a given requirement.
- SYSTEM INTEGRITY
  This position has responsibility for the analysis of a large multi-processor publishing system plus the development of guidelines and operating procedures to insure 100% data base integrity, in case of any two-processor failure. You'll also develop system test and acceptance programs for the final testing of systems integrity.
- MICROPROCESSOR
  You will create real-time development/research systems or develop applications programs for custom communications packages based around an 8080 microprocessor.

We offer comprehensive benefits and outstanding salaries.

Please forward your resume outlining salary history to J. Paul Costello,
Hendrix, Personnel Department,
645 Harvey Road, Manchester,
New Hampshire 03103.

an equal opportunity employer

System Analyzes Students' Journalistic Skills

By Denise Petski
CW Staff

MADISON, Wis. — Students at the University of Wisconsin-Madison School of Journalism here not only have to withstand the criticisms of their editors and professors but must also be subject to the analysis of a computer.

Prof. Kenneth D. Nordin used the computer in a news writing course at UW-Madison for the first time last fall, and it is still in the experimental stage.

The "Newswriting Analysis Program," which was developed at the University of Michigan by Prof. Robert L. Bishop, contains information on about two dozen "newsworthy" events and supplies a set of raw facts from which students can work. After a student writes a story, it is fed to the computer, which then sends back a list of critical comments.

Run on the university's Univac 1110, the program can spot repetitive sentence structure, overuse of adverbs and passive verbs, certain "planted" errors, inadequate use of quotes, libelous statements, good first paragraphs, overblown words and missed details. The computer provides appropriate feedback such as "good" or "Did you forget . . . "

Student reaction has been "at least cooperative and generally positive," Nordin said. The students seem to be intrigued that a computer can analyze their work. At present, 16 students can take part in the program at the same time, but the ultimate goal is to involve a much larger number.

While Bishop designed the program as a self-taught primer in basic news writing, Nordin sees the need for an instructor to look for things the computer doesn't see: the flow of words, transition of ideas and unity of thought within paragraphs. "Those kinds of things the program just can't pick up," Nordin explained.

Nordin believes, however, that there are objective and teachable standards for journalistic writing, and the computer helps make the point. "It's a very efficient way to make students aware of some of the basic elements of news writing."

Egg Farm's System Keeps Profits and Standards High

FOREST CITY, Fla. — In this small agricultural community just north of Orlando, the classic chicken or egg dilemma has received a new twist. It all started with the introduction of computer technology to the egg production industry.

Musselwhite Farms is one of the area's largest egg producers. According to the firm's controller, Don Bridge, the company has as many as one million chickens housed at 26 local contract farms in the area.

Each week Musselwhite receives and grades 300,000 dozen eggs. Data gathered from this "grade out" process is entered into an NCR 8200 computer through CRT terminals for processing via the egg settlement system. The system records egg production and runs comparisons using weekly standards, by strain of chicken, for jumbo, extra-large, large, medium, small and peewee eggs within Grade A.

Grade B, crax or odd-shaped eggs, stains, losses, pick-outs and "bloods" make up additional grading categories. The system also compares weight and mortality standards with actual results.

Once the data is entered into the computerized egg settlement system, the computer analyzes the information. Using the output, Musselwhite is able to compensate the farms and provides the farmers with vital production statistics.

Production information is critical to the profitable management of the farms — each of which specializes in a particular breed. Production data from the computer is compared to standards provided by the breeder, and problems which cause production drops are spotted immediately.

The egg settlement system was designed by American Software and Computer Services, Inc., a Tampa-based computer service firm. According to Larry Hires, systems engineer on the project, plans are now being developed for visual graphs of the production statistics. One graph per farm per week will be produced so that a picture of actual production versus the strain's standard will make for instant reference without the use of tables of numbers.

MODEM USERS:

PUT A COMPUTER IN PLACE OF YOUR MODEMS, THEN WATCH WHAT HAPPENS.

The MP-48 is the industry's first computer made into a modem. What's so good about that. Plenty.

Other modems control circuit paths under rigid hardwired tolerances. The MP-48 emulates them in a constantly adjusting mode that comes close to a line's actual theoretical performance. The result: nearly total elimination of ambient errors.

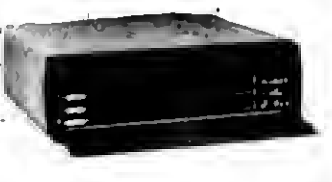
The MP-48's computer is program-controlled. That means its filters and digital equalizers "learn fast" in adapting to line conditions. The result: a 35 millisecond train time for multi-drop networks.

The MP-48's computer is powerful. It allows you to run four-wire full-duplex multi-drop, two-wire half-duplex multi-drop or point-to-point networks — with a two-wire dial-up capability — using the same modem. At 4800 bps. The results: more drops per line and more freedom to alter networks.

Tell me more about the MP-48.
☐ I have an immediate need for 4800 bps modems.
☐ I have a longer-term need, and would like to speak with a salesman.
☐ Please send me literature.

Name
Title
Company
Street
City State Zip
Telephone

The MP-48 is reliable. Ultra-reliable. Its computer's LSI chips are perfectly repeatable in manufacture and performance. Its all-digital circuitry permits operation on unconditioned 3002 lines and general switched networks. An MTBF of 20, 000 hours is unmatched in the industry.



The MP-48's computer is adaptable. Its read-only memory can be field-altered to meet most geographic or international standards. It has alternate voice capability option, and two-call manual dial back-up option. The result: it becomes what you need right where you need it — on-site.

The MP-48's computer is inexpensive. The result: you can buy an MP-48 for under $3,000, lease one for less than $75, and get delivery in about 30 days.

The MP-48 from Paradyne. The next generation of modems has begun.

THE MP-48 LETS YOU DO IT RIGHT NOW.

Chase Vice-President Explains

Giros Help Consumers Keep Payment Control

By Toni Wiseman
CW Staff

NEW YORK — The concept of Giro payment services is widespread in Europe, but it is little understood and less implemented in the U.S.

There are various ways in which Giro payment alternatives interface with the electronic payment infrastructure — standing orders. Telephone instructions, authorized bills and automated teller machines (ATM); each offers certain benefits, according to George C. White Jr., vice-president of The Chase Manhattan Bank N.A. headquartered here.

For the consumers, perhaps the main advantage of using Giros is that he can control the timing and amount of his payments: with preauthorized payments, he loses such control.

"A Giro system is basically a payment system which allows a consumer to pay bills by instructing his own bank to transfer funds to the account of his creditor, in whatever bank it exists," White explained.

"As opposed to the debit flow of funds associated with normal bill paying with checks or preauthorized payments through automated clearing houses, Giro systems involve a credit flow of funds. As a result, one clear advantage of Giro payments is that returns for reason of insufficient funds are eliminated," he said.

Payments Simplified

The present check-processing system entails the clerical effort of check writing, difficulty in using funds as effectively as possible because of the variations in mail delivery and the cost involved in mailing and processing the check — a possible total of up to 28 cents per check.

A Giro system would simplify payments by combining bills or initiation of payments, ensuring complete control of date of payment for efficient use of funds and by providing a record of the organizations paid, eliminating reconciliation of paid checks, White said.

Giros would benefit corporations by making funds available on the day designated by the consumer; they would be relieved of the chore of depositing individual checks, he said. It would also simplify accounts receivable updating because payment data is submitted in machine-processable form, such as magnetic tape, White pointed out.

Four Methods

White outlined the four ways in which consumers can use Giros:

- Standing orders. A consumer can have his bank automatically generate constant-amount, periodic payments, for such things as rent, installment loans or utility budget payments. The bank is told the necessary information at the inception of the arrangement, stores it and includes it with the generated credit payments.
- Telephone instructions. A bank can be given instructions by phone to pay specific bills. This can be done either by conversation with bank employees or by direct connection to a computer via Touch-Tone telephones.
- Authorized bills. A customer can sign and physically deliver (via mail or in person) bills to be paid. This can be economically attractive if companies use some standard data line for the optical scanning capture of the data on the billhead.
- Automated teller machines. Consumers can instruct their banks to pay specific bills by use of an ATM transaction, using a debit or other plastic card. Banks would prestore company information because it would not be practical to have it entered each time at the ATM by the consumer.

Workshops on Privacy Scheduled for Phoenix

PHOENIX — A series of three-day workshops here this fall on security and privacy will discuss the recently published reports from the Federal Privacy Protection Study Commission.

The workshops, sponsored by Honeywell Information Systems, Inc., will be held Sept. 27-29, Oct. 12-14, Nov. 15-17 and Dec. 6-8.

A special discussion in each workshop will cover the impact of some of the commission's conclusions.

The preregistration fee of $425 includes workbooks and related study material.

Further information is available from Jerome Lobel at HIS, P.O. Box 6000, MS-K99, Phoenix, Ariz. 85005.

Editorial

Alternatives Growing

The ongoing series of articles in *Computerworld* on the results of a survey of large IBM users proves one point conclusively: The alternatives facing computer users are growing every day.

In the past, an organization usually stuck with equipment from the manufacturer of the first system it installed, upgrading within that manufacturer's line. It was rare for a user to switch from IBM to any of the other manufacturers or vice versa.

The investment in programming, training and support was just too great an obstacle. The cost of conversion from one system to another severely limited a user's options.

But all that has changed, thanks to two developments: alternative mainframes and distributed processing.

Most large users in the survey — which was admittedly a limited sample, with 20 users contacted — have at least considered alternative mainframes for their present IBM installations and a majority were at least considering distributed processing alternatives [CW, Sept. 19].

But while all that is encouraging, there was also some not-so-good news.

For example, almost 30% of the people who had considered the alternative mainframes did not take the extra step of actually evaluating those offerings. Furthermore, there was a great deal of confusion over what was meant by distributed processing.

It is discouraging that a relatively high percentage did not actually evaluate alternative equipment, because it should be the responsibility of all DP shops to look carefully at any method of possibly reducing costs.

In most organizations, DP is an overhead item and DP operations are often criticized for their high costs. Without careful evaluations of ways to save money, DPers leave themselves open to the charge that they do not care about the profitability of the coporation they serve.

This is not to say that alternative mainframes will be right or cost-effective for everyone — clearly they will not be. However, without a real evaluation of those alternatives DPers will not know whether they will fit into their particular organization.

The confusion over distributed processing is also disturbing. If DPers are confused about the meaning of the terms they use, then upper management must be even more confused as it hears the terms bandied about. DPers have a responsibility to communicate with top management and they probably should do it in a jargonless form if they want to be understood.

Users — particular IBM users — are going to have even more alternatives from which to choose in the future and this is going to place a great deal of responsibility on the DP manager.

No longer will DPers be able to comfortably stick with one supplier, slowly wending their way up the upgrade path. They will have to perform more in-depth evaluations of the alternatives available.

This may make DP manager's job more difficult, but the opportunities for true cost savings will make the effort worthwhile.

Data Past

Five Years Ago
Sept. 27, 1972

WALTHAM, Mass. — Honeywell Information Systems introduced two computers in its Series 2000 family and announced major enhancements including communication facilities for its small Model 58 computer system. The 2040A and 2050A systems could be upgraded at the customer's site by adding power modules and memory units.

— — —

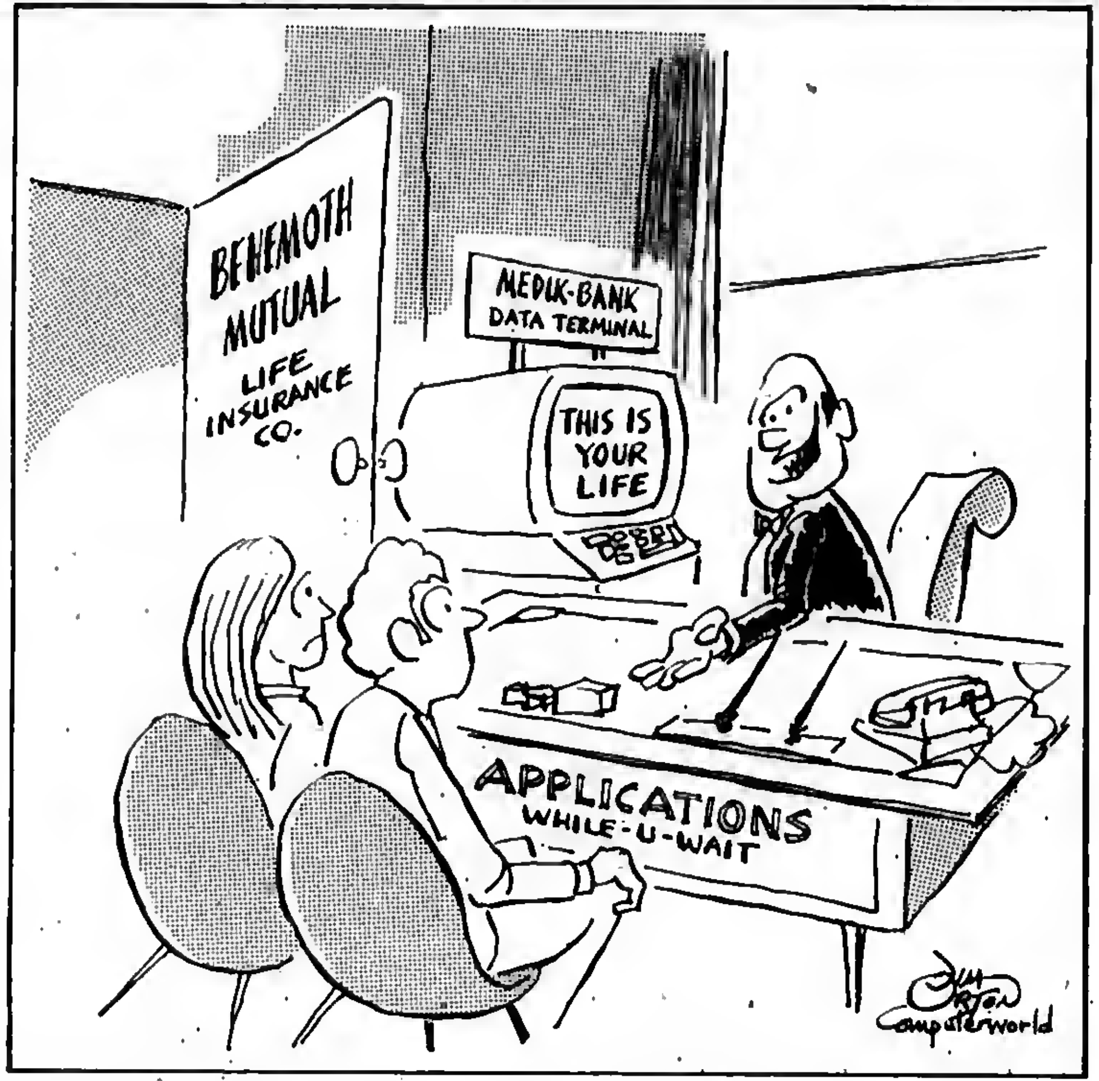
EL SEGUNDO, Calif. — Xerox announced two enhancements for users of its XDS virtual memory system. Real core memory support was increased from 512K to 2M bytes for the Sigma 9. A disk-only system was provided to replace the rapid-access device system for residency and swapping previously required by the Sigma 6 and Sigma 9.

Eight Years Ago
Oct. 1, 1969

WASHINGTON, D.C. — A national microwave comunications network in direct competition with the Bell System was planned by Microwave Communications, Inc. When conceived, the network would mark the first time common carrier facilities were available from nontelephone sources on a nationwide basis.

— — —

GRAND RAPIDS, Mich. — The IBM System/3 faced its first rival with a small system introduced by Cascade Data Systems. The 88/30 offered reader speeds similar to the faster reader on the IBM system and added four cartridge tapes. The system sold for "under $30,000" or rented for about $875/mo compared with the approximate figure of $1,000/mo IBM charged for its System/3 with comparable reader speed.



'Well, Put It This Way, Folks — If There Is Anything Sacred Anymore, We're Not Aware of It . . .'

Letters to the Editor

RCA Offered 360 Mode

Allow me to calm the astounded Seymour J. Metz ["Spectra Not IBM Compatible," CW, Sept. 12].

Metz is correct in stating that RCA's Spectra and 2,3,6 and 7 compared to IBM 360s have significant architectural differences. However, he does not seem aware that in 1970 RCA offered to the commercial market a fully supported software package called "380 Mode of Operation."

This site-tailored program resided in the Spectra system's high memory and simulated IBM 360 IPL and privileged instruction execution. 360 Mode translated 360 channel programs to Spectra, executed those channel programs and translated interrupts to 360.

Model 360 disk packs, tape volumes and unit-record files resided on RCA equivalent devices, without change. 360 Mode supported IBM 360 DOS, OS and standalone utilities and, believe it or not, is still in production at several installations.

After RCA's demise, Univac continued to sell and support RCA's 360 Mode, now offering similar 360 and 370 modes of operation on Univac 90/60, 90/70 and 90/80 systems.

Amdahl might take note that, in part, because of IBM's ability to quickly cause any given alternative system to become obsolete, RCA's and Univac's intentions seem to be to provide a smooth means of conversion to the vendor's "native mode."

Jerry B. Nesmith
Atlanta, Ga.

Standards of Good Practice

As vice-president of the Society of Certified Data Processors (SCDP), I couldn't agree more with Alan Taylor's column of Sept. 5.

The SCDP, as a charter member of the Institute for Certification of Computer Professionals (ICCP), looks to the institute to define standards of good practice and good conduct. The institute has designated Oliver Smoot as chairman of this standards committee.

Naturally, he can't complete his task for the ICCP alone. Even though it requires the ICCP's neutrality, he will need to rely on coordination with the American National Standards Institute (Ansi), the American Federation of Information Processing Societies (Afips) and constituent groups.

We're all in this together and working together is the best part.

J.J. Martin
Memphis, Tenn.

South African Figures Wrong

The Aug. 22 issue contained an article on the South African computer market ["South African Users Tighten Belts"] in which you stated that IBM possesses approximately 50% of the market with ICL second, holding 25%.

This is totally inaccurate and the exact figures are broken down as follows:

Firm	Systems Installed/ On Order	Share Of Sales (%)
ICL	395	33
IBM	340	34
Burroughs	127	14
NCR	101	4
CDC	12	7
Univac	39	8

From the above, it can be seen that ICL is the leader in the number of systems with IBM very marginally ahead on sales value.

Success Story Nominations Come Rolling In

By Jack Stone
Special to CW

There you go again! When the issue gets deeply personal, the exquisite communications capability that lies dormant in so many DPers comes roaring forth. In this case, I refer to the quality of nominations I have received in response to my search for the DP Success Story of the Year [CW, Aug. 22].

In this column, I want to provide a progress report on my quest, a change in ground rules and some guidelines for "success" as a remote computing service bureau — as originally developed by the Marquis de Sade.

First, good looking nominations have been received from: Pepperdine University, Malibu, Calif. Montgomery County Government (Md.); Garst & Thoman Hybrid Corn Co., Coon Rapids, Iowa; Catholic University (D.C.); Unisystems, Inc., Dallas; BancOhio Corp., Columbus, Ohio; and du Pont, Inc., Wilmington, Del.

Second, I received a bunch of indirect nominations from the Univac News Service and another one for the Mead Corp. Data Center in Dayton, Ohio. Sorry, nominators, but the rule is that the installation itself must come forth with the letter of justification.

Third, having been soundly chided by several readers for limiting the search to only 93% of the population by excluding scientific-oriented installations, I have lifted all restrictions on applications orientation. However, I will install a uniform questionnaire to be answered by all nominees requesting, among other things, that they define the success criteria they used and the measurements employed.

Remember, to nominate your installation (IBM 370/145-class machine or larger) as the DP Success Story, send a letter of justification to me, keeping its length to under 500 words. Include an OK to use your and your firm's names plus an invitation to me from a person in authority so I can interview members of the staff for subsequent writings (travel at my own expense). Each nomination will be acknowledged with a complete set of my CW articles. Also, I'll drag in some big guns to discuss the nominations before the final selection.

Of course, lurking in the background during this frenzied search is the as yet unanswered question : Will Stone's Theorem on DP success — that humanistic goals must be met before technical/business goals will be achieved — be validated or rent asunder? Well, if Al Muehlberger's letter is any guide, I'm on the right track. Let me quote the two introductory paragraphs from his nomination letter for Montgomery County government, where he is the director of management information services:

Letters to Stone should be addressed to him at Suite 222, 2233 Wisconsin Ave. N.W., Washington, D.C. 20007.

"My orientation to my job is nontechnical. I advertised myself to my current bosses three years ago as being a people-oriented manager and not a bit-chaser. My personal interests lie in the more sociological-type things — the effects of which I try to bring to the job.

"I contend, as I think you are saying, that the successes we are looking for in the field are only going to come about when we seek them in human terms and take into consideration the total human atmosphere in which they are to be pursued and made useful. In that pursuit, we have to understand human behavior.

The Human Connection

"I don't think anyone is confident enough to come right out and say 'Look at us — because we're a success.' There is too much insecurity in all of us to take such a risk. We all have successes and failures. Human nature being what it is, we are all afraid to brag too loud because we each live in some kind of glass house and could be made fools of too easily. When there is some confidence and some success, we should feel safe to proclaim it accordingly — but be ready enough to deal confidently with the failures. We think our department is like that . . . "

Now for the piece de resistance! Consistent with the "success" theme, I just had to present you with some basic guidelines on how to operate a "successful" OS/TSO/370 service bureau, based upon a recent particularly agonizing experience of mine:

1. *Be sure to include in the user's manual intricate detail on key terminal commands that are not supported.* This strategy encourages the sophisticated terminal user to (a) go out of his everlovin' mind trying to untangle the garbaged output before he gives up in total disgust, then (b) call the so-called "user support" group for assistance so that he may receive the comic book response, "You know, we really ought to clean up that manual."

2. *As a full service corollary to Guideline 1, make certain that other key commands that are not supported are specified in the HELP data set.* This tactic is insidious, to say the least, because the user will figure that HELP is right where the manual is wrong. A particularly diabolical twist is to include in HELP an *unsupported* foreground Cobol compile command.

3. *Emphasize in your marketing programs a very wonderful time-sharing capability and then permit only background compiles.* You can add some high-powered fuel to the hot temper of the users by providing a whiz-bang 25-minute background Cobol compile.

4. *Keep user account codes in the underground vault, absolutely inaccessible by the user support group.* This policy will guarantee that the user shall not operate during off hours should the poor slob forget the code.

I'm sure that if you follow these simple rules, adapting them to your particular environment, you will be successful, at least according to one installation's warped sense of performance.

Voyager II System Has Proven Its Value

The Taylor Report

By
Alan Taylor
CDP

"The computers have done everything we asked them to do, and Voyager II is going fine," was how Tom Draper of Caltech-managed JPL put it. He was echoed by National Aeronautics and Space Administration (Nasa) program manager Rodney Mills: "There has been a lot too much negative publicity about the computers and Voyager. They and the spacecraft are doing perfectly, and we have proved their value in space much more thoroughly than we ever expected." What, then, was the cause of the widespread publicity about a "mutinous" computer?

First of all, despite the claims that the computer worked perfectly at all times, there was a distinct computer problem that was really hardware-related. The memory was simply too small, so JPL used one register to store two functions. Owing to a previously known problem in the JPL designed Honeywell-produced Canopus star tracker, the functions interfered with each other, causing chaos.

This, however, did not occur until some time after the Voyager computers were first thought to be on the blink. The idea that the computers were doing something wrong arose almost immediately after the release of the spacecraft from the Titan rocket, when the Attitude computer suddenly switched from the primary control system to a standby one.

The switch was interpreted as suggesting that the Control computer had found something wrong in the Attitude computer. In fact, the Attitude computer was fine and remained so except for an initialization bug in the switch program.

Programming Bug

This particular programming bug occurred when the initialization routine for the standby computer simply duplicated the initialization routine of the primary Attitude computer — and forgot to pick up the latter's readings as to the current attitude of the spacecraft. Naturally, this caused some chaos later when they had to go through an unexpected series of 360-degree and 42-degree search maneuvers to find the sun. But the program to correct this error was right on the spacecraft, and it worked.

And there was a later programming bug involved in the resetting of a parameter at the end of a search cycle when the star Canopus is lost. The Canopus star tracker is really not a star tracker at all, it is JPL-designed bright spot tracker, which has earned its grandiose name from usable, although not perfect, performance on earlier space flights.

Bumps in the Night

The trouble is that the tracker cannot tell the difference between a dust particle passing over the sensor and the star Canopus (or any other star for that matter). It selects and tries to follow the brightest image around. That, fairly commonly, is a particle from the spacecraft itself.

When a group of particles passed over the sensor during the search sequence (i.e., after lock-on has been lost for some reason — probably another space-craft particle), the routine was set to increment the parameter by 0.04 each time a new particle was found. But at the end of the cycle, they reset by decrementing only once — which naturally did not work unless there was only one "bump" around. In fact, there were many. Now, this too has been fixed.

However, while a too-small computer memory and two fixable program bugs did occur, their importance was dwarfed by the noncomputer errors that were involved in the launch. If it had not been for the recovery power of the computers, the noncomputer errors could easily have ruined part of the mission if not all of it.

I don't think I have found all of the errors yet, but here are a few:

- Overloaded Gyros — The gyros were knowingly overloaded in the boost phase and naturally did not keep in perfect synchronization with each other. They even hit other parts of the craft during boost maneuvers. Again, this was done knowingly and caused no harm.

What did cause problems, however, was when the computer was not told of any overloads and was instructed to report whenever sets of readings from different gyros did not fall within reasonability limits set for cruise, not boost, conditions.

- Slow Valve Check — The thrust motors were turned off after the spacecraft was on its own so that a number of valves could be checked to see that they were not stuck and were in the right position. A check takes only a few milliseconds, but

Systems on Voyager Should Get Credit

(Continued from Page 19)

only one valve was checked per second and for up to a minute all thrust motors were inhibited.

No one told the computers that the thrust motors were being inhibited or that normal reasonability checks were not in force. They therefore switched from one set of valves to another and from one set of electronics to another to try to keep the spacecraft on course.

The system suspected itself, and that is what caused the computer switch to the standby systems and started the rumors of the computer failue.

- Unchecked Frequency — The communications frequency of the spacecraft was sent to the tracking stations after Kennedy Space Center released control to JPL without being checked after a manual transcription had occurred. As a result, communications in real time were lost for about 20 minutes — just after the switching of the Attitude computer.
- Wrong Firing Calculations — The rate of jet firings during pitch maneuvers was incorrectly calculated as being well below 750 firings every five minutes. In fact, it was consistently above this and every time it went above, flags were set that prevented any sensitive-flagged sequence from taking place.

One such was the second attempt to lock the science-boom in place. This was properly aborted, giving rise to the "mutiny in space" idea.

The upshot of the matter is that the public is under the wrong impression. The insiders who know what was involved in the multiple-particle problem and the "mutiny in space" ideas are resentful of the press reports, thinking that writers jumped to conclusions, as one JPL spokesman told me they had.

In fact, the computers, while perhaps too small, may well have saved the Voyager II's mission. This is something that deserves public acknowledgement.

How about it, Caltech? JPL? Nasa?

QUICK DELIVERY

More Mini At Lower Cost Than DEC And Data General.

Interdata is ready to deliver and install a complete 16 or 32-bit minicomputer system with a totally integrated hardware-software package and a full complement of peripherals. Now, just plug it in and you're ready to run.

Field-proven workhorse. For just $33,500 you can get Pack/16, our powerful 6/16 CPU with Interdata's versatile multitasking operating system and extended FORTRAN, and Interdata's powerful library of utilities.

You also receive a 10 MB disk, 400 CPM card reader, 200 LPM line printer, and a Carousel 30 teleprinter terminal.

Big computer at a small price. Need the extended addressing features and powerful instruction set of 32-bit architecture? Order our Pack/32. For only $43,500, you get a 7/32 processor plus all of the peripherals and software mentioned above.

Send me 1977 specs on Pack/16 and Pack/32.

CCP a 'Cliquish Vanity' Emphasizing Education In Place of Real Ability

Reader Commentary

By Jeff D. Murphy
Special to CW

It is time to speak out. The world of the programmer is crumbling before our eyes, but we do not see it.

I refer to the destruction which awaits us at the hands of one-half of one percent of our own members. Specifically, I refer to the Certificate in Data Processing (CDP) and the Certificate in Computer Programming (CCP).

Computerworld tells us there are approximately 10,000 holders of either a CDP or CCP. The U.S. Department of Labor estimates the total number of programmers at 200,000 and growing.

Nearly every issue of *Computerworld* has someone pushing for the acceptance of the CCP as the standard, the proper measure of a programmer's worth. On the face of it, this sounds like a great idea — an educational value worthy of pursuit.

So worthy, in fact, that I wrote to the Institute for Certification of Computer Professionals for a copy of its most recent announcement and study guide.

But there are things not mentioned by the supporters of the CCP.

The first problem with the CCP test is the $75 testing fee. Why on earth is the cost so high? I am not receiving anything for my money but the opportunity to take a test — and, perhaps, if I pass, a certificate which presumably would be my passport to better jobs.

Second is the areas covered by the test. Most programmers are business programmers. I challenge the Data Processing Management Association to produce an advocate that can demonstrate that knowing Boolean alegebra or tree and plexus data structures will make an individual a better business programmer.

Crucial Knowledge?

And how many DP managers consider it important that their programmers are conversant with, as the study guide suggests:

D. Professional Ethics and Legal Considerations
  1. Privacy.
  2. Security.
  3. Patents, copyrights, trade secrets.
  4. Personnel practices.
  5. Contracts (e.g. commercial, employment).
  6. Human impact of computers.

The point is that there are areas in the test which have nothing to do with testing the effectiveness of an individual's programming ability.

Third is the choice of terms used by the study guide writers. I think I understand subroutines. But to pass the test I am to be familiar with;

B. Program Structures
  •
  •
  •
  4. Subprograms
    a. Calling routines
    b. Common area
    c. Reentrant
    d. Local/global variable
    e. Open and closed
    f. Parameter message.

Tell me: How many of you reading this have any idea what a "local/global variable" is? Or what "snapshots" refers to in debugging a program? The study guide has such terminology in abundance. (Perhaps that is because the industry has such terminology in abundance.)

The fourth problem deals with the approach to storage media, where the programmer should know:

1. Physical characteristics of primary and secondary storage (e.g. track, sector, read-write heads, volume, speed, access time, etc.).
2. Selection considerations.

Now, I know what tracks and sectors are. But on which machine? Am I expected to know their use on an IBM 370/158, an NCR 8250 or an Imsai 8080?

The peripherals are all different for these machines, and the access methods are different. If I am only to understand the terms, then why don't we classify them under a more cogent label, such as "Terms to Know"?

Safely Disturbed

All right, so I'm begining to reach a little. There is a great deal of information outlined in the study guide which *should* be required knowledge for programmers.

(Incidently, if you are beginning to wonder why I keep harping on the point that it is programmers who are being tested, rather than systems analysts or management, the name of the certificate is Certificate in Computer Programming. And it will be programmers who will be required to have it if it is ever adopted as an industry standard.)

And one can argue that we need to encourage educational facilities to systemize their instruction along these lines. I am referring to the information under "II. Principles and Techniques of Programming," which is very well thought in general.

To force the adoption of the CCP as a standard for data processors, however, is to disturb the safety of 95.5% of the DP world by substituting educational attainment for demonstrable ability.

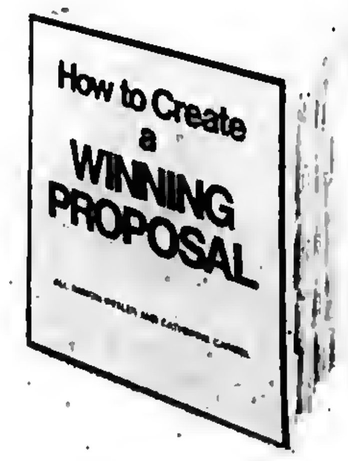
So why don't we let the CCP remain what it is — a cliquish vanity that suggests elitism to the unitiated and makes money for its creators.

Murphy is marketing monoger for CMI Systems, Inc., o softwore firm in Renton, Wosh.

How to Create a WINNING PROPOSAL

. . . a step-by-step guide to proposal preparation

- U.S. Government and Military proposals
- Commercial and OEM proposals
- R & D proposals
- Civil Project proposals



"The best book on proposals ever written"

250 PAGES—FULLY TABULATED

How to craata a WINNING PROPOSAL is a proposal methods and procadures workbook. It covers the entire proposal process from start to finish—giving detailad instructions on contents, structure and methods of praparation for both solicited and unsolicited proposals. "WINNING PROPOSAL" is so effectiva it is used by NASA, GSA, DOD, ERDA, HUD, HEW and other govarnment agencies as an aid in proposal evaluation. It provides step-by-step instructions on:

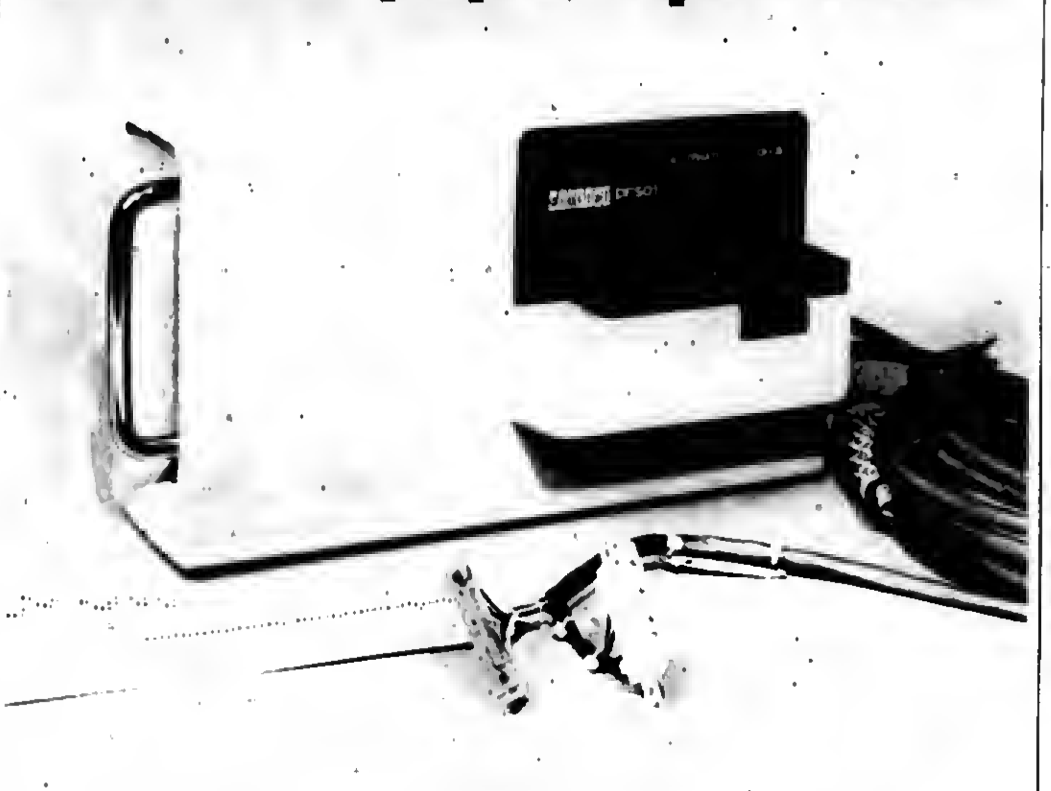
- **How to organiza** the proposal contents—what goes where in the management, tachnical and cost sections
- **How to develop** an effective "win stratagy," mobilize the proposal team and control the input of various team members
- **How to analyza** and respond to RFP's, RFQ's and IFB's
- **How to cost-out** engineering, research, manufacturing and production projects
- **How to davelop** (and use) task descriptions, manpower estimates and a work breakdown analysis
- **How to write** a winning technical section, a winning management section and a winning cost saction
- **How to plan,** schedule and manage the entire proposal affort . . . *successfully!*

Government requirements are covered in an overview of the U.S. procurement network, how it works, and how you can increasa your "win probability" in competing for prime and subcontracts. "WINNING PROPOSAL" also contains a list of both government and commercial information sources to assist you in your pre-proposal rasearch efforts.

Copies are available from Mercury Communications, Inc. $65.00 (pre-paid) includes 3-5 day delivery inside tha U.S. In Calif. add $3.90 tax. For outside U.S. $76.00 (Int'l Monay Order) includes air delivery. For multiple copy discount information; call 408/425-8444.

Mercury Communications, Inc.
730-S Mission St.
Santa Cruz, CA 95060

Now from Digital– a low-cost paper tape reader.



The PRSO1, Digital's new low-cost, portable paper tape reader for high performance terminals.

Now you can easily load your programs, bootstraps and diagnostics into any make or model of computer or terminal you currently own through an approved 20 mA interface. Available in 300 baud and 2400 baud versions, the small (12" x 8") and light (3kg) (6.5 lbs.) self-contained unit can go just about anywhere you need an input device. All for a mere $750.

For complete information on the PRSO1, call your nearest Digital office; or write Digital Equipment Corporation, Traditional Products, 125 Northeastern Boulevard, Nashua, N.H. 03060.

Reader Commentary

In Turning Esoteric to Understandable

Technical Writers Really Communicators

By Glenna James
Special to CW

"Low priority." "Hateful work." "What documentation?" Those might be some answers to a query on documentation in a typical DP environment.

Maybe DP needs more writers and maybe writers need to know more of what DP documentation expects.

As a novice tech writer just wrote in a letter asking for my help, "It seems to be an extremely esoteric subject." Yes, Virginia, so it seems. We confront fragmented and varied recommendations (volumes and volumes of it) when we study writing about systems today.

Programmer/analysts don't like to write narrative materials, standard formats never seem to fit and the job is tossed off to a writer who is bewildered because there is no one firm rule which fits all technical documentation tasks. Rarely is it done throughout an organization according to a precision standard procedure. Why?

Enter the human element. The documentation writer must translate or interpret before writing, therefore acting first and foremost as a communicator and grasping messages from the designer, the end user, the DP manager, the programmer/analyst and the operations personnel, not to mention the software and hardware manufacturers.

The writer must then translate and mesh all of these messages into documents to serve various levels of management and various levels of users. The technical writer, then, is translating probably five or six "languages" when these levels of human communications are considered.

Since the end product must address specific audiences, the writer must consider both source and interpretation to produce a meaningful, useful document. And added to that?

Enter style. Style, in technical writing, does not correlate to style as we think of it in creative or journalistic writing.

The most important element within a style as it pertains to technical writing is *clarity*. Keep it simple, concrete and, if procedural, active.

There is no such thing as one technical writing style. If we must decide on one, let it be elliptical — marked by extreme economy of writing. Procedures will be understood if they are brief, do not require interpretation and are easy on the eye. (Manual readers like a lot of white space.)

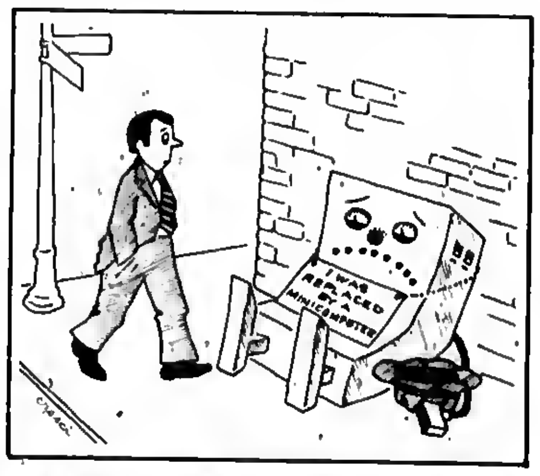
This is not to say that the documentation should be incomplete. Say it all, but in the least number of words and use simple words that are clearly understood.

Format? Use columns, blocks, matrices, bubble charts, flow charts, playscript, decision tables, narratives, graphics, outline and/or headline formats, Virginia, *if* they get your message across. Just as no one standard fits all documentation, one manual may use to advantage more than one format.

Last but not least, dear Virginia, learn to interpret all the mysterious terminology thrown around by this computer generation and translate it if your audience requires doing so. If you are writing for programmers, use their language.

But remember, the user is not a programmer. When in doubt, spell it out. Index the simplest of the acronyms in the back of the manual you write.

Technical writers still abound; they're just called communicators.



I WAS REPLACED BY A MINICOMPUTER

In the last 50 head to head competitions between DATACOM/DB and the 5 other leading DBMS vendors...

DATACOM/DB was bought 34 times... the clear choice by over a 2 to 1 margin!

Here's why DATACOM delivers more for your money: Easiest-to-use in design, implementation and maintenance of application systems □ Best on-line performance for inquiry and/or update transactions under DATACOM/DC (our superior telecommunications monitor), CICS or other monitors □ Unequalled sequential processing capabilities □ Minimum use of 360/370 hardware resources including CPU cycles, memory, I/O events and DASD space □ Exceptionally readable and usable documentation □ Continual, innovative, cost-effective enhancements. Call or write today. Let DATACOM prove why it's the "2 to 1 choice" among professionals.

You'll never be less than "State of the Art" with DATACOM.

I want you to prove OATACOM/OB "2 to 1" superiority on 360/370 systems

Study Planned On DBMS

NEW YORK — The American Institute of CPAs, along with the Canadian Institute of Chartered Accountants and the Institute of Internal Auditors, have launched a joint project to conduct research on the audit impact of data base management systems (DBMS).

The final report from the task force responsible for the project is not expected to dwell on explicit features of individual DBMS, although it may use some as examples of more general points.

The task force is planning to hire the services of a full-time researcher for one year. The position requires a person with a computer auditing background, a thorough knowledge of DBMS and an understanding of research methodology.

Persons interested in the position should send a description of their qualifications to Paul Levine, manager, Practice Applications, American Institute of CPAs, 1211 Ave. of the Americas, New York, N.Y. 10036.

Fortran IV One Highlight Of IBM 34 Enhancements

ATLANTA — Fortran IV, a Job Analysis System and on-line application systems for distributors and manufacturers were among the software offerings announced by IBM with its recent introduction of System/34 enhancements (see story on Page 49).

Fortran IV, scheduled for release next July, significantly extends the repertoire of languages available to the users of these small systems. Previously, the options were limited to RPG-II and Basic Assembler, a spokesman acknowledged.

Job Analysis System/34 (JAS/34), also set for release next summer, is "sort of a project management tool," he said, adding that it allows the user to plan for almost any type of project susceptible to Critical Path Method (CPM) analysis.

Fortran IV will carry a monthly license fee of $100, while JAS/34 will cost $68/mo.

Accounting System

The Distribution Financial Accounting System II (DFAS II) was introduced to assist its target users with on-line support for general ledger, accounts and payroll applications. The programs complement the previously announced Distribution Management Accounting System II (DMAS II) that handles billing, inventory control, accounts receivable and sales analysis.

The DFAS II modules should require no programming modification by the user, IBM said.

DFAS II modules are separately priced. Accounts payable and general ledger cost $35/mo each and the payroll module has been pegged at $47/mo.

The Manufacturing Accounting and Production Information Control System (Mapics) provides ready-to-use programs for 11 application areas incuding order entry and invoicing, inventory management and accounts receivable. Other areas are general ledger, accounts payable, payroll and product data management.

The final application areas supported by Mapics are material requirements planning and production control and costing. The software also provides data collection system support, IBM noted.

Each of the modules is separately priced with monthly license fees ranging from $35 to $90 each. All will be released in the period from November through February, according to present plans.

Interdata Updates OS/32 MT

OCEANPORT, N.J. — An enhanced version of the OS/32 MT operating system and a separately priced Multi-Terminal Monitor (MTM) software option that works with the update have been announced by Interdata for use with the company's 32-bit CPUs.

The Dynamic OS/32 MT supports multiprogramming with up to 255 user tasks written in Fortran, Cobol, Basic or Assembly language. It includes a real-time executive for resource management, task scheduling, roll-in/roll-out and subsystem management, a spokesman said.

File management with device-independent I/O and support for temporary files as well as spooling of both input and output are also built into the Dynamic OS release.

The resource management capability includes support for dynamic allocation of main memory instead of the partition approach used in earlier releases of the software.

The subtasking capability includes the creation of subtasks and segmentation of programs into "pure' and "impure" parts. The pure segments are those portions made up of reentrant code.

The spooling facility reads card images onto disk, on the input side, and writes printer images on disk, after which they are moved to the printer as it becomes available, on the output side of the operation.

Entire reports are spooled to disk before any printing is started, Interdata said. This delays the start of print runs, but means extra copies of reports can be made as needs arise.

The MTM option supports up to 16 concurrent on-line program development terminals and 16 background batch tasks. This means the OS/32 MT user now has remote job entry capability.

MTM includes an accounting mechanism which records system usage. An accounting program is available to provide reports of that use, the spokesman noted.

Dynamic OS/32 MT for either the 7/32 or 8/32 systems costs $5,000, which includes one-year paticipation in Interdata's Software Subscription Service. The MTM option, which requires the updated operating system, costs an additional $2,500.

Interdata is at 2 Crescent Circle, Oceanport, N.J. 07757.

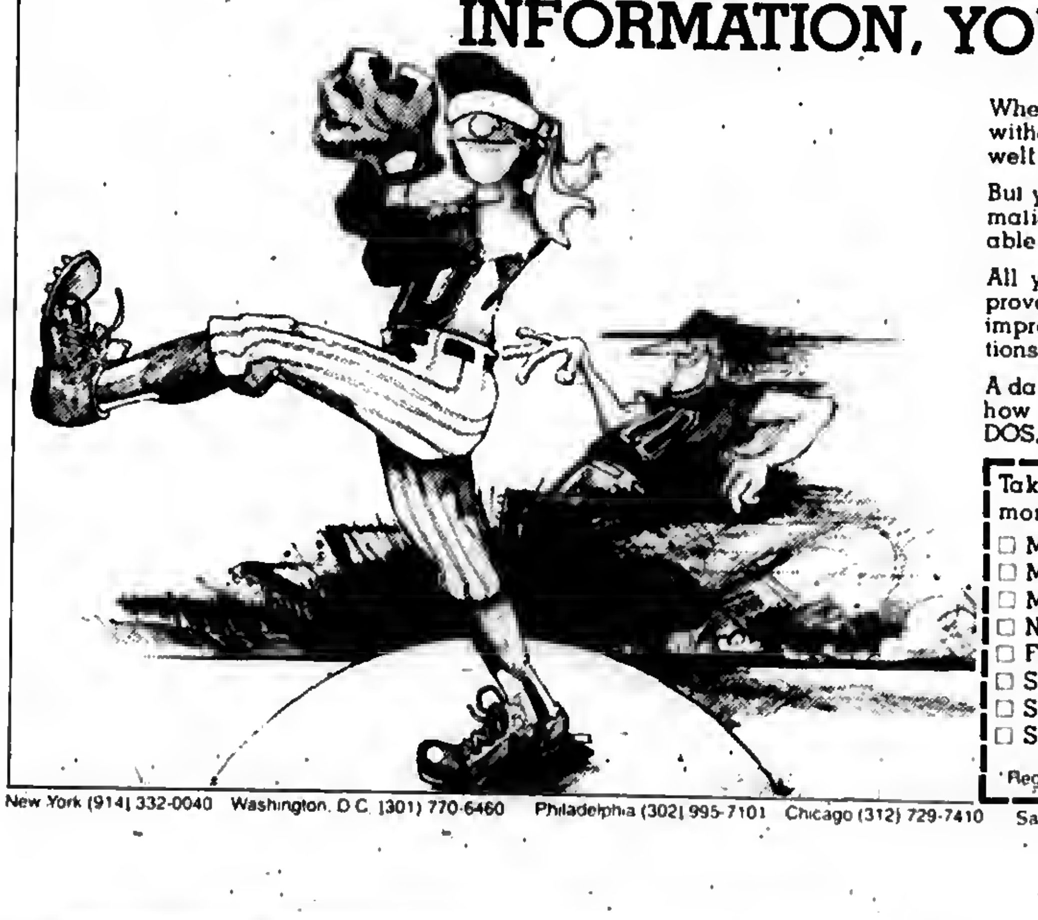
Basic Available For IBM Series/1

BIRMINGHAM, Ala. — Basic/1, an interpreter developed by Graham Computer Enterprises, Inc. (GCE) for the IBM Series/1 minicomputer, is said to offer the features defined in the American National Standards Institute (Ansi) proposed standard for minimal Basic, which was released for comment last December.

In addition, however, Basic/1 provides many extensions to that proposed standard, paticularly in the area of file processing, character string manipulation and output formatting, GCE said.

Files can be created, deleted or renamed within Basic/1 programs and can be accessed sequentially or randomly. The initial re-

(Continued on Page 25)



IF YOU'RE MAKING FINANCIAL DECISIONS WITHOUT TIMELY INFORMATION, YOU NEED THE MMS GENERAL LEDGER.

When your financial management makes decisions without accurate, timely information, they might as well be blindfolded.

But you can give your decision-makers *all* the information they need, in *any* format they feel comfortable with, and deliver with fast-ball speed.

All you need is the MMS GENERAL LEDGER. The proven financial reporting system, it's scoring an impressive record in more than 800 major corporations around the globe.

A data-base system, MMS GENERAL LEDGER knows how to handle all the league-leaders, including DOS, O/S, IMS, IDMS, DL/1 and TOTAL.

If your requirements need a heavy-hitter, the MMS GENERAL LEDGER is available with an additional *ON-LINE MODULE* that makes financial reporting a whole new ball game.

Best of all, MMS GENERAL LEDGER is only one member of Software International's all-star team, which features Accounts Receivable, Accounts Payable, Net Change MRP, Filetab Report Writer and three for Systems/3 — General Ledger, Accounts Payable and Accounts Receivable.

When the pressure is on and you can't afford mistakes, call or write Software International. Get the champion performer, MMS GENERAL LEDGER.

Take me out to a whole new ball game of financial reporting. Please send me more information about:

☐ MMS General Ledger
☐ MMS Accounts Payable
☐ MMS Accaunts Receivable
☐ Net Change MRP
☐ Filetab Report Writer
☐ S/3 General Ledger
☐ S/3 Accounts Payable
☐ S/3 Accounts Receivable

Data Administrator Duties Differ From DBA's

By Stephen L. Robinson
Special to CW

Data Base Corner

In a recent Data Base Corner [CW, July 25], I started a discussion of the differences between the responsibilities of a data administrator and those of a data base administrator (DBA). In this column, I'll go into more detail on the concepts of data administration.

Without muddling the terminology maze further, the most descriptive title I have heard for the data administrator's position (employed at General Foods, Toronto, among other places) is "manager of data resources." One of my colleagues, Arvind Shah of Performance Development Corp. (PDC), suggests the term "data controller," since the data administrator is to corporate data what a controller is to corporate finances.

Whatever the title, the data administrator is responsible for establishing, monitoring and, when necessary, modifying an organization's policy for data gathering and utilization. This responsibility transcends functional boundaries (a fact that argues against the establishment of a data administrator in many organizations).

Yes, but what does the data administrator do?

In approximate chronological order, the data administrator:

- Takes inventory of existing data collection, storage, maintenance and utilization.
- Builds a model of the relationships between the data elements which exist.
- Analyzes data/information requirements of the organization as a whole.
- Builds a model of the relationships between data elements which would reflect actual requirements, not existing systems.
- Develops a plan to evolve from the existing systems to an implementation of the second model.
- Works with the data base administrator to make it happen.

In the rest of this column, and in subsequent columns, I shall expand on each of these tasks.

Taking Inventory

In two columns last spring [CW, May 23, 30], Bob Chamberlain, a colleague of mine at PDC and CACI, Inc., described information flow analysis (IFA), the inventory taking process. I direct the reader to his columns for an overview of the IFA process and rationale. Rather than duplicate Chamberlain's efforts, I will summarize some of the key points and then delve into some of the nitty gritty.

Briefly, an IFA (which should probably have been called a DFA, or data flow analysis) is a complete study of existing data acquisition, maintenance and processing. This means:

- Identifying all data points of entry and cataloging the media by which the data is recorded.
- Tracking the media through an organization, noting where it is copied, where data/information is extracted, where changes can be made, where deletions can occur, etc.
- Observing and recording the creation of new media which carry data/information, e.g., reports.
- Following these new media, treating them as above.

With wisdom borne from numerous IFAs, the following is a recommended set of procedures;

- First, begin a study of data dictionary packages, or, if you have programmers/analysts who aren't doing anything, build your own data dictionary package. As should be evident from the brief description of an IFA, a lot of data about data is generated by this study. The sooner you have a tool on hand to store the data and analyze it the better.
- Begin your inventory with a well-documented area. Typically, this might be forms, files or reports. Experience dictates that entry forms are a good place to start (unless they are not well documented). The main things you will want to document for a data entry form are form name/number, data element names, formats, and flow history.

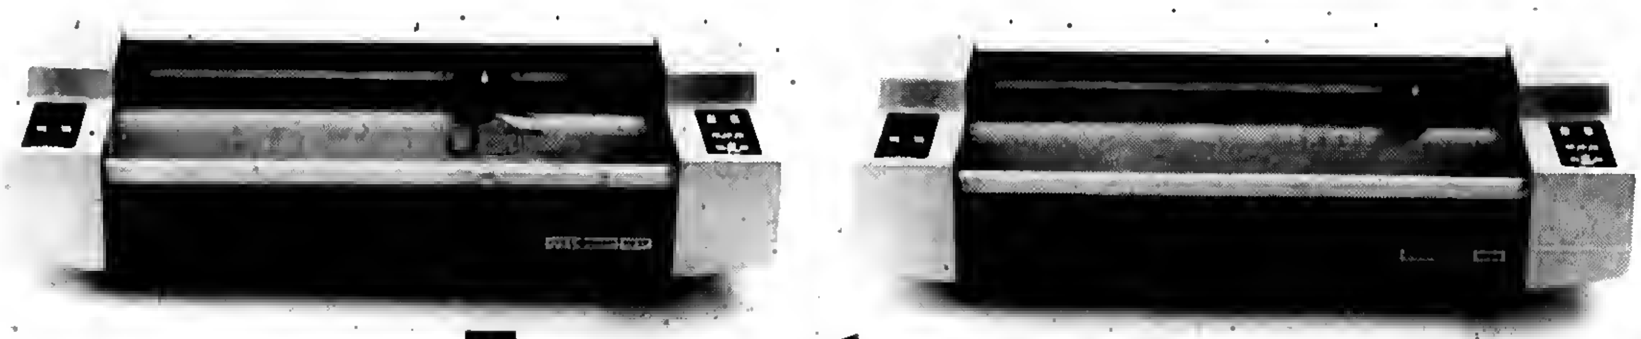
For the flow history, draw a "flow" chart with a "node" to represent every place something significant can happen to the document such as data extraction, form duplication, data changes, etc.

In addition, you may want to document other information about a form. This could include frequency of use, form supplier, storage locations, privacy/security criteria, etc.

- For automated files you will want (in addition to the above) record formats, storage algorithm for records, file names, backup file names, log names, etc.

(Continued on Page 25)

CalComp means



Introducing a new

CalComp innovates. Again.
This time with an all-new line of intelligent drum plotters.
Want performance? CalComp's new line comes through with the smoothest line quality output in the industry.
Want value? CalComp's new line delivers with price/throughput ratios second to none.
Want selection? CalComp's new line gives you greater freedom of choice with a total of four distinct models.
It all adds up to unbeatable performance, unprecedented value and the broadest line of drum plotters available.
Anywhere.

The world's best performance.

For greater accuracy, all four new models—including their pen actuators—are d.c. servo-motor driven.
This, combined with "smarter" microprocessor-based controls, means faster, more precise plotting in every application.

Once again, CalComp sets new graphics industry standards for throughput and output performance.

New plotting world facts.

plotter model	inches-per-second	pens	step size
1037	2.0	1	.002
1038	4.5	1	.002
1039	4.5	3	.002
1051	10.0	4	.001

Superior penmanship.

Penmanship, too, is unexcelled in each of these four new drum plotter models. Thanks to CalComp's special linear drive pen mechanism.

This newly designed linear drive creates consistently superior line quality by promoting greater pen force control.

You also get the industry's fastest pen-up/down time and fastest throughput. With matching CalComp-quality output.

What's more, CalComp offers plotter-compatible pens for every requirement. Pressurized ballpoints. Liquid inks.

M6800 Cross-Compiler Bows

CAMBRIDGE, Mass. — PL/M6800 is a cross-compiler from Intermetrics, Inc. that uses the facilities of an IBM 370 to create optimized, directly loadable object code and program listings for execution on a Motorola M6800 or AMI S6800 microcomputer.

The language source is syntactically identical to Intel Corp.'s PLM, according to a spokesman, but the object code produced is "highly optimized" since the compiler has enough room in the 370 environment to take advantage of nearly every instruction in the microprocessor.

PL/M6800 provides a user-controlled switch that determines whether the generated object code is in the AMI or Motorola loader format. Other user options include the preparation of source code, object code or equivalent assembler level code as well as symbol table dumps, the spokesman noted.

Microprocessor users who want to use the capabilities of PL/M6800, even though they normally have no access to a 370 for the purpose, will find the cross-compiler on both the National CSS, Inc. and General Electric remote computing networks, he continued.

Otherwise, the software is packaged and available for a purchase cost of $1,000, which includes a magnetic tape containing a copy of the cross-compiler and all associated library routines, a user's manual, language reference manual and product maintenance for a year.

Intermetrics is at 701 Concord Ave., Cambridge, Mass. 02138.

Data Administrator Leads Organization Into DBMS

(Continued from Page 24)

- Extend your study beyond the computer room. Typically, substantial data/information never finds its way to the computer. Starting with entry forms should avoid the trap of making this just a DP study.
- Enter your "meta-data" into a data dictionary.
- Resolve (identify and record) synonyms. They come in several flavors; data elements with the same name and same meaning; data elements with the same name and different meanings (watch out for these); and data elements with different names and the same meaning.
- Analyze data flows. You will probably identify the source of some of your information problems (e.g., unsynchronized maintenance). Fix these.

You have now demonstrated the value of data administration to management and are now ready for bigger and better things.

Robinson is an independent consultant. S.L. Robinson & Associates is in Morrisville, Pa.

Basic Available On IBM Series/1

(Continued from Page 23)

lease supports files on diskette only; disk file support will be available later this year, according to a spokesman.

Character strings controlled by Basic/1 instructions may range up to 255 characters, he added. Output formatting is provided in the PRINT USING statement; a PICTURE-type format is specified so formatting of a print line is "relatively simple," he said.

Both floating-point and integer numeric variable data types are allowed. Both types have ranges comparable to the double-precision ranges of the Series/1, the spokesman claimed.

Clause Addition

Another extension beyond the proposed Ansi standard for minimal Basic supports the addition of the ELSE clause to the IF statement. Programs can use multiple statements after the IF . . . THEN . . . ELSE construction, GCE noted.

License fees for the single-user diskette-based version now available is $1,800 per CPU. This fee can be applied as credit toward the purchase of the single- or multiple-user disk-based versions when they become available.

GCE is at Suite 106, 3 Office Park Circle, Birmingham, Ala. 35223.

plotting.

world of drum plotters.

Plastips. All in a wide variety of colors and widths.

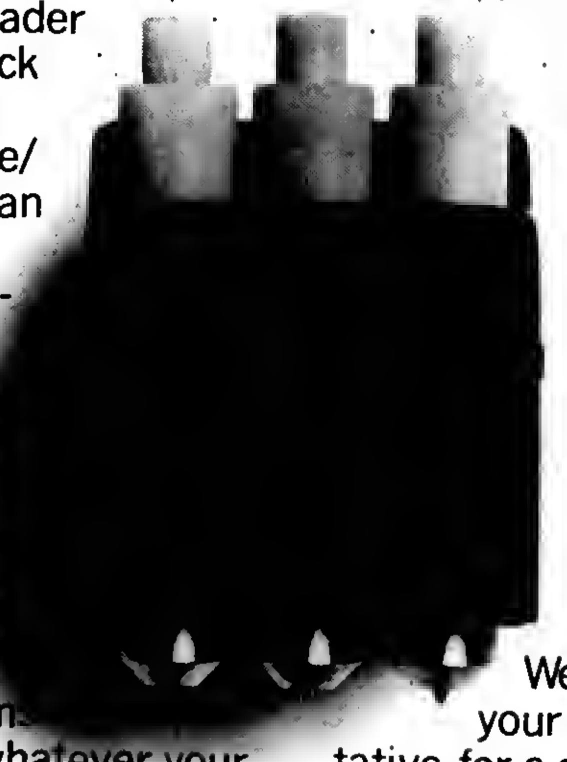
Our no-modes-barred approach to plotting.

CalComp is the world leader in computer graphics. So pick the mode of plotting that's right for you: on-line, remote/timesharing or off-line. We can easily adapt.

Let us expand the versatility of your calculator or minicomputer with on-line graphics capability and our software.

Or, let us show you how reduce transmission line ti[illegible] with a low-cost, high-quality CalComp solution for your remote/timesharing problems.

Whatever your mode—whatever your application—you're sure to find a new CalComp configuration that's a perfect match. Because, quite simply, there isn't a broader, more versatile line of intelligent drum plotters in the world.



The CalComp edge.

Service and support—worldwide and second to none—keep CalComp ahead of the competition even after the sale.

It's the industry's most extensive support network. In terms of both field service personnel and in-place field systems analysts. Another example of CalComp's dedication to excellence in all phases of the graphics business.

Our edge in experience is proven by the world's largest installed base of graphics systems and more than two decades as the world leader in computer graphics systems.

We'll prove we're better. Contact your local CalComp sales representative for a sample of our work. Seeing is believing.

CPEUG To Blend Technical, Managerial Topics

By Don Leavitt
CW Staff

NEW ORLEANS — The 13th meeting of the Computer Performance Evaluation Users Group (CPEUG), hosted by the U.S. Department of Agriculture, will be held Oct. 11-14 at the Fountainbleau Hotel here and all interested people are welcome, according to program chairman Dennis M. Conti of the National Bureau of Standards (NBS).

Founded in 1971 by the U.S. Air Force and now sponsored by NBS, CPEUG provides a forum for DP professionals actively involved in improving the efficiency and effectiveness of computer facilities.

Although the group has its roots in the federal government, it welcomes participation from the private sector.

In common with many performance-oriented conferences, this meeting will include workshops focusing on user experience with measurement, optimization and simulation tools and techniques. Vendor presentations will provide insight into current products.

Last year's major innovation — discussions of management-oriented issues — has been integrated directly into the main line of the CPEUG '77 program. Tutorials in performance fundamentals — another innovation last year — will be back again this year, Conti noted.

This year, CPEUG will experiment with a program structured around the three phases of a DP project's life cycle. The first afternoon's sessions will relate generally to the requirements phase of a project and will concentrate on workload definition.

The second day, concerned with the acquisition part of a project, will cover computer system acquisition in the morning and on-line system evaluation in the afternoon.

Sessions on the third day, centered on performance measurement in the morning and prediction methods after lunch, will be most pertinent to the operations phase of a project. The conference will adjourn early the next day after a discussion of future DP systems.

Keynote speaker this year will be A.G.W. (Jack) Biddle, president of the Computer & Communications Industry Association. Session chairmen will include Terry Potter from Bell Labs, Norris Goff of the Department of Agriculture and Thomas F. Wyrick of Fedsim.

Registration fee for the conference is $40, payable in advance (until Sept. 30) or at the door. Checks made out to CPEUG should be sent to CPEUG, c/o U.S. Department of Agriculture/Nocc, P.O. Box 60900, New Orleans, La. 70160.

Independent Has Sort For Interdata Minis

DEARBORN HEIGHTS, Mich. — An independently developed sort package for Interdata 32-bit systems, Kimsort from Northware is up to five times quicker than competitive Interdata sorting routines, according to the vendor's claims.

Kimsort is a disk-oriented sort for use with Ascii or Ebcdic files that supports both ascending and descending sequencing on "virtually any number" of key fields, Northware's spokesman said.

Although it can be used in stand-alone batch or interactive operations, Kimsort can be treated as a callable subroutine from Fortran, Cobol or Assembler language application programs.

The package also provides a facility for blocking/deblocking of magnetic tape and contiguous disk files. This is a feature not currently provided by Interdata-supplied software, according to Northware.

Kimsort costs $500 and is available now from Northware through P.O. Box 363, Dearborn Heights, Mich. 48127.

'Polaris' Eases Writing Of IBM 32 RPG-II Code

DENVER — The Polaris package, from Polar Dynamics, Inc. allows the user of an IBM System/32 to generate RPG-II programs from a single key-word-oriented coding form.

The user need be neither a skilled programmer nor high-level computer expert, but should have a basic knowledge of the hardware, a spokesman said.

The user still has to "tell" the system the input with which it has to work, what output is desired and what logical processing is required, but the single coding form is much simpler than the "half dozen or so" sheets normally used in creating RPG-II programs, he said.

The software is available in both a basic single-file version and a more complex one to work with multiple files. Both versions support record selection by user criteria, file merging and creation, file updating and report generation, the spokesman added.

Once the Polaris parameters are entered, the system proceeds without further operator intervention through a compilation and, if the user wishes, an attempted execution of the generated program.

Already installed at several user sites, Polaris costs $1,500 for the single-file version and $2,000 for the multiple-file implementation.

Polar Dynamics is at Suite 203, 5777 E. Evans Ave., Denver, Colo. 80222.

'SCSS' Supports On-Line Statistical Procedures

CHICAGO — The SPSS Conversational Statistical System (SCSS) from SPSS, Inc. is described as a fully conversational statistical and tabulation system for users of IBM's Time Sharing Option (TSO) on 360/370 mainframes.

The software was designed for files with many variables and up to "several thousand" records, according to a spokeswoman.

SCSS includes six major procedures. Frequency tabulations, n-way cross-tabulations and descriptions of subpopulations including means, sums, standard deviations and variances are featured, she said.

Correlations and partial correlations are also part of the package, as is multiple linear regression with forward, backward, true stepwise and direct solution methods.

The system's functions are triggered by user responses to questions. The user can select one of three styles of prompting — verbose, normal or terse — or escape the prompting sequence entirely and preemptively specify answers to the questions, allowing a complete set of results with each user command.

Whenever a user is unsure of what a question means or what answer would be most appropriate, a HELP command provides a complete explanation, the spokeswoman noted.

The system is fine-tuned in its operation through the use of several variables, she claimed. The user may create new variables from existing ones by writing Fortran-like statements, she noted.

SCSS can be used in conjunction with the original batch-oriented SPSS package.

Currently implemented in IBM OS and OS/VS environments, SCSS is also being adapted to other systems and other mainframes. A VM/370 version designed for use with the Conversational Monitor System (CMS) is expected in November.

SCSS can be licensed for $4,000 annually, with discounted prices available for tax-exempt and academic organizations. SPSS, Inc. is at Suite 1234, 111 E. Wacker Drive, Chicago, Ill. 60601.

Package Spools 3/12 Print Files

SANTA ANA, Calif. — Users of IBM 3/12s can spool printer output to temporary disk storage if they have the Spool/12 software and a printer from Business Systems Technology (BST), according to the vendor.

By providing an access route to the disk storage and then from there to the printer, Spool/12 is said to increase throughput by 25% or more.

An interrupt-drive routine, the package is described as identical in operation to the Spool/8 and Spool/10 packages BST still offers for other models of the IBM 3 line.

In addition to overlapping process-bound operations, Spool/12 enables the user to control the printing operation itself. Through commands entered on the CPU's data/-address switches, printer output can be temporarily halted, cancelled or repeated in its entirety, a spokesman said.

The package does not require either IBM's dual programming support nor a console typewriter. It requires at least 5.5K bytes of memory and a BST 1,200-, 750, 550- or 400 line/min printer. Either BST or IBM disk drives can be used with the program.

Spool/12 rents for $99/mo, but lease plans of one- two- or three-years and purchase plans are also available, according to BST.

The company is at 3015 Daimler St., Santa Ana, Calif. 92705.

Operating System Links OP-1 Programmable Units

WOODBURY, N.Y. — Four OP-1 user programmable terminals from Ontel Corp. can be attached to and share a disk storage system if the configuration is supported by Ontel's "hard disk" operating system (HDOS/80), according to the firm.

The system supports a named file structure including dynamic allocation/deallocation of disk space. Sixty-four private user file catalogs as well as a single share catalog can be supported, Ontel said.

The system also includes a device-independent I/O subsystem, according to a spokesman.

Under the file system, the users can work with read-only shared files or with read/write access including lockouts at the record level to avoid updating conflicts, he said.

Utility routines packaged with HDOS/80 include facilities for file copy, delete, rename, print and erase operations and a program editor.

The entire operating system package is free to users of Ontel's terminals, the company noted from 250 Crossways Park Drive, Woodbury, N.Y. 11797.

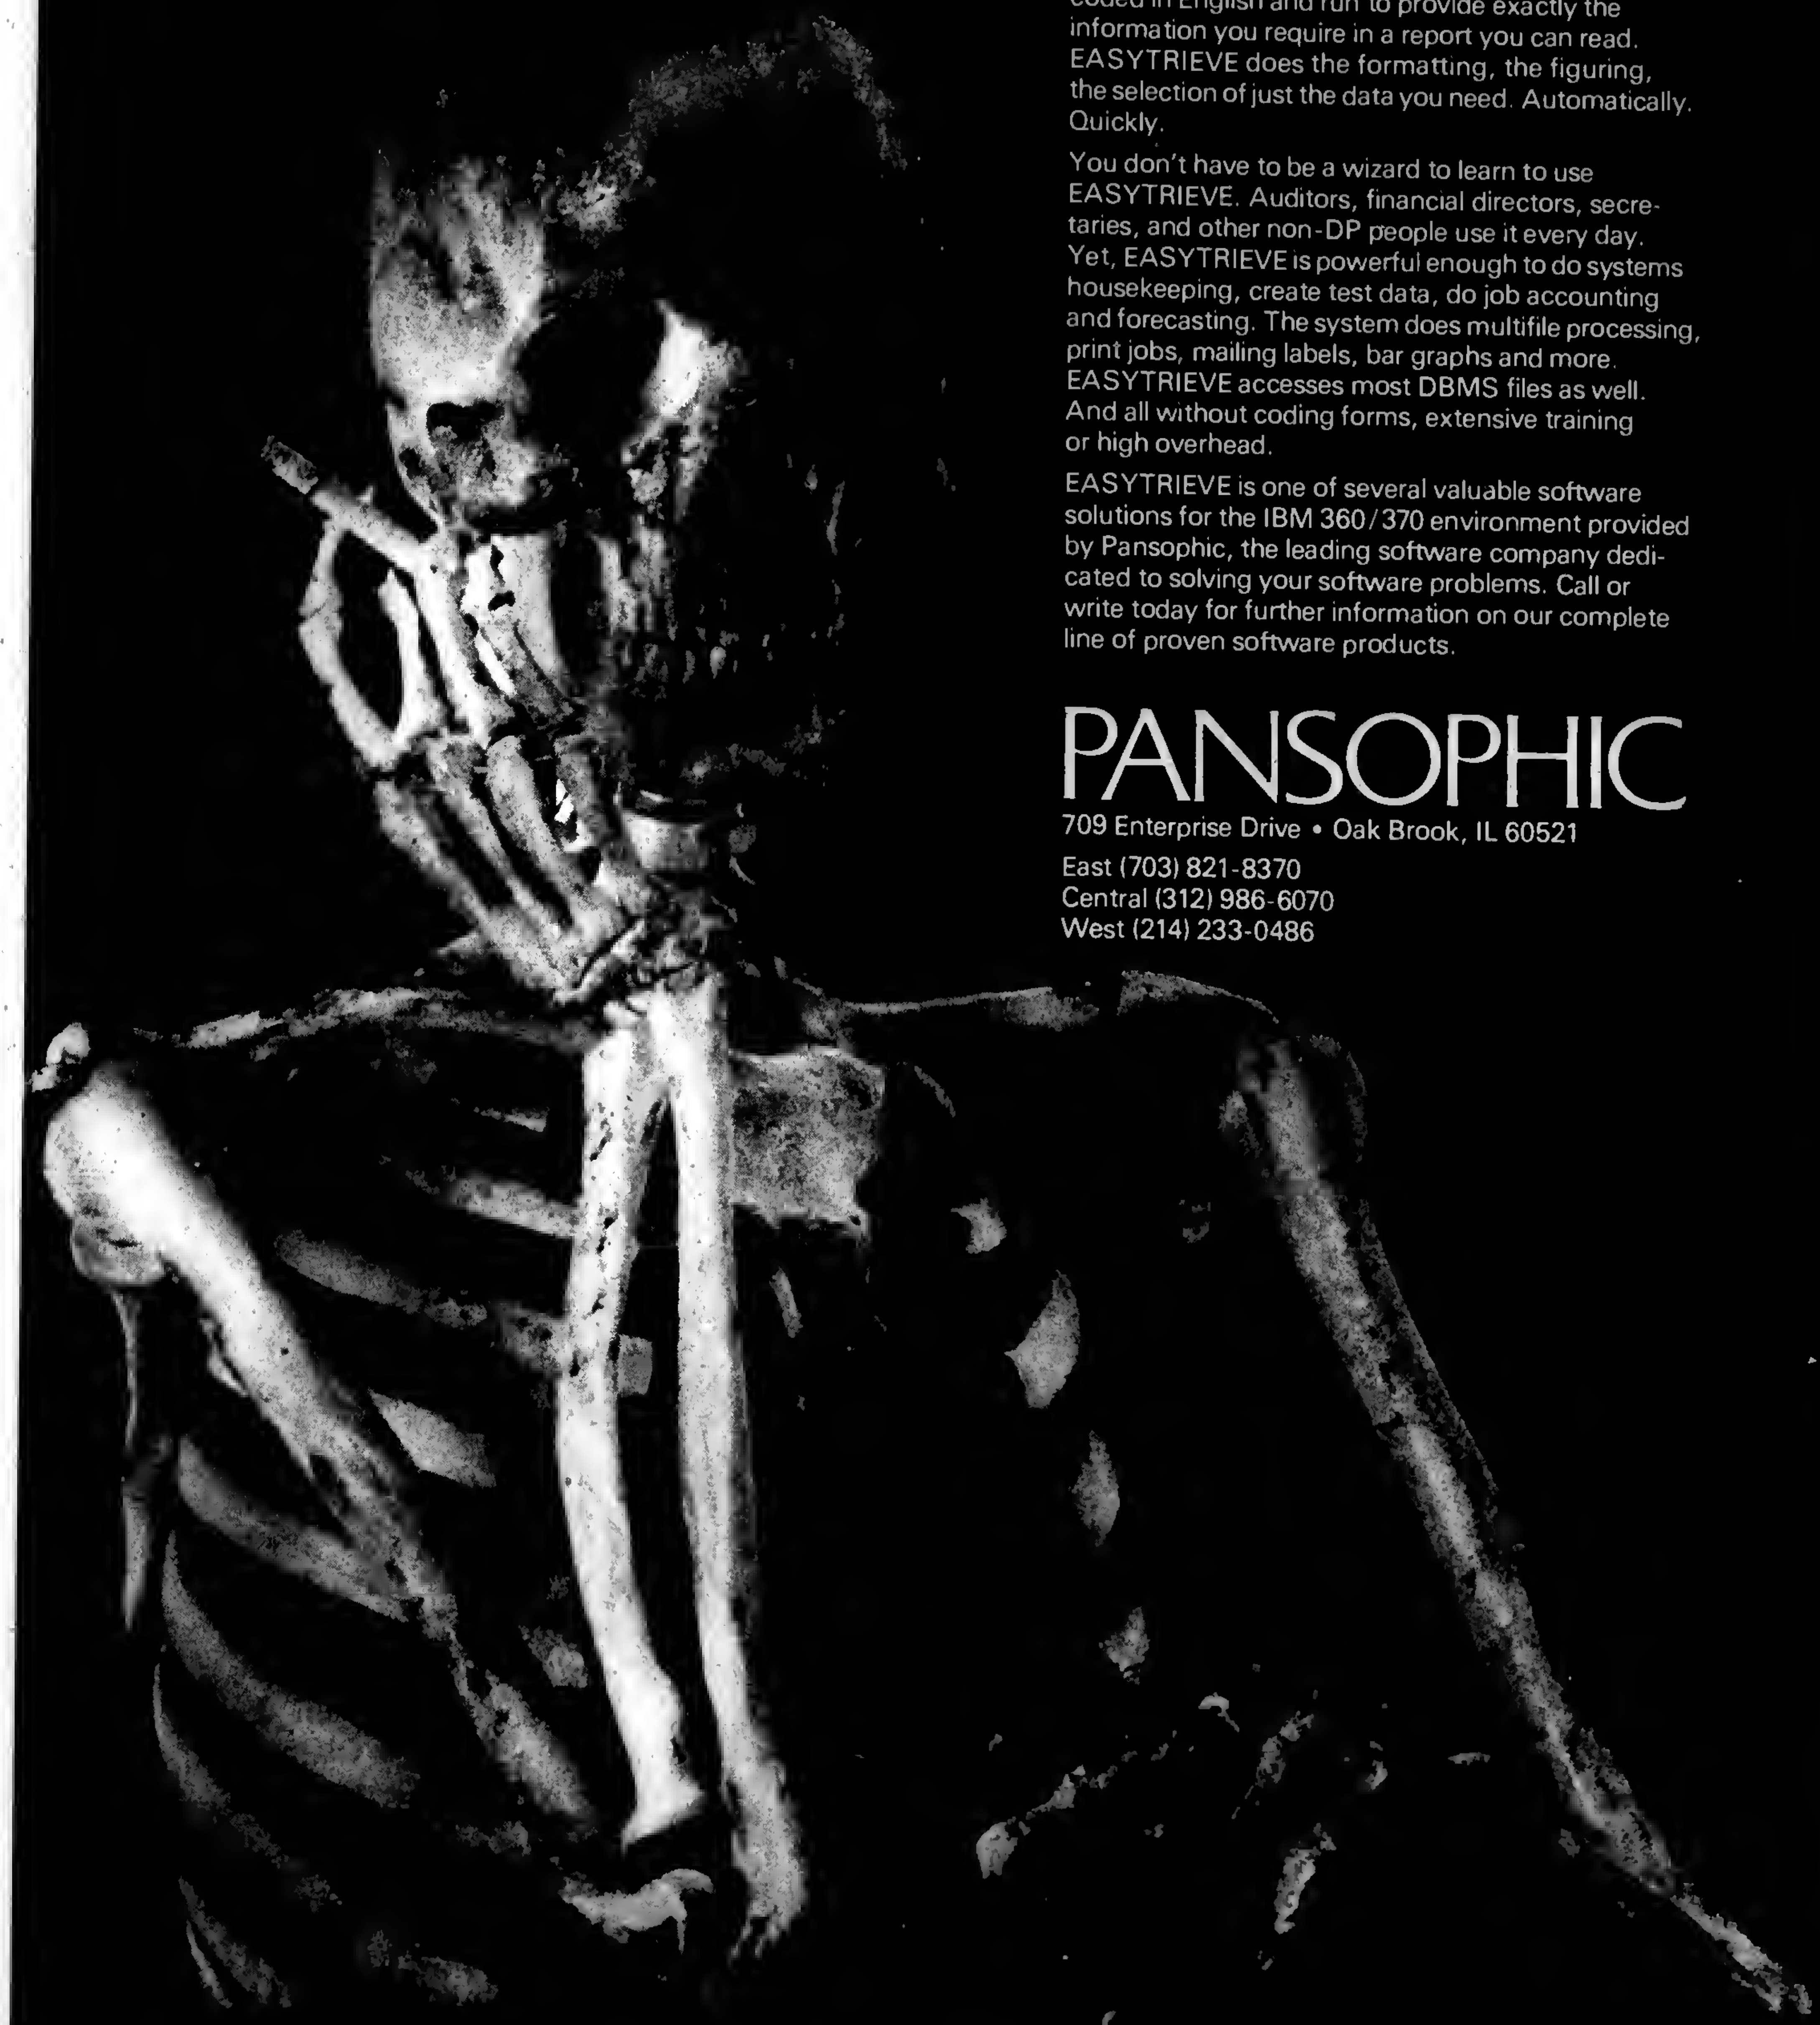
TIRED OF WAITING FOR REPORTS?



With EASYTRIEVE, there is no need to wait for reports. In a matter of moments a program can be coded in English and run to provide exactly the information you require in a report you can read. EASYTRIEVE does the formatting, the figuring, the selection of just the data you need. Automatically. Quickly.

You don't have to be a wizard to learn to use EASYTRIEVE. Auditors, financial directors, secretaries, and other non-DP people use it every day. Yet, EASYTRIEVE is powerful enough to do systems housekeeping, create test data, do job accounting and forecasting. The system does multifile processing, print jobs, mailing labels, bar graphs and more. EASYTRIEVE accesses most DBMS files as well. And all without coding forms, extensive training or high overhead.

EASYTRIEVE is one of several valuable software solutions for the IBM 360/370 environment provided by Pansophic, the leading software company dedicated to solving your software problems. Call or write today for further information on our complete line of proven software products.

IN THE SOUTHWEST, 645,000 NEW SQUARE FEET ARE READY TO GIVE YOU A HAND.

We grew 320,000 new square feet in Phoenix, Arizona...

...while growing 325,000 more in Albuquerque, New Mexico.

In the beginning of 1976, Digital's manufacturing facilities totaled about 3.4 million square feet.

By mid-77, they totaled over 5.5 million square feet.

We grew 2 million feet in a year and a half. We responded to the tremendous demand for our products.

New additions included 893,000 square feet in New Hampshire; 645,000 in Phoenix and Albuquerque; and 245,000 in Massachusetts. Plus another 400,000 square feet in other spots around the country and around the world. All up. All working. Now.

What it means when you add it all up is that you can look to Digital for "Now Delivery" on the great majority of Digital products. And it means that Digital equipment — always in demand — is a lot closer to being always in supply. And it means that we are ready to respond to customers who need to plan on delivery — now and later.

We built the capacity.

Let us give you a hand.

Digital Equipment Corporation, PK3-M18, 129 Parker Street, Maynard, Massachusetts 01754. (617) 897-5111, ext. 8614. European headquarters: 12, av. des Morgines, 1213 Petit-Lancy/Geneva. Tel: 93 33 11. In Canada, Digital Equipment of Canada, Ltd.

NOW DELIVERY. FROM DIGITAL NOW.

With Distributed Processing

Protocols Key to Communications Future

By Arthur Lynch
Special to CW

The advent of distributed processing networks and use of data communication as a medium for sharing processing resources has created a need to easily communicate via phone lines between remote processing systems or, more specifically, to communicate between remote operating systems.

This gives a computer user in one location direct access to the resources of a processor at another location. There are many ways this capability can be used. Some typical ones are:

- Remote job entry (RJE).
- Access to various service bureaus via a data link.
- Sharing or accessing remote data bases.
- Providing data to a remote processor.

There are two necessary requirements for implementing this capability— the hardware to interface and control a data modem and a line protocol to control the data transfers.

Vendor	Interactive Terminal Protocols	Batch Terminal Protocols
IBM 360/370	2741, 3270, 2260	2780/3780, Hasp-II Workstation
Univac	Uniscope	1004, DCT 1000, 2000, 3000
HIS	VIP-7700	G-100, DN-700
Burroughs	TC-500	TC-3500
Control Data Corp.	—	UT-200

Some Standard Line Protocols

The hardware requirement is well understood and, relatively easy to obtain. The proper line protocol is not so easy.

The definition of protocols, also called line procedures or line disciplines, can be stated as "a predetermined dialogue scrupulously maintained by both ends of a communications data link." The procedure consists of an interchange of characters or character sequences that guarantees control and integrity of message transfers.

Below is an example of the most standard line protocol, the IBM Binary Synchronous line procedure. A typical transmitter/receiver dialogue includes the following steps:

1. The transmitter first issues an inquiry.
2. The receiver responds positively.
3. The transmitter then transmits text.
4. The receiver continues to respond positively. (If errors were found in the transmission, then a negative acknowledgement would have occurred and the message block retransmitted.)
5. This process continues until a mutually understood end sequence occurs.

There are a large number of line protocol designs that are optimized for all types of system criteria, such as:

(Continued on Page 32)

BST Substitute for IBM 3277 Compatible With System/3

SANTA ANA, Calif. — The Business Systems Technology (BST) division of Memorex Corp. has announced the BST/1377 CRT station as a functional replacement for the IBM 3277-2 CRT.

The BST/1377 is fully compatible with the IBM System/3, according to a BST spokesman.

The BST/1377 keyboard and CRT is used for entering and displaying alphanumeric data. By utilizing either the keyboard or the optional light pen, the operator can enter, display or manipulate data on the screen.

The screen displays 24 lines of 80 characters (1,920 characters).

For readability, the 1377 uses a 7 by 8 dot matrix to display the CRT's 89-character set on a 15-in. diagonal screen. In addition, a tiltable screen allows the operator to adjust the viewing angle for visual comfort, BST said.

Other highlights of the station include nonglare keys and CRT, a 20% faster screen refresh cycle for reduced flicker, a line and a column indicator on the 25th line and a reverse video cursor, the spokesman said.

The BST/1377 attaches to the System/3 models 4, 8, 12 and 15 via appropriate CPU features, he added.

The unit is available on a monthly rental plan and on one- and two-year leases. On a one-year lease, it costs $90/mo with maintenance.

The unit can also be purchased for $3,600 with maintenance priced at $15/mo per terminal, BST noted from 3015 Daimler St., Santa Ana, Calif. 92705.

Eotec Adds Breakout Unit

SANTA CLARA, Calif. — Eotec Corp. has introduced the EIA Breakout, a troubleshooting unit that offers two methods of determining the signal interface between terminal equipment and modems.

The first of these methods uses an LED display of 17 signals that illuminate when positive. The second uses test points that provide access to each EIA oscilloscope or other test equipment.

Using an EIA RS-232-type interface, the EIA Breakout can be installed in series between all terminals or terminal controller units and modems, the manufacturer claimed.

Troubleshooters can open any EIA signal with 21 subminiature switches and use the test points for crosswiring to any other EIA signal or to a positive voltage source.

The $175 unit comes with three feet of cable from Eotec Corp., 2595 Martin Ave., Santa Clara, Calif. 95050.

THE $\$99^{00}$ MODEM*

You're suspicious aren't you? OK, we confess. Our M-1 asynchronous short haul modem won't do what a lot of other modems will do.

However, the M-1 will solve many of your local or in-house communication problems up to 10 miles or 9600 bps. And because you aren't paying for a lot of options and capabilities that you don't need in those situations, you'll be saving a bundle of money.

Interested? Write or call us now for a data sheet and complete price information.

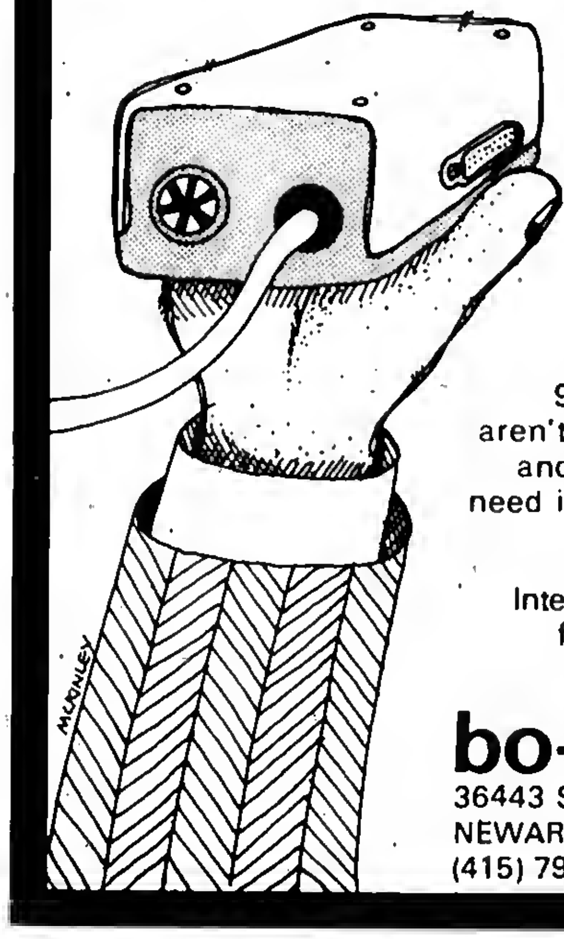
*100 Quantity



the shortest cost between two points

Everyone is looking at the cost of communications. As the quantity of information need increases, you look toward more efficient equipment and better use of time and personnel.

At *Management Response Corporation*, we can help. With a wide selection of communications terminals like the economical Teletype model 43 teleprinter, and Digital's LA36 DECwriter II or LS120 DECwriter III consoles. And, we'll stand behind you with factory approved installation, warranty, service plans, and operator training.

We can match your present and future needs with the right hardware, full product support, and flexible sale/lease plans.

To find the shortest cost between two, points, contact us.

Canadian Group Introduces Basic Glass Teletypewriter

OTTAWA — Vucom 4, a CRT terminal, has been introduced by The Computer Communications Group of the TransCanada Telephone System (TCTS) to meet the computer communications needs of business and industry for a basic glass teletypewriter.

Rates will be $115 on monthly rental and "significantly less" on two- three- or five-year Extended Term Rates for Candian users, according to a spokesman.

Quiet Operation

Designed as a basic conversational terminal with keyboard/CRT unit, Vucom 4 is said to feature quiet operation and high reliability. It can operate over the switched network or on private line facilities, TCTS said.

Compatible with most teleprinters operating at speeds from 30- to 120 char./sec, the Vucom 4 communication mode is asynchronous up to 9,600 word/min. The terminal display provides 1,920 characters in 24 lines of 80 characters each.

Additional features of Vucom 4 include the 13-key numeric pad for high-speed data entry, a multipositional cursor that can be controlled by the operator or the host computer, and upper and lower case Ascii character sets, the spokesman said.

Vucom 4 can be purchased outright for about $2,000. The Computer Communications Group is located at 160 Elgin St., Ottawa, Canada.

Protocols Key to Future

(Continued from Page 31)

- Transmission mode (asynchronous/synchronous/Synchronous Data Link Control.
- Types of transmission (full-duplex, half-duplex).
- Interactive terminal applications.
- Remote batch applications.
- Conversational services, TWX, Telex, etc.
- Specific terminal device characteristics.
- Throughput requirements.
- Error control and procedures.
- Data transparency requirements.

Host Emulation

The most popular method of implementing a protocol for communicating with a particular remote processor is to emulate or simulate a standard line protocol for that processor. This allows access without the need to program and debug a nonstandard line protocol in the host, which can be a lengthy, painful process.

For example, an easy way for a remote system to communicate with a Honeywell Information Systems CPU is to use the G-100 line protocol. The G-100 is a remote batch terminal in the HIS product line.

Conveniently, all of the major mainframe manufacturers support some kind of standard line protocols that can be used. Most have several for different types of applications. The accompanying table shows some important ones.

The table contains protocols for two different classes of applications, interactive and batch. An interactive application would be a data entry/data base inquiry/response requirement with CRT and/or Teletype input, requiring fast response times (1- to 10 sec) typically.

A batch application would be the RJE application that tolerates long turnarounds and is not serviced in real time by the central processor. Job turnarounds can vary between minutes and hours. The protocol emulation must be selected to suit the application.

Second Point

The second important point after the proper protocol has been selected is the assurance that the emulation software runs under the local operating system. Software that runs under the Data General Corp. AOS, RDOS or RTOS combines the higher level language support, resource management features that can be used in conjunction with the line protocol to a remote processor.

For example, in a dual programming RDOS environment, the system could operate as an RJE station in foreground and perform Fortran compilations, time-share Basic or execute an application program in the background.

Two Simulations

There are two protocol emulations supplied by DG that run under AOS, RDOS or RTOS. They are IBM 2780 RJE station (RSTCP, RJE80) and IBM Hasp-II workstation (Hamlet).

The IBM 2780 product is a simple RJE or remote batch terminal that supports a single job stream and consists of a remote hard-wired terminal with a printer and card reader. The IBM 2780 line protocol is supported at speeds up to 9,600 bit/sec.

The Hasp-II workstation is a higher performance RJE terminal that usually consists of an IBM 360/20 configured with a variety of peripheral devices. The Hasp line protocol supports multiple job streams, multileaving operations of up to seven input peripherals and seven output peripherals concurrently. The Hasp protocol operates at line speeds up to 56 kbit/sec.

Third-Party Options

Third-party vendors that supply protocol emulation software are also available. For example, Gamma Technology Corp. in Palo Alto, Calif., supplies a number of emulator packages that operate under RDOS — IBM 3270 emulation, Control Data Corp. UT-200 emulation and Univac 1004 emulation.

As a last resort, the user may be compelled to design a new protocol or develop an emulation to satisfy a unique system requirement.

Future requirements point to a continuing need for protocol emulation software to maintain compatability with new products and strategies or to provide access to new communications facilities like packet-switching networks.

Lynch is manager of communications and terminal marketing at Data General Corp. in Westboro, Mass.

Perkin-Elmer: System Integration by Design

Our design engineers spend a lot of time talking to each other. In fact, we insist on it.

Thanks to all the talk at the drawing boards, we can offer you systems that perform. At peak efficiency.

We realize that the more fully you can utilize the power of your system, the happier you'll be.

That's why we design every single product to suit the system. And every system to optimize its parts.

Perkin-Elmer Data Systems designs and builds a complete line of minicomputers from our Interdata division; mass storage devices from our Wangco division; and I/O terminals from our Terminals division. They're all designed for system integration.

Excellent price/performance. Complete software. Field-proven hardware. Integrated sales and service. Worldwide customer support. Perkin-Elmer Data Systems supplies the tools and support you need.

Give us a call at our toll-free number: (800) 631-2154. We have a lot to talk about.

To Include 166 Branches

Bank Installing Statewide Net and Diagnostics

SEATTLE — A management control and diagnostic system that isolates data communications problems remotely is currently being installed as part of a dedicated on-line banking system at Seattle-First National Bank. When operating early next year as part of the total system, Seattle-First will become one of the nation's first commercial banks to offer statewide, on-line banking.

The system, which went into its pilot phase last month in six branches, will then be extended during the next several months to the balance of the bank's 166 branches. Seattle-First, the nation's 21st largest bank and an innovator in electronic banking, will be able to remotely diagnose and monitor data communications and data transmission in branches throughout the state.

The network diagnostic control system, as well as modems and support data transmission equipment in each branch, is supplied by General DataComm Industries, Inc., Wilton, Conn. Called Netcon-5, it will provide Seattle-First, from its computer center in Seattle, with systems control and monitoring for all stations in the bank's on-line network. As part of its on-line system, Seattle First is also installing at its branches Incoterm Corp. teller and administrative terminals and central controllers.

From the central location, Netcon-5 gives the bank a window into its analog and digital communications network. The equipment was designed to perform the two basic functions necessary to maintain on-line operations of polling and distributive DP systems. First, it identifies that portion of the system which is malfunctioning and then provides the capability to restore operations through alternative facilities.

Problems Isolated

Besides automatic diagnostic test and control functions, Netcon-5 isolates local problems when they occur. Its automatic scanning feature monitors the bank network, providing on-line diagnosis without operator intervention. When the system operates without problems, personnel are free to perform other tasks.

Should a failure occur, the General DataComm system alerts the operator with an audible alarm and a message on the console's screen. The operator, in turn, can then isolate the problem and, when possible, use restoral features to correct the failure with a minimum of downtime.

Some of the malfunctions at the branch location that are reported to the central system are no response to its command, loss of data terminal ready signal, loss of carrier from the central site and loss of data set ready signal. Based on its diagnostic capabilities, Netcon-5 can then perform such restoral features as dial backup of four-wire telephone lines, hot transfer for all remote modems upon command and modem streaming detection and disabling.

Netcon-5 consists of a microprocessor-oriented diagnostic and control system that operates out of the main channel band. It allows off-line testing and on-line telemetry functions by scanning all lines and modems on a continuing basis. At Seattle-First, Netcon-5 addresses and monitors General DataComm 2,400 bit/sec modems at each branch along with multipoint diagnostic master units which operate in conjunction with each modem and permit the diagnostic, monitoring and restoral features of the system.

NUMBER CRUNCHER

Maxi FORTRAN power at mini computer prices.

If you need heavy number crunching capabilities but your budget can't take the cost of mainframe computers, Interdata has the answer...our 8/32 Megamini® FORTRAN Processing System.

This FORTRAN system is more powerful than any other minicomputer. It has a 32-bit word length for extensive addressing and manipulation—useful for image processing and simulation. Our 32-bit word length lets you address up to 1 million bytes of memory—just the ticket in linear programming and matrix processing. There's more...floating point hardware, writeable control store, and an optimizing FORTRAN compiler.

Amazingly, this FORTRAN system is priced like a minicomputer...1/7th the cost of an IBM 370/158 or Univac 1108, the traditional number crunchers for scientific work until our 8/32 system came along. Your budget wins with appreciably lower cost per instruction.

If you have requirements or plans for large FORTRAN programs, investigate our Megamini's experience in the scientific community. Call your local Interdata office or contact me, Gary Doninger, Interdata Scientific Manager. (201) 229-4040.

Send me information on your 8/32 FPS.

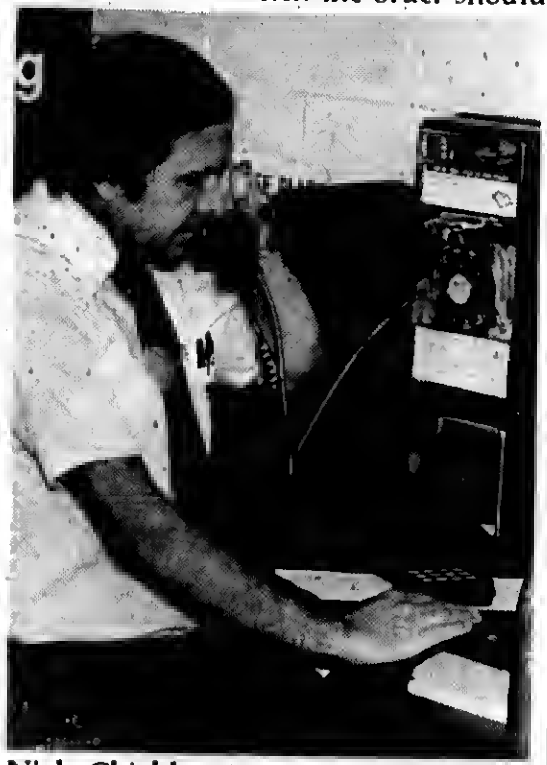
Keypad, S/7 Keep Orders Bubbling

DETROIT — In a phone booth 12 miles from the Detroit Coca-Cola Bottling Co. office, Nick Chichkan, a company salesman, dialed a number. In the Detroit Coca-Cola office, a small light flashed on an IBM System/7 and Chichkan was answered with a high-pitched tone.

He punched a series of numbers into a Port-A-Tone keypad that converts the rotary dial to a Touch-Tone telephone and was answered by a bleeping sound. The Port-A-Tone is made by Interface Technology of St. Louis, Mo., and costs about $75.



Nick Chichkan uses a compact Port-A-Tone unit to access the System/7.

In less than 30 seconds, without speaking a word, Chichkan ordered soft drinks for a grocery store. He gave instructions on when the order should be delivered and noted that empty bottles needed to be picked up at the store.

While Chichkan was placing his order, seven other account driver/supervisors were simultaneously placing other orders.

The Detroit Coca-Cola Bottling Co. is reportedly one of the first in the soft drink industry to use a System/7 to computerize its order entry system from the salesperson in the field to processing the order for delivery. The result for Detroit Coca-Cola and its customers is faster, more accurate order processing and improved service, according to a spokesman.

The System/7 can detect the sounds made by a Touch-Tone telephone and translate those sounds into specific information. Because of this ability, Detroit Coca-Cola's 34 salespersons can call the System/7 directly on one of its eight phone lines.

After the CPU answers a call, the salesperson enters a security code and then a customer code number and all details of the order including product, quantity and delivery date. The System/7 verifies the order total with the saleperson's total; it will not accept orders which do not balance, no matter how many times they are entered.

In addition, the salesperson can send special instructions with an order by entering a specific code. For example, he may tell the CPU to include a note to "stock shelves," "pick up empties," "place advertising" or "expedite."

The System/7 coordinates the order information phoned to it and records it on cards that can be accepted by the firm's Honeywell 1250 mainframe. From there the order is processed and sent on its way.

The previous system required a phone call to a keypunch operator who committed the information to cards, which were gathered four to eight times a day for a batch audit. That batch audit then was hand-checked against the original order. Twice daily, the salespeople would call to verify their morning and afternoon orders.

Warren Ginsberg, DP manager at Detroit Coca-Cola, said "the use of the System/7 saves our sales staff alone 242 selling hours per month, time that is now used to service customers and increase sales. The time savings of computer personnel is even greater.

"In addition, we can handle at least twice as many orders as before . . . and handle them faster with greater accuracy. This has allowed rapid company growth," he added.

Warren Ginsberg, manager of DP, uses the system for handling orders.

Build Your Own

SEATTLE — Thinking of building your own modem? "The Northwest Computer Club News," a publication of the Northwest Computer Club here, recently ran an article by Roger Modeem telling hobbyists how they can build such a device based on the Motorola MC6860 modem-on-a-chip.

The article, with schemata, discussed the various parts needed to build such a modem and noted it can be built for less than kits.

All is not glitter, however, as the article concluded with: "This circuit and article are offered as information only. No attempt is made to defraud, defang, defrock or discredit the Bell Telephone System . . . "

The club can be reached c/o Box 5304, Seattle, Wash. 98105.

You'll Love this Little Smart ASCII Minifloppy Disk!

Add local editing, storage and forwarding to ANY ASCII TERMINAL!

. . . with this all-new micro-processor-based minifloppy terminal.

- Stores 37 screens of 24 x 80 characters, or 13½ pages of 8½" x 11" printed data (71,680 characters) in non-volatile memory!
- Uses new minifloppy 5¼" media
- Two RS232 interfaces, terminal and modem
- Selectable CRT or Printer Edit Modes
- Basic functions: read, record (pack or line mode), erase, find, address, answer back, insert ("Go To" operation)

Teledisk is your answer for decreasing computer connect time, decreasing telephone connect time and the answer to unattended recording of data. Add more terminals to your computer *without* adding more ports. Call collect: 612-941-3300 and ask for TELEDISK!

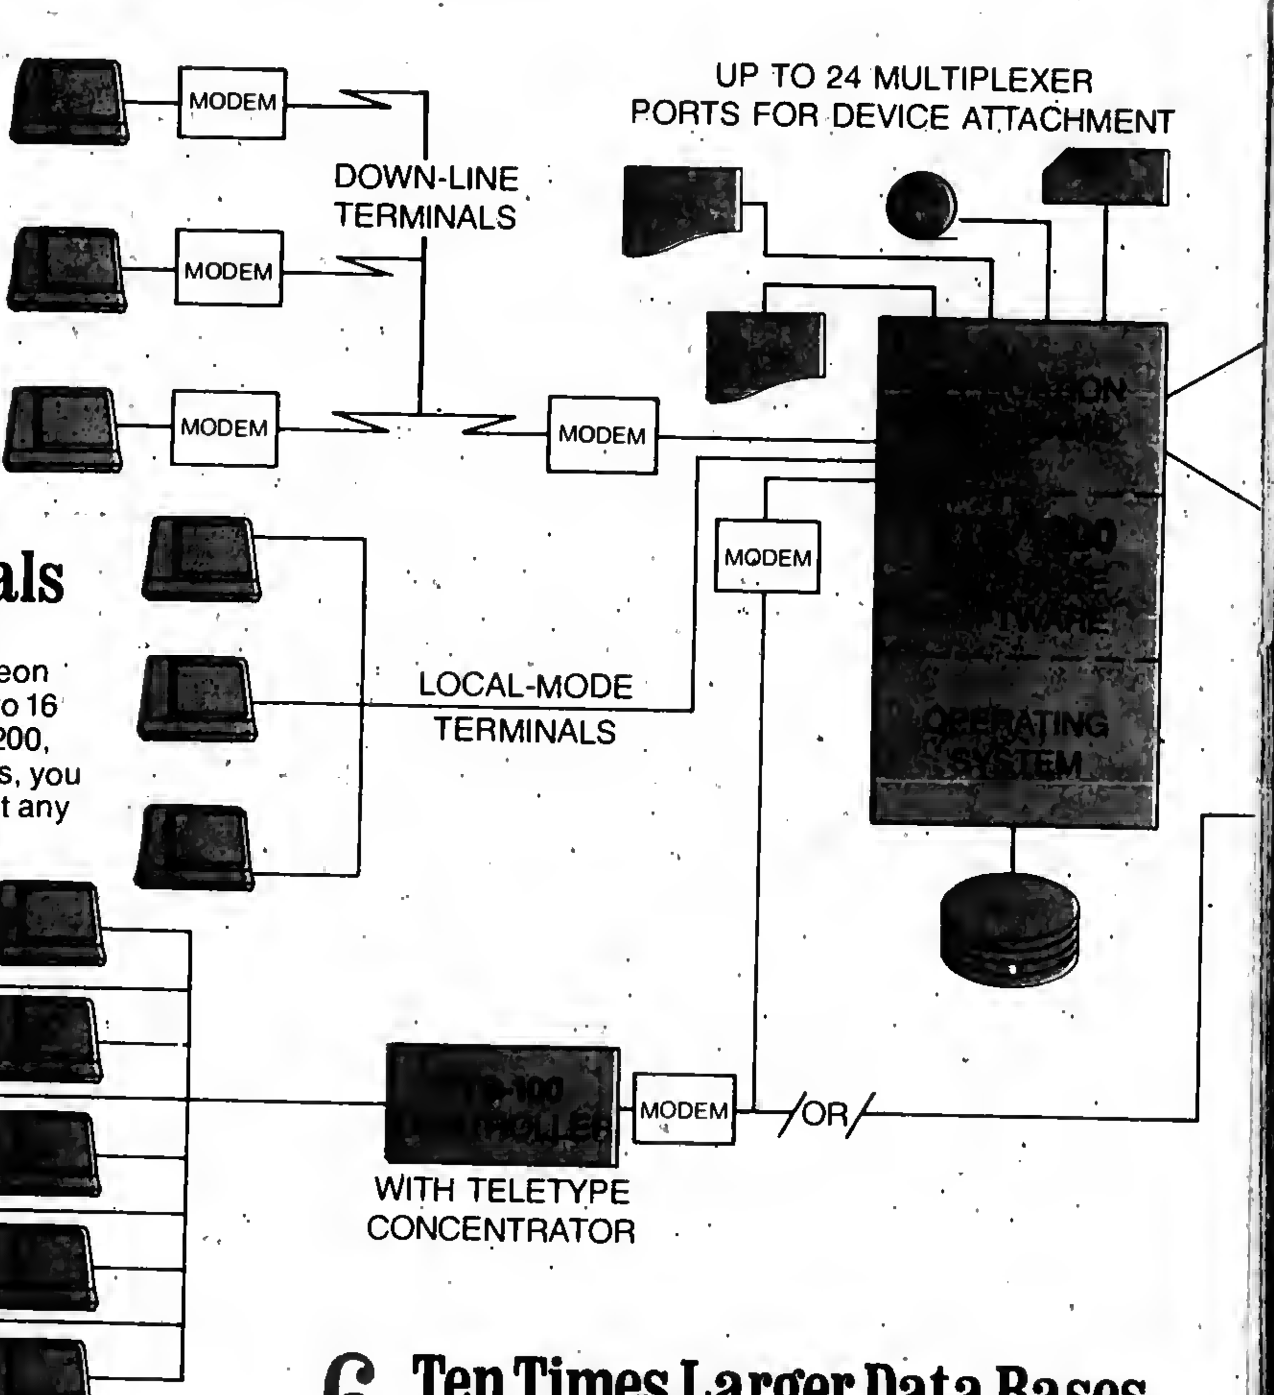
TELERAY DIVISION RESEARCH INC
BOX 24084 MINNEAPOLIS, MINNESOTA USA 55424

3270/3790 Users:
There were always at least five
Now, there are at least ten.

In the past three years, Raytheon has become the largest independent supplier of intelligent terminal and distributed processing system alternatives for IBM 2260, 3270 and 3790 products. Better performance, better pricing, better delivery, greater flexibility and greater intelligence were the capabilities that Raytheon offered. The result: users like yourself purchased more than 20,000 Raytheon terminals and distributed processing systems.

In the past three months, Raytheon has been busily adding more and more capabilities to its PTS-100 intelligent terminal and PTS/1200 distributed processing systems. The reason: to give you more and more reasons to keep buying Raytheon.

Here are ten good ones. Watch this space in coming months for at least five more.



1. Downline Terminals

A brand new capability of our PTS/1200 system that lets you assign the task of multi-drop terminal control, and even applications processing, to a Raytheon system, rather than to your mainframe. Of course, the PTS/1200 can communicate in either batch or interactive modes—or both concurrently—to your mainframe as needed. You can't get this from IBM.

2. Local-Mode Terminals

A long-standing capability of the PTS/1200, and one that only Raytheon offers. It means you can attach up to 16 terminals in local mode to a PTS/1200, at distances up to a mile away. Thus, you get a network in local mode without any TP requirements.

3. Teletype Concentration

Announced two months ago, after more than a year of user operation, this unique feature lets you add teleprinters to the same transmission lines as your 3270-type terminals, with maximum performance and data rates preserved. Know anyone else with this $80 a month feature?

4. Immediate Deliveries

Raytheon has always been known for prompt delivery. We know that when you need it, you want it. There are five new capabilities described in this ad. All five will be in production by June 30th. This year—1977.

5. Lowest Prices

A major attraction of Raytheon alternatives to 3270/3790 has been pricing. Even with IBM's recent price reductions, our pricing schedules permit you to obtain far more capabilities than IBM offers—at rental or purchase rates that are up to 27 per cent below IBM.

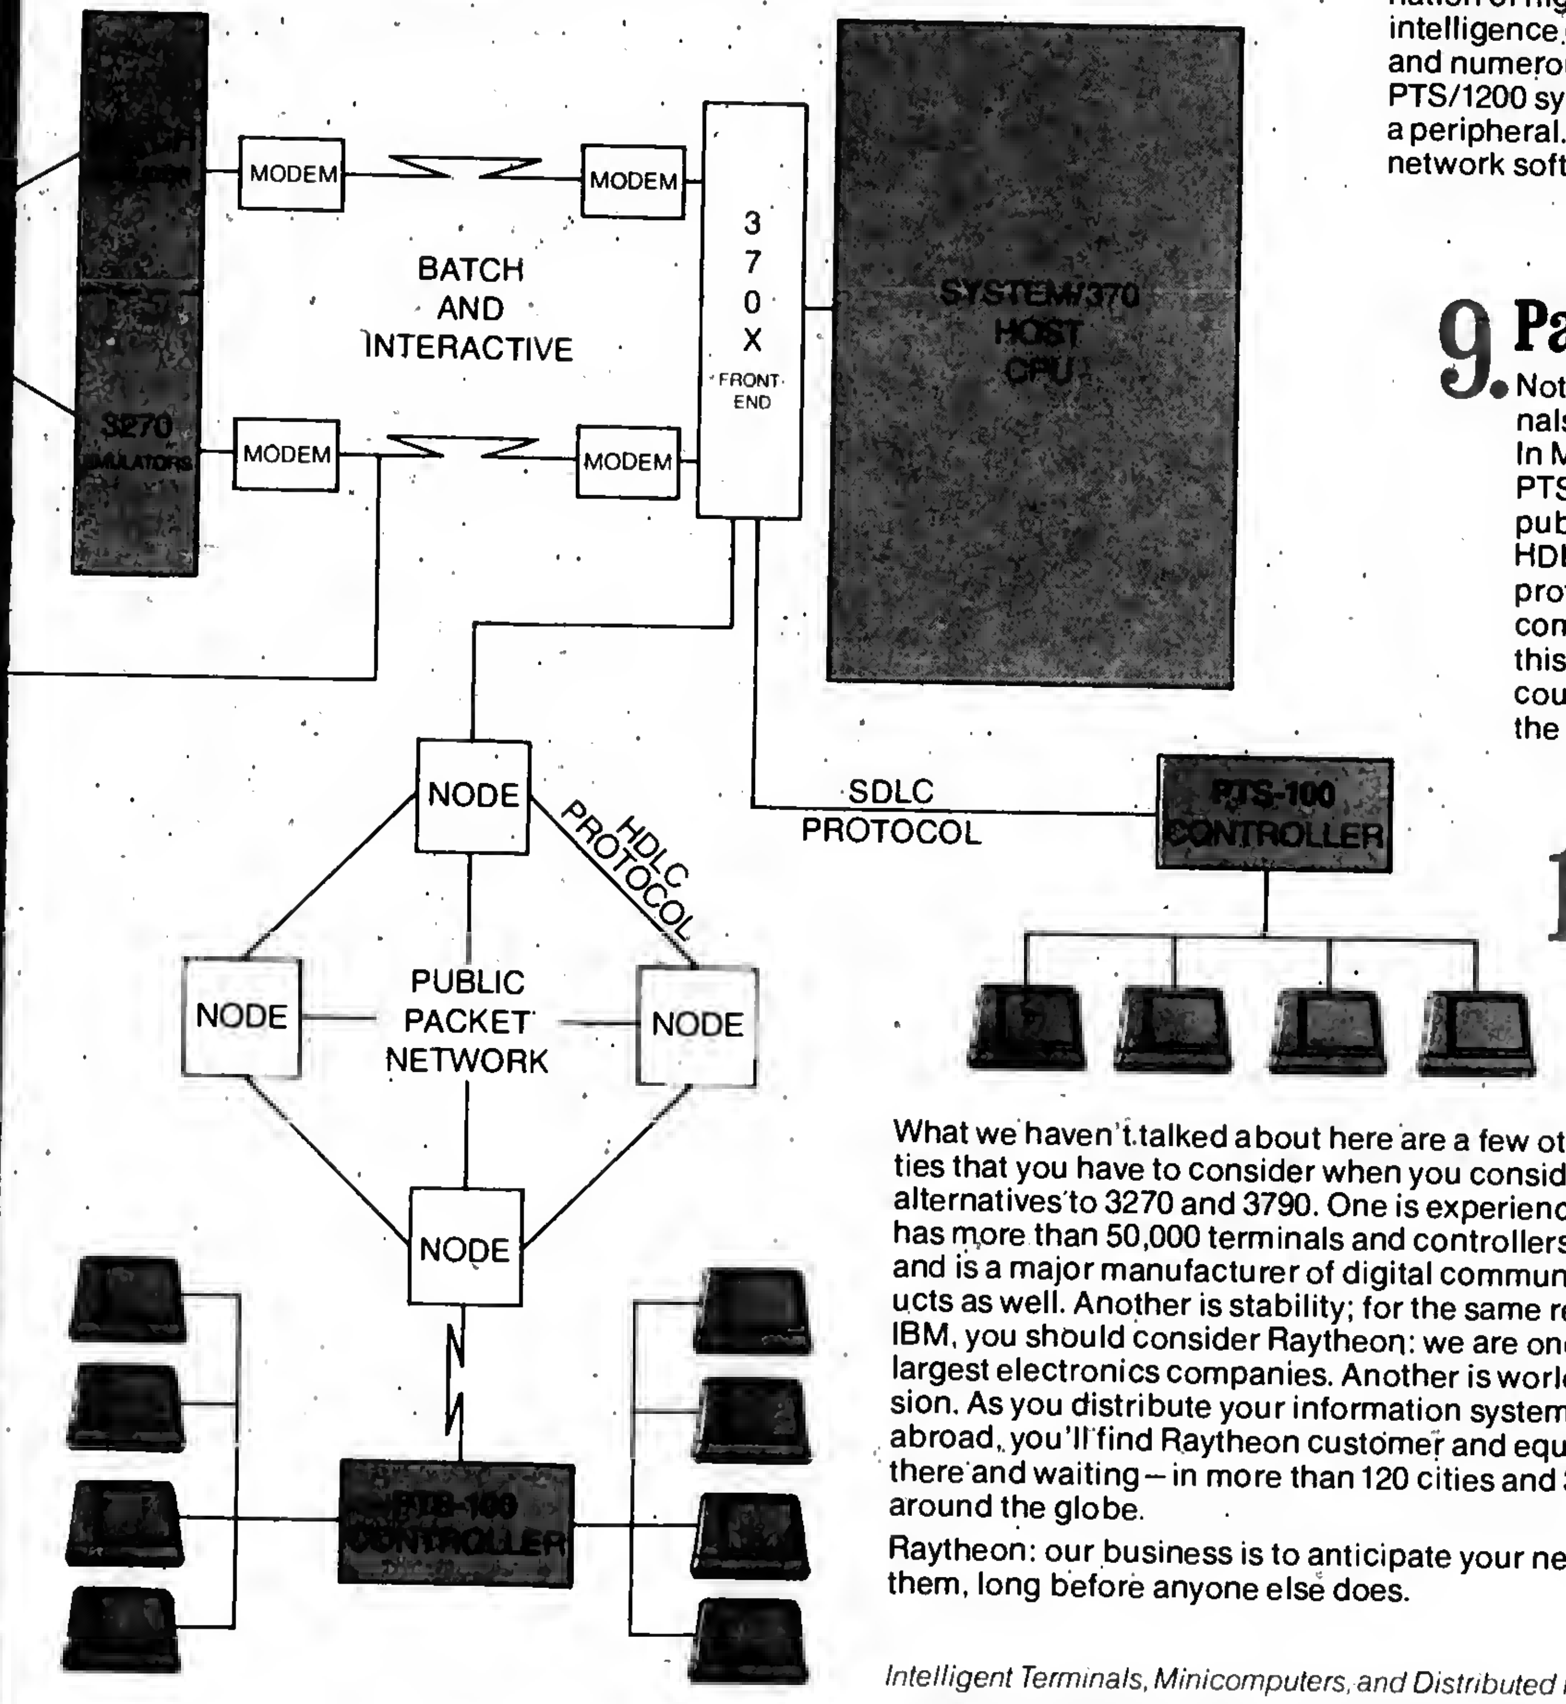
6. Ten Times Larger Data Bases

In a distributed processing system—anyone's distributed processing system—you need disk storage capacity adequate to handle the workloads. Raytheon has just announced a new 320-megabyte disk capacity for its PTS/1200 system. That's 10 times larger than the 3790's.

good reasons to choose Raytheon.

7. Simultaneous Interactive and Batch Communications

Two months ago, Raytheon demonstrated what no one else has—true 3270 concurrency. Our 3270 emulator lets you communicate interactively on a transaction basis with your host CPU. Our 2780/3780/HASP emulator package lets you—at the same time—communicate in batch mode. What counts about that is immediacy: you can do both right now, without any additional applications or front-end software development. And especially, no VTAM or NCP hassles.



8. Total Programming Freedom

This long-standing feature of Raytheon systems needs repeating. Because of the combination of high-level language, very large intelligence capacity, powerful macro routines, and numerous emulators, PTS-100 and PTS/1200 systems treat your host CPU like a peripheral. The result: data networks without network software development.

9. Packet Network Connection

Not with TTYs or ASCII-based terminals, but with 3270-type CRT devices. In March, Raytheon demonstrated its PTS-100 terminals operating on a U.S. public packet network under both HDLC line protocol and X.25 device protocol. We are the only major U.S. company operating such terminals on this international standard in other countries. Now we have it for you in the U.S.

10. SDLC Operation

And yes, every system in the PTS-100 family operates under SDLC protocol if you want it to. Or binary synchronous. Or HDLC. Or 1006. Or 2848/2260. Or Uniscope. Among many others.

What we haven't talked about here are a few other capabilities that you have to consider when you consider Raytheon alternatives to 3270 and 3790. One is experience—Raytheon has more than 50,000 terminals and controllers in use today, and is a major manufacturer of digital communications products as well. Another is stability; for the same reason you like IBM, you should consider Raytheon: we are one of the world's largest electronics companies. Another is worldwide dimension. As you distribute your information systems here and abroad, you'll find Raytheon customer and equipment service there and waiting—in more than 120 cities and 35 countries around the globe.

Raytheon: our business is to anticipate your needs and meet them, long before anyone else does.

Terminal Transactions

Vendor Uses Mini to Automate Remote Tests

MAHWAH, N.J — Remote field testing of data communications terminals has been automated by Western Union (WU) Data Services through a computerized diagnostic system. that reportedly will provide faster service to its customers.

W.U Data Services maintains a line of 10-, 30- and 120 char./sec teleprinters and CRT terminals. The automated system enables the company's field service engineers to order up diagnostic routines and terminal tests from a Hewlett-Packard Co. 2113 minicomputer and devise their own tests for computer execution on customer terminals.

Automated field diagnostics and testing represents an enhancement of the company's Termicare system, a terminal maintenance service that combines nationwide field service with a centralized customer-service. At the heart of the Termicare system is the Termicare Center, which receives calls for maintenance from anywhere in the U.S. over its toll-free lines.

Here technicians either help the customer restore his terminal to service or dispatch a field service engineer to the terminal site. Terminal problems are monitored by the Termicare Center.

Previously, automatic test capability consisted of test tapes being transmitted back and forth between Termicare technicians and field service engineers operating at customer's terminal. Alternately, the field service engineers called upon terminal controllers at the Termicare Center for the transmission of "canned" test messages.

The 2113 processor system eliminates both and simulates more exactly the computer timing of a customer's system, according to a spokesman.

Operated on the minicomputer, the system enables field service engineers to perform terminal testing on the company's entire product line. The minicomputer is said to contain all the special characteristics of each terminal type and generates tests for their special characteristics.

Programs available in the system's library of test routines include:

- Tests specified by the manufacturers of the company's products.
- Tests historically used and found valuable.
- Tests developed to check special terminal configurations.
- Tests initiated by the field service engineers.

Field service engineers can vary the test parameters at will; they can request the number of times they want a test to be run or a change in the line length of characters, transmission rate, code, parity, minimum line length and other characteristics.

This flexibility reportedly enables them to handle unusual terminal problems that are not covered by standard tests.

For example, conducting a store-and-forward test, a service engineer can store a message of any character combination up to 240 characters in the minicomputers. The message will be sent back to the terminal under test by command from the service engineer any number of times, the spokesman said.

The system spots parity errors and prints out "Parity Errors" as well as the bit configuration of the character received in error. More comprehensive data interpretation is planned for the future.

The 2113 mini keeps a running record of all calls it receives and records all test data. It logs in the identity of the user, the duration of the testing and the types of tests requested, providing a means to monitor the usage and effectiveness of the system's diagnostic aids and terminal tests.

An HP 2645 CRT terminal acts as the 2113 console. In addition to a multiplexer, the computer system has four auto-dialers.

The auto-dialers enable field service engineers to instruct the minicomputer to call back customer terminals so they can check the answering side of the terminals, the spokesman explained.

Micom Offering Rate Changer

CHATSWORTH, Calif. — Micom Systems, Inc. has introduced a 50/56 kbit/sec rate changer as a special implementation of its Model 720 digital data multiplexer.

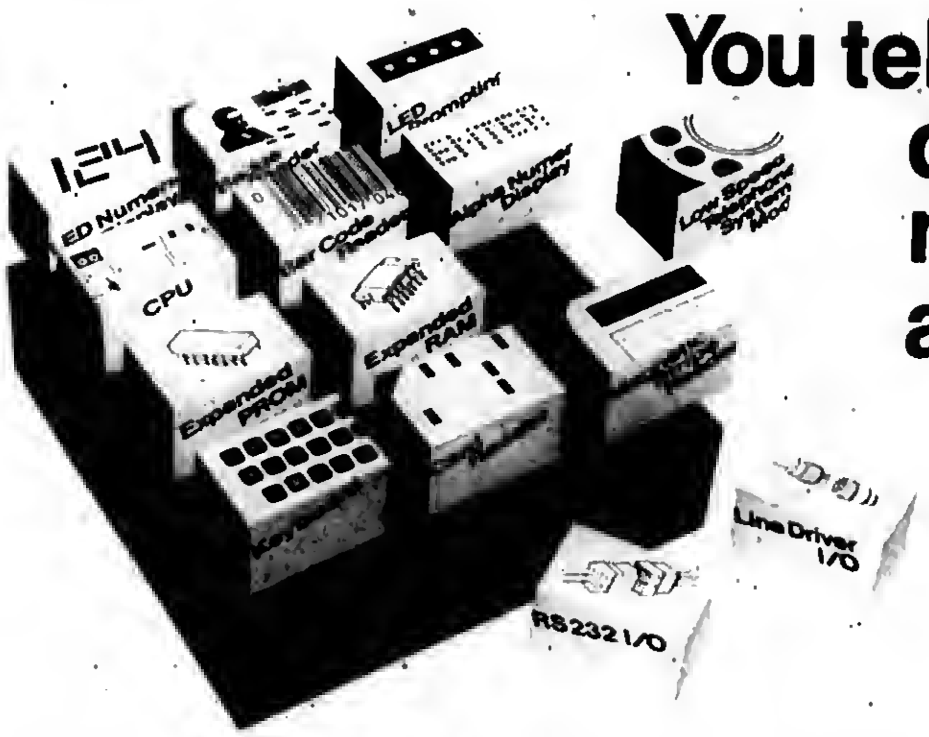
The rate changer permits tandem interconnection of digital circuits operating at 56 kbit/sec and analog wideband circuits operating at 50 kbit/sec with Bell 303 or equivalent modems, according to the firm.

The Micom hardware device reportedly can also be used to change rates between any two wideband data transmission speeds of 40.8-, 48-, 50- and 56 kbit/sec.

The higher speed composite interface operates synchronously at 56 kbit/sec using a CCITT V.35 interface, while the synchronous channel interface operates at the 50 kbit/sec speed using a Bell 303-type interface, Micom said.

Rate changing is increasingly becoming a necessity in the installation of long-distance, high-speed transmission links, the company claimed.

The 50/56 kbit/sec rate changer is supplied in pairs at $2,040 per end from the company at 9551 Irondale Ave., Chatsworth, Calif. 91311.



You tell us what your data collection requirements are.

We'll supply the parts.

With EPIC DATA'S new Model 1647 data collection terminals and Model 1648 system control units (SCUs), you can configure exactly the data collection system you need. These "building blocks," based on microprocessor architecture and modularity, allow you to provide your customers with simple, practical and flexible terminals or systems for virtually any combination of requirements they may have.

simple. EPIC DATA terminals with RS232C interface (ASCII), or optional alternative interfaces, are simple to use and deploy. No computer knowledge is required. Data collection building blocks can be combined to enable collection of information from a wide variety of pre-prepared and variable data. Maximum use of pre-prepared data reduces entry errors.

All models include an 8080 microprocessor; the user can program terminals to provide customized input, output and processing of data. In addition, programmability aids in prompting the user through entry steps; validating data and enables off-line or on-line operation.

EPIC DATA terminals weigh only 8½ pounds. They can hang on a wall, be placed on a desk, and are easily exchanged during maintenance.

practical. EPIC DATA terminals are designed with permanence in mind. Environmental tests conducted in conformity with MIL-STD-810 plus in-depth, on-site testing assure reliable operation over a broad spectrum of hostile, industrial environments. Simple design and rigorous testing have resulted in a demonstrated MTBF of over 19,000 hours. MTTR is only 30 minutes.

flexible. Choose the terminal and options which best meet your application. EPIC DATA terminals can optically read punched badges and 80-column ANSI cards. User-defined keys are available for inputting variable data. Key entry data or time of day is displayed and LEDs are available for prompting.

Terminals can be configured to scan bar codes and magnetic stripes or accommodate other peripherals through RS232 ports. Display options include additional numeric displays, up to 15 LEDs for prompting and a 32-character alpha/numeric display. A low-speed modem and serial asynchronous or synchronous communications ports with either RS232 or line driver I/O may be added. Both PROM and RAM memories are expandable.

SCUs. Model 1648 SCUs can be configured to poll up to 100 terminals, assemble transactions, format data, append time and date, and store or forward collected data to the host.

Let EPIC DATA show you how microprocessor-based architecture and building block modularity will provide you with simple, practical and flexible data collection terminals and SCUs.

OEM quantity (100) prices start at approximately $1000. Contact your Epic Data representative today or write:

DP Dialogue

Notes and observations from IBM
that may prove of interest to
data processing professionals.

TOPS supports freight car classification at Southern Pacific's Bayshore Yard, just south of San Francisco. Data on car movement is supplied by 545 terminals linked by telephone and microwave to dual IBM computers.

TOPS Saves Southern Pacific $6 Million Yearly

The Total Operations Processing System (TOPS) of the Southern Pacific Transportation Company keeps track of the 100,000 freight cars that roll over 13,445 miles of railroad. According to railroad president Denman K. McNear: "TOPS is producing tangible recurring savings of $6 million annually."

Terminals in switchyards throughout the vast rail system supply data on car movement to TOPS' dual System/370 Model 168's in Southern Pacific's San Francisco headquarters. From there, TOPS assigns cars to shippers; directs their movements and stores each car's current location. As a train approaches a switchyard, TOPS transmits the "consist": a listing of all cars, their contents, destination and special handling instructions. From this, yard men create a track list which directs switching operations. When a departing train has been assembled, its new consist is transmitted to TOPS.

"We've been installing programmable units of the IBM 3770 Data Communication System at our terminal locations," says J.W. Germany, vice president of management services. "We can perform local switchyard data processing functions as well as computer input-output on the 3770. This integration has speeded up operations in the yards and cut down on errors.

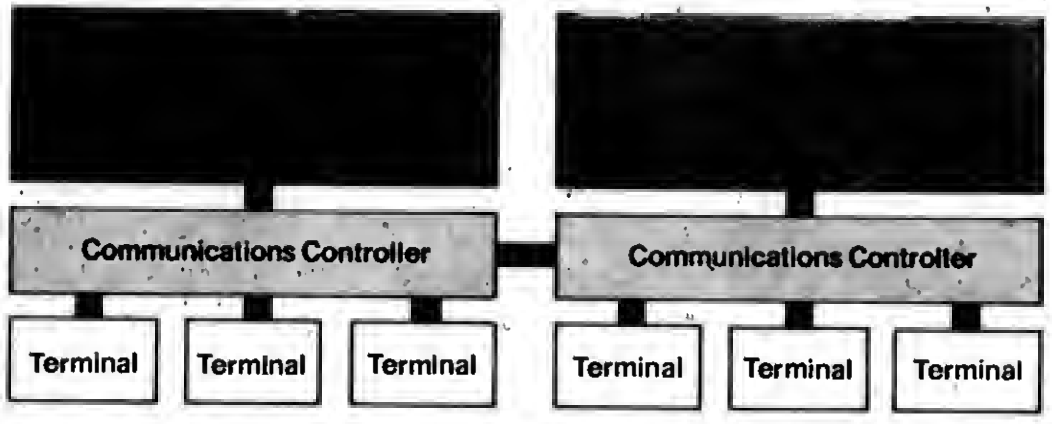
"Overall, there has been no increase in our hardware costs, and TOPS data is more current. The higher data rates of the 3770 make better use of our communication links, resulting in further direct savings.'

"The 3770 has opened the way for continuing enhancement of TOPS. We are currently running a pilot project in which we eliminate the paper waybills which accompany all freight cars. Instead, TOPS supplies required waybill data through the 3770 system.

"This is a substantial change in how we operate, and it holds a lot of promise. We're projecting important gains in personnel productivity, customer satisfaction, cash flow, error control, and shortened time from completion of movement to rendering of the bill."

Adds railroad president McNear: "The TOPS data base has made possible online inquiry of car location for shippers. And it permits better planning and better reporting on all levels of management."

Networking Extends the Reach of Computers



The engineer, visiting corporate headquarters, has a sudden requirement for a mathematical routine resident in a plant computer many miles away. He sits down at a terminal in headquarters—one which normally accesses business applications in the corporate computer—and logs on just as if he were at the plant. The local system senses that he is requesting a program only available at the plant, and routes his request to the computer there.

Similarly, a headquarters visitor to any company location with a terminal can as easily establish a link with an application in the corporate computer.

This mode of computer use is a feature of *networking*, and now a new form of networking is available from IBM under Systems Network Architecture (SNA). Called Advanced Communication Function (ACF), it includes enhancements to both the Virtual Storage operating systems for System/370 and the Network Control Program for the 3705 Communications Controller.

The 3705 can automatically switch a service request at any terminal to an application in any computer in the network. This action is "transparent" to the user, who sees a "single system image" and is not aware of or concerned with the computer to which his work is routed.

ACF provides an architecture which lets the user specify recovery procedures, switching rules, the Initial Program Load (IPL) sequence, emergency reduced-service operation, and communication to and from operators. This structure is provided by the Network Operation Support Program (NOSP)—a programming mechanism by which the user enters his own decision rules and priorities.

Networking with ACF offers great advances in reliability, availability, and cost/performance. Idle capacity can be put to use quickly since a new application can be installed wherever there is room for it. And ACF can greatly improve the economies of such general applications as text processing and interactive training systems, by making them widely available through existing terminals. Similarly, more terminal sites become economical, since each can access more applications.

Tying computers together in a network makes their power more accessible, reliable and economical. It extends their reach to more users and into new application areas.

DP Dialogue is designed to provide you with useful information about data processing applications, concepts and techniques. Give us 3 minutes

and we'll show you how to cure your 2501 headache

We're that sure of our new 6501 Buffered Card Reader. Call us and we'll tell you more about how:

- The buffered DOC 6501 can be installed on ANY position on the channel and puts an end to channel OVERRUNS.
- The buffered DOC 6501 gently handles and increases the life of repetitively read card decks.
- The buffered DOC 6501 saves you 25% or more than a 2501.
- The buffered 6501 can be purchased or leased NOW.

If you aren't convinced in three minutes, we'll send you some buffered aspirin. With an unbuffered 2501 you'll probably need it.

Call John Sterling at (800) 327-6424 or (305) 724-1111.

NCR Unwraps Largest Interactive 8000

DAYTON — NCR Corp. has introduced the latest model in its 8000 series, the I-8430, which is the largest interactive model NCR has released to date.

The heart of the I-8430 is a 112 nsec CPU that utilizes ECL circuitry, internal transfer-bus architecture and user diagnostics, according to the firm.

Memory available with the sysem ranges from a minimum 128K to 384K bytes. Memory increases come in 64K-byte increments, a spokesman said.

The I-8430 can accommodate NCR's complete library of interactive Cobol programs, he claimed, noting that Cobol programs developed by NCR, its users and by independent software houses for the NCR I-8200 series machines will run on the I-8430 without modification.

System options include two additional trunks to bring the total possible up to three and an integrated disk controller which allows one string of up to eight spindles.

The system can operate with CRTs, card readers with speeds up to 600 card/min, line printers up to 900 line/min and 10M- to 67M-byte disk units with transfer rates up to 885 kbyte/sec.

The basic I-8430 with 128K bytes of memory costs $71,500 and rents for $2,050/mo. A system with CPU, 256K bytes of memory, 10 CRTs, 67M bytes of disk storage capacity and a 300 line/min printer rents for $3,900/mo and sells for approximately $196,000.

NCR also released for sale its 721 communications processor. The processor is already installed in several communications networks.

The processor, although it predates NCR's recently announced distributed network architecture, can be conditioned to conform to the latest NCR architecture, the spokesman said.

Join the Show

WALTHAM, Mass. — Users who bring magnetic tapes to Info '77 in New York' Oct. 17-20 will have an opportunity to see their own reports printed on a Honeywell Information Systems, Inc. Page Printing System (PPS).

The HIS offer applies to users of IBM 360/370, Burroughs 6700, Univac 9700 and HIS Level 66 Series 6000 or Series 2000 CPUs.

Users interested in participating in the demonstration should contact Russ Bishop at HIS, 200 Smith St., Waltham, Mass. 02154, before Oct. 10.

'Independence' Can Liberate User Budgets

By Richard Egan
Special to CW

In an unparalleled technological boom, DP has evolved in two short decades from the wonderful to the commonplace. Computers permeate our society, making it possible for us to do scientific research, manufacture goods, cash checks and even get on junk mailing lists faster and more efficiently. A recent study showed there are more jobs for college graduates in the DP field that in any other except engineering. In short, we take computers for granted.

The one thing professionals in the field cannot take for granted any longer is the increasingly high cost of DP equipment. "Cost-effectiveness" has become the industry's favorite buzz word.

DP managers, faced with greater demands for service and tight budget constraints, are less willing to accept the costly, packaged solutions of single vendors and are becoming more independent in their choice of both software and hardware components.

The independent plug-compatible peripheral industry has developed in response to that growing user independence.

The independent manufacturer, whether his product is tape drive, disks, terminal or main memory, must compete head-on with large, entrenched vendors. The independent manufacturer must deliver better performance at a lower price if he is to survive. That fact can, and does, work to the independent-minded user's advantage. Over $2 billion worth of independently supplied DP equipment now operating successfully in the field represents an almost equivalent amount of savings to the user community.

A good example of the savings available through the acquisition of equipment from an independent is the cost of 512K bytes of 370/145 memory:

	Price	Savings
New from IBM	$192,800	none
Used IBM	$125,000	$ 67,800
Independent (Cambridge Memories 370 Stor/145)	$ 75,000	$117,800

The same 30% to 40% savings holds true generally regardless of the size of the mainframe being upgraded with add-on memory, whether it is a 360 or a big 370/158 operating in a virtual storage environment.

The catch is that if you own your own IBM mainframe or lease it from a third-party purchaser, IBM will not rent additional main memory to you. You have to buy it outright at around $250,000/M byte. If, for example, your need for additional memory is linked to a specific short-term project, the cost is prohibitive.

If your IBM mainframe is rented, you can add memory, but only at the cost of signing a four-year Term Lease Plan and paying extra-use charges. If your projected needs are reduced unexpectedly and you no longer require the extra memory, you're stuck.

Independently supplied expansion memory offers more flexible acquisition terms compatible with your specific long- and short-range planning. Most independent memory can be leased over a variable term or purchased. The fact that your CPU is rented, leased or owned is irrelevant.

In addition, you can easily reconfigure your system upward or downward to meet changing workloads or budget requirements. Independent memory modules may even replace all but the minimum amount of IBM-resident main storage (512K) for major savings on rented equipment.

Extra Budget Savers

In addition to the obvious equipment acquisition savings, independent equipment offers users several other benefits that can have a substantial effect on the bottom line.

Many independent suppliers offer higher density tape and disk storage capacity for faster transfer speeds and better utilization of I/O devices.

Double, sometimes quadruple, capacity main memory modules ranging in size from 512K bytes to 7,680K bytes are available only from independents. These not only improve throughput in many applications, but also allow users to upgrade service without giving up older, reliable and — often — fully depreciated CPUs.

CPU enhancements available from some independent vendors have increased throughput anywhere from 10% to 20% and at costs dramatically lower than acquiring a new CPU.

Energy savings are also more likely with independent equipment. For example, main memory is usually available a year or two after a vendor such as IBM or Digital Equipment Corp. makes its first customer shipments. Therefore, the later-introduced memories can take advantage of more advanced technology.

As an example, the 512K-byte Cambridge 370 Stor/145 memory requires only 1.8 kVA while the same capacity IBM memory consumes 5.8 kVA. Assuming the user pays 4 cents per kilowatt hour and air condition-

Five Suggestions Offered

Data Entry Savings Means People Management

By Ron Henderson
Special to CW

Month after month, users are being bombarded by a parade of new computing products. With the advent of bubble memories and microcomputers we are rocketing ourselves into a world that would startle even Buck Rogers.

But too little attention has been given to the all-too-familiar problem of capturing data to feed the voracious CPUs. Our main focus has been to "solve all problems with hardware." However, the simple fact remains that to continue to make computers work, someone has to depress keys, punch cards, write output tapes or directly enter data.

Let us not forget punched cards were first used in 1890 to tabulate the U.S. census. Now, 87 years later, we're still punching cards. Outside of some optical character recognition applications, the prospects for eliminating hand keystroking is doubtful in our lifetime. Data entry operators, whether centralized or dispersed, will remain a permanent part of any DP operation.

In recent years there have been numerous improvements in data entry systems. "Plain vanilla" has given way to "hot fudge with whipped cream and cherries" systems. These delicious new systems eliminate large numbers of keystrokes and costly errors while transferring many functions off the mainframe.

However, in spite of these new data entry systems the bulk of all data is captured by people. Computers need data entry people, for people have this wonderful ability to scan a disorganized source document, read the most ridiculous handwriting and spot mistakes no computer could possibly detect.

But some operators are more productive than others, so to stretch the data entry dollar a manager must make the best use of his people. Imagine what would happen if all data entry operators started increasing their keystroking rate by 30%. Imagine what that would do to the budget.

It probably isn't going to happen, but still we have to ask ourselves how is it some people can actually keystroke at 18,000 strokes per hour while others can only do 8,000. Why are there such wide disparities among people using the same source documents and systems?

More importantly, how can we help data entry people be more productive and happy . . . and in the process stretch our budget?

Here are five suggestions for increasing data entry productivity:

- Aptitude — Anyone who selects an operator with good experience over a person with certain high aptitudes may be sorely disappointed. With good hand-to-eye coordination, fast finger dexterity and a high degree of numeric and verbal reasoning, an inexperienced person can outperform the experienced operator with less aptitude within three months. Unfortunately, you can't train someone to have better aptitudes. Either you were born with them or you weren't. People with great attitudes, good attendance records and poor aptitudes can work as hard as they want, but they can never meet the level of performance of the people with the right aptitudes.
- Attitude — Operators can sometimes whiz through the day at fantastic rates of speed. Nothing seems to slow them down. How wonderful it is to have people who key 15,000

(Continued on Page 48)

Turning a profit in turnkey systems:

If your business is selling turnkey computer systems, using the right computer can be the key to making more sales—profitably.

You need a computer that's easy to use—and adaptable to many uses so you can get more customers. And you want a computer that's priced to sell, at a margin that's profitable.

You want a computer that can really protect your proprietary software—keep it safe, and saleable, sale after sale. And you need a better way of supporting your software than having to visit sites.

You need a computer with proven reliability, so there'll be fewer service problems. And you want a fast, dependable service network when there are.

Needs and wants met here

For all this, the one computer you want is the one we make:

The BTI 4000 Interactive Timesharing System.

It's a ready-to-go system with 10 megabytes of storage, magnetic tape drive, and 8 ports—just add terminals. And it's easily expandable—add disk storage to 400 megabytes, increase user capacity to 32 ports, add peripherals like industry-compatible magnetic tape and a line printer.

The BTI 4000 is designed, manufactured and supported by Basic Timesharing Inc. We're the manufacturer with timeshare experience. Which has helped us produce a computer uniquely right for multi-user applications.

A dedicated performer

The BTI 4000 has been proven in all kinds of applications—general accounting, dealer inventory control, entertainment ticketing, text publishing, school administration, and more.

What's more, the BTI 4000 is proving its reliability at locations in 39 states, in 5 provinces of Canada, and in Europe, too.

Things you'll like

The BTI 4000 uses BASIC-X, an unusually powerful extension of BASIC. With the features you need to get your software up—quickly, efficiently. So you can start selling sooner.

Especially important to you, the BTI 4000 protects your proprietary software. So you can count on selling it again, and again. Without losing control of it. And with the convenience of dialup access, so you can support it without the cost of site visits.

Things your customers will like

The BTI 4000 is a true timesharing system. It allows doing any mix of tasks, all at the same time, from any number of locations.

Your customers will enjoy faster response, because the BTI 4000 implements many of your application program operations in firmware.

The system also offers continuous availability, because software backups, updates, and other housekeeping activities can be performed locally, remotely or programmatically, with users on the system.

And the BTI 4000 is so easy to manage, your customer won't have to add a specially-trained employee just to run it.

Service—good and fast

In the packaged systems business, service can have a real impact on your success.

That's why service is such an important part of our business.

The BTI 4000 is designed for over-the-phone, on-line diagnosis of actual and potential problems. 24 hours a day, 7 days a week, we're ready to help. If a BTI 4000 ever needs on-site service, we have a network of field specialists to provide just that.

Priced to please

A single BTI 4000 costs $35,950. There are attractive quantity discounts—like $28,760 each for a quantity of 10.

For that price you get all the features and support benefits mentioned above, not a sealed-down version.

You can get complete information at your BTI regional office, listed below.

The BTI 4000. It could be your key to turning more profit in your turnkey installations.

The BTI 4000 Means Business.

Basic Timesharing Inc., 870 W. Maude Ave., Sunnyvale, CA 94086. Sales Offices: East: Cherry Hill, NJ (609) 662-1122; Midwest: Minneapolis, MN (612) 854-1122, Chicago, IL (312) 298-1177; South: Dallas, TX (214) 630-2431; West: Sunnyvale, CA (408) 733-1122, Anaheim, CA (714) 533-716t

ASSISTANT DIRECTOR

For operations and Technical Support - Administrative Computing Services. Degree + 4 years experience in systems analysis, programming or computer operations. Management experience and knowledge of computer operations, OS, CICS, COBOL, JCL & RJE preferred. Salary $15,117-$17,000. Send resume to Doug Duncan, Employment Coordinator, 2nd Floor HUB, University of Florida, Gainesville, FL. 32611.

Equal Employment Opportunity Affirmative Action Employer

'Ease of Use' Has Become Latest DP Buzzword

By Douglas J. Bartek
Special to CW

In the first 20 years or so of the computer industry, success among computer manufacturers was measured by superior price/performance of hardware and utilization of special operating system capabilities. However, in later years there has been a growing demand from the DP industry user community for systems that offer not only hardware efficiencies, but also better user conveniences and tools for maximizing the productivity of personnel. As long as hardware unit costs continue to drop and the cost of personnel continues to rise, this area — ease of use — will receive increasing attention.

The idea of stretching the DP dollar through easier-to-use systems is not new, of course. But because of the industry's past orientation to the DP professional and his use of the computer, some of the best ways of increasing productivity have been largely neglected. This includes expanding the use of the computer to the non-DP potential end user (businessman, executive or clerical personnel not trained in DP).

Industry efforts have been started in this area, particularly in the word processing and small business systems marketplaces. These efforts are expanding upwards into the larger mainframes as the value of easy-to-use systems and tools becomes more and more obvious.

'Different Strokes . . . '

This has created some semantic problems in the industry, as "ease of use" implies different things to the three different types of current and potential equipment users. "Ease of use" to an operator may imply a special function key on the system console. To an applications programmer it might imply a utility package to aid in debugging. To the non-DP end user it may mean simply asking the computer a question in the form of a natural English sentence and getting a natural answer in return.

Emphasis in the past has been placed on ease of use for systems personnel, perhaps since software developers are more familiar with their particular needs. Systems personnel are the operators, system engineers, systems programmers, librarians, etc. responsible for the maintenance and well-being of their system.

This group is concerned with optimizing resource utilization, developing scheduling procedures, the physical custody of the installation's data bases, the required security controls, new software release updates and other matters. Thus, ease of use for systems personnel is concerned with accessibility of system functions, diagnostic and monitoring capabilities, easy software release installation, minimizing operator intervention in handling of jobs and simple console interaction, among others.

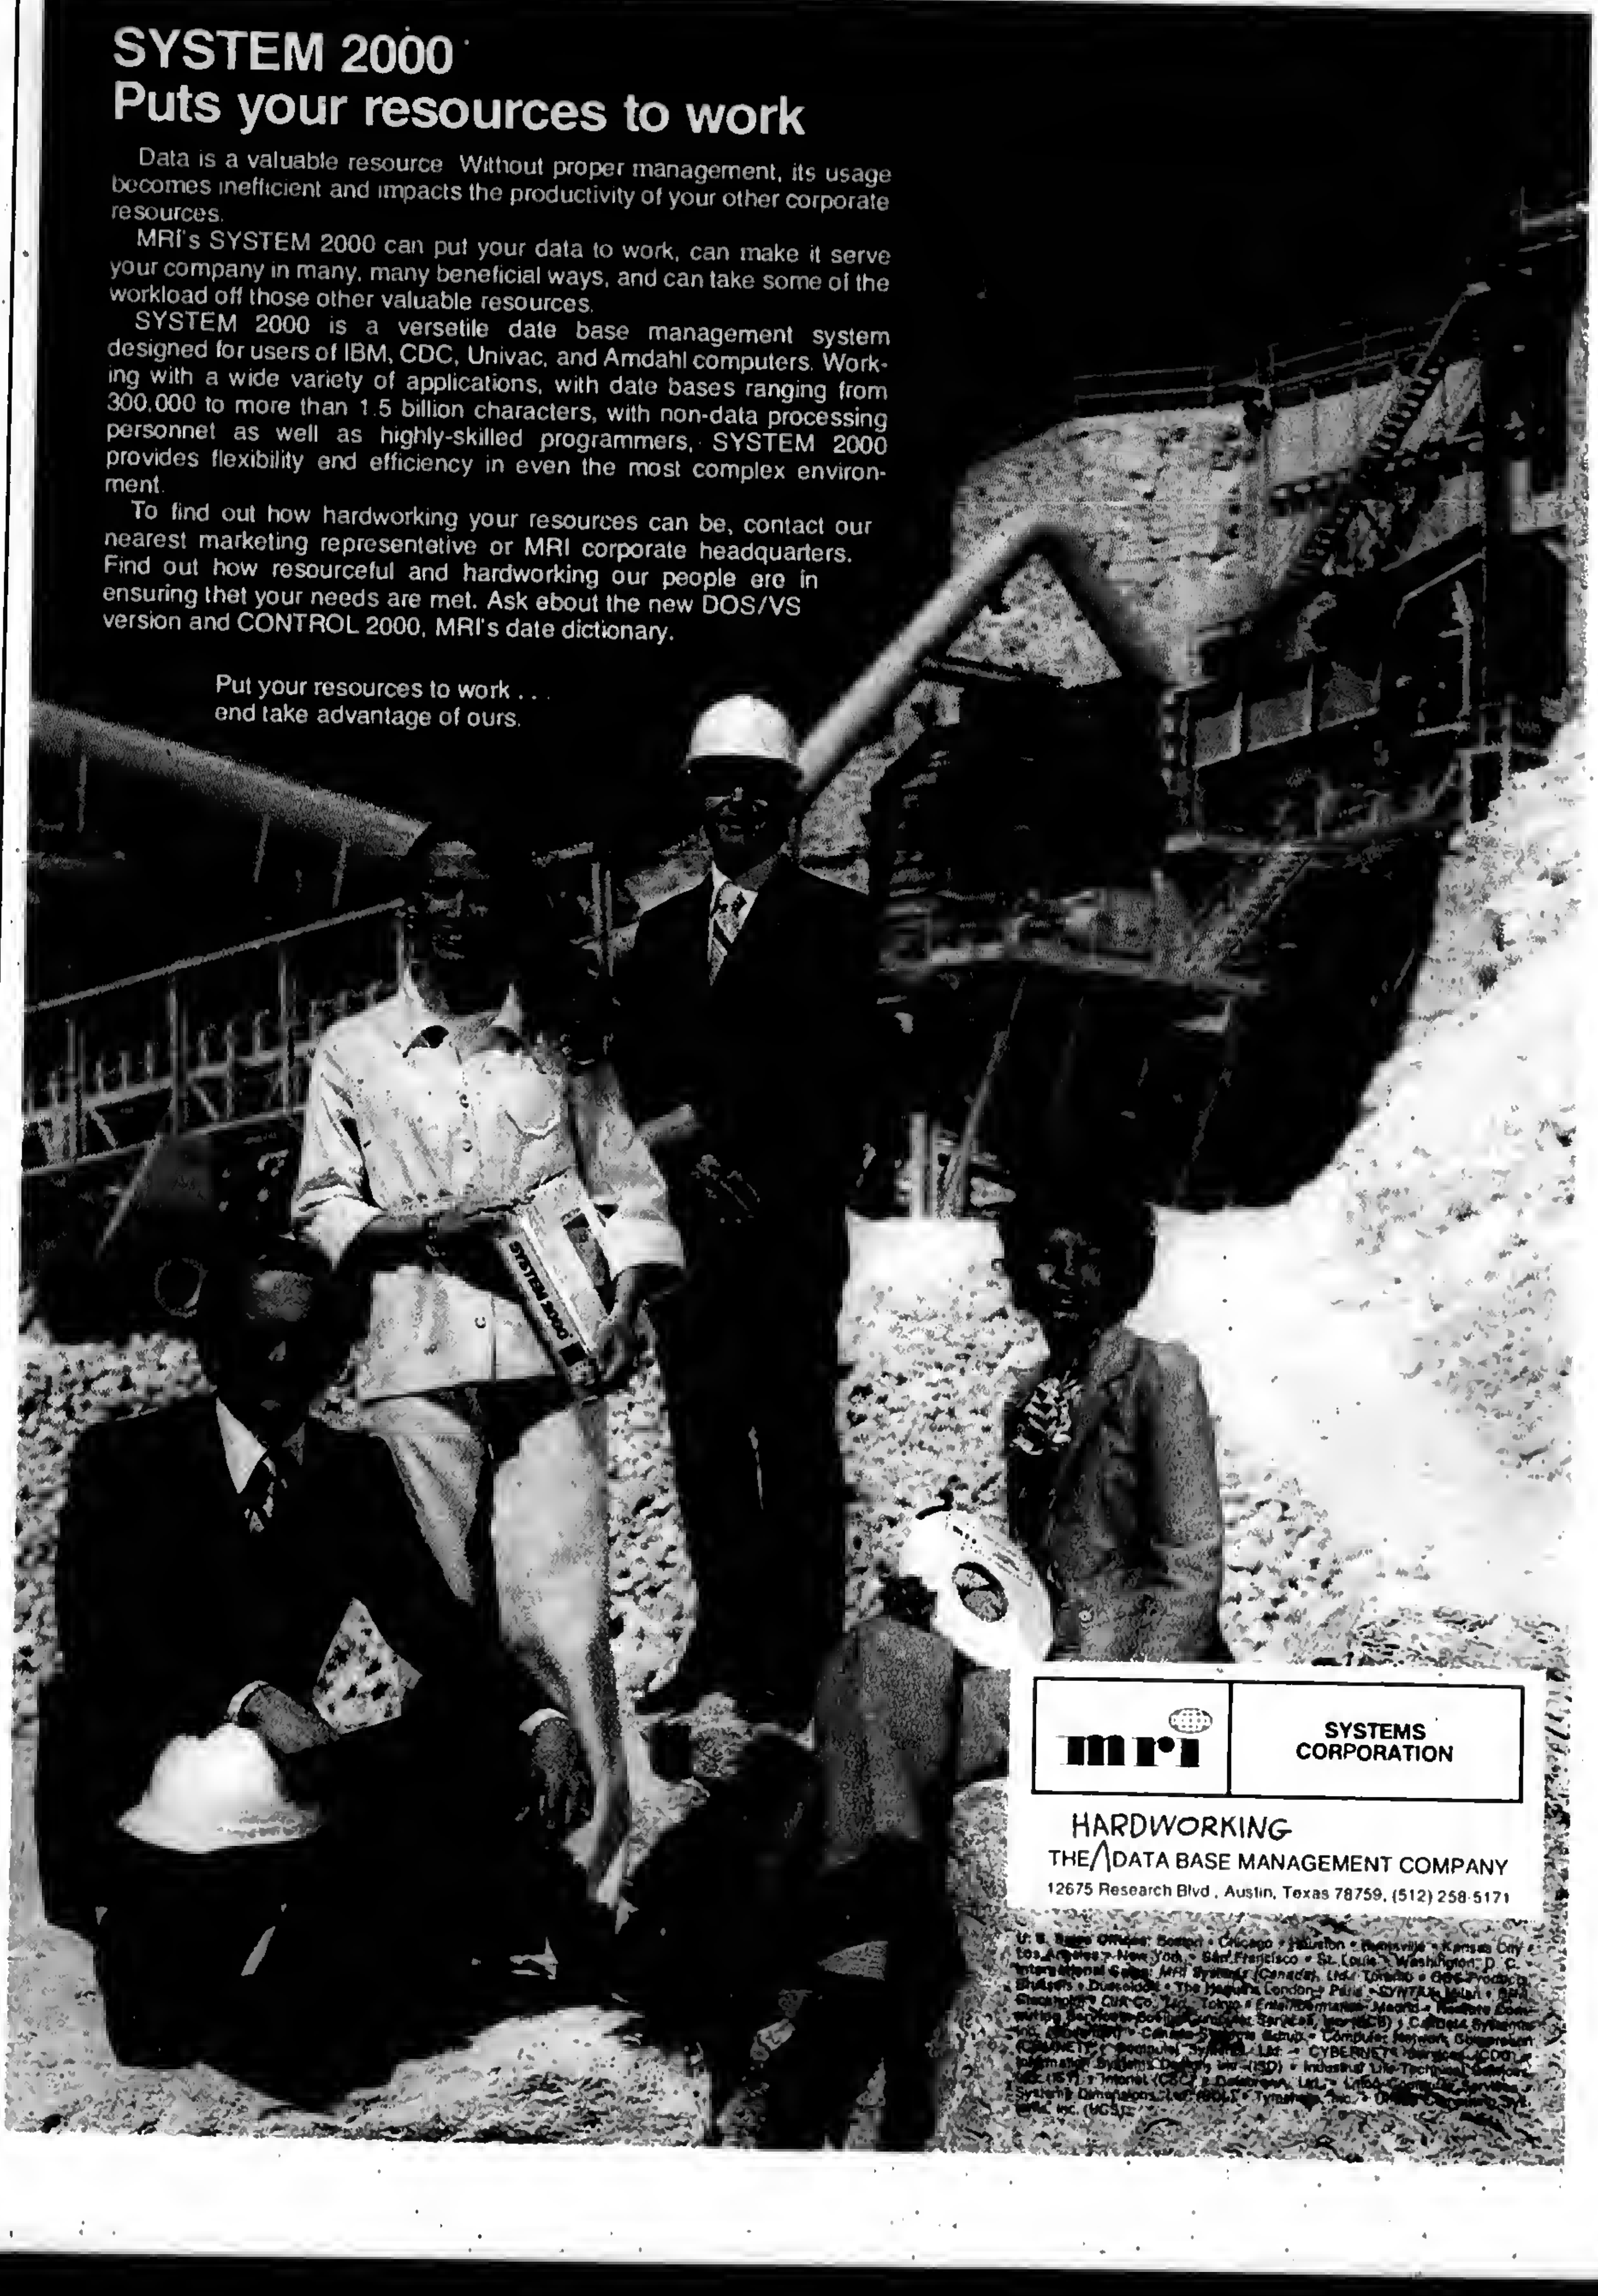
The application programmers analysts are those who interpret the end users' needs and develop the procedures and programs required to obtain solutions. Ease of use for application programmers/-analysts implies a DP facility which is available when needed and which provides quick and accurate feedback in understandable terms.

It also means to them a system which is consistent across all interfaces and a system in which they do not have to be concerned with particular methods the system uses to access data files and communicate with remote terminals. They should not have to be concerned with internal details of the system, specific resources used or the internal language of the system.

Ease of use for this class includes the facilities, capabilities and tools to improve programmer productivity, to allow them to be more responsive to user requests, to do their job with fewer and/or less-skilled personnel and to better utilize their production and development activities.

End users of DP systems include all those who use the system's output or results to perform their jobs. They may not be acquainted with DP technology and, in fact, probably care little about the details of DP systems. To them DP is simply one service among many they might em-

(Continued on Page 46)



SYSTEM 2000
Puts your resources to work

Data is a valuable resource. Without proper management, its usage becomes inefficient and impacts the productivity of your other corporate resources.

MRI's SYSTEM 2000 can put your data to work, can make it serve your company in many, many beneficial ways, and can take some of the workload off those other valuable resources.

SYSTEM 2000 is a versetile date base management system designed for users of IBM, CDC, Univac, and Amdahl computers. Working with a wide variety of applications, with date bases ranging from 300,000 to more than 1.5 billion characters, with non-data processing personnet as well as highly-skilled programmers, SYSTEM 2000 provides flexibility end efficiency in even the most complex environment.

To find out how hardworking your resources can be, contact our nearest marketing representetive or MRI corporate headquarters. Find out how resourceful and hardworking our people ere in ensuring thet your needs are met. Ask ebout the new DOS/VS version and CONTROL 2000, MRI's date dictionary.

Put your resources to work . . .
end take advantage of ours.

IF YOU DIDN'T HAVE TO COMPARE PRICE,

Of course, when making a large investment, you would compare price–and find that Itel offers you substantial savings over IBM. But if you didn't have to compare cost, you'd compare features–and choose Itel's Advanced System.™ Because we took IBM's best concepts and improved them.

Dramatic advances in the semiconductor industry have allowed us to build a more compact, more reliable and more powerful CPU using about half the components IBM uses. Which means Itel's Advanced System takes up much less space than the comparable IBM system. In addition, the Advanced System runs approximately 9 degrees

cooler, increasing the reliability of its integrated circuits.

And it comes complete, including a 180 cps printer. No optional "special features" that often end up costing you almost as much as the system itself.

What's more, the Advanced System's flexibility helps prevent obsolescence and protect your investment–all six of our models can be either upgraded or downgraded, as the situation demands.

Itel's Advanced System gives you everything its IBM counterpart does, and in some cases, more. But, even with all our features, the Advanced System will cost you less than the comparable IBM system.

When it comes to price, features and performance, Itel is the only sensible alternative to IBM. Not only in total computer capability, but in systems and software, in computer peripherals, in field engineering, in financial packaging.

Itel. The sensible alternative.

Bowe Burster

PLAINVIEW, N.Y. — Bowe Systems is offering a burster that can handle up to eight-ply forms and processes up to 550 ft/min, according to a spokesman.

The Model 321 features programmable command cards in the form of printed circuit boards with electronic controls and electronically assisted servo mechanisms

—Unit speed can be user-regulated, he added.

Center cutting and margin trimming can be accomplished with two margin trimmers and a longitudinal center cutter that are standard equipment, the spokesman said.

The Model 321 costs $10,900 from Bowe at 175 Express St., Plainview, N.Y. 11803.

'Ease of Use' Latest DP Buzzword

(Continued from Page 43)

ploy to solve their problems or to perform their work. Whether they employ it depends on how easy it is to use and on its accuracy, timeliness and cost.

Thus, ease of use to the end user centers around the user interface itself. The user must be able to interact with the interface in the user's "source" language; i.e., a businessman or secretary should be able to retrieve a "report," not a file under a certain catalog in the file system, and be able to make changes to it using simple commands or physical actions without worrying about temporary scratch files and buffer storage.

The end user also needs a simple, consistent command interface to allow him to state the developed solutions in terms that are meaningful to his area of expertise, without requiring him to learn the idiosyncrasies of the DP system. Furthermore, the end user needs user-oriented, easily understood documentation that describes the system's external behavior without describing the internals.

End Users Organize

The growing end-user orientation may, in fact, be the prime vehicle for stretching the DP dollar and system productivity in the near future. End-user organizations are becoming more actively and directly involved with access to their data and manipulating it for their needs. These organizations need facilities and capabilities to get responsive results and are pressuring their DP organizations to acquire the needed capabilities for them.

In a recent ABC Management Systems survey concerning non-DP end-user capabilities, 93% of the DP professionals in most companies have selected a variety of reporting, retrieval, file and data base management systems, making programming easier, faster and cheaper for programmers, analysts and systems personnel. But fewer than one in 10 non-DP end users — the businessman — is prepared to learn how to fill in some coded forms or to learn some simplified kind of programming. These are too complex for the remaining nine out of 10 businessmen.

Further evidence of this lack of end-user orientation to date are the findings of the End User Facilities Task Group, now a full-standing committee of Codasyl, which stated in a recent report: "The current interfaces claim to be designed for the non-DP-trained end users, but, in fact, they are similar to computer programming languages, without any effort to establish that such interfaces are the best and that they are truly effective."

Increased Emphasis

Undoubtedly, the future will see increased emphasis placed on the non-DP end user as a means of stretching the DP dollar. Just as the past has seen advances made first for systems personnel (for example, assembly language coding over machine language), and then for application programmers/analysts (higher level languages and operating system utilities) as a means of increasing productivity, the end user should begin to see major improvements in the future. Th driving forces of economics are present, intensified by a movement toward distributed systems, which will ensure that the computer becomes more accessible to the non-DP-professional end user.

We will begin to see, among other advances, natural English language (not just 'English-like") query systems attached to data base systems in order to simplify the extraction of data. We will see greater use made of special functions keys on terminals to perform a series of tasks specific to the individual user's environment.

In general, ease of use will be not only a methodology to apply in simplifying the work to be done by a computer, but it will come to be an attitude and philosophy in all areas and stages of development as manufacturers and users alike strive to increase the productivity and usage of DP systems.

Bartek is the manager for interactive systems planning for Honeywell Information Systems in Minneapolis, Minn.

Line Conditioners Out

SAN DIEGO — Power-Matic, Inc. has introduced a family of alternating current line conditioners.

Eight standard models are available with symmetric or skewed input ranges for wide-range, brownout and overvoltage conditions.

The units range in price from $445 to $505. Additional information is available from the firm at 8076 Engineer Road, San Diego, Calif. 92111.

For Leadership in Communications Management Look to Datapoint

Telephone costs are rapidly becoming one of the largest expenses in the corporate budget. Today's management needs to control this expense.

Datapoint's four INFOSWITCH™ Communications Management Systems cut costs, improve management control and dramatically increase user convenience.

Learn how these tools can control your communications budget.

LDCS–
For Long Distance Control

INFOSWITCH Long Distance Control System is a computer-based telephone management system that can reduce a user's long distance charges by from 15% to 50% and sharply improve authorized phone service in the bargain.

LDCS fits into ongoing telecommunications operations between existing PBX or CENTREX units and outgoing WATS, FX, or TIE long distance facilities. Using least-cost routing, call "packing," a common access number, and other features, LDCS makes any telephone system more cost-effective by directing calls to "flat-rate" facilities rather than expensive direct dialing. LDCS also provides the convenience of speed numbers, optional directory printing, call duration reminder signals, and other features for improved, less expensive long distance telephone service.

For accurate, timely management information, LDCS records vital data (caller-identification, number called, duration, cost and others) for each call and issues printed reports in a number of useful formats. Management receives a complete accounting of telephone costs at all levels in the corporation and can accurately "bill back" each department on the basis of use, even for flat rate services. The result is shorter, more efficient business calls, reduction of personal and non-business calls and more efficient use of telephone facilities.

LDCS is a modular and turnkey system requiring no user programming. LDCS can be configured to cut telephone costs for companies spending from $5,000 to $150,000 per month on long distance charges.

SMDR–
For Local Call Management

Telephone companies around the country are introducing a new pricing that can heavily impact telephone costs. It's called "Usage Sensitive Pricing". This pay-as-you-go message unit billing approach now affects about 40% of the Bell System's 9.3 million business customers. Already New York, Chicago, Los Angeles and other metropolitan areas are billed by message units with more cities due for this approach soon.

What this means to the businessman with heavy metro or local calling traffic is that the short distance telephone charges may soon start to rival the long distance charges. In fact, many companies are now spending $5,000, $10,000 and even more each month on local tolls.

The INFOSWITCH/SMDR (Station Message Detail Recorder) can let the businessman begin controlling this cost. In operation, the SMDR automatically records and stores the caller extension number, duration of call and number dialed of each local or metro area call.

Concise, tailored management reports are then produced that permit each department or cost center manager to see where the telephone budget is being spent. Unnecessarily long business calls and personal calls are curtailed with a direct cost savings immediately apparent.

An INFOSWITCH/SMDR can pay for itself in a few months in companies which are spending over $5,000 monthly.

SHARE–
For Multi-Location Telephone Management.

Many multi-location companies suffer from out-of-control costs, inadequately used telephone facilities and poor communications practices.

These companies typically will have a communication management staff at the home office but not in field locations because of the added expense and other considerations, which means that overall corporate control over phone usage is even more uncertain. Since home office communications management has no effective way to measure the usage of remote telephone facilities and no statistics on calls, the result is higher costs and overall lack of management control.

To solve this problem, Datapoint offers the SHARE System. SHARE places the switching subsystems that actually control the telephone call selection in each field location with the main computer and storage unit at the central office. The overall system is linked together via standard telephone data communication lines.

Under SHARE, central and field offices may be configured to control long distance facilities as well as local or metro area calling. In extended configurations system redundancy is built in for greater reliability.

SHARE is a modular, turnkey system capable of controlling up to 250 long distance trunks in up to 6 locations.

ACD–
Automatic Call Director

For many companies incoming telephone calls represent a primary and most critical contact with a customer or prospect. Whether received via local facilities or via long distance service, these calls must be handled efficiently. A company's image often depends on telephone response and agent handling.

Companies which depend on the incoming telephone call for basic business contact range from corporate giants, such as international airlines, down to relatively small firms such as direct mail catalog sales companies. Typically, calls are received on a variety of facilities such as local lines, IN-WATS, FX, TIE, and other services. Each of these calls is answered by an agent on key-set instruments.

In a typical call processing center, it's very difficult for the agent to provide fair and equitable service to incoming calls, and customer frustration can mount quickly. With currently used instruments it's impossible to distribute calls efficiently and fairly to an agent force, and very difficult for the agent to determine which call has waited the longest for service.

An INFOSWITCH/ACD can solve these problems. Computer-based and using efficient Datapoint manufactured instruments, calls are routed efficiently to agents, with automatic call queuing and holding messages and music if desired. Calls can be automatically routed to other agents during peak periods accordings to user-assigned groups and splits. Complete management information such as call load, waiting time and agent performance is available through video consoles for instant use.

A highly cost-effective system, the ACD will accommodate a wide range of user requirements.

These four INFOSWITCH systems, based on proven technology and supported by Datapoint's national customer service force, are tangible evidence that Datapoint is the Leader in Communications Management.

For a comprehensive brochure on any or all of these INFOSWITCH systems, fill out and mail the coupon or call (512) 699-7280.

Independent Memory Can Liberate Budgets

(Continued from Page 41)

ing costs are proportional, the energy savings are over $230/mo.

Further, some independently supplied add-on memory modules may be used as duplex memory. The common approach to configuring major teleprocessing or multiprocessing systems in which uptime is crucial, is to acquire redundant "twin" systems. If something goes wrong with one, the other provides backup. But the equipment cost is doubled. Some independent memories include sophisticated switching features that enable operators to dial out sectors of failed memory, while remaining memory continues to perform its full function. By utilizing an add-on memory of this type, the user can gain the reliability advantages of having two separate CPUs without the high cost of complete processor and memory duplication.

Minis Go Independent

Increasingly, cost-conscious computer users are turning to less expensive minicomputers to trim their DP budgets in specialized applications and "small shops." Here, too, it makes sense to stretch your equipment dollar by shopping both price and performance.

Many of the cost savings discussed here can be achieved through careful selection of non-storage devices, such as terminals, sophisticated communications processors and even complete CPUs. However, one must keep two major considerations in mind.

First, what impact will implementation of any equipment have on daily operations? Will time-consuming and expensive software modifications or conversions be required for successful implementation? Often, the piecemeal device approach to improving performance doesn't really solve the overall problem. Main memory is the only plug-compatible product that is truly software transparent, and that gives users what they need — more available computer power.

Second, how reliable is the vendor? Is his product backed by experience, support and service that are widely recognized and respected in the industry?

The thoughtful user can stretch his DP dollar only by examining all of his equipment alternatives thoroughly and independently. No single solution is appropriate to every problem, and the high cost of good performance doesn't have to be commonplace.

Egan is executive vice-president of Cambridge Memories, Inc.

Data Entry Costs Hinge on People

(Continued from Page 42)

keystrokes per hour day after day. Too bad they hardly ever show up for work. If you could only find some way to improve their attitude about working.

High degrees of aptitude and experience are worthless if you can't get people to show up for month-end closings. Slow, reliable people who can key without many errors are nice peole to have around when you need them. Remember, you can't change attitudes. We are what we are and not much is going to change us. However, if you can find people with good attitudes and aptitudes combined, you've got some winners.

• Incentive — Have you ever heard the comment, "Why should we pay these people an added incentive? They're getting a weekly paycheck; that's enough incentive." Sound familiar?

If you wonder why data entry operators need more incentives, try sitting in an upright position on a hard chair for seven hours, while trying to read some scribbled handwriting, meanwhile straining your eyes to keep pace with an unrelenting minicomputer feeding you requests for more and more data. It's tough work.

It's not like secretarial work for which you can set a personal pace. It's a throwback to the start of the industrial revolution when people were forced to keep pace with steam driven machines. Obviously they get accustomed to the pace, but people today want something more than just a promise of being able to keep their jobs.

Many operators will work more productively when their output is tied to a cash incentive. They can relate to that. For them an incentive bonus is something that makes work bearable.

• Training — Improved training may be the most overlooked technique for increasing productivity. It is the most controllable method in the hands of the supervisor. Training increases skills and productivity. People can be trained to increase their ability to scan and intepret source documents, make better use of the keying procedures and improve their concentration. Training builds skills and morale.

• Environment — Unfortunately for some operators and managers, data entry is still "down in the basement." The department was a nice place to work in 1910 and it hasn't changed a bit since. Too many companies place their operators in an environment which says, "Here is what we think of you and your department."

One of the simplest and fastest methods for increasing productivity is to provide a more productive environment. Simple changes in room layout, better chairs and improving lighting can produce remarkable results.

The fastest method for stretching today's data entry dollar is to consider the above techniques for making data entry operators more happy and productive.

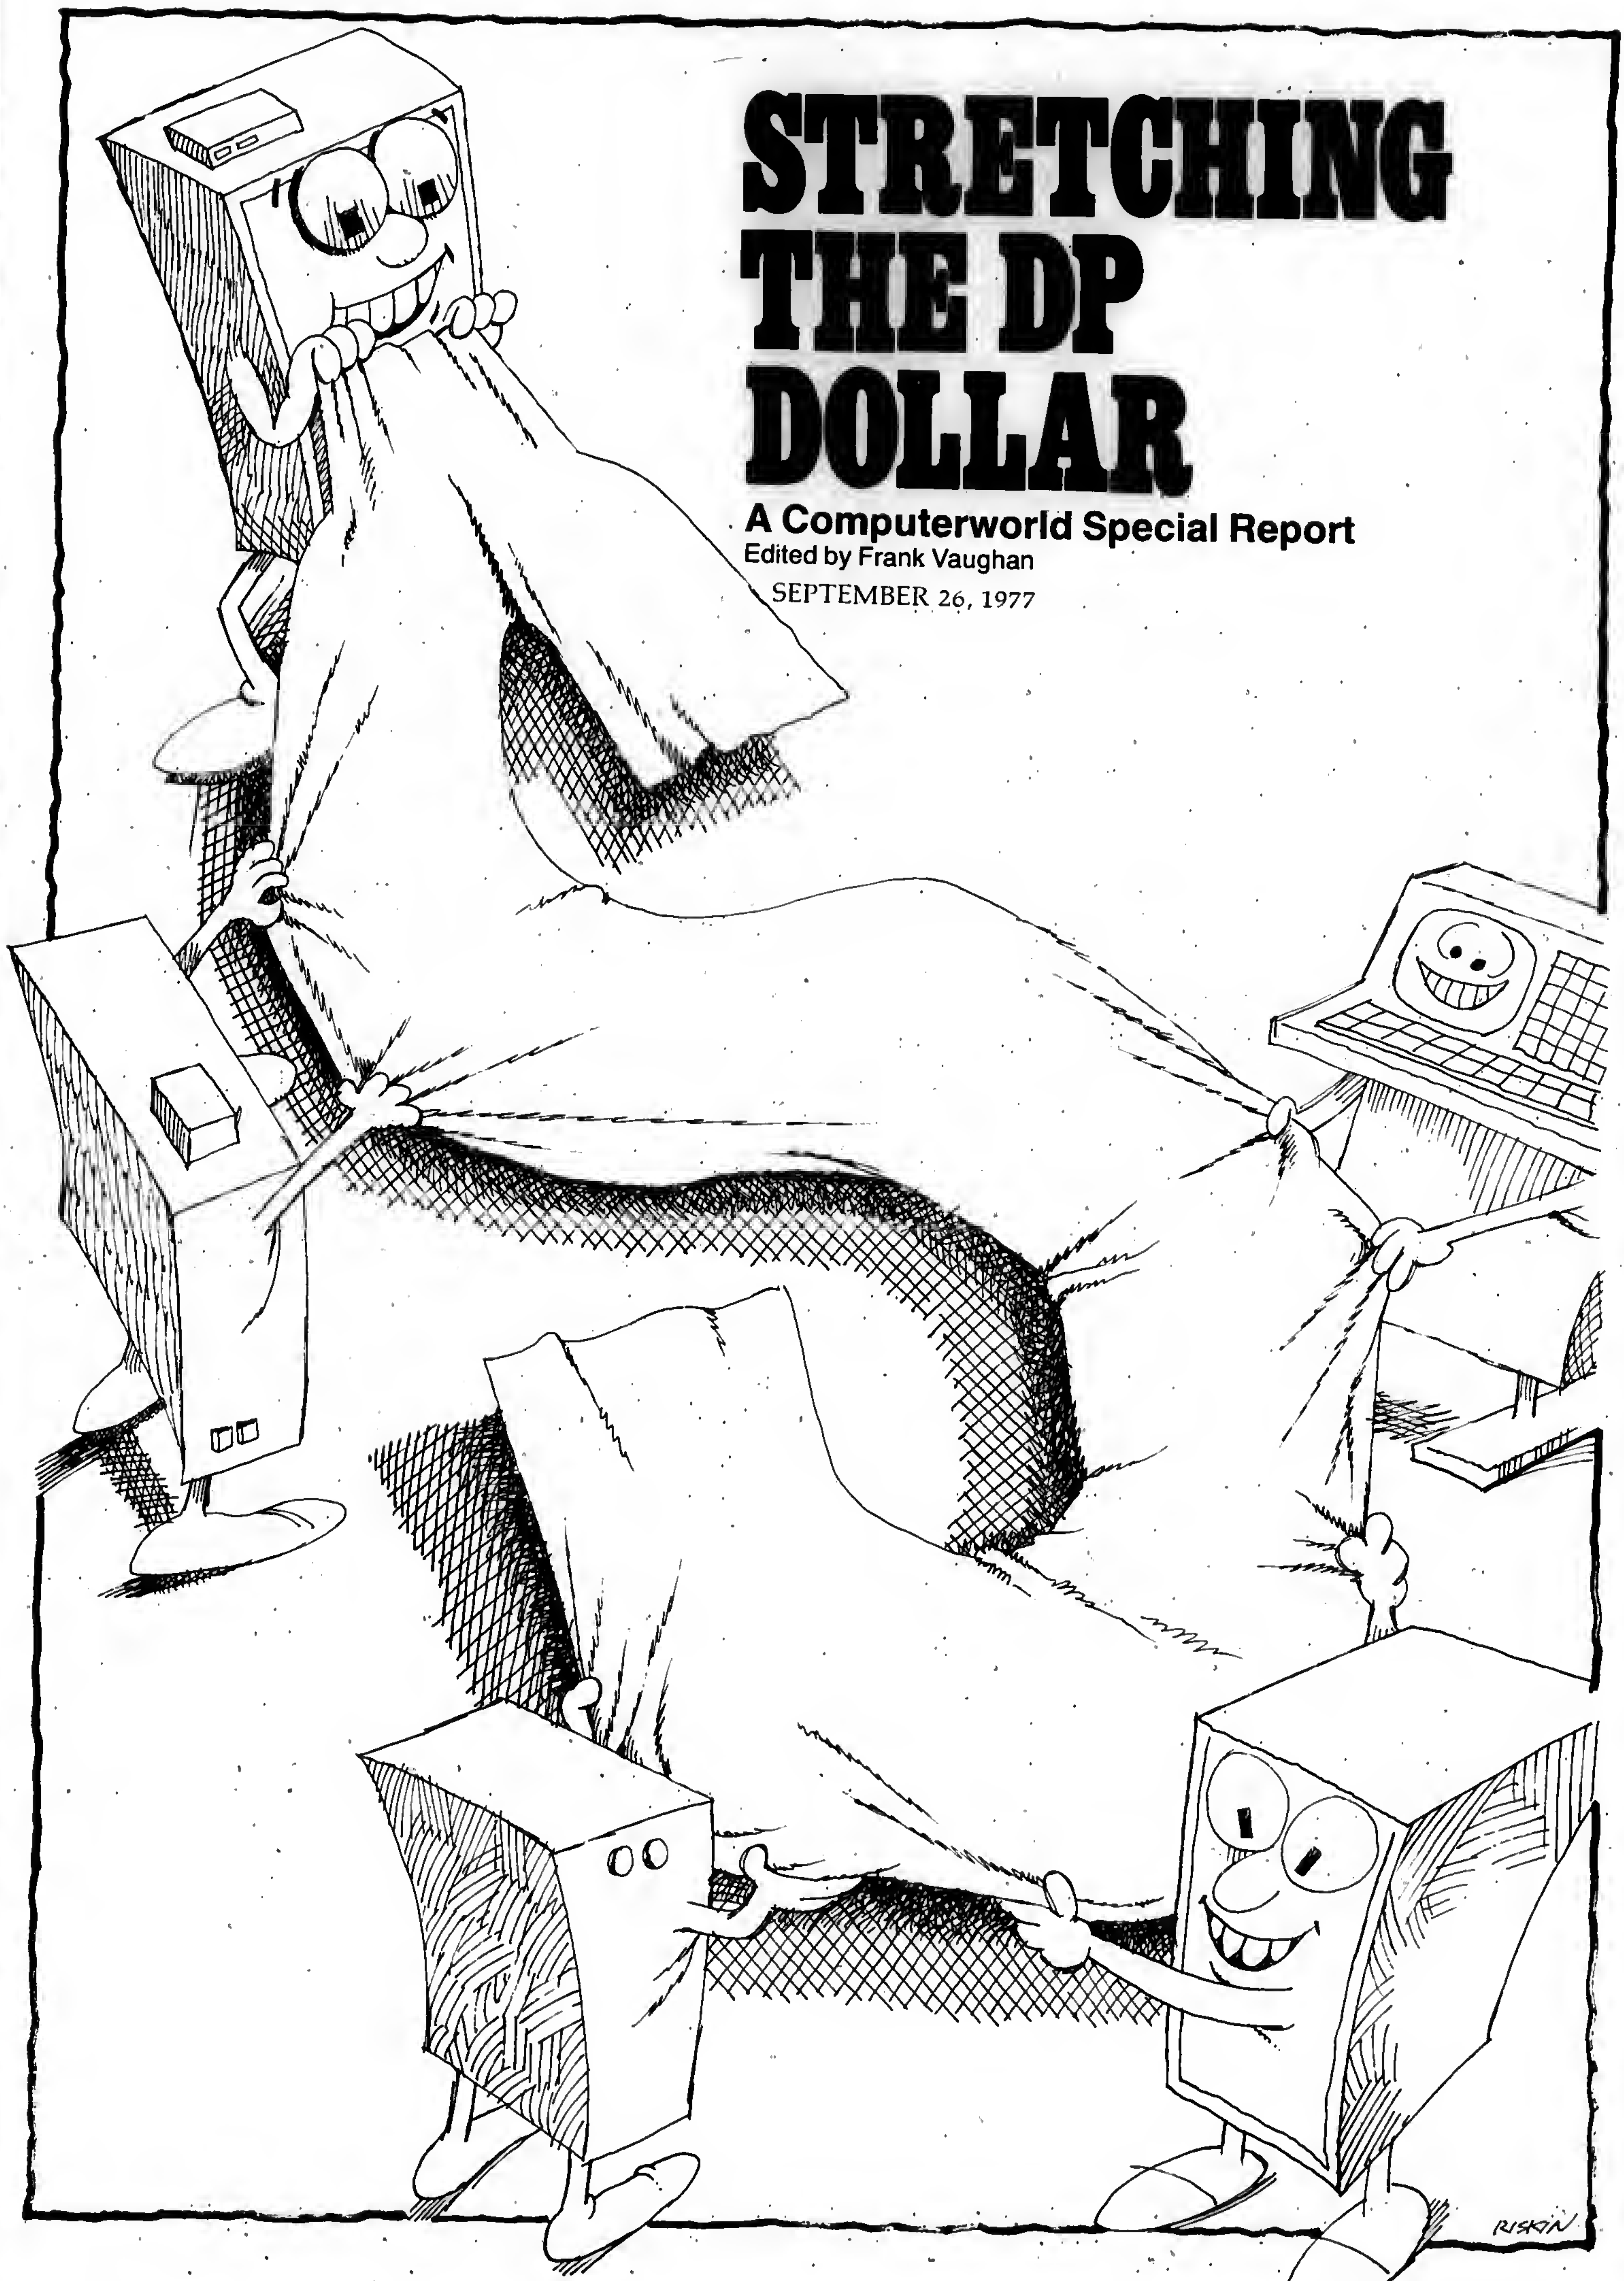
STRETCHING THE DP DOLLAR

A Computerworld Special Report

Edited by Frank Vaughan

SEPTEMBER 26, 1977



In Choosing Magnetic Media

Key Factors in Storage Choice? Access and Cost

By Phillip Ricketts
Special to CW

The correct choice of magnetic recording media for both on-line and off-line data storage applications can save money by improving system performance. The time a program waits for data to appear in main memory is, in part, the visible impact of the media on the system's throughput.

To determine which magnetic media, (magnetic tape, disk packs, floppy disks, cassette/cartridge or some combination of these) the following questions should be asked. How is the storage media going to be used? How fast do you need access to the data? What type of media is the present system compatible with? What are the trade-offs between faster data access and lower storage costs? Finally, are the data storage needs large or small?

When storage requirements are large, magnetic tape generally competes with disk packs. Similarly, when storage requirements are small, floppy disks compete with cassette/cartridges. Therefore, these two categories will be discussed separately.

Large Storage Requirements

Unquestionably, the most popular media for storing large quantities of data off-line is magnetic tape. Comparing tape with disk packs, for example, we can see in Figure 1 that significant cost savings can be realized by using tape in certain applications. Mass production techniques have reduced the cost of this media and large amounts of data can be stored on it relatively inexpensively. Another plus is data interchange. A reel of tape can be easily moved from one system to another. Also, tape provides low-cost data backup.

On the negative side, tape has the basic limitations of slow access time because processing of tape files is done sequentially.

To alleviate the problems of on-line data availability inherent in magnetic tape, disk media is generally used. Fast access rates and high transfer speeds are two major reasons for using disk media. When using disk storage, the data is accessed and transferred in milliseconds rather than seconds or minutes as with tape. Not only is system performance improved, but communications costs are also reduced.

Main Trade-Offs

The main trade-offs, then, between magnetic tape and disk packs are cost/access and cost/bit stored.

Disk media has the superior cost/-access (Figure 2). For example, to locate a random record on a full reel of tape would take an average 72 seconds assuming a 200 in./sec search speed. The time to locate the same record on a full 200M-byte disk pack is only 30 msec, since access time is independent of the location of the record. This high speed is particularly significant if the DP system operates in an interactive or telecommunications environment.

Therefore, disk media is preferred for applications that require an immediate response, as the incoming data enters the system in a random manner. To make use of the rapid response capability of disk, very active data sets are usually put on disk. At one large installation, all data sets that accessed 10 times or more per day and are less than 300K bytes in size are put on disks.

Tape media has a lower cost/bit stored than disk media. A typical reel of tape costs about $12, whereas a disk pack of equal capacity costs about $500. Therefore, tape is the preferred media when each rcord in the file needs to be read and worked on sequentially. Another plus is that magnetic tape offers the least expensive means of storing data off-line and backing up on-line critical files.

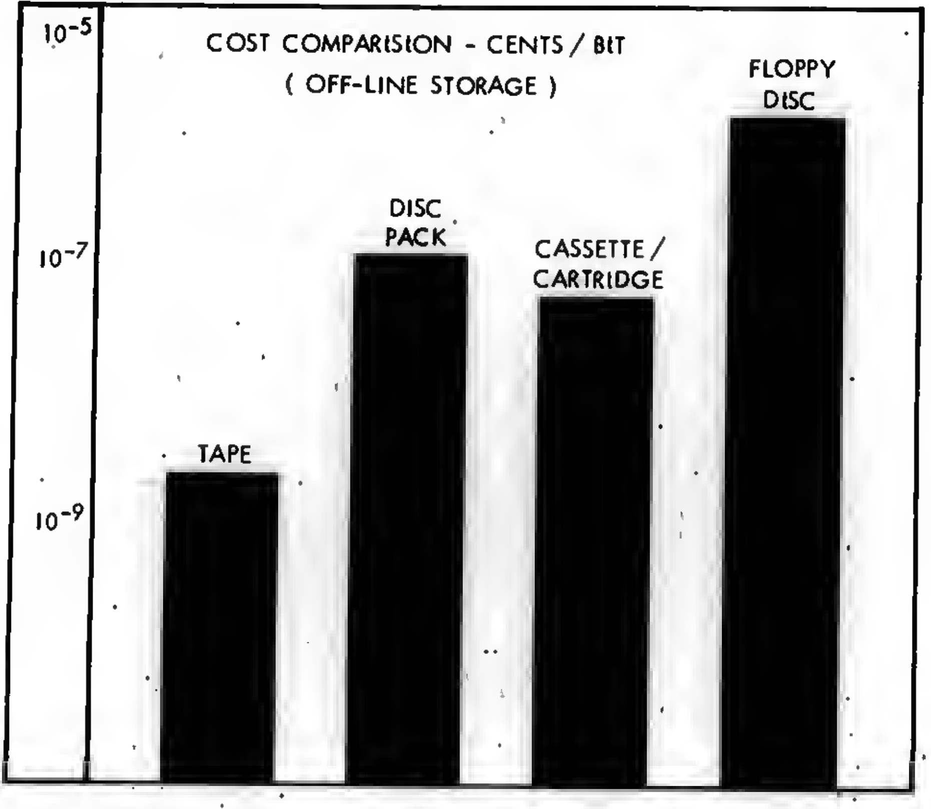


Figure 1

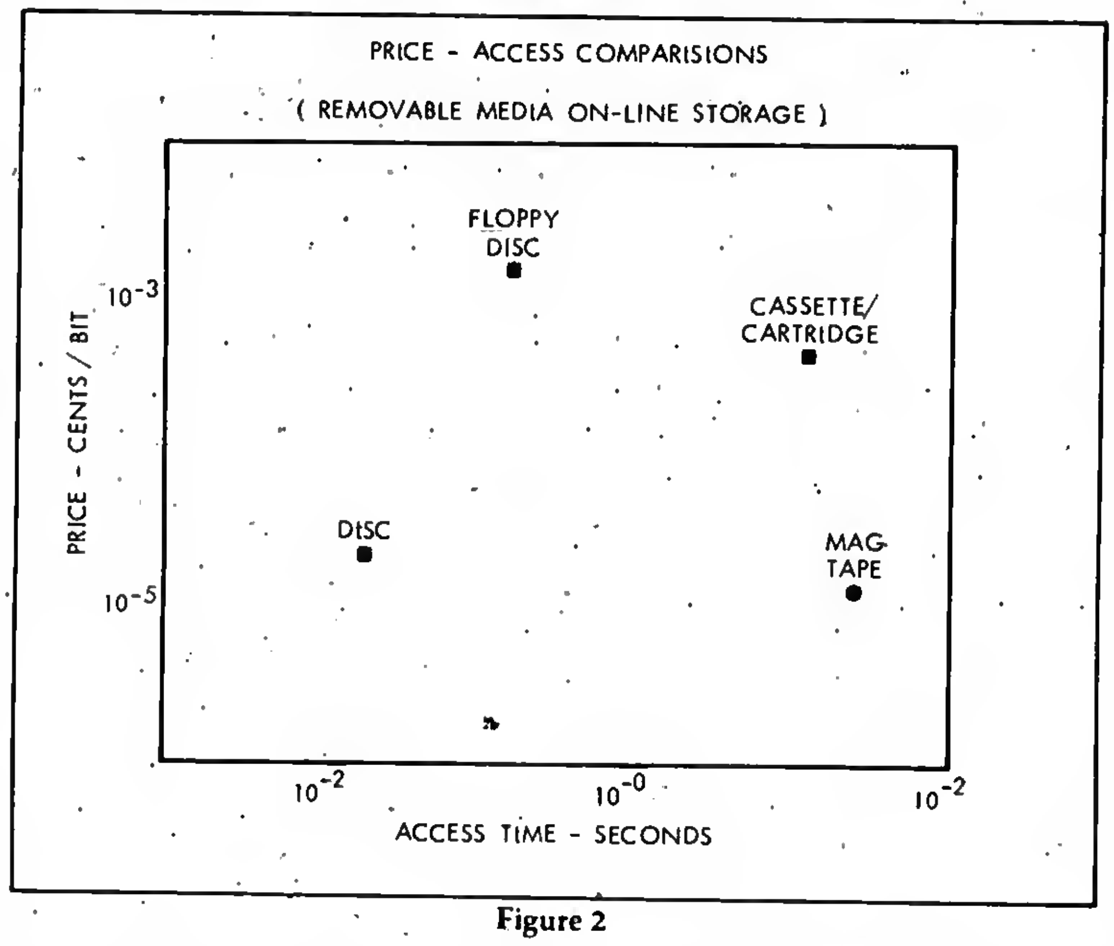

Figure 2

Small Storage Requirements

The tape and disk systems used with large computers are incompatible with small minicomputers requiring a small amount of storage. These large storage media systems can cost more than the minicomputer itself and have much more storage capacity than required by small minis.

For applications that require small data storage, cassette/cartridge and floppies are the favored media. The floppy disk is essentially the same media as tape, but it has the form of a disk and is similar to a 45 rpm record in appearance.

The greatest appeal of the floppy disk as compared with cassette/-cartridges is its quick access time (Figure 2) — one to two orders of magnitude faster than cassettes/-cartridges. A disadvantage of the floppy disk is its cost/bit for off-line storage. Floppy media can cost two to three times as much as cassette/-cartridge media for the equivalent amount of storage capacity.

Best Choice

Except where random access is needed, cassettes/cartridges are the best choice. This type of media, due to its small size, convenience and low cost is an ideal media for many small storage applications such as data collection. The advantage of the cassette/cartridge media is that it can be stored more easily and inexpensively (Figure 1). Also, in most cases, more data can be stored on a cassette.

Therefore, for small storage requirements, cassette/cartridge media has the edge for cost and storage capacity while floppies have superior access time. If the application calls for low cost and small size, cassettes/-cartridges are the answer. If fast access is needed, floppy disk media is the best choice.

Whether storage requirements are large or small the key criteria for determining the best media choice is the trade-off for a given application between faster access and lower storage cost.

Ricketts is disk packs products planning manager for Memorex Corp.

DP Center Heeds Hardware, People Comforts

By Frank Vaughan
CW Staff

NEWARK, N.J. — Companies can and frequently do make costly mistakes when putting up an office complex that has a DP center within its confines. The simple considerations such as where to put the computer cell are not so simple at all. In fact, location should be high on the checklist of major concerns, according to Harry Mahler.

Mahler is a partner in the Grad Partnership, a firm that has designed several hundred DP centers. He underscores the location of the computer cell as perhaps the most important consideration because it affects so many other factors: security, access to appropriate staff members, materials handling, operational efficiency and energy. The well-designed center can actually reduce operational DP costs, he said.

Ideally, the computer cell should be located as centrally as possible within the building, he said. The reason for the central location is that the insulation of computer cells is caused by the density of wall construction and air masses created by the rooms, thus stabilizing the internal environment. This stabilization of internal temperature and humidity is a desirable design goal that can save operating costs if successfully implemented.

Conversely, Mahler discourages utilizing space on an outside wall for reasons of security and because of vulnerability to environmental conditions and changes.

There can be exceptions to the "no outside wall" policy if walls of extra mass are used or if the earth is moved up against the side of the building to create a below ground effect for the computer cell. In both of these cases, the DP center is insulated from the elements and possible security breaches.

Bury the Pride

Companies should no longer pride themselves in showing off their computer systems with a fishbowl-type setup. The ideal location of the cell would provide adequate access to authorized persons and limited access to nonauthorized persons. The location, therefore, has a lot to do with the total security system.

With the large volume of paperwork traffic that accompanies a DP operation, the center should have direct proximity to the materials handling systems. A separate storage facility, with an environment consistent with the DP center, should adjoin the computer cell, Mahler recommended.

The size of the center would be dictated by the number of modules and the amount of hardware, he added.

People Work Here, Too

Many companies are becoming people conscious when planning their facility and this poses the problem of how to provide a pleasant working environment in an essentially windowless center that operates 24 hours a day under stringent security conditions, Howard Horii, another Grad partner, observed.

His solution is to provide a separate lounge as a definite part of the DP center.

There are also some safety standards that Horii indicated must be considered too:

- Fire Protection — The best method is a Halon system which is triggered automatically by a heat or smoke sensing detector and smothers the combustion with an invisible gas.

(Continued on Page S/4)

When Upgrade Seems Inevitable

Common Sense Can Save Some Cents

By Don Leavitt
CW Staff

Stretching the hardware dollar must have its start with a good choice of hardware and the best contractual arrangement available at the time. That's true enough.

The stretching can continue, often very effectively, through the use of hardware and software monitors, program code optimizers and other tuning tools, especially if the programmers learn the lessons put before them by the optimizers so that their code becomes more effective and efficient, even without the extra loop of "tuning" it before it goes operational.

There have been numerous instances, by now well documented, showing that monitoring what parts of the system are being used, or alternatively underused, has led to better balanced and often heavier workloads on the existing equipment. It has also led to the return of whole subsystems of peripherals, for example, so that the current work ends up being done very effectively on a smaller, less expensive system.

Certainly a number of installations have gone the route of assessing just what they had on their computers and what value, if any, it had for the organization's purposes. By offloading applications that no longer warrant the use of computer resources — if they ever did — and by sharpening how the remaining programs operate, these users have held the line stretching the life of what had seemed saturated hardware.

Each of these approaches clearly should be part of prudent management. There's little you can logically fault in any one of these ideas. But the fact is that even after they've all been tried and used to their fullest, tuning and monitoring and "do we really need that?" just can't get any more capacity out of a system.

Then is the time when an upgrade, or another CPU, or more memory or something is justified, right? Maybe, but then again, maybe not. There is a story that has gone the rounds of some DP circles — it happens to be true: I know at least one of the people involved — that shows how well just plain common sense can fit into the picture when all else fails.

In this instance, the installation was a large one by almost any measure. It had a pair of IBM 370/168s, or something in that same range, and was supporting a substantial national and/or international data communications network.

But the support was fading and supervisors were getting worried. Turnaround time, which had been at some quite comfortable level, had reached five and a half hours and that was not acceptable to this user com-

(Continued on Page S/11)

COMPUTER DISASTER.

95% of the computer contingency/recovery plans surveyed failed to work.
Would yours?

This startling fact has been revealed again and again in our review of the computer emergency recovery plans of many of the nation's top corporations. In our role as an independent computer security consulting firm for over 250 major companies, we have also found that only a few have even undertaken a formal risk analysis survey.

Considering what's at stake, perhaps you'd like to know more about our services. They include risk analysis, data security, physical protection, emergency/recovery plans, theft and fraud control as well as facility design. For more information contact: J. C. Matlock, Jr., Dept. C, 235 Northeast Loop 820, Hurst, Texas 76053, (817) 589-2244.

DP Audit Can Unearth Inefficient Practices

By Richard W. Lott
Special to CW

An audit of the computer operations may be used to increase the economic value of DP. It is well documented that the top management of organizations has not paid proper attention to DP operations and this lack of attention provides room for such practices as incompetence, empire building and covering for others. If there is no incentive or reason for DP operations to spend wisely, then they may not.

Following are four true examples of inefficient practices that were detected by DP audits. In one company, a four-hour computer run was interrupted by the company president who required that a special report be run immediately. The special report was run and the original job was restarted from the beginning. The DP personnel had never heard of the use of checkpoints to permit a restart at the point of the interruption.

Second Case

In a second case, a company never made a serious study of the economics and practicality of having a service center process its payroll. With a brief statement that "it wouldn't be respectable to hire outsiders to do payroll when we have our own computer," the company just went ahead doing the payroll itself and thus failed to computerize some "bread and butter" applications that would have had a significant impact on profits.

A third situation involved a company that had leased keypunch machines for 18 years. The justification for doing so was the reported ability to replace the machines quickly if new models were developed. The real reason for leasing so long was that the firm had cumbersome procedures for buying capital equipment. The manager was just taking the easy way out with no regard to the financial impact on his employer.

Another example involved a company that had a rerun rate of about 15%. The rerun situation had been with the firm at that level for so long it was a way of life — almost a joke. An auditor made a careful analysis of the rerun situation and determined that much of it was due to poor preparation of source data.

Unfortunately, most of the company's control procedures started at the point where the raw data entered the computer center (essentially at the keypunching stage). Manual procedures had never been considered a part of DP operations, and since the internal customers were being charged for all the DP costs without much caring about them, DP had never bothered to solve the problem.

Two Obvious Problems

Once top management recognizes its exposures due to a possible mishandling of DP operations, it is in a position to determine whether to invest in DP audits. Two obvious problems are whether an audit will be worthwhile and finding a competent auditor. Perhaps there will have to be an actual trial run to see if some problems will turn up; certainly management should be able to develop a list of several application areas that have potential.

An effective DP auditor is one who has both the inquiring mind of an auditor and much of the skill of a DP specialist. Perhaps it is best to hire this person on an *ad hoc* basis until it is certain that a full-time effort can be justified.

The final point is that management should not assume the DP side of the house is performing efficiently. The use of a DP audit is one method by which management can help assure itself that the organization is getting a fair shake.

Lott is a faculty member at Bentley College, Waltham, Mass.

Ideal DP Center Heeds Hardware, People Comforts

(Continued from Page S/3)

- Interior Security — Corridors used by employees during nighttime or off hours to get to the DP center must be well-lighted and security controlled.
- Parking — Again, because of the sometimes 24-hour operation of DP facilities, nighttime parking can be a hazard. Safe and well-lighted parking areas should be designated for DP personnel as close to the building as possible.

Other possibilities for improved efficiency as well as comfort are proper lighting, heating and cooling and carpeting, Horii said.

The ideal light fixture creates no glare, Mahler said. He compared the desired effect with the lighting people enjoy while sitting under a tree on a sunny day. The trick is to lower wattage per square foot, thus reducing energy consumption, while maintaining the proper quality of light.

When looking at heating and cooling, it is important to note that it is more efficient for the equipment to blow air through the flooring than from overhead, Mahler pointed out. This way, cool air can be delivered to the equipment and occupational areas first before reaching the full height of the human comfort zone.

In one project Grad designed with consulting engineers Jaros, Baum & Bolles for New York Life, they were able to devise a heat recovery system which used the heat generated by the mainframes, various mechanical systems, lights and body heat of the employees to heat the entire 400,000-square foot building. In fact, the boilers did not have to be turned on even in this past deep-freeze winter, he claimed.

INFORMATION

...makes it happen

Today, business success demands fast decisions. And fast decisions require decision making information on demand. INFONET delivers it!

INFONET's international remote computing network places full service data processing — full service information — at your fingertips. In data management, financial and business management systems, and the management sciences, INFONET provides the superior decision information tools that give you the "plus" advantage.

Thousands of subscribers around the world have discovered INFONET's "Information machine." To learn how it can help you, call or write Box C

dc SIM-14™ dc

It'll give your 1401 program* a new lease on life.

- AMDAHL, CDC, ITEL users...SIM-14 means *no* *re-programming!*
- IBM 360/370 135 to 3033 users ...SIM-14 means running multiple programs *simultaneously!*

If your 1400 series program has grown old, let our simulator give it a shot in the arm with features like...

...a self-relocating problem program that's completely interruptable; no hardware restrictions other than decimal arithmetic set; no control storage or micro codes; support for 1400 utilities and sort replacements...

And more. Enough, in fact, to fill a 26-page manual. To get your copy—*and to find out how "cheep" SIM-14 can be*—call your nearest Dearborn office.

*Includes 1440 and 1460 programs

PDMS/Program Development and Maintenance System is an extremely powerful extension to the DOS programming environment.

PDMS provides capabilities never before available to the DOS community.

Designed to increase productivity and reduce overhead, PDMS consists of an OS type partitioned data set library, a comprehensive set of commands to manipulate the library and its contents plus support programs to interface with the library in a batch and on-line conversational mode.

The system, which contains a terminal monitor eliminating the need for CICS, provides an exciting programmer work station environment by extending the computer facility to the programmer via 3270 type video display terminals. This allows all programmer development, maintenance, test and documentation functions to be performed in an interactive mode without leaving the work station.

The PDMS library may contain source programs, relocatable object modules, job control statements, test data, tables, text for documentation or any group of logically related records. These records may be scanned and modified by a comprehensive set of easy-to-use commands.

Functions such as:

- Add, Change, Delete statements in place
- Scan for and/or Replace character strings in place
- Scanning, Copying and rearranging source
- User program access to the library... verify data, load control tables, etc.
- Direct interface with Assembler, COBOL compilers and link edit
- Password protection limits access
- History of activity
- Lock/Unlock facility...for production programs

PDMS SETS A NEW STANDARD IN OPERATIONAL USE

- No need to condense ever...space is reused as soon as it is made available
- Single library concept...greatly simplifies source and relocatable maintenance functions
- Concurrent library updates...multiple partitions and processors
- Ease of Implementation...no conversion

PERFORMANCE

User acceptance has been enthusiastic and productivity improvements immediate and dramatic.

INEXPENSIVE

PDMS is available in the DOS, DOS/VS, and EDOS environment for $110.00 per month for the batch version or $260.00 per month for the on-line system.

Please send me your new PDMS brochure

Take Shortcuts on Software Purchase Road

By Donald R. Landgraf
Special to CW

Reaching a final decision on buying software is not fun, as people who have been on the "magical technical tour" well know. Many times, even the final results aren't fun either.

It is agonizing to spend great amounts of time to end up with a software package that doesn't exactly meet the specifications of the job at hand. It is many times more agonizing to try to write a system that is perfect, however, and that is why the software was purchased to begin with and why the shortcomings are tolerated.

In recent years, a common methodology has developed for the evaluation and acquisition of proprietary software: identify your need, scour the directories for possible solutions, write vendors for literature on products, schedule presentations with those with the most promising literature, evaluate the products in the final running and make a final purchase decision.

This whole process is a narrowing-down escapade with the ultimate purpose of finding the best package to meet a need. The trick of making the search as fruitful as possible is to make the search as short (inexpensive) as possible, but without sacrificing confidence that the end product is the best available.

There are some shortcuts and information gathering techniques that you can use to shorten that software acquisition cycle with greater confidence that your final choice is the right one. You still have to identify your need and survey the catalogs for the choices available. These suggestions are intended to shorten the narrowing-down process.

'Knockout Factors'

The first shortcut comes into play shortly after you have identified your need for a specific software solution. It is called "knockout factors," a list kept in mind all through the evaluation process.

William R. Synott, senior vice-president of the First National Bank of Boston, said in his address to the American Bankers Assocation conference in New Orleans, "These are your most important criteria for reducing the number of possibilities you will investigate." Such factors, as outlined by Synott, are the obvious ones of upper cost limit, modifications necessary to make the package run on your machine, amount of core required, payment plans available (if you can't afford large sums of money at once, lease is essential for acquisition), cost of on-site evaluation, hardware/-language restrictions, etc.

Two additional areas of knockout factors should be explored early in the acquisition cycle. The first is the company behind the product. The second is product applicability.

When one is shopping for a home, it is advisable to always look at the basement first before being excited by the wallpaper or the size of the master bedroom. The foundation is what holds the whole thing up.

Software purchasing is no different. The company behind the product is the system's foundation, it should be explored thoroughly.

You are ostensibly purchasing software for a long-term benefit. You are paying a good deal of money for the software to keep up with hardware technology and computing advancements. You want to make sure that is the intention of the company behind the products.

If a company is profitable and successful, that is the degree of proof of market acceptance and stability. These are questions you should ask:

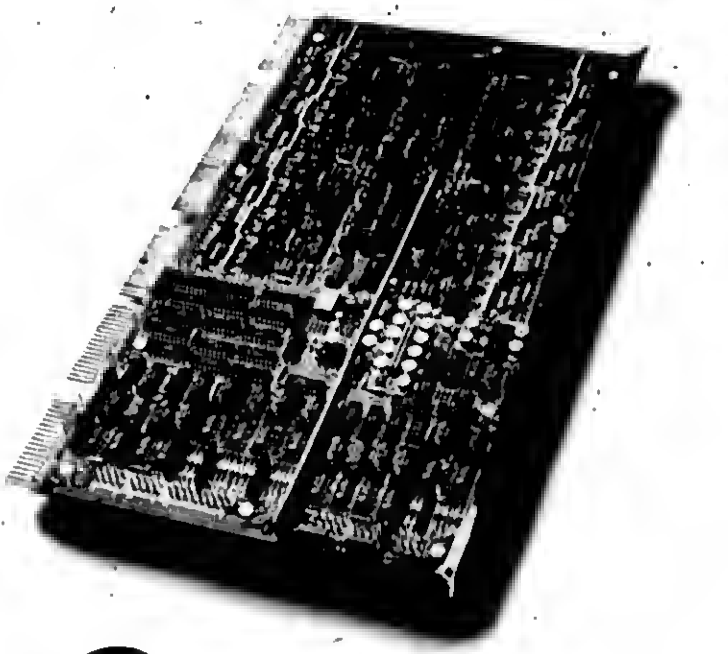
- What is the sales and profitability history of the company?
- What is the Dun & Bradstreet credit rating of the company?
- How old is the company?
- What user organizations exist for the products?
- How widespread is the serviceability? Local? National? Worldwide?
- How many products does the company sell? How many are on the Datapro Honor Roll of Software?

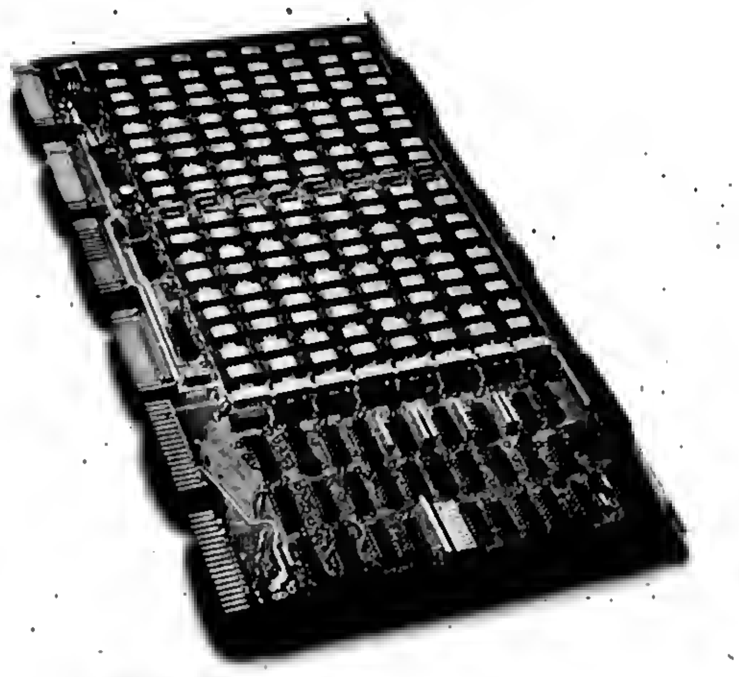
Assuming the company behind the product looks sound enough to grow with your DP needs, it's time to ask some pointed questions about the product itself. Try these for starters:

- What is the product's enhancement record? This will tell you just how well the product is keeping up with technology.
- Is there a maintenance fee for this product and, if so, what do you get for maintenance? There should be a healthy list of services supported by maintenance dollars "support" as an answer is not enough.
- What kind of technical support is there? Telephone only? Is there a periodic problem reporting system?
- How good is documentation and how often is it revised? Documentation is never perfect, but vendors who strive to approach perfection have your best interests at heart.
- What kind of training do you get with this product? In general, the more comprehensive a system is, the more training is required. One should expect on-site or personal training of key personnel upon installation with possible follow-up training included as part of the purchase contract. The better the training, the more use the product will get and, thus, the more benefit it will be to your organization.
- How many installations are there of this product. You'll find that the more

(Continued on Page S/14)

One way or the other,
you're going to profit
from plugging a
Plessey 32K memory card
into your PDP-11.





One way
The Plessey PM-1132.
32K words of non-volatile core memory on a single plug-compatible card that occupies just two slots in your PDP-11 mainframe. Compatible with either the standard or the new modified UNIBUS backplane. Available with and without parity.

The other
The Plessey PM-S1132.
Up to 32K words of high-speed NMOS semi-conductor memory on a single plug-compatible card that occupies only a single slot in your PDP-11 mainframe. Choose a full-complement 32K word card, or one of 7 depopulated versions, then expand in 4K increments as your data storage needs increase. Available with and without parity.

Plessey Microsystems
Either way, you get reliable high-density storage at a refreshing low-density price.
If that's more memory than you need, we also have a full range of 8K and 16K plug-in cards that are fully compatible with your DEC, Data General and Interdata minis. All supported with the backplanes, cables and expansion chassis you need.
And all available now. Contact us today.

Irvine, CA. (714) 540-9945. Los Angeles, CA: (213) 473-4581. Mountain View, CA: (415) 965-1400. Chicago, IL: (312) 871-4554.
Wheaton, MD. (301) 949-1664. Boston, MA: (817) 890-2854. Minneapolis, MN: (612) 881-0190, Kansas, City, MO: (816) 444-0168.

Ask CONTROL DATA to supply Monolithic Memory for your IBM 370... get reliability you can bank on at half the price.

We have it.

How reliable is Control Data Monolithic Memory? Reliable enough for 15 U.S. banks to use it for critical financial processing with their IBM 370-158's!

And so reliable, more than 320 other U.S. firms bank on it for their 370-135's through 168's.

We've installed more than 450 Monolithic Memories already to help IBM-370 users cut processing costs. And our users are our best proof that CDC Monolithic Memories work.

If you'd like to talk to some of these users, just ask our Peripherals Representative. He'll supply references! He'll also point out other key reasons for choosing our Monolithic Memory:

Stability. We're not a one-product company. We've been around a long time, and we'll be around for a long time to come.

Single-source responsibility. We can provide plug-compatible, cost-effective CDC disk memory, mass storage, and other peripherals. You place total responsibility in a single vendor.

If you want 370 memory capacity at half the price or double the capacity at the same price

...if you want to save $40K to more than $500K ...ask us about CDC Monolithic Memory.

And ask us about the users who have proved it works. Call your local Control Data Marketing Office or mail the coupon today.

Mr. James Kuntuzos, Sales Manager, Peripheral Product Sales, Control Data Corporation,
P.O. Box 1980, Twin Cities Airport, St. Paul, MN 55111. Dept. CW-9267

Please have a Control Data Marketing Representative supply further information about your Monolithic Memory.

To the computer evaluator more interested in saving kilobucks than storing megabyte

If you want to increase computer productivity and at the same time cut computer costs, Prime can help. We offer a compatible family of computer systems equally adept at interactive data processing and computational timesharing. Systems that provide a CODASYL-compliant DBMS for sophisticated data management applications. Systems that can handle specialized applications with software like MUMPS and SPSS. Systems with number crunching performance in the same league as the 370/158. Systems that process more megabytes for fewer kilobucks than you ever thought possible.

Sure, some people pick Prime computers because they provide up to 8M bytes of main memory, 512M bytes of virtual memory, and 2.4 billion bytes of disk storage.

And others choose Prime because our PRIMOS operating system supports up to 63 simultaneous users programming in any mix of FORTRAN IV, COBOL, BASIC and RPG II.

Still others select Prime because our high-performance Prime 400 and 500 systems can run very large, multi-megabyte programs without gimmicky programming, and at speeds that rival many larger systems.

But ultimately they all put Prime first because our computers deliver mainframe functionality at a fraction of mainframe cost.

Find out how a Prime system costing from $100,000 to $350,000 can give you results you thought you'd have to pay up to 10 times more to get. Contact J. D'Angelo Marketing Manager, Prime Computer, Inc., 40 Walnut Street, Wellesley Hills, MA 02181, (617) 237-6990.

Help Keep Costs Down

Student Staff, Mixed Vendors Aid College Site

By R. Waldo Roth
Special to CW

UPLAND, Ind. — Taylor University here has used a variety of methods to keep the cost of its instructional administrative computing center down during the 10 years the center has been operating. These methods have included mixed vendor hardware, in-house software and maintenance, student staffing and several do-it-yourself projects.

When the university's original Digital Equipment Corp. PDP-11/40 time-sharing system was purchased five years ago, it was a total DEC system with the exception of the Teletype Corp. Model 33 ASR terminals which had been obtained from a second source, Com-Data in Chicago. As time went on and the management of the center became more sophisticated and experienced, additional needs were met by evaluating alternate sources for each new hardware item. These purchases included CRTs, large-capacity disk drives, add-on memory from two separate vendors [CW, July 18] and printing terminals.

An additional way in which hardware acquisition costs have been minimized is that peripherals already in use on the school's earlier General Automation Corp. 18/30 batch system have been adapted to the DEC time-sharing system by obtaining either controllers or interfaces existing on the market for these purposes.

The first experiment of this type was to purchase an asynchronous data line from GA so that the system could be accessed by the DEC time-sharing system. In time, an in-house modification permitted the printer to be accessed from either computer system by changing a switch.

This success led to the purchase of other interfaces: An MDB Systems interface that allows the Wang Co. tape drive originally purchased with the GA system to become a permanent part of the time-sharing system.

It should be pointed out that these modifications have not all been made simply and easily, but with good in-house know-how and some vendor support they have all been successfully completed. Taylor is still looking for and pricing interfaces for its Calcomp 565 plotter so that it too can be attached to the time-sharing system.

Software Operations

Although most of the Taylor software to date has been written in-house, the purchase of a data base package from Educomp was helpful in bringing some administrative applications up on the time-sharing system. This package has been greatly enhanced and upgraded by the staff in the center.

Most instructional software has been obtained for reproduction costs or slightly more from educational software houses and other colleges and universities. However, certain instructional packages have been written by faculty and students in-house, including a package for drill and practice in music intervals and chords written this summer by two faculty members — one in music and one in computer science.

The original time-sharing system was on a maintenance contract for the first two years with DEC. However, it was then decided that one physics faculty member — given some release time from other duties — plus the computer center director, John Kastelein — formerly an electrical contractor in the Houston area for three years — could maintain most of the system. DEC has continued to be available on a time and materials basis and has been most cooperative.

The system has now grown to a point that the center is considering other possibilities for maintenance — hiring of a maintenance person, sharing a maintenance person with one or more other installations or contracting with a multiple vendor maintenance house.

Student Staffing

Students have been successfully employed in the center since its 1967 beginning. They have been utilized in a variety of capacities such as data entry operations, software development (administrative, instructional and auxiliary enterprises) and instructional support. Although effective in most areas, they have been of the greatest assistance in converting administrative software (during the summer) and providing excellent laboratory support for students using the center and learning about computing.

During these 10 years, the student assistants have been available for over 40 hours per week during evenings and Saturdays. They have also assisted in teaching a noncredit course for high school students.

Another way of utilizing students in a learning environment, but not yet put into effect, is the concept of "contract programming." Students would read a set of program specifications prepared by the center and submit bids based on the number of hours they would estimate it would take to do the job. The low or best bidder would be contracted for the software. If the student's bid was significantly off in either direction, the contract

Common Sense Goes Long Way to Save Cents

(Continued from Page S/3)

munity or to the DP management.

The computer work had long since been reviewed and found vital to the organization. It had been tuned and optimized till it just couldn't be handled any more efficiently.

To all appearances, the CPUs were saturated and the only solution left was to get another mainframe. The cost/justification was all worked out, passed up to the management committee and, depending on which version of the story you hear, the people from on high perhaps reluctantly agreed to seek a third 168.

But there was one last lonely staffer who still wasn't convinced. He had done some good performance analyses in the past, so when he asked for one more chance to "check something" before the requests for proposals were sent out, management gave its okay.

The analyst just couldn't accept the idea that a five and a half hour turnaround was caused by saturated CPUs. So he started timing how long jobs actually were in the computer, from entry to completion.

The actual numbers have been lost in the tellings of this tale, but they were in the range of five minutes or 5% of the total time. Small enough, in any case, so they seemed to confirm his suspicious that the CPUs weren't the bad guys.

Well, he couldn't let things go like that. Even if he was sure the CPUs weren't at fault, the installation still had bad turnaround time and there had to be a reason for that. He'd better find the real cause of the problem if he really wanted to head off the acquisition of another 168.

So he started timing all the steps in the cycle from the time the user submitted the request or the work to the time the desired output was returned. Everything was stop-watched; from pickup and delivery times, to data preparation, to computer room time, to time for printing, then collating, bursting, checking output and addressing it to the right party.

Without belaboring the story too much longer, he found that just about every phase of the system was working within reasonable limits — except for one. Output preparation — the printing, bursting, etc. — consumed something like 25% to 30% of the total turnaround time.

It wasn't that the people at that station were loafing or weren't dedicated to their work. They were typically working about as hard as any one else on the data center staff, and often a lot harder than those with more deskbound jobs.

The printers were producing the output fast enough: it was always stacked up higher than any of the workers liked to see it. But they had only one (or two or some too small number) decollators and bursters. That and not the "saturated" CPUs was the bottleneck.

The analyst recommended getting adequate paper handling equipment and the staff to man it properly and forgetting about a new 168.

Unfortunately, a simple solution might be great for the organization, but it can be embarrassing to those who had earlier proposed a grander answer. Obviously, the acquisition of bursters rather than another CPU was a constant reminder to the analyst's managers if not to himself that he was possibly more competent than they.

The atmosphere grew steadily more awkward and ultimately the analyst departed the scene.

Vendor Mixture Helps Cut Costs

(Continued from Page S/10)

could be negotiated.

Of course, this student assistance is not of benefit only to the college. The experience gained by students — some have worked at the center since their sophomore year — has been highly regarded by prospective employers.

The university has found that hiring its own graduates as full-time programmers has its benefits also. They are familiar with the system and can become fully productive in a short time. Two recent graduates are currently employed at the college full-time as programmer/analysts.

Roth is a faculty member at Taylor University.

Imagination, Control Can Trim Forms Budget

By H. Frank Coffman
Special to CW

When top management sends down the wurd that the forms budget must be stretched, where do you start?

Forms probably account for the largest single supply budget item, but you need them — for recording, for reporting, for testing, for all the jobs that must be done for all the other departments. And if your forms are nuw being purchased at the lowest price possible, how can you stretch this budget any further?

The key phrase here is "lowest price possible," and the answer to the question posed may well lie in how you and/or the director of purchasing understand forms costs. The money you pay the vendor is but one element of forms costs and probably the smallest one at that.

There are a number of other factors that contribute to the complete cost of forms and their usage. So there are probably many ways in which you can reduce the seemingly irreducible cost per thousand forms. It all comes under the broad heading of forms control, which is not, contrary to popular opinion, simply inventory control.

If yuu really want to get more for your money from forms and stretch that budget to meet management's request, it would be worth your while tu take a closer look at your total forms costs. Here are a few guidelines to help you get started.

While stock forms constitute the greater volume in your area, the custom-designed documents eat up a larger portion of the forms budget. Nevertheless, there are ways to save in both areas.

More Lines Per Inch

Most companies have established their price levels for stock forms and, order by order, bids will vary little over a period of time. But there are possibilities, primarily through reducing the quantities you need to buy and small gains here and there can add up significantly over a year's time. Printing eight lines to the inch, for example, instead of the normal six, can really make a dent in the volume of stock forms being used. The programming changes are usually minor, little readability is lost and you will gain considerable printing space.

Another suggestion is to make use of both sides of single-copy stock forms for running tests and similar one-shot operations confined to the computer room. Instead of tossing several hundred pounds of paper into the bin, turn the forms over and use them again.

It could be advantageous to check the usage of the multiple-copy stock form repotts that are prepared daily. Are all copies really needed? This may be a sensitive area and require diplomacy on your part, but our experience has shown that in many cases, report copies are simply thrown away without even being looked at. The need that may have been real at one time has long since passed and no one bothered to advise the DP department.

Give some thought to using lighter weight papers in stock forms. If you're currently getting 20 pound stock, check into the possibilities of 15-pound.

Now look at those more expensive forms, the ones that must be designed to meet specific requirements. They range from payroll checks to customer status analyses, from purchasing paperwork to production reports. They also include any number of special effects like magnetic ink or optical character printing, die-cuts, perforations and so on. They also come in a wide variety of sizes, styles and plies. It's easy to get lost in this jungle if you are not familiar with the terrain.

There are so many possibilities here that we must confine ourselves to the major ones (and the prime consideration is experience in this field).

Print Cycle Analysis

A good starting point is with something called Print Cycle Analysis [CW, Jan. 17]. The basic idea is to design those expensive forms so they require less time on the high-speed printer. This is done by eliminating spaces between print lines, rearranging print lines that have the same data, combining print lines, printing documents side by side and in other ways. The details should be reviewed.

Inventory control is basic to budget control. You must know what you have on hand, what you will need in the near future, how to get needed forms fast and so on. Without an organized approach, however, there are many traps into which you may fall.

It is well-known, for example, that the longer a printing run is for a forms manufacturer, the lower the per thousand cost of the form. This, unfortunately, leads many companies to order a year's supply of a form, sometimes two or three years, in order to get a price break. Then the inevitable happens and the forms must be changed in one or more aspects and you are stuck with thuusands of obsolete forms plus storage costs that constitute complete waste.

On the other side, there is the danger of not ordering enough or failing to keep adequate recurds of usage. Suddenly you run short of a form and have to order it on an emergency basis. This is usually costly.

How can you order, say, a six-months' supply of a form and still get a volume price break? The answer to this lies in something called grouping. This requires a complete review of all forms with the object of redesigning them to standard sizes, the fewer the better. You may be surprised at the wide variety of form sizes you have and how easy it can be to standardize on three or four sizes. These can then be ordered all at the same time to obtain the desired volume price break.

Ordering for price breaks through grouping of sizes also requires the standardization of order dates. Some old forms destined for standardization may be in surplus: others may be running low.

Of necessity, the grouping objective carries with it the need to redesign forms, and while striving for size standardization it can be profitable to include other elements of design or redesign aimed at cutting costs. As in the stock form area, determine if all the copies printed are actually needed and look into printing eight lines to the inch so form sizes can be cut.

The number of copies acquired is particularly important when dealing with high-speed printers. Depending on the model, a printer usually has a limit as to the number of copies it can accept and still give readable impressions on carbons. Very often the DP department finds it has to run the same form twice because too many copies are needed. If the quantity cannot be reduced, then think about the possibility of having the form produced in a side-by-side or two-wide configuration.

There are many other design ideas that can help either bring a form into standardization with others or simply reduce its size to use less paper. Consider the possibility of back-printing.

Another ploy is to redesign a form to do double or triple duty. This is a very good possibility with reports. In many cases the differences in the data to be accommodated on various reports are small. A good forms designer can produce a form that may be used for a variety of reports, even if column widths differ.

These are just a few of the ways and means available to the DP department head to reduce costs in the forms area. Many companies have found that for years they have been missing a good bet and that cuts of upwards of 10% or more in annual forms costs are quite reasonable to expect if they are organized and are able to approach the problem correctly.

Coffman is the manager of continuous product marketing for the Standard Register Co., Dayton, Ohio.

Hierarchy of Modules

Structured Design Ensures High Quality System

By Raymond C. Fish
Special to CW

It has long been felt that the only way to design high quality yet inexpensive systems was to design and implement modular systems.

As recently as eight years ago, there was no specific formula or method for designing such a modular system. The only help that was offered to a system designer was "... approach the task in a certain frame of mind." Since that time, many firms have implemented modular systems, even though most would probably disagree as to exactly what modular really means.

The current consensus seems to be that a system or program should consist of a group of highly independent single-function modules arranged in a descending hierarchy. The problem is, with few exceptions, no one is able to specify exactly how the hierarchy is derived. Furthermore, given two modular solutions to a user problem, few can actually determine which is the better solution.

'Subjective Process'

Many DP professionals believe there really is no problem at all and that the concept of modularity is, by nature, intuitive. They believe anyone can build a modular system simply by placing each system function in a separate module and by making each module as independent as possible from all the others. Yet when asked exactly how this is done they can only answer that "it's a subjective process,"

In fact, the traditional design process itself (modular or not) has always been a subjective process. When presented with the functional specifications for a proposed system, the analyst/programmer will first decide the nature of the system (on-line, batch, etc.), then the procedural flow of the system (how many programs and what they will generally attempt to accomplish) and, finally, the way in which the data will be stored and maintained on the various files.

Once these decisions are made and documented, the general design is considered complete. The detail design phase can begin and the team can decide exactly how each program should be constructed in order to achieve its purpose.

The traditional nonstructured "modular" design is better than no design at all, but results are often less than satisfactory. The project team seldom delivers the system on schedule, the user feels the system does not accomplish all it intended to accomplish and the maintenance programmers are immediately saddled with a system that is difficult to maintain and modify.

What we need, therefore, is an approach to formal design which will produce structured modular systems that are inexpensive to develop, highly reliable and easy to maintain or modify.

This approach will have to describe the exact procedure for defining a system as a hierarchy of modules. It will have to specify criteria for judging how strong (or single-functioned) each module is and criteria for judging how independent the modules actually are. Such an approach has been formulated and it is called structured design.

Relationships Analyzed

Structured design is concerned with both the relationship of the pieces of the problem to the pieces of the solution (or "system") and the interrelationships among the pieces of the solution. It is an approach to the design phase of system development that includes the following concepts and techniques:

- The idea that a system can be defined as a hierarchy of highly independent, single-functioned modules.
- A strategy (or group of strategies) to produce such a hierarchy by refining each function into its constituent subfunctions, according to a formal theory of "modular" systems behavior.
- A method of graphically representing a completed or in-process design as a "structured chart." The structure chart is both a form of documentation and a tool for aiding the design process.
- A measure (called cohesion) of exactly how "strong," or single-functioned, each module actually is.
- A measure (called coupling) of exactly how interdependent the modules actually are.
- A set of guidelines, or heuristics, that can be used to distinguish the best design among several alternatives.
- A strategy (called packaging) for partitioning the completed systems design into individually executable load units (or programs).

The objective of applying structured design is to decrease the complexity of a proposed system. While traditional "design" methods will produce a system that is far more complex than the problem the system intends to solve, the application of structured design will produce a system that is no more complex than the actual problem itself.

This reduction in complexity will subsequently result in significant cost reductions during implementation and in a system that is more reliable, easier to maintain and easier to modify than otherwise possible.

Formal Design Technique

The achievement of less complex, inexpensive systems is only possible through the use of formal design techniques, such as those found in structured design. There are a significant number of improved productivity techniques in use today, but none of them will achieve optimal results unless a complete formal design has been accomplished. These techniques are entirely independent of, and yet completely compatible with structured design.

It is a common misconception that structured programming is equivalent to structured design. this is, however, completely false.

In fact, structured programming, although highly desirable, will produce mediocre results if not used in conjunction with a formal design methodology like structured design.

Short Search for Software Can Be Fruitful

(Continued from Page S/6)

installations there are, the more bug-free the system will generally be.
free the system will generally be.

- What modifications are necessary for installation? If there are any, they will cost you money. Find out how much.
- Is there a cost for evaluation? This should have been stated up front, but it never hurts to ask.

Once you have qualified both the company behind the product and the product itself (all of which can be done on the telephone), you are ready to institute other shortcuts that will get you to that successful software goal.

Shortcut number two is to use the vendor as a consultant. Chances are very good that after you have qualified the vendor down to this point, he can give you excellent ideas on how to use the product.

Ask for user references in your industry and with your specific machine type and operating system. You can rely on the experiences of others in this business.

The vendor can be used as a cost-free consultant during the process of software acquisition. He is a walking repository of information on cost-justifying his products, studies that show the benefits of his products, experiences of others both with and without this product, etc.

It is also common and fair to ask each vendor about his competition, not to downgrade another product, but to illustrate the superior or unique aspects of one product over another.

Shortcut number three is to use your associations. Employees of your organization probably belong to several DP organizations. It could save you a lot of time to poll the membership of those organizations by mail to ask of experiences with a specific software product. Several organizations regularly publish catalogs of such information for members.

In addition, it can be a very worthwhile experience to probe the experiences of fellow professionals at large user group meetings such as Guide, Share and Common. You can be assured that the opinions you gather there will be candid ones.

Shortcut number four is to poll your industry. Certainly you know the members of your industry are involved in DP. You may be on first-name terms with people at those other companies. It is a relatively easy matter to draft a letter and a one-page questionnaire to be sent en masse to all of those DP people.

Ask them their recommendations for a specific situation and why. The best answers will be obtained from people who are quoting from firsthand personal experience.

Shortcut number five is to poll your employees. Chances are, if you have more than five people in programming and management in your installation, some of the people are relatively new. Chances are, also, that they have had software experienced elsewhere in the DP industry.

It won't take long to ask your people if they have familiarity with any of the packages you are considering. By no means should their opinion be the last word on the system evaluation, but their input can certainly give you some direction as to the questions that should be asked across the board.

Shortcut number six is to pay a consultant/software broker for information. This isn't the most economical way to evaluate software, but it is less expensive than subsidizing your own evaluation research. The one true way for this shortcut to have a true net effect for the searcher, however, is to check more than one source or commission, more than one study. No matter how objective any one source might try to be, that source is limited in its knowledge and if there is one thing you don't need when evaluating software, it's half knowledge of a topic.

The key to success involving these shortcuts is reliability of your peers and the information they have been able to gather through firsthand knowledge of various software systems.

Landgraf is executive vice-president of Pansophic Systems, Inc.

Buy The HP Don't Get Caught And The

The rock? That's your shiny, new HP 3000/II computer. Full of promise. Ready to do great things. Probably a very wise huying decision on your part.

And the hard place? Well, that's another place altogether. The place you're at when you discover that, all of a sudden or somewhere just down the road, you have large disc needs and a high ticket system that can offer only small disc solutions.

Needless to say, the hard place is no place to be.

Microcomputer Systems Introduces The MSC-1677. A Disc System With Big Capacity, High Reliability and Super Savings.

Our MSC-1677 is a high-power, low-cost hardware combination that delivers all the mass disc storage you require to keep your HP 3000 working and profitable. Part I of this attractive subsystem is our own super-sophisticated MSC-1000 disc controller, a product of advanced microprocessor-hased technology—and a product field proven to be the most reliable and maintainahle in the business.

Part II is Memorex's impressive 677, a 200 megahyte disc drive that boasts a track record of over 15,000 successful installations. Together, these parts form a package that is totally hardware/software transparent under MPE—and totally superior to the disc package HP offers with the Series II.

Sometimes, Two Rocks Are Better Than One.

We know what you're thinking. Single-source systems, particularly Hewlett-Packard single-source systems, can make one feel very warm and cozy. But warm and cozy can turn uncomfortable and unprofitable in a hurry. Because it doesn't make a lot of sense to pay for the security if the system doesn't deliver the storage you need. Particularly when you can get both the security ond the storage by working with us and our working partner, Memnrex Corporation—like HP, a rock to be reckoned with.

Memorex, long known as the "memory/excellence" people in the IBM-compatible marketplace, has helped us make the HP 3000 a sensible, reliahle, cost-effective alternative to IBM mainframes. Perhaps more than anyone else, Memorex has "written the book" on the successful installation of disc subsystem add-ons. They have, in large measure, shown the way in making "mixed vendor" systems preferable instead of just tolerable. They've done it with support—before, during and after the subsystem installation.

But most of all, Memorex has done it with the product.

Sometimes, Two Drives Are Better Than Six.

Particularly if they are Memorex 677 drives. This 200 megabyte, single spindle, disc storage drive is the product of three generations of Memnrex disc experience. And it is the one product that has been installed more often than any other of its kind—count them, over 15,000 units at work for customers today.

No question. This is exceptional, feature-laden hardware. But what is more important to you is this: with 150 megabytes each of usable storage, two *677's will dn the work of six HP 7920 discs.* That can mean upwards of 50% cost savings nn the initial drive purchase alone. It can also mean dramatic increases in the mean time between failure. Because, over and above the proven reliability of the 677, two electromechanical devices are simply going to break down a whole lot less than six.

Your HP 3000 Will Never Know How Much You Are Saving.

Thanks to Microcomputer Systems MSC-1000 disc controller, which emulates the presence of the biggest drive

With Unplanned Application

Importer of Frozen Seafood Nets Bonus Catch

SAN DIEGO, Calif. — Like finding the proverbial pearl in an oyster, Ocean Garden Products, Inc. here has netted an unexpected bonus by using its small business system for in an unplanned application.

The frozen seafood importer originally bought its system to handle routine accounting functions. The system has since been given the extra job of controlling sales traffic by determining which cases in a given warehouse should be removed to fill incoming orders and then issuing sales invoices as the goods are shipped.

Founded 20 years ago, the firm has been using computers for accounting for more than a decade, according to controller Frank Barrancotto. At one time an IBM System 360 was leased but "it was too big and too expensive. However, our sorting and computational needs are so high that nothing smaller would do," he said.

A switch to a service bureau followed, with Ocean Garden personnel punching cards that were sent to the bureau for handling. "This had drawbacks, too," Barrancotto said, "since it didn't give us an interactive capability, which is particularly important in terms of checking customer records or reviewing transactions. The service bureau was performing a simple historical function compiling data."

In mid-1972, Ocean Garden had a management consultant conduct a study to determine an economical, flexible accounting system. Initially, a Basic/Four Model 400 was recommended, and since then the company has upgraded to a Model 600.

The Model 600 is at the food company's headquarters to prepare data for the IBM 360 used at the local service bureau. This enables the accounting department to work with elementary data in its offices, yet have the 360 to process as much as 100,000 records at a time.

The present Model 600 system consists of one CPU, six CRTs, two 200 line/min printers, one paper tape punch, one magnetic tape and two disk drives.

About a year after installation of the original system, Barrancotto and his staff began toying with the notion of using the computer to handle sales traffic from the warehouses in which Ocean Garden stores its imported frozen products. The sales inventory control system went live in September 1976.

In discussing the order entry aspects of the system, Barrancotto explained that as orders are received, sales information is typed onto the video display terminal and entered into the customer files. While this data is being reviewed and adjusted, the system is also performing accounts receivable functions. The Basic/Four system maintains a perpetual physical inventory of what lots of products are in which warehouses, and a salesman decides from which warehouse to take the goods, but the computer selects the cases to take.

The decision is based on three criteria:

- The lot storage dates and when the space rental for various cases will lapse.
- The age of the products, based on when they entered the U.S.
- The size of the lot being ordered in relation to the tariff structure of the specific warehouse.

In what Barrancotto describes as an unusual process, the minicomputer punches out tape to drive a remote printer that advises the warehouse on which lots to pull and where to send them. This same information is also used by the mini to produce written confirmation records for the broker or the firm's own sales office, the trucker who will transport the shipment, the warehouse from which it's released and the final destination.

"Our sales inventory system plus the computer's ability to weight 40 to 50 lots in seconds contributes to the most efficient use of our inventories," Barrancotto concluded.

3000 But... Between The Rock Hard Place.

HP can offer, the 50-megabyte 7920—without emulating either its capacity or its overall cost. To the Series II, our 677 will look exactly like three 7920's. This means usable capacity of 150 megabytes per spindle, with up to eight spindles (or 1200 megabytes) supportable by one of our MSC-1000 wonders. It also means that no customized, non-HP software is required to do the trick. You'll never have to worry about staying up to date with future HP software enhancements to the 3000.

HP 3000 SERIES II
677

Disc Subsystem Comparison Chart

Feature	HP 7920	MSC-1677
Software Transperent under MPE/DS-3000	Yes	Yes
Microprogrammed Controller Architecture	Yes	Yes
Full ECC (error correction)	Yes	Yes
3330 Disc Technology	Yes	Yes
Capacity per spindle (megabytes)	50	150
Reliability	Good	Much Better
Complete Maintenance Support	Yes	Yes
Price	Competitive	Super Competitive
Number of installed spindles	Less Than 1000	Over 15,000
Operator oriented self-testing capability	No	Yes

Rock-Solid Support. Around The World and Across The Board.

You are still saying to yourself: "Sure, you have significantly more installed spindles out there than they do. And yes, simple math tells me that the MTBF on yours will be a third of theirs. And granted, I could save upwards of 50%, even 100% on drives alone. But what about once it is mine and no longer yours and something just happens to . . ."

Relax. Customer support is guaranteed. In spades. Don't forget one of the rocks on which we have built this ad. And this product. Memorex Corporation is committed to support the MSC-1677 program with its vast service organization—a sophisticated interweave of skilled people, strong technical support and a logistics network bound together for a single purpose: immediate customer response.

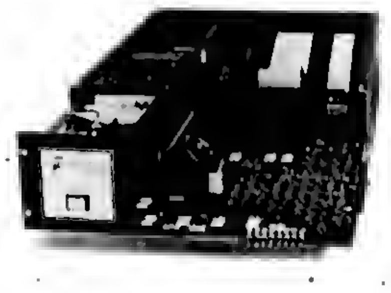
Beyond them, there is us. And our team of HP 3000 experts, backed by a fully functioning HP 3000/II System that can "acceptance test" subsystems, "systems test" spare parts, reproduce failures or anomolies so as to quickly analyze and troubleshoot problems at the system level.

Once again now, Memorex and Who?

Memorex and Microcomputer Systems Corporation. The people who forked out over three grand for this ad space because we think the MSC-1677 Disc Subsystem is something data processing decision-makers should know about. (We'd also like to sell a couple.)

In the coming months, you'll be hearing more from us. And not just in the HP 3000 peripheral add-on marketplace either. Dedicated to the continued "conception through production" development, generation by generation, of micro-programmed controllers a year or two ahead of the industry, we are already hard at work in the 317 mb and 630 mb Winchester technology arena.

Beyond our individually marketed controllers, we will continue to work with "rocks" like Memorex Corporation developing products like the MSC-1677. After all, wasn't it a rock that helped David take the steam out of a fellow named Goliath?



Call our President, James Toreson, at (408) 733-4200, to find out more. Or write Microcomputer Systems Corp., 440 Oakmead Parkway, Sunnyvale, CA 94086.

microcomputer systems corporation

Get Smart.

ADDS Regent · Smart for the price of Dumb.

Time was, if a man bought a Dumb terminal, he was considered pretty smart. Times change.

ADDS Regent family of Smart terminals is making Dumb look dumb.

For under \$1000 our Regent 100 has features no smart man can resist.*

You get cursor controls for operational simplicity and extensive remote commands that make it easy to control the Regent from the computer. Optional function keys customize Regent to your specific application.

You get a Status Line that provides current information on the terminal's operating status. And, you get visual highlights such as blinking, zero intensity, half intensity, underline and reverse video.

You also get self diagnostics.

In other words, you get Smart. Or Smarter: Our Regent 200 has everything our 100 has plus buffered transmission, auxiliary port and editing options.

You can't get a whole lot more.

Get Smart. Get ADDS.

Quality, Reliability and Integrity. It all adds up to ADDS.

Mini Bits

Commercial Applications Set as Five-City Course

NEW YORK — "The Commercial Application of Minicomputers" will be the topic of a course given by the American Management Associations in five cities this fall and winter.

The course will be held in Chicago, Sept. 26-28; New York, Oct. 26-28; Los Angeles, Nov. 7-9; Atlanta, Dec. 12-14; and San Francisco, Feb. 8-10.

The coorse costs $425 for members of the organization and $490 for nonmembers. Teams from the same company can be accommodated at a redoced rate.

The organization is located at 135 W. 50th St., New York, N.Y. 10020.

DG Sets Seminars

WESTBORO, Mass. — A series of seminars discussing the minicomputer as a management tool will be presented in several cities this fall by minicomputer vendor Data General Corp.

The seminars will address the ways minis can help businesspeople deal with inflation, competition and government regolation, according to a spokesman. Included in the three-day meeting will be a demonstration of the firm's small bosiness system.

Seminars will be held in New York, Sept. 27-29; Philadelphia, Oct. 4-6; Chicago, October 11-13; Atlanta, Oct. 18-20; Dallas, Nov. 1-3; Los Angeles, Nov. 15-17; and San Francisco, Nov. 29-Dec. 1. Additional information is available from DG, Route 9, Westboro, Mass. 01772.

Common to Meet in Boston

BOSTON — Common, an IBM users groop, wil. hold its fall conference Oct. 9-12 here.

Common members who use IBM 3, 7, 32, 1130, 1800 and 5100 systems as well as DOS/VS and OS/VS are orged to attend the conference, which will feature over 50 sessions consisting of users and IBM speakers addressing varioos DP topics, a spokesman said.

Several sessions will be devoted to the System/34 and Series 1. A luncheon presentation by Robert A. Yellowless, director of worldwide requirements for the General Systems Division, will give General System's perspective on the futore of DP.

Information on the meeting is available from David G. Lister, Administrative Director, Common, Suite 1717, 435 N. Michigan Ave., Chicago, Ill. 60611.

Storage to 128K

IBM Enhances System/34

By Esther Surden
Of the CW Staff

ATLANTA — IBM's General Systems Division has announced several enhancements to its System/34 small business system, originally announced in April. The enhancements were designed to provide additional storage — up to 128K bytes — and allow the attachment of up to 64 remote workstations via ordinary telephone lines.

The enhancements are said to solve some of the major user-oriented weaknesses in the system that have been pointed oot by industry observers.

IBM also added application programs for manufacturing and distribotion as well as another version of its 5251 CRT workstation, the Model 12.

The Model 12 stations, which must be used to take advantage of the System/34's communications options, allows users to link remotely located workstations with a central data base and use common application programs, IBM said.

With the additional storage capacity, users can now opt for either 96K bytes or 128K bytes of storage. The previously announced top capacity for the system was 64K bytes.

Also added to the system was a second communications line. This second line can "balance traffic on the communications line or provide concurrent data processing from remote workstations while commonicating with other systems," IBM said.

The workstation can be attached to either or both of the commonications lines. It features a 1,920-character screen, keyboard, field highlighting and data editing and serves as the communications controller for additional workstations at the remote location.

Up to eight workstations, which can either be IBM 5251 CRT stations or 5256 tabletop printers, can be attached to each remote Model 12. The System/34 can address op to 64 workstations attached via communications lines and op to eight attached directly.

The Model 12 provides communications control functions and can be located wherever common carrier facilities can be installed, IBM noted. Communications with the System/34 is via Synchronous Data Link Control protocol.

The clostered 5251 display stations or 5256 printers can be located up to 5,000 feet from the display station serving as controller, a spokesman added.

Prices for a System/34 range from $32,700 for 96K bytes to $47,220 for a 128K-byte system. Monthly rental ranges from $962 to $1,413 and monthly lease prices from $875 to $1,285.

First deliveries will be in September of next year, IBM said.

The second communications line adapter, scheduled to be available in January 1979, will cost $2,880, $88/mo to rent or $80/mo to lease.

The 5251 Model 12 CRT station with keyboard featore and electronic interface adapter also will be available in January 1979 for a purchase price of $4,830, monthly rental of $165 and monthly lease of $140.

One of First System 700 Users Pleased by 'Big-Time Features'

By Esther Surden
CW Staff

LOS ANGELES — One of the first osers of the Basic/Four Corp. System 700 said he is pleased with the system's ability to provide his company with increased capacity and "big-time computer features."

According to Charles Smith, vice-president for DP at American Insurance Consultants, Inc. here, the Basic/Four system is a sophisticated one that fits his firm's needs. A former Model 600 user, Smith recalled that "we could have increased our capacity on the 600, but we would have reached the limit in another six months."

The firm was foonded in 1969 and performed all applications manually until 1972, when it went to a service bureau. The 600 was installed early in Dec. 1975.

The System 700, announced about a year ago [CW, Oct. 4], was delivered at the end of April to the user, an administrator of groop health and accident insurance. The system performs monthly billing and cash receipt applications; it also reports to carriers on moneys collected and aids in claims processing and check writing.

Present hardware at American includes the CPU with 72K of memory, five CRTs, foor 75M-byte disks with 150M Bytes on-line and a 1,300 line/min printer.

Smith said conversion from the 600 to the 700 has been "simple," although "it does take time." First programs are converted at Basic/Four's office. "You can hook the 600 to the 700 to convert files directly," he explained.

The 700 was attractive to American because "you can control videos off of the central unit, designate who you want to use the videos and hook more of them into it."

Using Effectiveness Grid — Part 2

Method Promotes Organizational Enrichment

By Carl Masi
Special to CW

One of the most important future issues in any organization is one that has been virtually impossible for users to implement in the past three decades because of the limitations of the technologies used. That issue is known as organizational enrichment. This is a "quality of life" matter that is becoming increasingly more important.

Surely the day of the keypunch person pounding only little rectangles in little cards eight hours a day is finished. Today's products make it much easier to give that person more satisfaction, more dispersed responsibility. People need responsibility to excel and more authority, at least commensurate with expanded responsibility.

This is the second part of a two-part series on using an effectiveness grid to determine distributed processing methods.

Equal in subtlety, as well as importance, is the fifth major issue — policy impact. And it may be a polite term that expresses what has to be the biggest worry of distributed systems planners: "Are we opening a Pandora's box of loss of control of our total operation?"

Who decides what equipment will be selected initially, with what capabilities and for what applications? That in itself is difficult to decide. Just think how much more difficult it will be a year or two from now when time and need will have altered the priorities of each local site.

Another issue is cost allocation. Who pays for what increment of hardware? Will it be that far-off branch office, its parent department or the DP group?

What costs will be allocated, to whom, under what criteria. These, we all know, are extremely complex issues.

Another policy matter is vendor/user relationships, and this issue escalates in complexity in direct relationship to the utilization of equipment by multiple sites. Matters of concern here include: Who do we call to fix a software bug — the home office or the local software expert? Who do we call when we want to add more memory?

Another area of concern is the degree of local user authority a corporation is willing to give to operating field management, and still another is displacement policy.

For example, a distributed site has been in for a year. The office at which it is located has grown rapidly. It needs more processing to go along with the central site services it receives. Who makes that decision? In what time frame? Under what selection criteria?

And what about single vs. multiple vendor policies? Should there be one or many policies? Under what circumstances?

The final issue is productivity measurement. Distributed processing only makes sense if it allows an organization to function more effectively in one or more ways. But in terms of measuring sought-after benefits it is important to assess the related and sometimes overlooked matters of initial hardware costs, plans for full utilization of the new asset, benefits of displacing existing services, effects of new skill requirements on salary levels, cost implications of total new systems development and the cost/-resource requirement for maintaining the new system.

This article was excerpted from a speech delivered by Masi, director of product marketing for Wang Laboratories, Inc., Lowell, Mass., at a recent conference.

Mapping Mini Helps Assessors In Switzerland

KANTON AARAU, Switzerland — A minicomputer-based mapping system will soon be helping tax assessors here better determine the value of land and buildings.

The system is being used in what is called a "municipal cadastral application." A cadaster is the total information known about a piece of property — usually expressed in the U.S. in the form of a title insurance policy, a spokesman explained.

Until recently in Kanton Aarau, title records and tax information were maintained by hand ledgers. Consequently, there was a backlog for updating the records — often years.

To cope with this problem, Aarau purchased a Calmagraphic interactive data management system, which is being used to "digitize" (convert to computer code) each individual parcel of land in the city, its zoning, its use and its ownership — in some cases going back as far as four or five centuries.

"This program started in June 1976 and will continue through May 1977," the spokesman said. The digitized information is then stored on magnetic tape where it can be recalled and presented on the Calma system's CRT or in hard-copy map on its high-speed plotter.

Computer Optics announces a new 3270 feature.

Immediate Delivery

Computer Optics can deliver a complete 3270 replacement installation — CRT displays, remote and local controllers, printers. And we can deliver tomorrow, the next day or as soon as you need it.

Computer Optics is totally dedicated to 3270 series replacement systems.

Minicluster systems that handle up to eight tubes or printers in a remote location. Maxiclusters, either local or remote, for up to 32 tubes or printers on one controller. All are plug-to-plug compatible with IBM equipment.

We've always saved you money over your IBM 3270 costs. And now, we can also save you time.

If you can't wait a year to expand your present display installations, or if you'd simply like to reduce your display costs, call Computer Optics immediately.

After all, time is money.

Computer Optics Inc.

12:00 Reward yourself. You just saved a week of installation time.

"IDMS is the easiest DBMS to install"*

*say users in Datapro study

In the fourth annual Datapro Research survey of software users, Cullinane's IDMS was rated #1 among all Database Management Systems. #1 in Overall Satisfaction. #1 in Documentation. #1 in Training. #1 in Vendor Support. #1 in Ease of Use. And #1 in Ease of Installation.

We were rated "easiest to install" because IDMS goes in in one or two hours – not one or two weeks like IMS or DL/1. This is possible because we've worked hard to develop a simple installation process. Yet it's thorough – every system module is proved operational on your computer system.

Following installation, you also get a three-day training session in IDMS for as many of your people as you want. This training program was rated #1 in the Datapro study. For the complete story – including technical literature on IDMS and a schedule of seminars for your area – send this coupon, or phone us at (617) 237-6600.

Think twice. You'll choose the database system users rate #1.

Mini-Based Units Read Pages, Documents

SIMSBURY, Conn. — Scan-Optics, Inc. has two mini-based optical character recognition (OCR) systems designed for small business users or large companies in which data entry requirements are distributed among many locations.

The System 506 and System 515 operate off-line and read both pages and documents. They can be operated "by regular office personnel with a minimum of training;" the company claimed.

Each system includes a CPU, optical scanner, floppy disks and graphics CRT and keyboard terminal for key entry or video image capture.

The 506, which can process up to 30 documents per minute or three pages per minute, costs $52,490 in its basic configuration. The 516 can process up to 60 documents or 7.5 pages a minute, the firm said. It costs $72,650 in its basic configuration.

One-, two- and three-year rental plans are available. The 506 rents for $1,587 monthly on a three-year lease, and the 516 costs $2,177 per month on the lease plan. The company is located at 22 Prestige Park, E. Hartford, Conn. 06108.

Controllers Fit DG Minis

BEDFORD, Mass. — Aviv Corp.'s TFC 701 and TFC 702 imbedded magnetic tape controllers can now be used with Data General Corp. minicomputers.

The controllers are transparent to the DG operating system, the firm said, and are inserted in the DG chassis.

The TFC 701 provides NRZI recording for standard tape drives with speeds of from 12.5 in./sec to 125 in./sec. It costs $2,500. The TFC 702 gives users both NRZI and/or phase-encoded recording techniques over the same speed range and costs $3,300.

The controllers are provided with documentation, diagnostic software, installation instructions and cabling, Aviv said from 300 Sweetwater Ave., Bedford, Mass. 01730.

Graphics Card For HP Minis

CUPERTINO, Calif. — The Intermedia Systems Model 4422 Graphic Video Generator I/O card for Hewlett-Packard 2100/MX and E Series systems is contained on a single circuit card.

Using the unit, the display data is stored in a local screen refresh memory. The random-access memory allows plotting in excess of 300,000 point/sec, the company claimed.

Software includes a Fortran-callable graphics library, drivers for all HP operating systems and a device diagnostic, the firm added.

The unit costs "less than $2,000," a spokesman claimed from 10601 S. Saratoga-Sunnyvale Road, Cupertino, Calif. 95014.

Turnkey Aimed At Novice Users

MILWAUKEE, Wis. — The Mesa Two from A.O. Smith Corp. is a turnkey small business system that comes with a library of accounting programs designed for first-time users.

The system, which the vendor says carries the name of a product formerly sold by Martin Wolfe, Inc., is based on Data General Corp. hardware. Software provided includes packages for accounts receivable, accounts payable, inventory, payroll, general ledger and sales analysis, according to a spokesman. Audit trails are provided from financial statements, he added.

The system can communicate to a larger mainframe if needed in a distributed processing appplication, the vendor noted.

The minimum hardware includes a 64K CPU, a 165 char./sec printer, a CRT and 10M bytes of disk. The system costs $57,000 including software. Prices range upward to $100,000 depending on options selected.

A.O. Smith noted that the system will be ready for delivery in five months. Its Data Systems Division can be reached through P.O. Box 584, Milwaukee, Wis. 53201.

900 Line/Min Printer Suits Range of Minis

FORT LAUDERDALE, Fla. — A 900 line/min impact printer that interfaces to Data General Corp., Digital Computer Controls, Digital Equipment Corp., Interdata, Hewlett-Packard and Lockheed Corp. minicomputers is available from Southern Systems, Inc.

The unit accommodates up to six-part forms. It costs $15,440 including control logic, buffering, interface and cables from the company at Suite 309, 3000 N.E. 30th Place, Ft. Lauderdale, Fla. 33308.

TI's new portable means remote

Until now, remote order entry meant expensive on-line operation with a computer via a telephone line.

But TI has changed all that.

The new *Silent 700** Model 765 Portable Memory Terminal has built-in bubble memory. So it can remember, even when the power is off, while it waits to talk to your computer.

With the 765 you can enter sales and order information all day long using the typewriter-like keyboard.

Then you can edit when you have time.

The 765's powerful, yet easy-to-use text-editing functions let you add, delete, locate, and correct data on the spot. So you can transmit more accurate data when the phone rates are lower. At a fast 30 characters per second.

Traveling companion. Lightweight portability is the key to convenient field use. And at 17 pounds, the 765 is really compact.

But it's no lightweight when it comes to features. With its built-in numeric cluster, keyboard with upper and lower case characters, quiet 30-cps printer, and acoustic coupler for telephone connection, the 765 is a heavy-duty operator.

And the 765 gives you plenty of storage space. The basic terminal comes with 20K bytes of memory. And it can be expanded to 80K bytes—the equivalent of up to 20 fully typed pages.

System Helps Firm Triple Cash Flow Speed

VENTURA, Calif. — A small business system at Bruce's Transport Service here has tripled the speed of cash flow for this company and will pay for itself in three years, according to William Aulich, accountant for the firm.

The company's primary business is hauling oil well drilling tools and equipment. As such, it is regulated by the Public Utilities Commission (PUC) as well as the Interstate Commerce Commission. The reports these agencies require are extensive, and in addition to keeping track of all general accounting details, the firm must keep tabs on miles driven, weight carried and surcharges for each driver and each vehicle.

A small business system was clearly needed to provide this information. The company first installed an NCR Corp. 399 system which, according to Aulich, "never worked. We were very unhappy with the performance of both the hardware and software."

After eight months, the firm began surveying the field for another system that could do the job. It looked at IBM, Singer Business Machines, Burroughs Corp. and Digital Equipment Corp. systems and finally purchased a DEC Datasystem 310 in October 1976, Aulich reported.

The system was programmed by Mini Computer Business Applications of Los Angeles. The first set of programs were test run on the software vendor's mini, so "we were up and running as soon as we got the hardware in. The rest of the programs followed soon after."

The system will pay for itself in three years, Aulich predicted, through reduction in personnel needed, cut overhead and faster turnaround time on invoices. Staff has already been cut in half.

"We're turning our records around daily now, instead of always being five, six or seven days in arrears as we were when the accounts were being done by hand. Invoices which used to go out every three or four days are now going out daily.

"And since we're getting money back three times as fast, we're tripling the speed of cash flow," Aulich said. Payroll now takes three hours as compared with three days and accounts payable has been reduced to three hours from five days, he added.

Its versatility, dependability and cost sold the company on the system and it's a decision the firm feels was well made. In fact, the PUC has asked other firms of this type to come look at the system at Bruce's, Aulich said.

Mini Answers User's Demand For Job Control

REGO PARK, N.Y. — Sometimes the best system for the job isn't one touted by a major computer manufacturer; sometimes it's a system from a turnkey vendor that suits the particular needs of a user in a specific industry.

That's the opinion of John Bianco, head of accounting for Samson Management Co., a real estate management firm.

"Most systems you look at are designed to suit a multitude of purposes and to attack the biggest market," he noted. But the system his firm purchased was designed by people who knew real estate management.

The system has "produced almost everything we expected of it, with faster turnaround and much better control of our overall picture than before," Bianco said.

Switch From Bureaus

Samson switched from service bureaus that handled the firm's work over the years. Small business people should remember that "it's a lot more work" to own your own system. "You now have to contend with doing the work that the service bureau formerly performed." However, if you are willing to do this, an in-house system can be a "great improvement," he advised.

The equipment installed at Samson includes a VMAC II mini from Columbus Computing, based on a Data General Corp. Nova CPU with two disk drives, a Centronics Data Computer Corp. printer and three Hazeltine CRT terminals.

With the system, management can secure information on demand that previously was not available at all or very difficult to produce, Bianco noted. While service bureaus might have been adequate indefinitely, the company initially decided it needed this system to gain control over the general ledger which was maintained by a hybrid of service bureau computer and in-house manual methods, making it very difficult to analyze.

Development Effort

Thus, when the system was installed, the primary development effort was given to the general ledger, producing information available in response to inquiry.

"Real estate management is typically in the hands of family-run enterprises such as ours, with principals the dynamic sort who want what they want when they want it," Bianco said.

"When a pricipal asks for a June 30 rent roll on June 15, he may be only half-kidding. With a system in-house, you're not tied to the batch processing schedule of the service bureau. You go to your own terminals and printer and can usually generate what you need right away."

memory terminal order entry.

Office companion.
Many people want a terminal with the features of the 765 for applications where portability is not required. So we designed the Model 763. A table-top version of the 765, the 763 has the same performance capabilities in a compact unit, and comes standard with either a TTY current loop or EIA interface instead of the acoustic coupler.

Small price for remembering.
TI's new Model 765 Portable Memory Terminal is priced at only $2,995.† Additional 20K increments of bubble memory are $500† each.

And, the table-top Model 763 at $2,695† is another price/performance leader. Of course, quantity discounts and a complete range of lease programs are available.

TI terminals mean business.

Minis Built for Governments

SPRINGFIELD, Ohio — Computer Systems and Services, Inc. recently introduced its System 88 series of minicomputers, designed for use in local government, manufacturing and distributing applications.

Three hardware packages are available for the unit, which is based on an Interdata 7/32 CPU. The Series 1 with 128K bytes of main memory, 20M characters of disk in two drives, two CRT terminals and a heavy-duty 300 line/min printer costs $58,900.

The Series 2 with 192K bytes of memory, 134M bytes of disk storage on two drives, two 9-track tape drives, four CRTs and a 600 line/min printer costs $110,000.

The third member of the family, the Series 3, has 256K bytes of memory, 512M bytes of disk, two industry-compatible 800-and 1,600 bit/in. tape drives, eight CRTs and a 1,000 line/min printer. It costs $192,600.

Available software includes packages for tax accounting and billing, treasurer's on-line receipt posting, collection and receipt reporting.

The firm assumes "single-source responsibility for hardware, software, user training, technical support and hardware maintenance," it said.

The system can be expanded from the smallest model to the largest without replacing the CPU, the company noted from Suite 403, 120 S. Linestone St., Springfield, Ohio 45502.

Ampex Has PDP Options

EL SEGUNDO, Calif. — Ampex Corp. has expanded its line of plug-compatible core memory systems for the Digital Equipment Corp. PDP-11/70 minicomputer with two additional models.

The ARM-1170 Model B is said to provide 64K to 128K words of memory in 5.25 in. of rack space, including power supplies and blowers. The unit enhances performance through two-way memory interleaving on systems equipped with 128K words or less of DEC memory, Ampex said.

The ARM-1170 Model C includes up to 256K words of memory in 10.5 in. of rack space, also including power supplies and blowers. It uses two- and four-way memory interleaving techniques to enhance performance, the vendor noted.

The systems are "totally transparent" replacements for the MJ11 and MK11 memories used in the PDP-11, he stated.

The Model B costs $12,875 for 128K words and the Model C costs $23,865 for 256K words. Ampex is at 200 N. Nash St., El Segundo, Calif. 90245.

HP Turnkeys Automate Labs

PALO ALTO, Calif. — Hewlett-Packard Co. has three mini-based turnkey laboratory automation systems using chromatographic software.

Designed for analytical research, quality control and process monitoring applications, the 3351B, 3352D and 3353A systems are incrementally expandable, HP explained.

The 3351B and 3352D include an HP 21MX processor with 16K words of memory, an A/D converter and a 30 char./sec printer and console with built-in dual cassettes.

The 3353A has a thermal line printer, CRT terminal with 12K bytes of memory and a dual tape cartridge.

The systems range in price from $10,000 to $24,800 HP said from 5207 Page Mill Road, Palo Alto, Calif. 94304.

MDB Controller Links HP 21MX, Printers

ORANGE, Calif. — MDB Systems, Inc. has a plug-in line printer controller for the Hewlett-Packard Co. 21MX.

The controller is said to be transparent to host computer diagnostics, drivers and operating systems. It is contained on a single circuit board.

The controller costs $850 to $1,250 depending on the printer used. It will operate with any printer that has a Centronics Data Computer Corp. or Data Products Corp. buffer emulator, a spokesman noted from the company at 1995 N. Batavia St., Orange, Calif. 92665.

With Micro Interfaces

Builder Shares Knowledge, Frustrations

By Doug Anderson
Special to CW

I own an Altair 8800 with 21K bytes of static random-access memory (RAM), a Processor Technology Corp. video monitor board, a Panasonic video monitor and two Shugart Associates mini-floppy disk drives with a North Star Computers, Inc. controller. In addition, I have a Practical Automation printer, a surplus Texas Instruments keyboard and modem, a Mits, Inc. EIA board for the modem and four-port parallel I/O board for the keyboard and printer plus a Cromemco 8K-byte programmable read-only memory (Prom) board with 5K bytes of Prom.

My Altair was ordered back in March 1975 and delivery took about three months. This was my first electronic kit and I did a number of things wrong. After about six months, however, with a lot of help, I got it to run simple programs that were toggled in on the front panel switches.

Things Learned

During the building of the kit, I learned a number of things the hard way: to wipe a soldering iron instead of filing it; that chips must be in sockets to facilitate replacement; that Molex, Inc. Soldercons were essentially useless for my purpose; that about 10% of all chips will eventually fail; and that dynamic memories cause far more problems than static memories.

I spent a very frustrating six months trying to get a Mini Micro Mart cassette interface to work — and failed. I ordered a different interface from Morrow's Micro-Stuff, put it together and it worked right away. That made life a lot simpler, since I am a software guy by nature and the operational cassette opened up new worlds. I could write and compile software. Since I initially didn't have a hard-copy capability, I would call up a terminal with an auto-answer modem and print there.

The cassette eventually proved a frustration, though, as the bit dropout rate was too high. I finally ordered a mini floppy and controller and sold the cassette board. The result was no more dropouts, and I was able to increase my productivity ten fold. I ordered a second drive and have plugged that one in, too.

I ordered a printer from the Digital Group and it proved to be a big disappointment. Althouth the hardware was good, the components provided with the interface were not. Two bad transistors caused the print head to burn out in 20 seconds flat. Also, the documentation was among the worst I have ever seen.

Self Zapping

The printer solenoids are driven by software. It is possible to stop the microprocessor unit MPU with the needle solenoids engaged and in 20 seconds they will overheat and zap themselves. Additionally, the routines provided did not work and were written in a nonstandard Assembler language and were not documented.

As far as software goes, I have extended Basic running as well as a disk assembler. I am currently debugging a disk-oriented text editor with automatic memory management. I have written and am using a disk I/O package that supports open/close/rewind, read/write blocks and get/put records. A

Micro Bytes

Osborne Publishes Programs in Basic

BERKELEY, Calif. — Osborne & Associates, Inc. has published *Some Common Basic Problems,* by Lon Poole and Mary Borchers. The book is a compilation of programs written in Basic that perform a variety of common tasks.

The book does not teach the user to program in Basic, and users can utilize the programs in the book whether they know how to program in Basic or not. All programs are written in a restricted subset of standard Basic and should be compatible with many versions of that language currently available to microcomputer users, a spokesman explained.

Options are included with some programs to allow the user to change the input or output format of the original program, he said.

The book consists of 76 programs and is available for $7.50 from Osborne at P.O. Box 2036, Berkeley, Calif. 94702.

COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

Board Bows

WESTLAKE VILLAGE, Calif. — Vector Graphic, Inc. has introduced a board with 1K byte of on-board random-access memory (RAM) and a capacity for up to 12K bytes of 2708-type erasable programmable read-only memory (Eprom).

The board occupies two independently addressable 8K-byte blocks and complete addressing flexibility is provided to conform to any system configuration with a minimum of address jumpers required, a spokesman claimed. Video boards or disk operating systems can be nested in the 3K bytes of unused space, he added.

The board costs $135 in kit form and $175 assembled from the firm at 790 Hampshire Road, A-B, Westlake Village, Calif. 91361.

Tele Speed Has Serial Printer

SYOSSET, N.Y. — Tele Speed Communications, Inc. here has introduced a dot matrix serial impact printer for the microcomputer hobbyist.

The Model 81 printer is an 80 char./sec, 80-column, bidirectional asynchronous printer. It comes complete with electronics, power supply and cabinet. The printing medium is friction-fed pressure-sensitive paper.

The unit's paper advance and carriage are stepper-motor driven, permitting the unit to be used for graphics or as a plotter, the spokesman added.

The printer with parallel Ascii interface costs $615 and deliveries will begin in December, the spokesman said. Tele Speed can be reached at P.O. Box 647, Syosset, N.Y. 11791.

Development Support Offered

CUPERTINO, Calif. — Zilog, Inc. has introduced a program development system, the Z80-PDS, to provide support for developing and debugging Z80-based mirocomputer programs.

The standard Z80-PDS includes a floppy disk drive with up to 300,000 bytes of on-line data storage, internal memory consisting of 3K bytes of programmable read-only memory and 16K bytes of random-access memory and serial I/O with RS-232 or strapable current loop interface, according to a spokesman.

System Expandable

The system is expandable to provide additional I/O or terminal capability and can also be used as a general-purpose microcomputer.

The serial I/O feature allows the use of CRTs or hard-copy devices with rates from 110 bit/sec to 19.2 kbit/sec.

Software for the system includes a disk-resident operating system, editor, assembler, debugger and file handling utilities.

The system costs $2,850 from Zilog at 10460 Bubb Road, Cupertino, Calif. 95014.

Gnat Introduces Micro Compiler

SAN DIEGO, Calif. — Gnat Computers, Inc. has introduced a Fortran compiler for its Minifloppy/Microcomputer system.

The compiler includes all Ansi-standard Fortran, X3.9-1966, except for double-precision and complex numbers, which will be available at a later date, a spokesman claiemd. In addition to the compiler, a relocating assembler, a linking loader and Fortran library are included. Fortran function are implemented with 32-bit floating-point arithmetic and integers are implemented with 16 bit numbers, the spokesman explained.

The Fortran can be purchased for $500, which includes a single copy and documentation. Gnat is at 7895 Convoy Court, Unit 6, San Diego, Calif. 92111.

Builder Shares Kit Experiences

(Continued from Page 55)

Prom resident monitor with device independence, program relocatability, spooling and procedure library is also in development. After these projects are complete, I plan to develop a linking loader, sort/merge and commercial Fortran compiler.

Incidentally, for the privilege of being a Canadian, I have to spend about one-third more than an American for the same product. Of the $6,000 I have spent so far, about $1,500 has gone directly to the Canadian government in customs duties and taxes. Say, for example, I buy a memory board for $100. The exchange rate costs me $8, shipping $4, and customs, which is 10% and is figured on cost and exchange, will run $11. Finally, a 12% federal sales tax — which is figured on cost, exchange and duty— will run $14 for a total of $137 for the $100 board.

One of the most important things I have learned through all of this is that there are many "hidden gotchas" to look out for in hobbyists kits.

Anderson is a hobbyist in Ottawa, Ontario.

WANG'S PCS-II
THE END OF THE LINE FOR INTELLIGENT TERMINALS.

Wang's PCS-II. The small business computer that makes intelligent terminals obsolete. And introduces a whole new world of Distributed Data Processing.

Endowed with commercial BASIC and exclusive Wang minidiskette storage, the PCS-II delivers direct access data processing capabilities no ordinary terminal can. And with Wang's programmerless "EASYFORM" forms building and data-entry language; the PCS-II is a hands-on winner in any data-entry or forms-processing environment.

Wang modularity lets you expand memory, communications or peripherals as your needs grow. Or new technologies as they develop. Directly at the operator site.

The PCS-II even gives you a price tag no intelligent terminal can match — just $6,200. With 50K memory, dual minidiskette drives and bisynchronous 2780/3780 communications it's still only $9,200.

Hungry for more intelligence? Call your local Wang office or mail this coupon to PCS-II Product Sales, Dept. DDP, Wang Laboratories, Inc., One Industrial Ave., Lowell, Massachusetts 01851.

I'm hungry. Send me information on Wang's PCS-II.

Finally... a word processing system that does things your way

Our new word processing system—ForeWord™—gives you the flexibility you need to fit today's advanced technology to your work environment...at a price your business can afford.

More than an automated typewriter

ForeWord is a shared logic system that uses a Four-Phase computer with up to 16 video display stations and 16 printers to help your staff prepare letter-perfect correspondence in a fraction of the time once required. Either in a central location. Or in individual offices. Or both with the same system.

Ideal for manuals and proposals

ForeWord can also be used for direct composition, editing, and final typing of the large documents that once tied up your staff for days. Paragraphs can be retrieved from local storage and updated, chapters reorganized...all at computer speed. And all while other operators are performing their independent tasks.

Nationwide support

ForeWord uses the same proven hardware as our distributed processing systems, and is backed by the same network of experienced service personnel in strategic locations throughout the country.

For more information, call your local Four-Phase office. Or write us at the address below.

Unit Programs Eprom Chip

DERBY, Conn. – A programmer for the 1702A erasable programmable read-only memory (Eprom) chip has been introduced by E&L Instruments, Inc. as an accessory to the firm's MMD-1 microcomputer.

By sharing MMD-1 circuitry, the device can be used to program a 2K-bit Eprom chip in about four minutes, a spokesman claimed.

A 1702A Eprom chip installed in the programmer will accept data from any block of MMD-1 memory as well as from any chip designated as a master to be copied. After programming, the Eprom's contents can be verified.

Data transfer between the programmer and MMD-1 takes place over a 40-pin connector and ribbon cable assembly. The unit costs $222 assembled and $166 in kit form from E&L at 61 First St., Derby, Conn. 06418.

The Eprom programmer is an accessory to the MMD-1 microcomputer.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, *etc.* count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:

Box XXXX

As Market Soars

Bubble Memory Prices to Drop: Study

By Toni Wiseman
CW Staff

SAN JOSE, Calif. — Bubble memory components for small systems will sell for 6 millicents per bit in 1981, a year in which the market will total $180 million.

That same year, bubble memory components for disk replacement will sell for 3.6 millicents per bit with a market totaling $72 million, according to a recent report by Small Business Systems.

The study made several dramatic statements on the market impact of bubbles. For instance:

- "The gap filler or Fast Access Memory (FAM) role will be taken by charge-coupled devices (CCD). Little effort will be made to improve bubble memory shift rates.
- "Bubble memory chip capacity will exceed random-access memory (RAM) chip capacity by an average factor of better than 10 to 1 between 1977 and 1981.
- "IBM will announce bubble memories in a product before 1980. The system will be configured to discourage attachment of non-IBM peripheral memory devices."

Small Business Systems noted that bubble memory is similar to semiconductor technology in that Bell Laboratories controls many of the patents.

"Bell has taken a stance in bubble memory technology similar to that in semiconductor technology: Licenses are available at a relatively modest fee plus royalty. This means that no company will be able to become dominant through its patent position; this should ensure a competitive market for some years to come," the report suggested.

Entry into the bubble memory market is an expensive proposition at this point in time since there is little equipment which uses the technology and therefore no significant sales volume. Small Business Systems estimated that a new component manufacturer would have to announce its product and then wait between 18 months and two years for volume usage to begin, all the while bearing the high fixed cost of bubble memory manufacturing operations.

Once the market develops, however, the firm estimated that the necessary $1.8 million capital expenditure for a bubble memory line will be less than that required for a new semiconductor line, marking it appear attractive to a component supplier.

Market Forecasts

"The rate of growth of bubble memory sales is limited by two factors: the design time required to bring products using bubble memories to market and the ability of manufacturers to expand their capacity to meet demand," the report stated.

While an 18-month "dry" period between the introduction of a component and its first volume sales can normally be sustained by manufacturers because the capacity of their production lines is absorbed by more mature products, bubble memory lines make only bubble memories. This means the capacity of the production line is unabsorbed and it is likely the first manufacturers to announce products will sustain heavy losses until sales build up, it said.

Despite this fact, Small Business Systems forecast new suppliers will enter the market by 1979 or 1980, joining Texas Instruments and Rockwell — the only current suppliers.

The study predicted two significant events will occur in the 1979-80 timeframe; the entry of new suppliers will make prices more competitive and the lower prices and higher industry capacity will cause bubble memory suppliers to seek to enter the disk replacement market.

The estimated 1977 U.S. memory market will be dominated by RAM memories (60%), followed by disk drives (26%), tape drives (6%), FAM (4%), floppy disk drives (3%) and mass storage (1%), according to Small Business Systems' figures.

The size of the RAM market has always attracted the semiconductor industry, whose constantly growing productive capacity demands a very large market. Small Business Systems expects the same scenario will be repeated in the disk market and, while bubbles are not semiconductors, fabrication techniques are similar and should not be difficult for a semiconductor firm to master.

IBM Entry

"In addition, the projected entry of IBM should legitimize the application. IBM may well introduce bubble memories in a new system in such a way that it is impossible for add-on memory suppliers to duplicate the memory without access to bubble technology.

"This would cause these suppliers to seek access to the technology and create an IBM-compatible bubble memory market similar to the present add-on memory markets. This, in turn, would stimulate the merchant market for bubble memories," the report said.

The small system bubble memory market should grow from 12,000 units in 1977 to 1.2 million in 1979 and 3 million in 1981. Bubble sales during that time will rise from $4.8 million in 1977 to $92.4 million in 1979 and $180 million in 1981, it added.

The report — *Bubble Memory — Impact and Opportunity* — is available from Small Business Systems at Suite 230, 4320 Stevens Creek Blvd., San Jose, Calif. 95129.

Five Years, 40 Members Later, CCIA's Influence Still Growing

By Edith Holmes
CW Staff

WASHINGTON, D.C. — It all began with an association with a one-year charter whose "whole purpose was to get U.S. vs. IBM off the dime."

Today, five years later, the Computer and Communications Industry Association (CCIA) aspires to be the spokesman for these industries in a broad range of issue areas.

The membership push is on. "We must double our membership" if the association is to meet the expenses of covering the capital formation, standards and competition issues it sees in the computer and communications industries, according to A.G.W. (Jack) Biddle, the CCIA's president.

During the meeting of its member companies' executive officers in Chicago in August (CW, Aug. 29), the CCIA formally established a new category of membership: associate member, which is open to user organizations and to institutions — such as banks and investment firms — that are concerned about the future, Biddle said.

The CCIA hopes its drive will attract between 50 and 60 companies — yielding about a one-to-one correspondence with its corporate membership of 40 firms. The association expects to attract the more sophisticated users, the multivendor shops.

"It behooves the user, particularly the sophisticated user with a million-dollar DP bill and a million-dollar phone bill, to come forward and be active in the issues facing these industries," Biddle stated.

Interest Aroused

Long a proponent of user involvement in DP, and more recently in the communications scene, the association conceived of its new membership category in the wake of IBM's 3033 system announcement. Eleven companies, all with over $200 million in annual revenues, called the CCIA to express concern over IBM's plans and to express interest in the association, Biddle said.

Five years ago, in Encino, Calif. seven beleaguered plug-compatible peripheral manufacturers (PCMs) banned together un-

DEC LA-36 SINGLE UNIT
YEAR END SPECIAL!

$1,375*

*Offer ends Dec. 15, 1977

From DDI, America's leading terminal supplier.

Branch offices: New York City • Morris Plains, N.J. • Philadelphia (Cherry Hill, N.J.) • Washington, D.C. • Detroit (Southfield) • Chicago • Atlanta • Dallas • Houston • Los Angeles (Encino) • San Francisco

This is just one of DDI's special year-end offers. Whatever your terminal needs, we offer you the market's finest values—and we're prepared to prove it!

With DDI, you also get:

- A single source for DEC, TI, ADDS, DIABLO, OMNITEC, TECHTRAN.
- Full range of new products.
- Choice of rent/lease/buy plans.
- Unique Combination Savings Plan.
- Nationwide maintenance service.
- Nationwide branch network for prompt response to your needs.

Five-Year-Old CCIA Gaining in Influence

(Continued from Page 59)

der the title "Computer Industry Association" (CIA) to blunt the battering they were taking from IBM through leasing plans, tape drives and disk drives.

Early on, however, the association realized if it was to speak for the industry, it had to broaden its interests and understanding beyond that of the PCMs, Biddle noted.

By that time, though, the anti-IBM image had already been created. The anti-AT&T image quickly followed. From the viewpoints of those giant corporations, the association might as well have been the federal CIA.

Biddle maintains that today's CCIA is a different organization from the fledgling band of five years ago, with a different member complexion, a different leadership.

"Monitoring and affecting the competitive structure of the industry is still considered the highest priority of the association by its member companies," Biddle added.

But CCIA notions of just how that competitive structure is to be achieved have mellowed and matured.

Broad Membership

The Association's membership is sufficiently broad — including Amdahl and Itel, software firms, all forms of peripherals companies, terminal makers and third-party leasing outfits — and its stance on issues is consiliatory enough that it can join with either IBM or AT&T to urge a more competitive industry structure.

The CCIA cooperated with IBM in filings before the FCC concerning AT&T's Dataspeed 40/4 offering and the second Computer Inquiry, and the association aligned itself with AT&T concerning IBM's Satellite Business System venture.

Perhaps the CCIA has learned that antitrust suits don't provide the only means available to make an industry more competitive.

"The computer industry is 30 years old. For almost 20 years, there has been litigation pending against IBM. We have to stop that because it affects everybody, including IBM and users," Biddle said.

A.G.W. (Jack) Biddle

Certainly, the progress toward relief achieved thus far in both U.S. vs. IBM and U.S. vs AT&T has shown that there must be other avenues leading to more open markets, Biddle suggested.

Beyond the court cases, however, the association firmly believes that the computer and communications industry and its marriage with communications intensify "the situation of the nation as a whole" in that these fields are capital intensive, Biddle said.

Capital Formation

Capital formation is a key, crucial issue and one that must be resolved soon if the computer and communications industries in particular and the nation as a whole are to continue to raise new entrepreneurs, the CCIA president added.

The issues the association hopes one day to represent rapidly become global problems driven, chiefly, by the rising cost of energy, Biddle suggested. The CCIA's concern for the recreation of the competitive structure of the economy has led to its worry that small and medium-sized businesses are not sufficiently represented before the federal government.

The CCIA would like to work more closely with organizations like the National Small Business Association, but a lack of manpower makes working with others difficult, Biddle said.

Again, membership is crucial. In this area, as in the fields of interest to users, investment firms and the specialized common carriers, the CCIA plans to increase its current staff of 12 people. It will add at least one person per interest area to take care of the needs of each of these groups as soon as they join the association in sufficient numbers to provide the necessary funding, the CCIA president said.

The CCIA stands the best chance of representing the entire industry because it opens its membership to all segments of the industry, unlike the other two computer and communications industry representatives in the nation's capital — the Computer Business Equipment Manufacturers Association (Cbema) and the Association of Data Processing Service Organizations (Adapso), Biddle said.

But can the CCIA represent the computer and communications industries without IBM, "the seven dwarfs," AT&T and the other carriers? No, not the entire industry, Biddle said.

Maybe the threat of government regulation of the computer industry would bring IBM closer to the association. Maybe it is currently in the CCIA's interest not to have AT&T and IBM as members, equal though all the association's members might be. Maybe in five more years . . .

We knew it from the beginning. And, so did our customers. We were convinced from the start that static RAM technology was the way to go on our 370 add-on memories. Static is faster. More reliable. And, totally compatible with IBM.

Now, we see an interesting thing happening. Our competitors, long-time proponents of dynamic technology, have suddenly changed their tunes. They're now planning to jump on the static bandwagon. But, they have a long way to go. We spent two years to develop our static technology before we started delivering it in 1975. We were the first with an NMOS static chip. The first with a 4K chip. And, our new 4K chip is the fastest, static or dynamic. All from EMM's own semiconductor facility in Phoenix.

Evidently, recent IBM enhancements have left some of our competitors holding the bag. We knew from the beginning that complete IBM compatibility requires static technology. We've kept right up with IBM. And that's how our customers are always going to be up-to-date with future IBM enhancements.

When you need add-on memories, check with EMM. We've got the best total all-around add-on-memory package going. We'll see to it that your memory stays IBM compatible.

Trial Documents

Foreign Share to Drop 8%

ADL Sees U.S. Losing Edge in World Market

By Molly Upton
CW Staff

NEW YORK — By 1981 the installed value of the non-U.S. computer base could exceed that of the U.S., according to a five-year forecast from Arthur D. Little, Inc. (ADL) that was entered into evidence in the U.S. vs. IBM antitrust trial here.

The rest of the world could contain 52% of the world total installed base of general-purpose computers by that year, ADL said in its study on "The World Computer Industry 1976-1981."

At the end of 1976, nearly 47% or $40.9 billion of equipment was located outside the U.S. The value of general-purpose computers worldwide was $87.4 billion, the report indicated.

By 1981, the non-U.S. installed base will be about $78 billion, or 52% of the world total of between $140 and $155 billion, according to ADL. This represents an increase in value of over 90% during the next five years.

U.S. manufacturers' share of the foreign market should drop from 71% to 63% by 1981, although the value will grow from $29.3 billion to $49.2 billion, up 68%, the report indicated.

The principal reason for the reduction will be the increasing nationalistic efforts by local governments, although the difficulty in distinguishing between U.S.-affiliated and foreign firms because of international combinations will also be a factor, the research firm said.

ADL estimated a 9% annual growth rate for the U.S. installed base and an annual 12% abroad, assuming an average real gross national product growth rate of 3% annually for Western Europe and 5% for Japan in the 1976-1981 period.

Looking at various regions, ADL said U.S. makers should increase their base in Canada from $2.3 billion in 1976 to between $3.8 billion and $5 billion in 1981.

The U.S. portion of the Western Europe base should grow from $21.2 billion to between $30 billion and $38 billion while Eastern Europe should jump from $.2 billion ~~to b~~etween $.6 billion and $.8 billion during that same time frame, the report continued.

The U.S. piece of the Japanese pie will grow from about $2 billion to between $3.2 billion and $4.8 billion, the report added.

The only region in which the U.S. share is supposed to increase is Eastern Europe, where the base should include 10% from U.S. shipments, up from the 5% in 1976.

The total base there should grow from $3.3 billion in 1976, to either $5.5 billion or $7.5 billion in 1981.

ADL expects more countries to concentrate on developing minicomputers rather than larger systems.

In Western Europe, the value of computer systems installed is expected to rise 50% to 90% to the $37 billion to $47 billion range by the end of 1981, ADL forecast. The wide range reflects the uncertain economic situation and its dependence on exports and petroleum imports.

During 1976, general-purpose computer systems in use in Western Europe increased in value by 15% to $24.6 billion, the report observed.

The U.S. share of the Western European market should decline from about 86% to 81% in 1981, principally because of "stronger participation of indigenous manufacturers in the fields of minicomputers and small business systems," it said.

IN QUANTITIES OF ONE

Why spend $160,000 or more for a firmware system when our's can give you the same End results for less than $300/mo. (60/mo lease plan). Remember us! We're that "FREE SOFTWARE" company that provides you with thousands of dollars of software for just a little more than the cost of the paper its' printed on. NOW we are going to virtually give away our "Firmware System" at mere fractions of everyone else's prices. How can we do it? Well — Just like we did with our software; by providing a quality product at very nominal prices and relying on volume for our profit instead of making it off you! Unlike some of the other advertised systems we offer a TOTAL system package with mass memory, video display, line printer, operating system, plus a full Application Software Library. Software packages available with the system include: Payroll, Inventory, General Ledger, Medical Record Keeping, Word Processing and more. Entire package includes everything above plus system tutorial, more than 600K Bytes of formatted disk storage and over 65K Bytes of RAM. Assembled and ready to use. Complete Unit price $8999 plus shipping. Leasing plans and national service available from any of our 134 dealers.

42,178 buyers attended the 1977 Computer Caravan 9-city tour... that's an increase of 32%

Thousands of computer buyers from all across the country are planning to attend one of the 1978 Computer Expos. They'll be there to gather information about a variety of products and services, evaluate the companies who supply them, and select the ones that best meet their needs.

If you're marketing computer products or services, then you'll want to be in one or more of the regional Computer Expos beginning in March. How else can you meet well over 50,000 computer buyers across the country in just nine short weeks?

Computer Expo '78 is part of a nationwide Conference and Exposition program, which each year serves the computer community by bringing nine regional Computer Expos to the most important business areas in the U.S.

You'll want to exhibit at one or more of these shows, but for PRIME positioning, you've got to reserve space NOW.

For complete information on how the 1978 Computer Expo tour can work for you, use the coupon below or call Kim Wichert at (617) 964-4550 (collect).

Keep in mind, your prime prospects will be at Computer Expo '78... so will your competition.

Hewlett Explains Fundamentals of 'HP Way'

By Molly Upton
CW Staff

PALO ALTO, Calif. - What is the "HP way?"

"I feel that in general terms it is the policies and actions that flow from the belief that men and women want to do a good job, a creative job, and that if they are provided with the proper environment they will do so," according to Bill Hewlett, Hewlett-Packard Co. president.

"But that's only part of it. Closely coupled with this is the HP tradition of treating each individual with consideration and respect and recognizing personal achievements," Hewlett observed in the firm's publication *Measure*, which was devoted to looking at how employees and officers explained the firm's philosophy.

Although Hewlett admitted this sounds "almost trite," he said he and cofounder Dave Packard have tried to operate the company along these lines since it first started.

In line with this confidence in, and concern for, people, the founders decided the firm should not be a "hire and fire" operation, he said.

"Perhaps the company's most important responsibility to its people is providing stability of employment."

In at least two instances, rather than cut the workforce, HP has shared the burden of a recession or imbalance of orders and production by reducing work hours and pay for those affected. The net effect is that the firm emerges fully staffed with capable people who have confidence in the company, according to the publication.

One corollary to the HP way is that "employees should be in a position to benefit directly from the success of the organization," he continued. HP developed a profit-sharing plan and an employee stock purchase plan, as well as medical insurance for catastrophic illness.

Each foreign country organization tailors its benefits to its own traditions, laws and values.

In the U.S., employees with more than six months of service are eligible to participate in the profit-sharing plan, which is calculated on HP's pre-tax earnings.

The U.S. stock option plan permits employees with at least one year of service to set aside up to 10% of base earnings to buy shares, which are issued quarterly at current market price. HP contributes 25% of the cost of the stock, Hewlett said.

Small Divisions

HP's policy of keeping basic business units, the operating divisions, small and well defined is designed to "give people a clear sense of their own mission and an awareness of their individual contributions to overall performance," he continued.

HP believes in developing its own management and has applied its own concept of management by objective.

"When stripped down to its barest fundamentals, management by objective says that a manager, a supervisor, a foreman given the proper support and guidance (that is, the objectives) is probably better able to make decisions about the problems with which he is directly concerned than some executive way up the line — no matter how smart or able that executive may be.

"This system places great responsibility on the individual concerned, but it also makes his work more interesting and more challenging," Hewlett said.

"It makes him feel he is really part of the company, and that he can have a direct effect on its performance," he continued.

The firm has a wide variety of company-sponsored training and development programs including apprenticeship programs combining on-the-job training and classroom instruction.

It also offers televised courses from universities in which the remote classrooms are equipped with audio communications to the instructors.

Individual's Worth

Stressing the importance of the dignity and worth of the individual, HP long ago eliminated time clocks and more recently introduced flexible work hours.

"This is meant to be an expression of trust and confidence in HP people as well as providing them with an opportunity to adjust their work schedules to their personal lives," Hewlett remarked.

The firm operates with an informal and personal atmosphere. Hewlett hopes it can retain this "'family' way of operating with a minimum of controls and the maximum of a friendly 'help each other' attitude."

"You can't describe it [the HP way] in numbers and statistics. In the last analysis, it is a spirit, a point of view. It is a feeling that everyone is a part of a team, and that team is HP . . . It is an idea that is based on the individual.

"It exists because people have seen that it works, and they believe in it and support it. I believe this feeling makes HP what it is and that it is worth perpetuating,'" Hewlett said.

List of Concepts

A 1975 management meeting produced the following list of concepts embodied in the HP way:

- Belief in people; freedom.
- Respect and dignity; individual self-esteem.
- Recognition; sense of achievement; participation.
- Security; permanence; development of people.
- Insurance; personal worry protection.
- Share benefits and responsibility; help each other.
- Management by objective (MBO); decentralization.
- Informality; first name; open communication.
- A chance to learn by making mistakes.
- Training and education; counseling.
- Performance and enthusiasm.

Tran, SDC Plan Project

EL SEGUNDO, Calif. — Computer Transmission Corp. (Tran) and System Development Corp. (SDC) have agreed to combine their capabilities in a product development and manufacturing effort aimed at the commercial market sector in data processing and data communications.

The agreement includes a "significant financial investment" in Tran by SDC, making it a minority shareholder in Tran, according to Tran president Ray Sanders.

Along with the sharing of resources and techniques by the two companies, Tran will undertake the manufacture of products designed by SDC, as well as products resulting from cooperative efforts.

Details of the agreement were not disclosed.

Timetable Set

Diablo Systems, Inc. has established the production timetable for its Series 400 family of disk drives. The Models 411T (26.6M bytes) and 413T (53.3M bytes) will be available in October 1977.

Models 410T/F (13.3M bytes), 411F (26.6M bytes), 412T/F (40M bytes) and 413F (53.3M bytes) will be shipped in October 1978.

Result of U.S. Recession

Data 100 Happy With Move to Expand Abroad

By Nancy French
CW Staff

MINNEAPOLIS — Data 100 Corp., a company that provides computer terminal systems for a wide variety of distributed data processing applications, has what many consider to be an unusually far-flung international operation for an organization of its size.

Not too long after Data 100's December 1968 founding, a recession hit the U.S. When that happened, the firm's founders were quick to see the advantages of becoming an international operation since, at that time, European countries were "out of phase" with the U.S. and business was still good there. As a result, in 1971 the company established its first fully owned subsidiary in the UK, according to William J. Bryant, staff manager for international business.

Today, six years and 13 wholly owned subsidiaries later, Data 100 doesn't regret the move, Bryant said in a recent interview.

The Minneapolis-based firm designs, manufactures, sells, leases and services products that are compatible with those of the major mainframers and intended for use at remote locations. The original products were oriented toward batch work — as well as interactive terminal systems.

It also produces minicomputer products, line printers and disk drives that it markets to other equipment manufacturers.

Its customers include large corporations, service bureaus, universities, financial institutions and government agencies in 22 countries, Bryant said.

Seventy percent of these customers use the firm's products in conjunction with a large IBM mainframe as the host computer, he said. The rest of the customers link Data 100 equipment to CPUs manufactured by Control Data Corp., Univac, Honeywell Information Systems and, in the UK, ICL, he noted.

Ambitious Growth

Having 13 wholly owned subsidiaries in Western Europe, a joint venture in Japan and distributor relationships in 15 other nations would be considered rather ambitious for a company the size of Data 100, a firm whose revenues in 1976 reached only $122 million.

Bryant explains it by saying, "Our compelling reason for expanding so quickly overseas is that 50% of the potential business for an American-based computer or peripherals company is outside the U.S. — especially for a firm like Data 100, whose customers are largely multinational corporations.

Data 100 took the route of wholly owned subsidiaries because it allowed the firm to give "better service to its customers," Bryant said.

Despite its 1,704-strong customer base, the company faces the need to raise capital constantly. Like most of IBM's competitors, Data 100 must lease 95% of its equipment rather than sell it outright.

Only last month, the firm raised $15 million in convertible subordinated debentures, Bryant noted.

But the future is bright, he said. Rather than replacing their large 370 mainframes with larger systems or by configuring them into dual processors, many users have begun to add functions remotely, using their 370s as hosts to a number of remote smart terminals with a controller or entire minicomputer systems. This trend bodes well for companies like Data 100.

"Customers are looking for additional functions and ways to do some processing out in the field — the local payroll, for example," he said.

Higher Level Languages

By using a higher level language with their terminal systems, users can run them as minicomputers, he said. Right now, Data 100 offers RPG on its tape-based Model 78 terminals. The next step is a disk-based model, followed by a product with a small data base capability, he said. The next language offering, of course, would be Cobol, but "that hasn't been introduced yet."

The firm's 80 series, the first part of which was announced earlier this year, will have more models with more capabilities announced throughout 1978, he said.

The 80 is advertised as a "multifunctioned series with all terminal functions plus processing. Voila, a stand-alone minicomputer system." But Bryant argues that Data 100, with its terminal controllers, has been in the minicomputer business all along. "We just didn't call it that."

And Bryant is also bullish about the firm's viability in the IBM world.

"Even if IBM changed its operating systems or interfaces, it wouldn't effect us directly," Bryant said.

"We're insulated by the telephone line, which is not in the hands of IBM," he said. Even if IBM's Synchronous Data Link Control (SDLC) becomes the de facto communications protocol, and that's likely to happen, according to Bryant, he feels it will replace the older well-established binary synchronous communications (BSC) protocol very slowly because users have spent years developing their BSC-type networks.

A.B. Dick Files Suits Against REI

DALLAS — Recognition Equipment, Inc. (REI) has been named defendant in two lawsuits filed last week in Chicago by A.B. Dick Co.

The first suit, filed in the Circuit Court of Cook County, Illinois, alleges that royalties being paid to A.B. Dick by REI under an existing licensing agreement relating to an ink-jet printer patent are lower than required under the agreement. In the suit, A.B. Dick seeks to recover an unspecified amount for the alleged underpayments.

The second suit, filed in the U.S. District Court for the Northern District of Illinois, Eastern Div., alleges that REI, in the manufacture, use and sale of ink-jet printers, is infringing another patent under which A.B. Dick in the exclusive licensee.

A.B. Dick had previously offered REI a license under this patent. In this suit, A.B. Dick seeks to recover monetary damages of an unspecified amount and seeks an injunction against further infringement.

In responding to the two lawsuits, REI denied that A.B. Dick is entitled to recovery or relief under either of the suits and intends to oppose vigorously the claims made in both actions.

Think about the world's most popular video terminal. Chances are you're thinking about the Dumb Terminal.™

Because with a 24-line screen, and 1920 bright, easy-to-read characters as standard equipment, it would be difficult to come in second best. Especially at a price of $895. (Even for the Dumb Terminal.™)

In fact, the more you look at it, the smarter it is to think Dumb.

Lear Siegler, Inc., E.I.D./Data Products, 714 N. Brookhurst St., Anaheim, CA 92803; (800) 854-3805. In California (714) 774-1010.

ADABAS CHALLENGES EVERY OTHER DBMS!

Everyone says his DBMS is the best, but we want to prove it...with your data, on your computer.

Even Adabas isn't right for everyone, and if we're wrong, the test won't cost you a penny. (Obviously we're right a whole lot more than we're wrong, or we couldn't afford to make this offer.)

Adabas performs better, has more features, and is easier to use than any other DBMS. That's what survey after survey has shown. So now we'd like to show you.

We'll prove these Adabas advantages.

- The most cost-effective DBMS
- Low staffing requirements
- Flexibility in long-term maintenance
- Greater programmer productivity
- Easy-to-use reference manuals
- The best re-start and recovery capability
- Smallest on-line storage requirements
- Answers in seconds that used to take days
- On-line inquiry and reporting with "Adascript +"

Ground rules for the DBMS challenge.

Together, we'll set the evaluation criteria. Naturally, these will be based on measurable results of the benchmark.

Then we'll take on any other DBMS you can name. Of course, if we win, we assume you'll buy or lease Adabas. If you buy the loser (But why would you do that?) or buy nothing (Then why bother to play?), we'll have to charge $5,000. And even then, we'll be out $5,000 ourselves.

If we lose (which happens on rare occasions), we'll shake hands and wish the winner well. No charge, of course.

One more option.

Even if you don't have time to benchmark, we'll be glad to demonstrate Adabas on your computer. If it doesn't do exactly what we mutually agree it should do...no charge, of course.

1976 Trade Results Mixed For Electronics Products

By Edith Holmes
CW Staff

WASHINGTON, D.C. — Foreign trade in high technology, electronics-oriented products showed mixed results in 1976, according to the department of Commerce's International Business Administration.

Computer and communications products were among the five industry groups registering some increase in their trade balances; calculator shipments were among the three industry areas experiencing a decline.

The net result of these cross-currents in the trade of electronics products was a deterioration in the overall trade surplus of these goods to $876 million in 1976 compared with with $2.2 billion in 1975, the Commerce Department said.

Total exports rose 19% above the 1975 level to $8 billion, while imports rose 57% to $7.2 billion.

Exports of most industry group products increased in 1976. Exports of computers and related equipment rose 16% to $2.6 billion; telephone and telegraph equipment was up 15% to $227 million; and electronic components rose 27% to $2.5 billion.

Mirroring exports, nearly all import categories experienced increases last year. Imports of computers and related equipment rose 82% to $235 million; telephone and telegraph equipment was up 8% to $100 million; and electronic components rose 39% to $1.6 billion.

Only imports of calculating and accounting machines declined dropping less than 1% to $335 million. This decline was attributable to price erosion, Commerce stated.

BCC Sees Strong Growth For Xerographic Printers

STAMFORD, Conn. — There will be a substantial market for xerographic printers if IBM adopts them as the standard printer in the late 1970s or early '80s, according to Business Communications Co., Inc. (BCC).

Currently, there are over 80,000 impact line printers throughout the U.S. By 1985, over 120,000 line (or page) printers will service 59,700 computers, BCC estimated, noting that 23,000 of these will be xerographic printers.

While this is only 19% of the total, it represents a tenfold growth in eight years, BCC pointed out in a recent report on high-speed printing.

Computer output microfilm (COM) is also an attractive concept, it noted, adding that since 1973 COM sales have increased 30% annually because of the increased costs of paper. But COM faces many objections, most psychological, which will ultimately limit the field, BCC suggested.

"COM usage will continue to grow, and this presents an excellent opportunity for service bureaus, but this growth simply doesn't translate into equipment sales," the report said.

Finally, plotters present a stable market, though one dominated by California Computer Products, Inc. BCC said.

Companies have tremendous excess capacity for plotting. Therefore, growth can come from new or better equipment, such as the electrostatic plotter, and new uses, such as business graphics, it stated.

BCC estimated that 23,200 xerographic printers will be installed by 1985 — 8,800 with small computers, 6,000 with medium-sized systems and 8,400 with large computers.

By the same year, 4,783 COM recorders, 4,135 COM processors and 6,780 COM duplicators will be in use.

The largest base, however, will be plotters, with 1,689 flatbed plotters and 24,000 drum and electrostatic plotters installed by 1985.

A complete report is available from BCC at P.O. Box 2070C, 9 Viaduct Road, Stamford, Conn. 06906.

Expansions

Dataflux Corp. will move to 1050 Stewart Drive, Sunnyvale, Calif., where new facilities will provide a 50% increase in manufacturing and office space.

Pertec Computer Corp. will begin production at a 100,000 sq-ft manufacturing and support group facility in Chatsworth, Calif. The facility will accommodate all of Pertec's hard disk product line under one roof.

Digital Equipment Corp. has announced an agreement with the city of Boston to be the first tenant in the new CrossTown Industrial Park in the South End and Roxbury. DEC will occupy a 50,000 sq-ft facility.

Perkin-Elmer Data Systems' Terminals Division has doubled the size of its production facilities in Randolph, N.J.

Interactive Data Corp. of Waltham, Mass., has opened a 32,000 sq-ft computer center, doubling its time-sharing capacity.

Data General Corp. will add a 128,000 sq-ft plant to its Westbrook, Maine, facility.

General DataComm Industries, Inc. has purchased a manufacturing and headquarters facility in Danbury, Conn., including a 150,000 sq-ft complex.

Univac has purchased a 40-acre tract in the Oakmead Business and Industrial Park, Santa Clara, Calif., where it plans to build a development and manufacturing center. The initial phase will be a 400,000 sq-ft complex.

Persci, Inc. has moved its operations from Marina del Ray, Calif., to larger facilities at 12210 Nebraska Ave. in West Los Angeles.

MINICOMPUTER DEVELOPMENT

you can see the stars in Wichita

and grow a great career with NCR

We know *you* couldn't match our one-*two* combination offer anywhere else in the United States.

In Wichita, you and your family will enjoy the clean air, water, and general peacefulness of our modern municipality. Without giving up the advantages of urban life, you can gain safe streets, good schools, and the time to enjoy the "good life" however you define it. Our location offers opportunities for higher education, 52 parks, and the charm and hospitality of the Oldwest.

Professionally speaking, we offer state-of-the-art challenge in realtime architecture, developing network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development documentation testing and enhancing of large compilers.

OPERATING SYSTEMS

Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

PERFORMANCE ANALYST

Systems Analyst experienced in performance testing and evaluation. Develop testing procedures to evaluate a minicomputer/ based interactive system and apply the results to future development.

You're planning to move up, if you're the kind of professional it takes to join NCR. Why not move in to a friendly atmosphere, where your neighbors will welcome you and your career can expand? We offer both. We'd like to tell you about it in the personal interview, at your convenience, either by phone, or in person.

We welcome your inquiry.

Call us at 316-687-6192, or send us a resume for more details: Mr. Jerry Long, Professional Placement Office, Dept. CW-926, 3718 North Rock Road, Wichita, Kansas 67226.

Removal of DP Duties Seen Boost to Canada

By Molly Upton
CW Staff

TORONTO – The removal of duty on computers by the Canadian government would give the industry here a real shot in the arm, according to Richard J. Ball, vice-president and general manager of Honeywell Information Systems, Canada.

On the average, a Canadian user pays 18% more for (imported) DP equipment than the U.S. user, he indicated. That's one reason why the small business market is not larger, he added.

Richard J. Ball

Ball said he thinks the government will remove the duty on DP products, thereby following a recommendation made three months ago by the nation's tariff board.

Rather than implementing a hardware manufacturing operation in Canada, HIS is concentrating on software and has several agreements with the University of Waterloo for software creation.

"Hardware manufacturing isn't a good charter for Canada because it is rapidly becoming low in labor intensity," he remarked.

Job Creation Emphasis

The emphasis in Canada is on job creation, he indicated, adding the government has become more interested in software development than hardware manufacturing in the past two years.

HIS Canada had its best year in history in both volume and profit in 1976 and at the recent end of the first half was 14% ahead of the 1976 period in volume, he said.

The Canadian market is about 10% of that in the U.S. but the complexion of the market is different, he added.

For example, 65% of the total industry revenues come from large-scale machines, compared with 45% to 48% in the U.S., Ball observed. Thus, the emphasis is on large-scale network-type systems, he said.

The figure for large-scale devices also includes related terminals and minis, but so far there are relatively few minis hooked into the large-scale systems, he indicated.

Much of Canadian business is based in one head office with branch plants scattered across the country, and banks are spread out coast to coast, he added.

For example, large banks have from 500 to 2,000 branches, so HIS Canada ran into the demand for large conventional network requirements as early as 1971, he said.

The next step is distributed networks, he added.

Buoyant Industry

Although the Canadian economy is down, with unemployment at 8.1% and the Candian dollar 93 cents on the U.S. dollar, the computer industry has been relatively buoyant, Ball said.

The industries aiding automation traditionally do better when the economy is down, he added.

However, he expressed concern that the Candian economy does not seem to be following its usual path of being 18 months behind the U.S. economy. It should be tracking upwards by now, he observed.

The economy in Ontario is pretty good, with 60% of the gross national product within 150 miles of Toronto, he noted.

Quebec accounts for 33% of the Canadian market and 35% of HIS' market, but Ball sees a lot of hesitancy there because of the bilingual issue. Many firms are reluctant to pour more investment into Quebec, he said.

Not only does HIS have a staffing problem in Quebec because of the languae requirements, but products such as GCOS operate in English and therefore are meeting reluctance. "You'd have to reinvent the product," he said, adding many other non-English-speaking parts of the world have accepted GCOS.

Foreign Orders & Installations

Computer Analysts and Programmers Ltd. of the United Kingdom has ordered an IBM Series/1 system.

Dai-ei Co., Ltd., a department store chain headquartered in Suita City, Osaka, Japan, has ordered a Honeywell Model 66/05 large-scale system.

Kaiser Resources Ltd. of Sparwood, British Columbia, a coal mining company, has ordered a Honeywell Model 66/05 large-scale system.

The Computer Communications Group of the TransCanada Telephone System has selected NCR Canada Ltd. to supply network interface machines for the Datapac network.

The Legal and General Assurance Society Ltd., an Australian insurance firm, has installed two NCR Criterion systems to help accommodate its growing volume of business.

Sky Line Cable Vision of Ottawa has ordered a Reality system from Microdata Corp.

Hacetepe University in Ankara, Turkey, has ordered a B6800 system from Burroughs Corp. to be installed in the new Beytepe campus now under construction.

Caja Rural Provincial de Huelva, a local savings bank in Huelva, Spain, has ordered a Univac 90/30 system.

Where low cost is part of our high efficiency software package.

At Argonaut Systems we know that good packaged software requires real craftsmanship. We set high standards to make our modular software really work.

You pay one moderate price and that's it. We are available to explain and maintain your software. Or to modify for your system. But there's no need for a team of experts and unforeseen consultation costs. That's the software security we offer at Argonaut Systems.

Well written, solidly crafted programs. If tax laws change, our Payroll Personnel System is easily updated. An accounts payable package that you can tailor to your operation. And a taxbreak Taxcost package that doesn't break the bank.

Quality software modules at a low cost – that's what we call efficiency.

Attend the Chicago Personal Computing Show™ October 27-29 at the World's Largest Holiday Inn near O'HARE Airport.

See the New Affordable Computers

Now's your chance to see the new low-cost computers you've been reading and hearing about. On display at the Chicago Personal Computing Show will be new computers for your home, professional, business or education use.

For example, Radio Shack will unveil its new $598 complete computer with typewriter keyboard, memory, cassette recorder, video screen and programming. Is it everything that people in the electronics industry are saying it is? You can see for yourself in Chicago. Or how about the Commodore PET? At $595 this computer was the first to be aimed at the mass consumer market. How about the Apple Computer? Digital Group? What new business applications have been developed for the Altair computer and how does it compare with the minicomputers from Wang or Data General?

Literally hundreds of personal computers and related equipment will be up and running for your own, personal hands on inspection. You'll see the latest in inexpensive line printers, floppy disks, video terminals, memory boards and cassette interfaces. You'll also see the latest programmable home video games, many of which are evolving into true home computers.

You can learn from the experts what the computer revolution is all about. See all the new applications for these wonderful machines; compare price and decide what kind of computer would be best for your own use. Attend one of the many free or paid seminars. There's even a computer school where you can learn how to program while actually using a personal computer.

A personal computer can be your equalizer in a complicated world. Come to Chicago and learn what this new product, which could outsell handheld calculators, is all about.

Over 10,000 people and hundreds of exhibits are expected for this big, three day event. Admission: $10 at the door or $15 for all three days.

For $1 discount coupon or more information write:
PERSONAL COMPUTING SHOW, 401 Louisiana SE, Suite "G" Albuquerque, NM 87108.

International News

Asian DP Has Healthy Year

By Toni Wiseman

©CW Staff

HONG KONG — This has been a landmark year for computing in Asia, with sales, installations and legislation all adding to the general air of well-being.

Hitachi Ltd., the second largest local computer manufacturer in Japan, signed an $8.5 million contract to supply three large computers to China — two Hitac M160 Series-II and a Hitac M170, according to the *Asian Computer Yearbook*. The computers will be used for weather forecasting and are scheduled for delivery early in 1978 to the Central Meteorological Bureau.

The sale, however, is still subject to approval by the Coordinating Committee for Trade of Strategic Goods with Communist Countries (Cocom), an agency of the Organization for Economic Cooperation and Development (OECD).

Meanwhile, communist bankers in Hong Kong are expected to decide this year on a computer system for 13 Peking-controlled banks in the British territory, the yearbook said.

"The People's Bank of China, with more than 500 branches throughout China, has been studying computerization for some time but has yet to make a move.

"Some members of the banking and computer communities believe banking authorities in Peking will use the installation in their Hong Kong banks as an experiment before deciding on a computer system for mainland banks," the yearbook suggested, noting that Control Data, IBM, Univac and NCR are thought to have the best chances of landing the contract.

While the banks are studying proposals, the Royal Hong Kong Jockey Club has made the largest computer purchase in Southeast Asia in recent years, selecting a system based on Digital Equipment Corp. hardware for its extensive betting system.

The system due to be installed for the opening of he club's new racetrack in October 1978, will be based on 14 PDP 11/70s and 11/05s and will have 600 terminals, located both on-course and in the club's off-course betting shops, the yearbook said.

"The system will be capable of handling 250 transactions a second, sufficient to accommodate the frenzied betting that takes place on horse racing in Hong Kong," it added.

Singapore's computer industry came of age in 1976 with SEARCC 76, the first Southeast Asian regional computer conference, organized by the Singapore Computer Society.

"There have been estimates that Singapore, like Hong Kong and other countries in the region, is currently running about seven or eight years behind developed countries in the West, but such estimates are challenged by some industry leaders who put he figure at closer to three years," the yearbook stated.

"Many people are confident Singapore eventually will emerge as the leading center for data processing in the South East Asian region, a position currently held by Hong Kong," it added.

India Delays Growth

Computer development in India is being carefully regulated by the government, with the twin aims of preventing a drain on foreign currency reserves and avoiding any loss of jobs, the yearbook indicated.

"The government has a policy of discouraging the use of computers for routine commercial functions, and it has placed an embargo on the import of hardware for such purposes," it said.

There are currently about 300 computers in India, with IBM having the largest share of the market. IBM was given notice early in 1976 that it must accept a local partner or be closed down, an ultimatum that IBM clearly found unsatisfactory, the yearbook noted.

"The Indian government's policy, expressed through the Electronics Commission, is to eliminate the import of minicomputers and to limit sales to locally produced units," it stated.

Finally, on the legislative front, the Hong Kong Computer Society has concluded a comprehensive investigation into the question of privacy and DP, resulting in a recommendation for legislation to protect individual privacy against the misuse of information stored in computer files.

"It has become clear . . . that reliance on such influences as professional codes of conduct to secure the basic human right of privacy will be misplaced. Legislation is the only answer, and has been found to be the only answer elsewhere," the Society said in its official viewpoint.

The Asian Computer Yearbook is available from Room 302, Ivy House, 20 Wyndham St., Central, Hong Kong.

Canadian DP Arena Detailed

OTTAWA — As of May 1, 1976 the installed base of computers in Canada renting for more than $1,000/mo totaled 5,937, according to a census taken by the Canadian Information Processing Society (Cips).

IBM had the largest market share with 1,645 systems, followed by Digital Equipment Corp. with 985, Honeywell with 532, NCR Canada with 448 and Univac with 402.

By province or territory, Ontario has the largest installed base, 2,714 systems, followed by Quebec with 1,350 and British Columbia with 621.

Almost half the sytems, 2,314, rent for $1,000 — to $1,999/mo. There are 1,924 systems renting for $2,000 to $4,999/mo and only 240 rent for $50,000 or more, Cips found.

Manufacturing is the largest user, accounting for 1,332 systems. Distribution (wholesale/retail) accounts for 714 computers while government uses 690 computers and service bureaus 586.

A complete census is available for $50 from Cips, Suite 214, 212 King Street West, Toronto, Ontario, M5H 1K5.

DEALERS...AJ WANTS YOU

Anderson Jacobson, a leading manufacturer of data communications products, would like to introduce you to our new minicomputer, the AJ System 1500. And we need your expertise to make our small business system successful.

Here's what we have to offer:

- Good margins
- Exclusive territories
- A small business nucleus of application software at *no charge* to you
- Excellent client accounting software, also at *no charge*
- A multi-programming, multi-terminal system that is *fully* expandable
- AJ field service available in selected areas of the United States
- Floppy or hard disk systems

If your are interested in being a part or AJ's successful future, call or write Bob Reed, National Marketing Manager, for more information.

San Jose, California 95131 • (408) 263-8520

Pertec: Plug-Compatible Floppies Developing

BOSTON — The flexible disk drive will be thought of more and more as a component by system designers.

And, in response, disk drive suppliers will strive for plug compatibility among competitive products, J. David Callan, vice-president and general manager of Pertec Computer Corp.'s Microsystems Division, told the Invitational Computer Conference here recently.

As an example, Callan pointed to Pertec's recent introduction of its FD200 Microfloppy disk drive for 5-1/4-in. diskettes, which is mechanically and functionally interchangeable with the Shugart SA400 introduced earlier.

"Performance and features differ," Callan said. "The FD200, for example, permits writing on 40 tracks vs. 35 for the SA400. But the signal interfaces are compatible and mounting holes and outline dimensions are the same.

"With two independent suppliers of floppy disks offering plug-compatible units, there will be a strong incentive for other manufacturers to follow suit," he stated.

The result of the trend toward plug compatibility will be that OEM system manufacturers can be much more comfortable about the availability of second-source suppliers and the ease of upgrading as new products are introduced, he explained.

Capacity Doubling

Callan also noted that the capacity of floppy disks has been doubling at two-year intervals — a growth rate that, coincidentally, parallels the increase in density of LSI memory chips.

"The doubling of storage capacity has come about through the successive introduction of double-sided recording and double-density coding schemes in floppy disk drives," Callan said. "The next jump in capacity is likely to come from double-track recording, which seems to be just about two years away."

Manufacturers are working on write precompensation schemes in the disk controller to implement double-track recording, Callan said. In addition, media improvements may become available to overcome some of the stability limitations of current mylar flexible disks.

Either of these developments, or a combination of the two, is likely to make double-track recording and the resultant doubling of disk capacity available to users within the two-year span, he said.

As for pricing trends, Callan said a round of competitive price cutting is likely to be over; and floppy disk prices will probably stabilize for some time to come.

He does, however, foresee the user benefiting in the near future from improved performance and added features without a significant cost increase. This will be achieved through improvements in the drive and through the availability of new LSI controller chips now being developed by semiconductor companies, Callan said.

Executive Corner

- Donald L. Gross has been elected chairman of the board and William R. Doniger has ben named president and chief executive officer of Mini-Computer Systems, Inc.
- Richard L. McCall, president of U.S. Datacorp, has been named to the Trade Member Council of the National Micrographics Association.
- Ronald E. Vance has become vice-president of Anacomp, Inc.
- William R. Kaseta has been appointed director of sales and marketing at Information Access Systems.
- James MacKenzie has joined Data Terminal Systems as director of marketing.
- Jesse W. Caravello, Martin Hoffman, Paul L. Jones, Michael E.McCorry and Donald J. Walker have been named vice-presidents of Comshare, Inc. They will head operations, research and development, financial product services, Western sales and Eastern sales, respectively.
- John E. Fox has become vice-president for marketing and Robert J. Perry has been appointed vice-president for plans and controls at Satellite Business Systems.
- Clyde J. Cook and William S. Ringler have been promoted to senior vice-presidents, and W. Chuck Kruger and Dennis Self have become vice-presidents of Central Computer Services, Inc.
- Richard L. Seaberg has been named vice-president and general manager and Wilfred D. Geiger has been appointed director of business planning for Univac's Defense Systems Division.
- Robert E. Didion has become division vice-president for operations and Bob C. Barron has been promoted to vice-president for industrial relations and administration at Pertec Computer Corp.
- Ronald G. Gilch has been appointed director of the business development department of Aspen Systems Corp., a subsidiary of American Can Co.
- John Russell has been named manager of marketing programs at Bowne Time Sharing.
- John Puchon has been appointed director of systems development for Decision Data Computer Corp.
- Fred J. Gentile has been appointed vice-president for development at Action Communications Systems.

DataComm 78
Conference & Exposition
Washington, D.C.
Feb. 21-23, 1978

The ONLY National Industry Show Scheduled For An East Coast City In 1978

Extraordinary buying power will be represented at DataComm 78 because of its prime location, Washington, D.C. The Conference and Exposition takes place in the heart of the concentrated computer population in the Northeast and Northcentral parts of the country.

Almost 40% of the total installed value of general-purpose computer systems in the entire U.S. is within a 400 mile radius of DataComm 78. . .Sites within that area account for approximately 1/3 of all U.S. data processing expenditures. Users in this key geographic area find DataComm not only essential to attend, but also within easy reach.

Organizers of the annual DataComm Conference and Exposition have taken full advantage of the Washington, D.C. site to present special sessions on government involvement in data communications.

DataComm's 1978 Conference Program is nearing completion with well over 100 speakers, more than 1/2 representing vendor companies. . .all the way from AT&T to Xerox. That's good company. . .it means business! For them and for you.

The expanded program for this year's DataComm, coupled with the show's traditional appeal to all levels of interest in the data communications marketplace, is designed to attract an even greater number of attendees than in the past.

Excellent booth locations are still available. . .to reserve your space NOW, return this coupon immediately.

POSITION ANNOUNCEMENTS

SYSTEMS PROGRAMMER PROGRAMMER ANALYSTS (3)

- SYSTEMS PROGRAMMER

minimum 1 year experience with IBM 360/370, ALC, systems generation. VM/370, VS/1, teleprocessing, and minicomputer experience helpful. College degree preferred. 18-20K

- PROGRAMMER ANALYSTS

1-2 years COBOL programming essential. Familiarity with PL/1 and/or MUMPS helpful. Experience in a University environment preferred. College degree preferred. 12-15K.

We offer challenging positions in a progressive DP department using VM/370, CMS, and VS/1 on an IBM 148. Also, DEC PDP 11/45, 11/10 under Mumps. Fringe benefits include free tuition program. Forward resume, including current salary to

Ines Kerch, Administrative Officer
Georgetown University
Ryan Administration Bldg., Washington, D.C. 20057
EEOC/Affirmative Action Employer

COMPUTING PROFESSIONALS

ARE YOU A RESULTS ORIENTED TECHNICAL TEAM PLAYER? Do you take pride in what you do as an individual, but also appreciate the satisfaction of working closely with highly competent technical colleagues? Do you want the visibility and the rewords that go with full utilization of your skills?

Consider COMSHARE. We are looking for people who know they are better, are willing to prove their value, and can deal with success. We have the following senior level openings:

TECHNICAL PROGRAM MANAGER

B.S., M.S. or M.B.A. and five plus years experience in software/hardware development line management or product/program management functions.

INDUSTRY ANALYST

B.S., M.S., or Ph.D. with at least five years experience in the data processing industry. Ability to evaluate systems configurations, functionality content, and performance characteristics of computer vendors and competitor computer service companies.

COMPUTER SYSTEM ENGINEER

B.S. or M.S. in Electrical Engineering or Computer Science and five or more years in designing and developing computer systems related hardware. Some software understanding and skills are required.

COMMUNICATIONS/NETWORKS PROGRAMMERS

B.S. degree or equivalent and at least two years experience in programming teleprocessing systems, preferably on minicomputers.

SYSTEMS PROGRAMMERS

B.S. degree or equivalent and at least two years experience in developing operating system software internals.

COMSHARE is a rapidly growing international computer services company headquartered in Ann Arbor, Michigan, Research Center of the Midwest. These positions command excellent salaries and fringe benefits. And by the way, our people think we're a fun place to work.

Please send your resume to:

Morty Hoffmann
Vice President, Research and Development
COMSHARE, INCORPORATED
P.O. Box 1588, Ann Arbor, Michigan 48106

An equal opportunity employer

COMSHARE

Take this Opportunity to Talk Informally about Upgrading Yourself.

You may not be actively looking for a new position. But you recognize that your ability to grow—both professionally and personally—is constrained by a variety of factors in your present environment. Maybe you've reached an endless plateau. Maybe you've become too far removed from leading-edge state-of-the-art hardware or software. Or, perhaps you feel lost on a slow track in a large, highly structured organization.

You have probably been following Amdahl's progress and have come to respect the company's technical, marketing and support capabilities. You may even know someone from Amdahl, and you are somewhat envious of his or her professional freedom and opportunities for advancement. And you may already be impressed with the enthusiasm and spirit of the challenge that seems to touch everyone at Amdahl.

There is still room on the ground floor at Amdahl. We are actively looking for candidates to fill the local positions in this advertisement. (We also have available openings on our headquarters support staff in California.) Please call 415/735-4308 (collect) for an advance appointment to talk in one of the cities shown below; ask for Phil Beckhelm. Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, California 94086. We are, of course, an equal opportunity employer.

LOCAL INTERVIEWS FOR LOCAL AREA POSITIONS

Call Phil Beckhelm at 415/735-4308 (collect) for advance appointment, or contact him locally at the indicated hotel.

WASHINGTON, D.C.	NEW YORK CITY	DETROIT	MINNEAPOLIS
Capitol Hilton	New York Hilton	Sheraton Southfield	The Registry Hotel
Thurs., Fri., Sat.	Sun., Mon., Tues.	Thurs., Fri., Sat.	Sun., Mon., Tues.
Oct. 6, 7 & 8	Oct. 9, 10 & 11	Oct. 13, 14 & 15	Oct. 16, 17 & 18

FIELD SYSTEMS ENGINEERS

You will provide first-level systems software support at Amdahl 470 installations, assisting the center in maintaining systems software both within and without the Amdahl supported systems. You have large systems software experience with one or more of the following SCPs or program products: MVS, VM, SVS, VS1, ASP, JES2, JES3 or CSCP. You know internals and have defined and tuned SCPs. You also have exceptional diagnostic abilities, and are familiar with large systems hardware and peripherals as they interrelate with IBM compatible software. You have the personal skills to assume account management responsibilities.

FIELD ENGINEERS

You will provide first-level hardware support at Amdahl 470 installations, utilizing your initiative as well as your talents in aiding the center in overcoming all hardware problems regardless of their origin within the center. You will troubleshoot CPU and memory units, and act in an advisory capacity on non-Amdahl peripherals. In addition to performing all types of maintenance on 470s, you will coordinate Amdahl headquarters support staff in making installations. You have several years' large systems experience (preferably 370/158-168), or have worked as a peripherals field engineer in a large-system environment. You will enjoy some travel.

REGIONAL FIELD SYSTEMS ENGINEERS

You are a well-seasoned, large-scale systems programmer with the experience or aptitude for supervision and marketing support. You will perform survey and analysis work at prospective installations, provide technical assistance in proposal generation, and participate in marketing presentations. You will also be a strategy advisor to field systems engineers, aid in recruiting regional support personnel, make field support recommendations to headquarters, and bring your talent to bear on the more elusive software maintenance problems. The most immediate openings exist in Washington, D.C. and Detroit.

COMPUTER SYSTEMS SALES REPRESENTATIVE

You are the right candidate for this opportunity if you do not *have* to make a move; if you are currently leading your peers in competence, enthusiasm and performance, and if you have a need to be on a winning team selling the better product. You will have a thorough knowledge of the large-scale computer marketplace, and a five-year performance record. You will enjoy the personal and professional satisfaction of selling the proven price-performance leader, and enthusiastically relating the Amdahl success story to a wide audience that is anxious to hear the details. The most immediate opening is in our Eastern Division.

OUTSTANDING CAREER PACKAGE

Engineers – Software Design

3 Reasons Why You Should Look Into the Career Opportunities at GTE Automatic Electric!

Career challenge: the opportunity to make significant contributions at the beginning of a new era in a major industry.

The technical evolution in telecommunications is underway, We're working in many areas of software design in an on-line, real-time environment. Definition, design and implementation projects include CAD, Data Base Systems, Simulation, Fault Recovery, Diagnostics, and very complex switching networks using distributed control system technology. These are the forerunners of even more advanced systems that will be designed for the next generation.

SOFTWARE DESIGN

We're looking for an indepth background in the development of systems software and a minimum of 3 years' experience in structured design, testing and documentation of programs running on large data base, multi-file systems in real-time. Familiarity with HIPO design documentation, TSO usage and software simulation techniques as well as PL1, Fortran and assembler languages for the 8080 and PDP 11 programming is also important.

DATA BASE DESIGN

This position requires a minimum of 5 years' experience in the planning development, design and implementation of data base software, including data base management systems administration. Your primary responsibilities will be the development of data base system for a large on-going project including the implementation, support and administration of systems.

COMPUTER AIDED DESIGN

We are looking for an extensive background in the design of CAD/CAM systems and the development of Interactive access by the users of CAD/CAM functions. Required is 5-10 years' experience in both hardware and software aspects; DA systems operations, and design, and systems engineering. Your initial responsibilities will include evaluation of existing systems, and working with a project team in the Architectural Planning of a major new system.

MINI-COMPUTER PROGRAMMERS

We have specific assignments available on project development teams responsible for the design implementation of various telecommunication processing systems utilizing mini-computers as the processing element. Responsibilities will include the development of software programs for real-time operating systems as well as unique hardware elements incorporated into the systems.

Call now and let us fill-in more details. . .

CALL (800) 323-1966

In Illinois call (800) 942-0491
Sunday thru Friday, from 8 am to 4 pm cdt

If you have current experience in one of these areas, a BS, MS or PhD In Electrical Engineering, Computer Sciences, Math, or other appropriate discipline, let us count out more of the benefits and challenges you receive as a member of the GTE family.

If unable to call, please send your resume to:

Field Engineering Specialists

Amdahl Corporation has earned an international reputation as builder of the most advanced large computer system. Since our first shipment two years ago, we have delivered a quarter of a billion dollars worth of computers to the world's major companies and institutions. The company is exciting, the environment stimulating, and our compensation and benefits are excellent.

We seek Field Engineering Specialists who have a minimum of 5 years' experience in maintaining large-scale systems with in-depth training on compatible CPUs. You will have company support in assisting the Amdahl customer in his mixed-vendor environment to maintain full operations in his center. You will have the opportunity to work with multiple customers, to guide and support field engineers and to use your technical expertise for your own personal development and the growth of the Amdahl Corporation. Openings exist at Amdahl headquarters in California and temporary assignments are available in the Far East with a permanent assignment following. Please indicate 580-E on your response and direct it to Employment Manager, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. We are, of course, an equal opportunity employer.

amdahl

COMPUTER SYSTEMS SPECIALISTS (DISTRIBUTED PROCESSING)

IT PAYS TO JOIN THE LEADER!

General Electric is the world leader in information services—time sharing, remote batch processing, networking. Now we're looking for aggressive Systems Specialists to help us grow in the area of distributed processing.

Major responsibilities for this position will include design and implementation of the software for an Intelligent Terminal Cluster in conjunction with our major time sharing network service. This includes assisting in the design of a Cluster Controller software system; implementation and coding of Cluster software; checkout of the implemented system; and software maintenance of the developed product.

Applicants must have programming skills in assembler languages, including at least four years experience with mini-computers and/or micro-processors, and experience in the design of data base and file structures for small size media such as floppy disks and cartridge disks. In addition, experience/knowledge in using and programming Intelligent Terminals (Datapoint, Sycor, Texas Instruments, Four Phase); distributed processing and distributed data bases; and communications protocols such as BYSNC, GRTS, SDLC, and X-25 is desired.

Send your resume, salary history and requirements in confidence to: J. Calhoun, Employment Manager, General Electric Company, Information Services Division, 401 N. Washington St., Rockville, Md. 20850.
An Equal Opportunity Employer M/F.

THE SEARCH IS ON

For The Top Sales & Support People In The Computer Industry.

Marketing and Services Information Systems Division (MSISD)

has embarked on a major expansion program, sparked by both the outstanding success of our current state-of-the-art hardware and software systems and the promising new mini, small, medium and large computer systems going into production shortly. Honeywell MSISD is exploding throughout the country and seeks qualified professionals at all levels of experience to join them in the exciting computer future. Honeywell will be a major factor in this future. Talk to us and we will give you the hows and the whys as well as the whats about your future.

Hardware Marketing Representatives

Career and growth opportunities exist for sales/marketing representatives with experience in one or more of the following areas: LARGE SYSTEMS, MEDIUM SYSTEMS, SMALL SYSTEMS, MINI SYSTEMS AND PERIPHERALS. It will be your responsibility to develop and cultivate prospective clients and to ensure that all Honeywell marketing and service functions are coordinated to offer the most effective presentation of the company product lines. Expansion openings exist in major cities coast-to-coast.

Systems Representatives

This extremely important function involves planning, designing, developing and implementing systems applications and/or modifications to meet specific customer or prospective customer requirements. Career openings exist at all levels of experience from entry level with college degree or equivalent and at least one year programming background. Experience with languages such as: Fortran, Cobol, RPG-II, PL1 and Operating Systems, GCOS, and GMAP is desirable.

Field Engineering Representatives

At Honeywell, we seek Field Engineering Representatives to maintain and service computer systems and/or peripherals. You should have 2 years technical training or equivalent military/industrial electronics experience.

The odds are in your favor with Sperry Univac!

One of the biggest names in big computers has recently become one of the biggest names in small computers with the V-77 family of high performance mini-computers, a fast, powerful trio that relate to most mainframes. Specifically, the V-77 family is directed to applications in the commercial marketplace and include process control, data communications, data base and distributed processing systems.

What can Sperry Univac offer you that DEC, Data General, HP or GA can't?

Well, for starters, we feel we have one of the industry's best incentive plans, and second, real career opportunities - not promises! The goal to double in size within the year has been established and this means that both short and long term management opportunities are available for hard working, dedicated professionals.

What do we expect from you?

A minimum of 2 years mini-computer sales experience in the Data Base, Data Communications and/or Distributed Processing marketplace AND technical competence in hardware and software; plus a record as a closer who maintains account relationships and gets new and repeat business.

If you're experienced in selling the Nova, Eclipse, the Naked Mini, PDP's HP or GA's-SPC, the odds are in your favor with Sperry Univac.

For openings in: Chicago, Dayton, Detroit, Philadelphia, New Jersey, New York (Manhattan), Atlanta, Orlando and Washington, D.C. please call Gerry Goerlitz collect at 215/542-5254 or send your resume to B301M, P.O. Box 500, Blue Bell, Pa. 19422.

For openings in Dallas, Houston, Los Angeles, San Francisco or Seattle please call Gary Montgomery, collect at 714/833-2400 or send your resume to 2722 Michelson Drive, Irvine, Ca. 92713.

ASSISTANT DIRECTOR .SENIOR SYSTEMS PROGRAMMER

The University of Notre Dame seeks a qualified Assistant Director for Hardware/Software Systems and a Senior Systems Programmer. The Computing Center provides services for administrative, instructional and research activities of the University. The major computing environment is a 370/158 operating under MVS with heavy TSO usage. Major areas of growth are expected to be in networking and in on-line update/inquiry of data bases. Applicants should have broad computing experience including 2-5 years of systems programming. Experience in an academic institution and appropriate acaemic credentials are desirable. Salary range is 19-25K for Assistant Director end 15.5-19.5K for Senior Systems Programmer. Send resume, salary history and references to James R. Wruck, Computing Center, Notre Dame, Indiana 46556. Notre Dame is an EO/AA Employer.

Computer Architecture

Our Systems Architecture group seeks talented professionals to help design future high-performance computer systems. You should have a broad educational background in EE or CS with emphasis on computer architecture or design and be familiar with most of these areas: computer systems organization; storage systems organization; operating systems theory; assembler/high-level languages; data base fundamentals. Combined hardware and software experience and familiarity with system 370 is desirable. We have immediate openings for the following positions.

SENIOR SYSTEMS ARCHITECT

You will be a key decision maker on an architectural team. You have experience in either computer systems or operating systems architecture or design.

CONSOLE AND MAINTENANCE ARCHITECT

You will be responsible for the design of system consoles and work on system maintenance strategies. You have experience or aptitude in most of these areas: small and large computer systems; diagnostics; small operating systems and project management.

STORAGE SYSTEMS ARCHITECT

You will be key in defining the architecture of of future storage and data base sub-systems. You have experience in either of these areas.

SOFTWARE SYSTEMS ARCHITECT

You will be a software systems specialist on an architectural team. You have an architectural orientation and experience with operating systems/data base, preferably on system 370.

SYSTEMS ARCHITECT

You will be a member of an architectural team working on diverse investigations. This position offers tremendous educational and advancement opportunities. You have at least 2 years' related experience.

SYSTEM PERFORMANCE ARCHITECT

You will be the performance specialist on an architectural team. You are a qualified professional in computer system performance measurement, evaluation and modeling with emphasis on architecture or design. Research into key areas of new product development will be a major responsibility.

PERFORMANCE MEASUREMENT SPECIALIST

You will be responsible for the development of measurement methodologies to provide the measurement support of future product development. The position requires broad experience and knowledge of computer system operation, measurement methods and system modeling.

WORKLOAD SPECIALIST

You will be responsible for research of computer system workload classification and analysis, including workload creation and synthesis. Research ability in the areas of performance measurement and evaluation is necessary.

We're looking for exceptional talent. You can expect an exceptional compensation and benefits package. Please direct your response to Manager, Professional Employment, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. To expedite your application, please indicate 416-E on your resume or letter. We are, of course, an equal opportunity employer.

DIGITAL SYSTEMS ENGINEERS.

Career opportunities for Digital Systems Engineers are available with Aramco in Saudi Arabia. Aramco, the world's largest oil producing company, has several multibillion dollar projects under way, and if you're qualified, is willing to pay you well for your talents.

Besides one of the best benefits packages in the industry, you can expect your net take-home pay in Saudi Arabia to be approximately equal to your gross pay in the U.S. Advancement opportunites are excellent.

The job.

You will be responsible for maintaining minicomputer systems used for process control, power dispatching, and other sensor-based applications.

It is required that you be familiar with state-of-the-art design practice for logic circuits such as TTL and CMOS, A/D and D/A converters, core and semiconductor memories, bulk storage devices, and CRT consoles.

You should also have experience in assembly and machine languages, programming and diagnostic fault-finding techniques.

You must be willing and capable of performing hands-on system troubleshooting and maintenance as well as supervising technicians.

You are required to have an engineering degree in an appropriate discipline and a minimum of 5 years' experience in minicomputer systems.

Work schedules.

Successful applicants may be requested to relocate permanently in Saudi Arabia and work a regular work schedule, or work a special "42-21" schedule in which you work 42 consecutive days in Saudi Arabia then have 21 consecutive days off for repatriation to the U.S. with round trip air travel provided. (You would work a 60-hour week with guaranteed overtime pay—something you might not ordinarily get in the States.) Persons working the "42-21" schedule also receive free room and board while in Saudi Arabia.

Other benefits Aramco offers.

Medical care for you and your family is furnished at no charge by the company while you are in Saudi Arabia. On the average of every 12½ months, persons working a regular work schedule will receive 40 days' paid vacation plus round trip air fare to the U.S. for themselves and their families. And to this time off, add another 12 paid holidays each year.

Aramco also offers you good savings and retirement plans. And in addition to your salary, you receive a generous, tax-protected expatriate premium.

Want to know more?

If you're qualified and want more information, write for an application. We will be back in touch with you as soon as possible.

DP MANAGER

Irvine based food supplement manufacturer seeks an individual who will be responsible for the operation of the DP Department. Position reports to the Vice President of Finance. Specific responsibilities to include system development, programming, machine operation of an IBM System 3/Model 15 environment and training of supporting staff. Successful candidate will have experience with IBM System 3/Model 15, RPG-II, and CCP. Experience with computerized manufacturing control systems including forecasting will be helpful. Please send resume and salary history to Vice President-Finance, P.O. Box 16307; Irvine, California 92713.

Software Engineers

As one of the most dynamic and rapidly expanding companies in the computer industry, Amdahl still has excellent opportunities to offer good people who are ready to upgrade their career and work environment.

You will be working on a very large mini-based control system. You should have 1 to 2 years' programming experience with mini-based operating systems or control systems. Your background includes some hardware experience, hopefully with large digital computers, and a BSEE or BSCS or the equivalent experience. Please indicate 436-E on your response and direct it to Employment Manager, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. We are, of course, an equal opportunity employer.

Who closed the last computer sale—the Sales Engineer or the Systems Engineer?

Sales
Systems

Both of them. At Data General Sales Engineers and Systems Engineers work hand in glove on every sale.

Together they find the customers, create the systems and do the selling. Both meet with customers. Both present the system they feel meets the specific application. And both provide the technical information to back it up.

This kind of dual capability has helped Data General increase sales from $1 million to over $177 million in 9 years.

What's more Data General has sold and installed over 39,000 computers in 33 countries around the world. And all that money coming in has resulted in a great deal of money going out—to our Sales and Systems Engineers.

Computer Sales Engineers

We require a solid technical background in mainframes, minis or systems—plus the ability to open up new OEM and end user accounts is a must. BSEE with a successful track record in computer hardware sales required.

Computer Systems Engineers

You will use your technical expertise to provide pre- and post-sale software support to our customers and Sales Engineers. You should have minicomputer systems programming experience plus a thorough knowledge of disc-based operating systems in a multi-terminal real-time environment. BS in Computer Science with three plus years experience on Data General NOVA® or ECLIPSE® based systems is desirable.

COMPUTER MAINTENANCE TECHNICIANS.

Aramco is expanding its EDP facilities in Saudi Arabia, and now has several multibillion dollar projects under way. A number of openings exist for Computer Maintenance Technicians.

If you are qualified, Aramco will pay you well for your talents. As a rule of thumb, you can expect your net take-home pay in Saudi Arabia to be approximately equal to your gross pay in the U.S. Your chances for advancement are excellent.

The Job.

You would be responsible for the maintenance of real-time minicomputers and peripherals. A solid background in electronics is required, plus training and experience on minicomputer mainframes and peripherals. Peripherals include typers, line printers, ISC drives, magnetic tapes, color CRT consoles, and process interface units.

We have SCADA systems using large numbers of RTV's at remote installations. The job includes diagnostic troubleshooting at the system level, detailed troubleshooting and repairs on specific items, plus routine maintenance and calibration of electromechanical peripherals, RTV's and process interface units.

You must be a high school graduate and have a minimum of 5 years' related experience.

Work schedules.

Successful applicants may be requested to relocate permanently in Saudi Arabia and work a regular work schedule, or work a special "42-21" schedule in which you work 42 consecutive days in Saudi Arabia then have 21 consecutive days off for repatriation to the U.S. with round trip air travel provided. (You would work a 60-hour week with guaranteed overtime pay—something you might not ordinarily get in the States.) Persons working the "42-21" schedule also receive free room and board while in Saudi Arabia.

Other benefits Aramco offers.

Medical care for you and your family is furnished at no charge by the company while you are in Saudi Arabia. On the average of every 12½ months, persons working a regular work schedule will receive 40 days' paid vacation plus round trip air fare to the U. S. for themselves and their families. And to this time off, add another 12 paid holidays each year.

Aramco also offers you good savings and retirement plans. And in addition to your salary, you receive a generous, tax-protected expatriate premium.

IMS SYSTEMS PROGRAMMERS

Responsibilities will include Data Base design, data dictionary maintenance, Data Base performance monitoring and tuning, and technical support.

The successful candidates will have extensive IMS/VS DB experience. Working exposure with the DC facility. Knowledge of JCL and COBOL and MARK IV a plus.

An Equal Opportunity Employer M/F

Amtrak

COMPUTER PROFESSIONALS

Our modern computer center located in Linden New Jersey is experiencing rapid expansion and currently seeks talented individuals for the following positions:

MANAGER-TECHNICAL SUPPORT

This new position has been created to provide full systems support to operating management. Reporting directly to the Vice President, the individual we seek must have a thorough knowledge of the B-6700 Hardware and Communication equipment, plus a detailed understanding of the MCP, DMS and NDL Software. Must also be knowledgeable of on-line banking systems.

COBOL SYSTEMS & PROGRAMMER ANALYSTS

Three to seven years COBOL experience required; Burroughs DMS II and on line banking experience highly desirable.

These positions offer extremely competitive salaries, outstanding fringe benefits and exceptional growth potential.

Send resume including salary history and requirements in confidence to: PERSONNEL DIRECTOR.

An Equal Opportunity Employer M/F

Software Development

Systems Programmers

Our Software Department that designs and implements compilers, operating systems, and record management systems has doubled its size in the last two years and is still expanding rapidly. Due to this extraordinary expansion, the opportunities for growth in our organization are unmatched in the industry. We have several openings for Systems Programmers at all levels.

Your ability to learn and enjoy software development in a fast changing organization is more important than your specific background. The only firm requirement is that you have at least 2 years experience in assembly language programming, and a strong desire to learn operating systems and/or compiler run time systems development. A BS or equivalent, familiarity with PDP-11, RMS-11, RSTS/E and RSX-11M, or a knowledge of BLISS would be helpful.

If you have the energy, talent, and resourcefulness to become an important contributor in this fast-paced environment, please send your resume, including salary requirements to Joe Hart, Digital Equipment Corporation, Dept. B9i9, 162 Main St., Maynard, Massachusetts 01754. We are an equal opportunity employer m/f.

We're the company looking for people:

digital

San Diego opportunity in advanced-technology

EDP SYSTEMS DEVELOPMENT

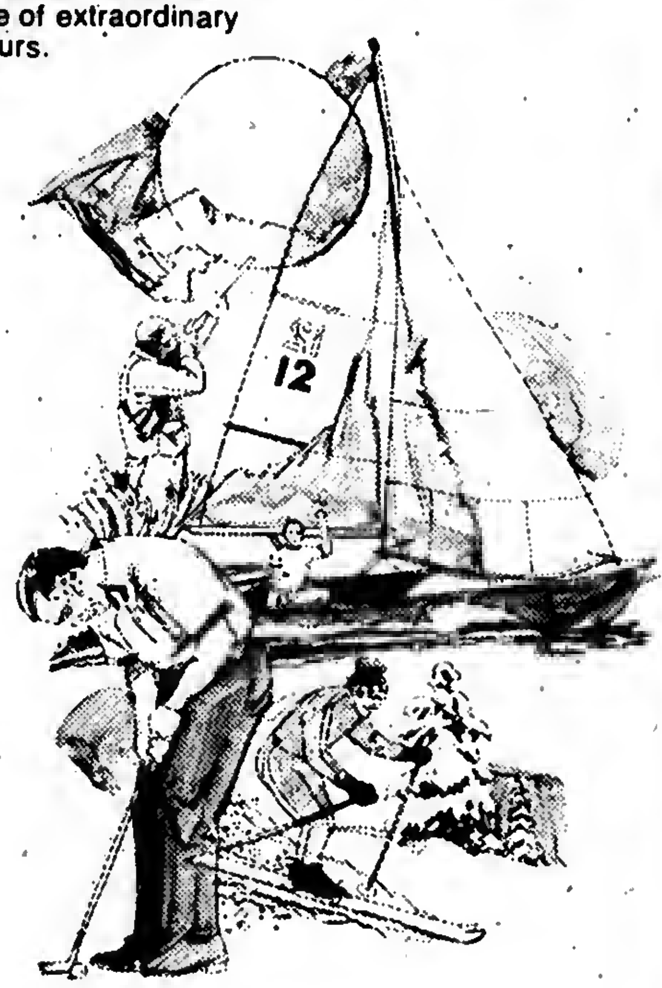
Want to combine the ideal career opportunity with your favorite lifestyle? NCR Special Systems Division needs your help now in developing advanced, high-technology EDP systems for customers around the world. You'll be doing important work in our Sorrento Valley facility, just three miles from the ocean and only minutes from Torrey Pines, La Jolla and downtown San Diego. You can live in the setting of your choice—beach, valley, mountain, country, small-town or urban—and still be only a short drive from work. Spend your leisure hours golfing, swimming, hiking, getting advanced degrees from major universities, attending theatrical, music, art and sports events, or soaking up the year-round sun. Pick your climate, too—from mild coast to dry desert. San Diego is a place of extraordinary choices—and right now the choice is yours.

COMPUTER PROFESSIONALS

The Special Systems Division has opportunities for software professionals in a broad range of disciplines and in all experience levels. Our current and firm future programs require top people with experience in any of the following areas:

- TELECOMMUNICATIONS SOFTWARE
- FILE PROCESSING
- NETWORK DEVELOPMENT
- LARGE MAINFRAME, MINI and MICRO PROCESSOR
- OPERATING SYSTEMS
- COBOL APPLICATIONS
- ASSEMBLY LANGUAGE

Assignments will include the development and implementation of various EDP systems for specific customers as well as the development of future NCR total systems; both requiring state-of-the-art knowledge.



Our benefit package is what you would expect from a major blue chip corporation. What you might *not* expect is the relaxed and very creative environment of this small, highly specialized division. The facilities are modern, comfortable, designed to provide an atmosphere in which every employee can achieve an uncommon degree of personal and professional satisfaction. May I offer you the opportunity to judge for yourself? Please send your resume (with salary history) to me,

Thom Harris, Employment Specialist

Computer System & Software Engineers

You can get ahead faster with us than with anybody else.

Here's why:

1 You are needed right now. Our project teams are crying for good professionals who can grab hold fast.

2 You'll get a chance to prove how good you are. Everybody is evaluated regularly; there are no missing persons at TI. If you're good, you move up fast. No matter how long the people above you have been there.

3 You'll be involved in state-of-the-art projects. Air Traffic Control. Satellite navigation systems. Landing systems. Radar and infra-red sensor systems. Computer-aided design, manufacturing and electrical test systems, machine tool control, text processing and process control. Acoustic data and image processing. In addition, an Advanced Software Technology Department has been formed to develop state-of-the-art tools, procedures, and languages for computer system design and software production. TI is the technological leader in literally scores of product fields. This leadership has produced more than 5,000 patents.

4 You'll work on a complete system. No threat of getting locked into a repetitious specialty. You'll work on a small project team. You'll interface daily with other disciplines and other phases of your overall program.

5 You'll work in a job-stable, multi-market situation. We have a variety of products and markets. We're not heavily dependent on any one of them — and neither is your job.

Entry Level or Experienced Openings for U.S. Citizens

Software System Designer
M.S. in Computer Science or Engineering and experience in design of software systems for real-time and interactive systems.

Computer System Engineer
M.S. or PhD in Electrical Engineering or Computer Science and five years experience in hardware and software design of real-time computer systems.

Engineering System Analyst
M.S. or PhD in Math, Physics, Computer Science, or Engineering, and experience in analysis of engineering systems.

Programmers
B.S. in Computer Science, Math, Physics, or Engineering and programming experience with higher order languages such as Fortran, Pascal or PL/I. Both scientific and real-time programmers are required.

Language Processor Designers
M.S. or PhD in Computer Science and three years experience in development of programming languages, compilers, translators, assemblers and link editors.

Software Engineers

Our expanding product lines have opened several challenging positions to qualified software engineers in the following disciplines:

Project Engineer

To develop the architecture for a modular system, which also contains resident diagnostics using microprocessors. BSCS or BSEE and experience in system design. Hardware familiarity helpful.

Evaluation Engineers

To evaluate diagnostic routines for testing Microprocessor Development Aids and similar products. Minimum of BSCS or BSEE with hardware and software knowledge. Design or evaluation experience necessary.

Design Engineer

Software engineer for microprocessor system programming. Will interact with digital design engineers and operating system programmers to develop software support for a variety of microprocessors. BSCS or BSEE and familiarity with digital hardware. Extensive assembler language software experience, microprocessors or minicomputers helpful.

Diagnostic Programmer

Maintain existing diagnostic programs and work closely with digital design engineers during development cycle. Write diagnostic program for circuitry under development. BSCS or BSEE and ability to read digital schematics to the gate level. Assembler language background necessary.

Salary is open. Benefits include liberal insurance, educational support and profit sharing programs.

Send detailed resume and salary history to Mary Walhood, TEKTRONIX, INC., P.O. Box 500, C81, Beaverton, Oregon 97077.

An Equal Opportunity Employer M/F/H.

COMMITTED TO EXCELLENCE

DATA PROCESSING PROFESSIONALS

For key research support assignments at Lederle's DEC System 10, PDP-11 installation.

If you're an innovative professional, consider the demanding assignments and solid potential for growth you can have with this leader in pharmaceutical and medical technology. You'll join the expanding staff at our Pearl River, N.Y. EDP center — located just 30 miles from New York City — and make vital contributions to programs that meet our diversified, large-scale research requirements.

The opening in our **MEDICAL DATA GROUP** is for:

SENIOR SYSTEMS ANALYST

Will plan, design, and develop systems that support clinical research programs. Assignments will emphasize data base applications and user-oriented software. Requires MS in Math or Computer Science, at least 3 years experience developingand implementing computer systems, large scale data base background, and knowledge of FORTRAN and COBOL. Familiarity with SAS and INQUIRE desired.

The openings in our **LABORATORY AUTOMATION GROUP** are for:

SENIOR INSTRUMENTATION SCIENTIST

Will be project leader for lab engineers and computer hardware analysts. Requires MSEE and 5-10 years of experience. Also essential are knowledge of minicomputer hardware (PDP-11's), analog data reduction techniques, and computer interfaces to analytical instruments . . . familiarity with life science equipment, engineering and mathematical modeling, and communications network design.

SENIOR SYSTEMS ANALYST

Will be project leader for Systems Analyst and Analyst Programmers with technical responsibility for applications in various real time environments. Requires MS in Computer Science, Math or Life Science and 5-10 years experience. Knowledge of PDP-11 Operating Systems (RSX-11M & RT-11), and practical knowledge of MACRO-11, analog data reduction techniques, and image data processing necessary.

LABORATORY APPLICATIONS ENGINEER

Will design hardware/software sub-systems in research laboratory environment. Involvement will include hardware design, data acquisition and reduction systems. Requires BSEE with Computer Science exposure and 3-5 years experience. Knowledge of PDP-11 hardware strongly preferred.

ANALYST PROGRAMMER

Will develop application programs in research lab environment including laboratory data acquisition and reduction systems. Requires BS in Computer Science, Math or Life Science and 1-3 years experience. Knowledge of PDP-11 Systems desirable.

We provide fully commensurate salaries for all positions and excellent benefits. Send resume, including salary history, to Mr. G.J. Stein.

TANDEM

Non-Stop Opportunity

We are the only manufacturer who offers a non-stop multiple processor computer. It's the most important development in computer architecture since the development of the minicomputer itself. It's proven in the field. It's working in a wide variety of industries: banking, manufacturing, distribution, medicine, printing and publishing, in communications. It's great. It's growing.

And we are growing, too.

If you have the background, drive and enthusiasm to make your mark with and for the company which pioneered non-stop on-line transaction processing, we have significant openings in senior sales and systems positions in key cities throughout the country.

You can show us how you'll contribute to our growth, coming from a minimum of three years directly applicable experience. We have the openings now for men and women who enjoy the challenge and opportunities of working with the leader in the field who is still small enough to recognize—and reward—their contribution.

The opportunity is real. The rewards are significant. If you're the one who's ready for this kind of a package, write or call with the information we'll need to recognize your potential.

Sam Wiegand, Vice President, Marketing
Tandem Computers, Inc.

Instructor

Several good reasons you should move to Itel.

First and foremost is Itel's new Advanced System (TM). We just introduced the only sensible alternative to the IBM 370. It's more powerful, more efficient and twice as reliable. So we know it will sell. Big. Which means more growth for us and a greater need for more good people.

Another good reason is our new facility in Palo Alto's Stanford Industrial Park. It offers convenience, the latest in technology and excellent working conditions. They all add up to the kind of working environment we want to provide for our employees.

The Advanced Systems and our new facility are just a couple of the exciting things that are happening at Itel. Our continued growth has created an immediate opening for an Instructor with IBM CPU background, preferably with IBM 370/158/168 and 3800 printer.

Itel offers an excellent benefits program, salaries commensurate with qualifications and experience.

For immediate consideration, please submit a resume in confidence to: ITEL Corporation, Personnel Department, 3145 Porter Drive, Palo Alto, CA 94304. An Equal Opportunity Employer M/F.

ITEL CORPORATION
FIELD ENGINEERING DIVISION

We can give you 3 good reasons to call Robert Half for data processing positions:

1. Robert Half has been in business for about 30 years. Can you name an EDP personnel service that's been around longer?

2. Robert Half specializes. We've been an integral part of the data processing community through all its generations.

3. Robert Half's offices are staffed by experts in the EDP field.

and if 3 reasons aren't enough, we can give you 55 more:

55 offices. Robert Half is a network throughout the U.S., Canada and Great Britain. One call and you've searched the local market ... or the world.

and if 58 reasons aren't enough, we can give you Half a reason more:

Robert Half. Where integrity is a lot more than just HALF.

ROBERT HALF PERSONNEL AGENCIES

COMPUTER SCIENCE PROFESSIONALS

MEET THE CHALLENGE WITH GULF

Build a meaningful career in Southwest Houston at Gulf Oil's newest and most advanced computer complex. Gulf Science & Technology, one of the operating companies of Gulf Oil, offers an excellent benefit package and competitive starting salaries for:

Applications Programmers

Prerequisites include a degree in Computer Science or related field, two years experience in Commercial Applications Programming using COBOL and/or ALC in a 370/OS-VS or MVS environment. Experience with IMS, TSO and VSAM a definite advantage.

Systems Programmers

Prerequisites include a degree in Computer Science or related field and/or experience with systems software. Prefer knowledge of ALC, compilers, systems architecture, and programming support of IBM OS/MVS and JES3 under 370/168 Systems. Primary duties could involve active participation in operation system maintenance of large TP network (NCP/VTAM), IMS, TSO, CICS and Batch Processing.

Qualified applicants are invited to submit their resumes including salary history to:

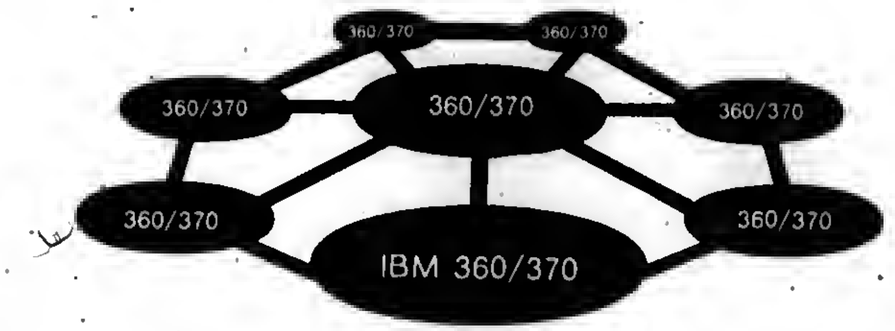
Meet FLEXICOM, the only distributed processing system based on IBM 360/370 architecture.

Flexicom is an entirely new approach to building multi-processor networks. Flexicom is the only distributed processing system that uses IBM's 360/370 architecture at *every* location in the network.



This consistent architecture means more flexibility, more power, and much simpler application design. The confusion of linking minicomputer "satellites" to a general-purpose mainframe "host" is gone. Each Flexicom site can run the same applications, use the same database management system, and access the full range of IBM 360/370 software.

Flexicom systems come in a variety of sizes and speeds. They range from small remote satellites to powerful front-ends.

Each Flexicom system is a complete hardware/software package. Each system combines an IBM mainframe with proven software, peripheral devices, and complete transmission control facilities. In addition each member of the Flexicom family is interchangeable with any other, giving you almost unlimited flexibility in network planning.

For Front-Ending

When locally-attached to the host, a Flexicom system provides all of the advantages of a front-end processor—without the need for specialized hardware and software.

A Flexicom front-end will relieve your main computer of all line control, error recovery, queuing, and message switching overhead. Flexicom even supports a complete administrative message switching system that can be selectively or completely independent of the host. Best of all, a Flexicom front-end can off-load all message editing and formatting logic—sometimes more than half the transaction processing load—with little or no user programming.

Your existing staff can write programs for a Flexicom front-end using high-level languages such as COBOL, FORTRAN, and PL/I. This allows you to access your existing database to edit and process messages both before and after they are sent to the host, further reducing the host workload.

For Distributed Processing

When remote from the host, a Flexicom system provides many of the off-loading advantages of a front-end while also functioning as a powerful distributed processor. This means complete support for its own network of terminals, selective access to the host, truly distributed databases using identical host and satellite file structures, plus local batch processing on a full-feature CPU.

As with a Flexicom front-end, developing new applications is simple and straightforward. On-line programs can be written in high-level languages, message editing and formatting logic can be developed interactively at a terminal, and a complete on-line data entry system can be implemented without user programming.

A True Turnkey System

Flexicom is delivered with everything you need: prepackaged software, CPU, peripheral and transmission control hardware, complete installation services and full documentation. Trained Customer Service Representatives will provide on-site education in the use of Flexicom and will also show your staff how to integrate Flexicom into your existing CICS, IMS, or other telecommunication system.

Interested?

We'll be glad to send you a Flexicom brochure or enroll you in a free Flexicom seminar in your area. Just return the coupon or give us a call.

Systems Programmers

Two Systems Programmers. One relatively junior with experience in PL/1, design and installation of computer measurement and accounting systems, knowledge of other programming languages; i.e., Assembler and SAS, and IBM large scale operating systems (OS or VM). The other more senior level requires experience in performing computer requirement studies, designing and installing integrated computer systems applications, experience as project leader and knowledge of IBM large scale operating systems (OS or VM), mini and micro computers mainly from a planning and coordination standpoint, and knowledge of data communication and computing networks.

Programmer Analysts

Senior programmer to work on the development of a large on-line library automation system (BALLOTS). The primary work will involve development of bibliographic data base systems to support library operations. Demonstrated skills in design and programming of information retrieval and/or data base management systems in a TYMSHARED environment is required. Approximately three years experience plus a BS in computer science or related field and/or equivalent combination of experience and education is desired.

Senior Communications Design Engineer

To design and implementa data communications system to connect a large network of terminals to the BALLOTS library automation system. The communications system will support nation-wide networks of polled multi-drop lines to intelligent terminals, direct connections among mainframes, and direct dial or VAN access for dumb terminals. Applicants should have a BS in EE, Computer Science or closely related fields, and a minimum of three years experience demonstrating technical knowledge of both hardwareand software aspects of data communications and understanding of common carrier services, or equivalent combination of education and experience.

Send resume with salary history to: Stanford University, Center for Information Processing, c/o C.W. Coulter, Encina Hall, Room 30, Stanford, CA 94305.

STANFORD UNIVERSITY

Equal Opportunity Employer
Through Affirmative Action

PROGRAMMER ANALYST

MISSISSIPPI STATE
CENTRAL DATA PROCESSING AUTHORITY

Sealed proposals will be received by the CDPA, 508 Robert E. Lee Bldg., Jackson, MS 39201, up until 2:00 p.m. 10-17-77 for the following data processing equipment.

Request for Proposal No. 311 for the acquisition of keyboard activated data communication terminals: 311A-ASR and KSR hard copy terminals; 311B-TTY compatible CRT terminals, 311C-Printer devices for receive only, 311-D graphics terminals, 311E-IBM compatible CRT's, controllers, and printers, This RFP will be used to select terminals for the State of Mississippi until June 30, 1978.

Request for Proposal No. 312 for the acquisition of the IBM MVS/System Extensions or an equal or better software product.

Request for Proposal No. 313 for the acquisition of a job accounting system to operate under MVS.

Request for Proposal No. 314 for the purchase of a disk-oriented computer system with multi-processing capabilities, cardless with up to 12 data entry stations to be used in a small college environment.

Request for Proposal No. 315 for the lease or purchase of printing interpreting keypunch-verifiers

Request for Proposal No. 316 for the lease or purchase of data entry devices utilizing diskette recording media and capable of interfacing with an existing IBM System 3 Model 10.

Request for Proposal No. 317 for the purchase of a disk drive to attach to an existing IBM System 3/10 with one existing 5444 Model 2 drive. Must have a capacity of 4.9 million bytes minimum.

Request for Proposal No. 318 for the upgrade of an existing IBM System 3/10 from 15K bytes of memory to 32K bytes of memory, to upgrade a 5444 Model 1 disk drive to a Model 2, to upgrade the System 3/10 to a dual programming machine capable of loading and processing 2 programs simultaneously.

Detailed specifications may be obtained from the CDPA office. The CDPA reserves the right to reject any and all bids and proposals and to waive informalities.

Clyde P. Ballard, Executive Director
Central Data Processing Authority

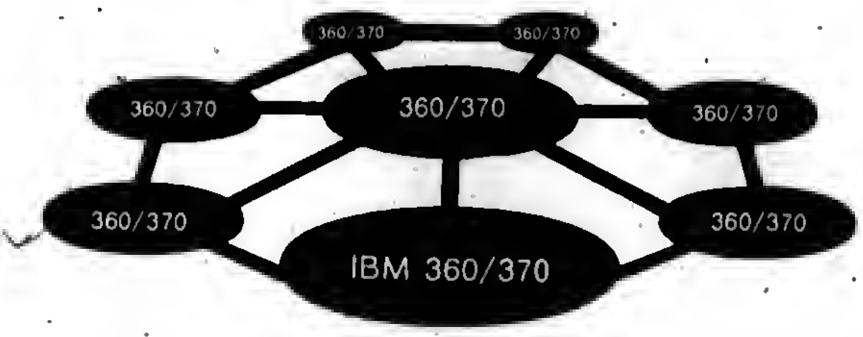
Meet FLEXICOM, the only distributed processing system based on IBM 360/370 architecture.

Flexicom is an entirely new approach to building multi-processor networks. Flexicom is the only distributed processing system that uses IBM's 360/370 architecture at *every* location in the network.



This consistent architecture means more flexibility, more power, and much simpler application design. The confusion of linking minicomputer "satellites" to a general-purpose mainframe "host" is gone. Each Flexicom site can run the same applications, use the same database management system, and access the full range of IBM 360/370 software.

Flexicom systems come in a variety of sizes and speeds. They range from small remote satellites to powerful front-ends.

Each Flexicom system is a complete hardware/software package. Each system combines an IBM mainframe with proven software, peripheral devices, and complete transmission control facilities. In addition each member of the Flexicom family is interchangeable with any other, giving you almost unlimited flexibility in network planning.

For Front-Ending

When locally-attached to the host, a Flexicom system provides all of the advantages of a front-end processor—without the need for specialized hardware and software.

A Flexicom front-end will relieve your main computer of all line control, error recovery, queuing, and message switching overhead. Flexicom even supports a complete administrative message switching system that can be selectively or completely independent of the host. Best of all, a Flexicom front-end can off-load all message editing and formatting logic—sometimes more than half the transaction processing load—with little or no user programming.

Your existing staff can write programs for a Flexicom front-end using high-level languages such as COBOL, FORTRAN, and PL/I. This allows you to access your existing database to edit and process messages both before and after they are sent to the host, further reducing the host workload.

For Distributed Processing

When remote from the host, a Flexicom system provides many of the off-loading advantages of a front-end while also functioning as a powerful distributed processor. This means complete support for its own network of terminals, selective access to the host, truly distributed databases using identical host and satellite file structures, plus local batch processing on a full-feature CPU.

As with a Flexicom front-end, developing new applications is simple and straightforward. On-line programs can be written in high-level languages, message editing and formatting logic can be developed interactively at a terminal, and a complete on-line data entry system can be implemented without user programming.

A True Turnkey System

Flexicom is delivered with everything you need: prepackaged software, CPU, peripheral and transmission control hardware, complete installation services and full documentation. Trained Customer Service Representatives will provide on-site education in the use of Flexicom and will also show your staff how to integrate Flexicom into your existing CICS, IMS, or other telecommunication system.

Interested?

We'll be glad to send you a Flexicom brochure or enroll you in a free Flexicom seminar in your area. Just return the coupon or give us a call.

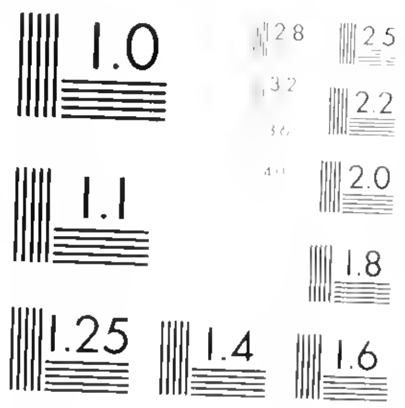
RESOLUTION CHART



MICROCOPY RESOLUTION TEST CHART
[illegible]

100 MILLIMETERS

INSTRUCTIONS Resolution is expressed in terms of the lines per millimeter recorded by a particular film under specified conditions. Numerals in chart indicate the number of lines per millimeter in adjacent "T-shaped" groupings.

In microfilming, it is necessary to determine the reduction ratio and multiply the number of lines in the chart by this value to find the number of lines recorded by the film. As an aid in determining the reduction ratio, the line above is 100 millimeters in length. Measuring this line in the film image and dividing the length into 100 gives the reduction ratio. Example: the line is 20 mm. long in the film image, and 100 20 5.

Examine "T-shaped" line groupings in the film with microscope, and note the number adjacent to finest lines recorded sharply and distinctly. Multiply this number by the reduction factor to obtain resolving power in lines per millimeter. Example: 7.9 group of lines is clearly recorded while lines in the 10.0 group are not distinctly separated. Reduction ratio is 5, and 7.9 x 5 39.5 lines per millimeter recorded satisfactorily. 10.0 x 5 50 lines per millimeter which are not recorded satisfactorily. Under the particular conditions, maximum resolution is between 39.5 and 50 lines per millimeter.

Resolution, as measured on the film, is a test of the entire photographic system, including lens, exposure, processing, and other factors. These rarely utilize maximum resolution of the film. Vibrations during exposure, lack of critical focus, and exposures yielding very dense negatives are to be avoided.
